Stem hispid, tetragonal. Corolla dusky red or purple, sometimes varying to white, hairy. Seeds elegantly latticed.

Far. (3, vérna (Pers. ench. 2. p. 150.) leaves ovate-lanceolate, toothed; bracteas longer than the flowers. ©. H. Native of Piedmont, in pastures. Euphrasia vérna, Bell, append, fl. ped. p. *33.* Willd. spec. *S.* p. 194. Perhaps a distinct species. Euphrasia sylvestris major purpurea latifolia, Column, ecphr. 1 p. 201. t. 202. f. 1.

Red Eyebright. Fl. July, Sept. Britain. PI. i to 1 foot.

2 O. LUTEA; leaves linear, serrated: superior ones quite entire; segments of the lower lip of corolla emarginate. ©. H. Native of the South of Europe, on arid mountains; and of Barbary. Euphrasia lutea, Lin. spec. 841. Jacq. fl. austr. t. 398. Desf. fl. atl. 2. p. 35. E. Coris, Crantz, austr. p. 298. Hall. helv. no. 305. Odontites flore luteo, Riv. mon. t. 91.—Mor. hist. 3. p. 432. sect. 11. t. 24. f. 16.—Column. 1. p. 204. t. 203. This resembles- *Odontites rubra;* but the flowers are yellow; the upper lip bearded and emarginate. Stem and leaves rough. Capsule villous, shorter than the calyx. Calyx pubescent.

reWow-flowered Eyebright. Fl. July, Sept. CIt. 1816. PI. 1 foot.

3 O. LINIFOLIA; leaves linear, all quite entire; calyx glabrous or pubescent. ©. H. Native of France and Italy. Euphrasia linifolia, Column, ecphr. *2.* p. *68.* t. *69.* Lin. spec. p. 842. Flowers yellow. Capsule hairy, exceeding the calyx.

Flax-leaved Eyebright. Fl. July, Aug. Clt. 1826. PL \ to | foot.

4 O. VISCOSA; leaves linear-lanceolate, 3-nerved, almost quite entire; calyxes clammy; lateral lobes of lower lip of corolla emarginate. ©. H. Native of Provence and Switzerland, in sterile, gravelly places. Euphrasia viscosa, Lin. mant. 86. Gouan. ill. *37.* Desf. fl. atl. 2. p. 36. Lam. ill. t. 518. f. 3.—Hall. helv. no. 306. Garid. aix. 351. t. 78. Plant pilose, clammy. Flowers yellow. This differs from *E. lutea* in the leaves being linear-lanceolate, not strictly linear; and in the calyxes being villous and clammy, not glabrous. Corolla closed, and not shorter than the stamens. Capsule hairy, equal in length to the calyx. It is also to be distinguished from *E. linifolia.*

Clammy Eyebright. PL 1 foot. ?

5 O. TENUIFOLIA; leaves subsetaceously linear, caducous, all entire; calyxes nearly glabrous; stem branched, twiggy, nearly naked, terete. ©. H. Native of Portugal. Euphrasia tenuifolia, Pers. ench. 2. p. 150. E. linifolia, Brot. fl. lus. 1. p. 185, but not *o£* Lin. Corollas yellow. Anthers woolly, not exserted beyond the lips of the corolla.

Thin-leaved Eyebright. PL \ to f foot. ?

6 O. CORSICA; stem prostrate at the base, branched; leaves linear, quite entire; flowers axillary, subspicate; calyx equal in length to the corolla. Q. H. Native of Corsica, on the mountains. Euphrasia Corsica, Low. fl. gall. 2. p. 367. Flowers yellow.

Corsican Eyebright. PL prostrate.

7 O. PURPUREA; leaves linear, quite entire, glabrous; racemes secund; stamens about equal in length to the corolla; capsules oblong, villous. ©. H. Native of Barbary, in sandy places. Euphrasia purpurea, Desf. fl. atl. 2. p. *36.* Stem dark purple, stiffish, bluntly tetragonal; branches terete, panicled. Calyx 5-toothed. Corollas violaceous, size *of* those of *E. viscosa;* segments of the lower lip roundish, usually denticulated. The purple stems and flowers readily distinguish this from *E. viscosa* and *E. lutea.*

Pwrp/e-flowered Eyebright. PL 1 to 1| foot.

8 O. LONGIFLÒRA ; clothed with clammy pubescence ; leaves linear, quite entire; tube of corolla filiform, 3 times as long as the calyx. ©. H. Native of Spain, on arid gypsose hills. Euphrâsia longiflòra, Vahl, symb. 3. p. *78.* Cav. icon. 1. p. 45. t. *62.* Barrel, icon. 1204. Leaves blunt: rameal ones imbricate. Upper lip of corolla undivided: lobes of the lower one rounded. Stem purple. Branches quadrangular. Flowers axillary, in spikes, yellow. Seeds striated longitudinally. Cells of anthers awned at the base. Perhaps a new genus.

Long-flowered Eyebright. PI. ^ to 1 foot.

Cult. For culture and propagation see *Euphrâsia* above. A light soil answers the plant best.

XCVI. BA'RTSIA (named by Linnaeus in memory of his particular friend John Bartsch, M.D., of whom he gives an interesting melancholy account in his Flora Suecica.) Lin. gen. no. 739. Schreb. gen. no. 996. Juss. gen. p. 100. ed. Usteri, p. 113. Nutt. gen. amer. 2. p. *55.* Trixâgo, Stev. ped. p. 4.

LIN. SYST. *Didynamia, Angiospermia.* Calyx 4-cleft. Corolla bilabiate: upper lip concave, entire: the lower-lip trifid and reflexed. Stamens 4, didynamous. Anthers tomentose, equally lobed, free. Capsule 2-celled, 2-valved ; dissepiment contrary to the valves. Seeds angular.—Herbaceous plants. Leaves entire, alternate, and opposite. Flowers alternate, braeteate, in terminal racemes. Corollas bluish purple, or yellow.

SECT. I. EUBA'RTSIA (this section is supposed to contain the true species of the genus.) Corolla shortly bilabiate. Seeds with membranous striated angles.

1 B. ALPI'NA (Lin. spec. 839.) leaves opposite, ovate-subcordate, bluntly serrated; anthers hairy ; capsule pilose, exceeding the calyx. ©. H. LAMOURO/XIA (named by Kunth) after J. V.

alveeds written some works on zoophytes and Lin% s ^; H. B. et Kunth, nov. gen. amer. *2.* p. *336.* t. 167. neai Venn *Pld V^ia, Angiospermia.* Calyx campanulate, on & ventr- ^labiate, 4-cleft. Corolla with a short tube, a so mewl com Pressed throat, and bilabiate limb ; upper ate lon ga eate» entire: lower one narrower and 3-lobed, ous, f ne arly equal, oblong, obtu y ntin ginZ u PPer ones very short, and generally sterile, se; cell- Vtsc osa- Anthers of the fertile stamens reniform. s usually mucronate at the base. Stigma clavate, undivided. Capsule ovate, compressed, 2-celled, 2-valved ; placentas adnate to the dissepiment. Seeds covered by a reticulately cellular membrane.—Erect, branched herbs. Leaves opposite, sessile, serrated, or pinnatifid. Flowers axillary, solitary, opposite, subspicate, scarlet.

§ 1. *Stamens* 4 : *2 upper ones short and sterile.*

1 L. VIRGATA (H. B. et Kunth, nov. gen. *2.* p. *356.* t. 167.) branches nearly terete; calyxes and leaves glabrous; leaves linear-lanceolate, obsoletely crenulated ; calycine segments lanceolate, quite entire. T? . ? S. Native near the town of Quito, at the altitude of 1500 hexapods. Herb suffruticose, branched. Leaves about an inch long, and *2* lines broad. Corolla flesh-coloured.

Twiggy Lamourouxia. Shrub li foot.

2 L. SERRATIFOLIA (H. B. et Kunth, 1. c. t. 168.) branches tetragonal, bifariously pilose; leaves linear-lanceolate, deeply serrated, and are, as well as the calyxes, glabrous; calycine segments oblong-lanceolate, quite entire. 1L. S. Native of New Granada, near Santa Fe de Bogota, and at the Cataract of Tequendama. Leaves nearly sessile, 14-15 lines long, and %\ lines broad. Corollas like those of the preceding.

Serrate-leaved Lamourouxia. PI. 1 to 1^ foot.

3 L. RHINANTHIFOLIA (H. B. et Kunth, 1. c. p. *337.* t. 169.) stem and branches sub-tetragonal, pubescently pilose ; leaves oblong, acute, rounded at the base, half stem-clasping, crenately serrated, finely hairy ; calyx pilose, with ovate-lanceolate, serrated segments. "2/. S. Native of New Spain, in temperate places near Magdalena, Actopan, and Santa Rosa de La Sierra, at the altitude of from 1040 to 1300 hexapods. Leaves about an inch long. Corolla as in the two preceding. In the Magdalena plant the stem is said to be nearly terete.

Yellow-rattle-leaved Lamourouxia. PI. 1 to *2* feet.

4 L. SYLVATICA (H. B. et Kunth, 1. c.) plant twining a little; branches terete, rather pilose ; leaves lanceolate-oblong, acute, narrowed at the base, somewhat doubly serrated, and are, as well as the calyxes, hairy ; segments of calyx oblong, acute, serrulated. *1].* S. -Native of Peru, near Ayavaca, in woods, at the altitude of 1400 hexapods. Leaves nearly sessile, one inch and more long. Corolla rose-coloured, hairy.

Wood Lamourouxia. PL twining.

5 L. CORDATA (Cham, et Schlecht, in Linnaea, 5. p. 103.) this is an intermediate plant between L. *visebsa* and *L. rhinanthbides,* it differs from the' first in the broader leaves, and from the second in the inflorescence being clammy ; calycine segments quite entire. %. S. Native of Mexico. Habit of the plant peculiar. Stem strict, twiggy, densely leafy. Leaves decreasing in size from the top of the stem ; largest only \\ inch long. Corolla scarlet.

Cordate-leaved Lamourouxia. PL 1 to *2* feet. ?

6 L. VISCOSA (H. B. et Kunth, 1. c. p. 338.) stem sub-tetragonal, and is, as well as the calyxes and leaves, pilosely tomentose, clammy ; leaves lanceolate, acuminated, serrated ; calycine sregments lanceolate, quite entire. %. S. Native of Mexico, on the sea-shore near Acapulco. Habit of *Lobelia.* Leaves hoary, about *2* inches long, and *6-7* lines broad : floral leaves ovate-lanceolate, an inch long, beset with glandular hairs. Corolla flesh-coloured, tomentose outside.

Clammy Lamourouxia. PL 1 to *2* feet.

§ *2. Stamens* 4, *all fertile.*

7 L. XALAPE'NSIS (H. B. et Kunth, 1. c.) stem and branches nearly terete, hairy; leaves lanceolate, acuminated, sharply serrated, and are, as well as the calyxes, glabrous ; stamens all fertile; calycine segments.oblong-linear, quite entire. 1/. S. Native of Mexico, on the eastern declivities of mountains near the town of Xalapa, at the altitude of 680 hexapods. Leaves

nearly sessile, 1| inch long, and 3 lines broad. Corolla scarlet, hairy outside. Cells of all the anthers mutic. This is, probably, a distinct genus, from the stamens being all fertile, and from the cells of the anthers being mutic at the base.

Xalapa Lamourouxia. PI. 1 to *2* feet. ?

8 L. MULTÍFIDA (H. B. et Kunth, 1. c. p. *S39.)* stem sub-tetragonal, ' and is, as well as the leaves, nearly glabrous ; leaves pinnatifid ; stamens all fertile ; calyx clothed with mealy down, with lanceolate, quite entire segments. 1/ . S. Native of Mexico, between Guanaxuato and Santa Rosa de La Sierra, at the altitude of 1200 hexapods ; and among bushes near Jalapa, &c. Stenochilus élegans, Willd. herb. no. 11694. Stem rather pilose, reddish. Leaves petiolate, 9-12 lines long. Corolla scarlet, downy outside. Cells of anthers all awned at the base.

Midtifid-leaved Lamourouxia. PL 1 to *2* feet.

f *A species not sufficiently known.*

9 L. BARTSIOI'DES (Hook. bot. misc. 1. p, 234.) pubescent, branched; leaves linear-oblong, obtuse, crenately pinnatifid, scabrous ; bracteas lanceolate, shorter than the corolla ; flowers crowded into an oblong spike. 7/ . ? S. Native of Peru, in the valley of Canta. Habit of *Bártsia viscbsa,* or *Rhinó'nthus cristagálli;* but the calyx is cylindrical, and the corolla, as far as c:in be judged by dried specimens, of *Lamourouxia,*

Barfsia-like Lamourouxia. PL 1 to 2 feet. ?

Cult. For cuUure and propagation see *Angelónia,* p. 609.

SUBTRIBE II. CASTILLEGIE\E. Cells of anthers mutic at the base.

C. CASTILLEJA (named by Linnaeus after D. Castillejo, a botanist of Cadiz.) Lin. suppl. 47. no. 1408. Schreb. gen. no. 1059. Lam. ill. 519. Smith, icon. ined. t. 40. Juss. gen. p. 100. ed. Usteri, p. 112. H. B. et Kunth, nov. gen. amer. 2. p. 329.—Bártsia species of authors.

LIN. SYST. *Didynamia, Angiospermia.* Calyx tubular, compressed, cleft on one side, rarely regular. Corolla tubular, compressed, bilabiate : upper lip linear, canaliculate, entire : lower lip very short, tridentate, or tripartite, ventricose at the base. Stamens 4, didynamous. Stigma capitate. Capsule ovate, compressed, 2-celled, 2-valved. Seeds covered by a loose, reticulated membrane.—Herbs, sub-shrubs, or shrubs. Leaves alternate, entire, or trifid or multifid : floral ones of two forms, bractea-formed and coloured. Flowers axillary, solitary, or terminal and spicate. Corolla white, or greenish.

SECT. I. EUCASTILLE'JA (from *ev, eu₉* well; and *Castilleja.* This section is supposed to contain the true species of the genus.) Calyx cleft on one side, and toothed or lobed on the other. Anthers distinct, narrow, with equal lobes. Herbs or subshrubs.

1 C. PA'LLIDA (Kunth, ex Cham, in Linnaea, 2. p. 580. Spreng. syst. 2. p. 232.) tomentose ; radical leaves linear, acuminated, entire : superior ones alternate, ovate-lanceolate, 3-nerved, toothed ; spike simple; calyx villous. %. H. Native of Siberia, in shady places on the banks of rivers; also of Hudson's Bay and Labrador, &c, ; Canada and New Hampshire, on the white hills. C. septentrionàlis and C. Sibirica, Lindl. bot. reg. 925. Bártsia pállida, Lin. spec. 839. Michx. fl. bor. amer.—Gmel. sib. 3. p. 201. no. 11. t. 42. Corollas pale purple.

Far. fi₉ Unalaschénsis (Cham, et Schlecht, 2. p. 584.) stem simple, thickness of a hen's quill; upper leaves ovate-lanceolate, 3, rarely 5-nerved, more hairy than in the species, and the bracteas less jagged. 2/. H. Native of the Aleutian Islands.

Pale Castilleja. Fl. June, Sept. Clt. 1782. PL \ to 1 foot.

2 C. AFFI'NIS (Hook, et Arn- in Beech, voy. pt. bot. p. 154.) stem herbaceous, nearly simple, pilosely hispid; leaves lin car- lanceolate, 3-nerved, pubescent, entire: floral ones linear^ n- tire, rarely dentately lobed at apex ; lower ^wers peduncAat be floriferous calyx tubular, cleft both in front and behind ,, the bifid: segments linear-lanceolate, acute; corolla exceeai y C. calyx. V- H. Native of California. Nearly alhed to *pállida,* the *Bártsia pállida,* Michx. It differs ^ t ^ and *spermoides* of Kunth, in the floral leaves not ^ from *C. integrifblia,* Lin. in the calyx being tubular, not cose.

Allied Castilleja. PL I foot. 329#)

3 C. TOLUCE'NSIS (H. B. et Kunth, nov. gen. ^ P ^ stems branched, procumbent, glabrous; leaves lanceol^ved; tuse, hispid, nearly entire : superior ones trifid at apex, flowers axillary, sessile ; calyx about equal in lengi. corolla. h_c . G. Native of. Mexico, on the moununs the town of Toluca, at the altitude of 1380 hexapods, tufted. Branches quadrangular, densely leaty. brous. Calyx bifid ; lobes rounded.

Toluca Castilleja. Shrub procumbent. fFmticose,

4 C. MORANE'NSIS (H. B. et Kuuth, 1. c.) stem sunt simple, prostrate, pubescently hispid; leaves lanceola hispid, entire : superior ones trifid ; flowers axilla corolla exceeding the calyx a little. *?. G. Native co, in temperate places between Pachuca and M^ altitude of 1320 hexapods. Calyx bifid ; lobes emaipnat

Moran Castilleja. Clt. 1825. Shrub prostrate.

5 C. NUBI'GENA (H. B. et Kunth, 1. c. p. 330.) stew branched, erect, hispid ; leaves linear, trifid at ^ P y hairy, the middle segment also somewhat trifid ; now on short peduncles; floriferous calyx ventricose, length to the corolla. Cleft on one side, and *loot* other. J?. G. Native on Mount Pichinca, in near the plains of Verde Cuchu, at the altitude ol pods. Branches tetragonal. Floral leaves red.

Nubigenous Castilleja. Shrub J to \ foot.

6 C. LACINIAVTA (Hook, et Am. in Beech. ^v0/', bot# p. 40.) plant beset with a few stiff hairs ; stem erect, leaves linear, trifidly pinnatifid, with elongated ments ; flowers axillary, almost sessile ; calyx equa the corolla. ' %. ? G. Native of Chili, about con ^ ^ Very closely allied to *C. nubigena,* but that ^PP^ents of the fruticose, and has an inflated calyx, and the seg leaves are much broader and shorter.

Jagged-leaved Castilleja. PL 1 foot. ? branch^'

7 C. FISSIFÒLIA (Lin. suppl. 293.) stem ^ hairy erect, hispid ; leaves linear, trifid at the apex, middle segment 3-lobed; flowers spicate, pedicel tubular, one half shorter than the corolla. *h/* gant a Fe New Granada, in frigid places between Zipaqurra an de Bogota, at the altitude of 1360 hexapods. g.nerved, ined. t. 40. H. B. et Kunth, 1. c. p. 330. ^ an inch long. Rudiments of branches from the leaves.

Cleft-leaved Castilleja. Shrub *2* to 3 feet.

8 C. ARVE'NSIS (Cham, et Schlecht, in & ^ g; leaves stem herbaceous, simple, or branched, hispid iro ^ spatulate-lanceolate, or oblong-lanceolate, obtuse, the base, 3-nerved, entire, hairy ; flowers ^ scarcely exceeding the calyx. %. G. Native Jalapa, among corn, between San Andres and.= ^ Nearly allied to *C. lithospermoides,* but is (listin^ by the form of the leaves. Seeds cuneated,

Corn-field Castilleja. PL 1 foot.

9 C. IHTEORIFOLIA (Lin. suppl. *293.)* ^ p hispid from white hairs ; leaves ^ cently hispid ; flowers spicate, nearly sessile ,

H. Native of California. Castilleja Tolnccensis, Cham, in Linnaea, 2. p. *579* but not of Kunth. "This and *C.foliolbsa* belong to the same sub-genus or section of *Castilleja,* with *Euchrbma coccinea* of Nutt. having the same kind of calyx, while *Castilleja offmis* has the same kind of calyx as *Euchrbma grandiflora."* Arnott.

Broad-leaved Painted Cup. PI. 1 foot. ?

15 C. FOLIOLOSA (Hook, et Arn. in Beech, voy. pt. bot. p. 154.) plant clothed with snowy tomentum ; stem shrubby, branched ; leaves crowded : lower ones linear, obtuse: upper and floral ones divaricately tripartite, or rarely entire ; flowers nearly sessile ; floriferous calyx tubular, equally cleft in front and back : lobes emarginate ; tube of corolla shorter than the calyx. 1/. H. Native of California. In some points this plant agrees with *Castillèja fissifblia,* Lin. The axils of the leaves are furnished with a tuft of small leaves, or short abortive branches.

Leafy Painted Cup. PI. 2 to 3 feet.

16 C. GRANDIFLORA ; perennial; leaves and uncoloured bracteas shortly trifid ; segments divaricate ; calyx 4-cleft, partly oblique; corolla longer than the calyx, with the segments of the lower lip acuminated. %. H. Native on the plains *of* the Missouri, from the confluence of the river Platte to the Mountains ; also near the Prairie du Chien, Mississippi. Euchroma grandiflora, Nutt. gen. amer. 2. p. *55.* Castilleja sessiliflora, Pursh, fl. amer. sept. 2. p. *738.* ? Bartsia tenuifolia, Pursh, fl. *2.* p. *738.1* Plant downy in every part. Corolla downy, 2-3 inches long, greenish white, a little rosaceous : upper lip almost green.

Great-flowered Painted Cup. Fl. April, June. Clt. 1811. PI. ^ foot. ?

17 C. PURPUREA ; leaves cuneated, trifid, or a little jagged; bracteas red ; calyx and corollas coloured, quadrifid, unilateral; segments of corolla acute. 1/. H. Native of the Arkansas, on rocks in the hilly prairies of Red river. Euchroma purpurea, Nutt. in amer. phil. trans, n. s. vol. 5. p. 180. Stem tomentose, the leaves more slightly so. Calyx and corolla of a brilliant reddish purple. Segments of calyx linear, all inclined to one side, and nearly the length of the corolla : apex *of* the upper lip of the corolla greenish. Nearly related to *E. grandiflora,* but differs in the proportion of the corolla, and the dilation and brilliant colour of the bracteas.

Pwrp/e-flowered Painted Cup. PI. 1 foot. ?

§ 2. *Calyx quadrifid, equal.*

18 C. AMBIGUA (Hook, et Arn. in Beech, voy. pt. bot. p. 154.) annual; stems many, branched a little ; leaves scattered : lower ones lanceolate, obtuse : superior and floral leaves gradually increasing in size, dilated, and deeply multifid ; floriferous calyx tubular, equally 4-cleft to the middle, with subulate segments ; tube of corolla exceeding the calyx : upper lip short : lower one 3-lobed : lateral lobes rounded, very concave : middle* one straight, mucrone-formed. % . ? H. Native of California. Said to be nearly allied to *Bartsia tenuifolia,* Pursh. The lower lip of the corolla is quite at variance with the character of the genus, yet the upper lip and-habit are the same. At each side of the central lobe of the lower lip is a small gland, as in several other species.

Ambiguous Painted Cup. PI. 1 foot. ?

19 C. PARVIFLORA (Bougard, in mem. acad. petersb. *2.* p. 157.) stem simple, ascending, clothed with ovate, entire, or cut, acute scales at the base, villous at top; leaves scattered,

sessile, ovate-lanceolate, regularly jagged, with usually 3 segments on each side, opposite, divaricate : lower ones lanceolate, acuminated : upper ones linear, acute : lower ones downy on the nerves : uppermost ones more villous, an inch long ; flowers densely racemose at the tops of the branches, sessile, red ; bracteas conforming to the leaves, villous ; calyx tubular, 4-cleft, with linear lobes ; corolla with a tricrenated upper lip, and a tridentate lower one ; anthers sagittate, yellow. %. ? H. Native of the Island of Sitcha. Said to be nearly allied to *C coccinea,* but the flowers are one half smaller.

Small-flowered Painted Cup. PI. J to § foot.

2O C. ANGUSTIFOLIA ; dwarf, hairy; leaves divaricately trifid ; radical ones simple, with linear, bluntish segments ; bracteas trifid ; middle segment generally 3-lobed; calyx quadrifid, segments equal. %. H. Native in dry prairies, on the borders of little Goddin river, near the source of the Columbia. Euchroma angustifdlia, Nutt. in journ. acad. nat. sc. phil. 7. p. 46. Many stems from the same root, about 3-4 inches high, and hairy ; the leaves covered with shorter pubescence, rather hoary ; the segments divaricate, bifid, trifid, and simple. Bracteas apparently of a lake colour. Corollas small, hardly longer than the equal calyx.

Narrow-leaved Painted Cup. PL J to \ foot.

2 C. BRADBU'RII ; rather pilose ; leaves palmately somewhat twice trifid, with linear segments ; bracteas divided like the leaves ; calyx quadrifid, with equal segments. *If.*. H. Native along with the preceding. Euchroma Bradburii, Nutt. 1. c. p. 47. Stem simple. Leaves pubescent, trifidly divaricate from the middle ; the central segment trifid. Bracteas apparently scarlet, the central segment 3-lobed.

Bradbury's Painted Cup. PI. \ foot.

Cult, The species are very difficult to cultivate. Peat is the best soil for them. They may be grown in shady peat borders ; but are best in pots, being more easily sheltered during winter, by placing them under a frame.

CI. ORTHOCxVRPUS (from *opQoQ, orlhos,* straight; and kap7roc, *karpos,* a fruit; the straightness of the fruit readily distinguishes it from *Me lawpyrum.)* ^Jutt. gen. amer *2.* p. *56.*

LIN. SYST. *Didynamia, Angiosfermia.* Calyx tubular, semiquadrifid. Corolla bilabiate, closed ; upper lip smaller, compressed, with inflexed margins : lower lip concave, obsoletely 3-toothed, unexpanded. Anthers free ; cells unequal, divaricate. Capsule straight, elliptic-ovate, 2-celled, 2-valved, many-seeded, opening on both sides ; dissepiment transverse. Seeds small, with a winged lunate margin.—Annual. Stem simple. Leaves alternate, entire. Flowers axillary, alternate, sessile, and bracteate ; bracteas divaricately trifid. Corollas yellow.

1 O. LUTEUS (Nutt. 1. c.) ©. H. Native in humid situations on the plains of the Missouri, near Fort Mandan, very local. Flowers size and form of those of *Melampyrum* at first sight. Leaves lanceolate, linear, sessile, acute, opaque, and are, as well as the bracteas and calyx, viscidly pubescent. Margins scabrous. Bracteas 3-nervecL Corolla yellow, smooth. Stigma simple, minute.

IW/ow-flowered Orthocarpus. PI. 1 foot.

Cult. For culture and propagation see *Euphrasia,* p. 611.

CII. SCHWAXBEA (named by Christian George Schwalbe, who has written a Botanical and Medical History of the Quina of the shops). Grov. virg. 92. Schreb.gen.no. 1001. Lam. ill. t. 520. Nutt. gen. amer. *2.* p. 54.

LIN. SYST. *Didynamia, Angiospermia.* Calyx ventricose, tubular, obliquely 4-cleft: upper segment shortest* the lower large and emarginate, or bidentate. Corolla bilabiate : upper lip entire, arched, the lower 3-lobed. Capsule ovate, nearly terete, 2-celled, 2-valved ; dissepiment produced by the inflexed margins of the valves, and parallel with the longitudinal receptacle. Seeds numerous, imbricate, linear, ana[illegible] A perennial, herbaceous plant. Leaves alternate, entire. [illegible]alyxers axillary, racemose, alternate, on short P[illegible]icuous ly mostly marked with 10-12 angular stripes, and co[illegible] bibracteate at the base. Said by Nuttall to belong to t[illegible] *iirrhmece.* Capsule without any transverse dissepimen[illegible], longitudinally always below the adhering summit[illegible]froir)

LIST- SYST n^ 1020- Juss. gen. p. 118. ed. Usteri. p. 133. genus the «ol ld ynamia, Angiospermia. The character of the VOL. IV. a« that of the tribe.

1 H. LU'CIDA (Lin. spec. 872.) leaves ovate, acuminated, serrated ; corollas bilabiate; calyx 3-lobed; stamens exserted. J? . G. Native of the Cape of Good Hope, in woods. Thunb. nov. act. ups. 6. p. 39. Sims, bot. mag. 1744.—Burm. afr, 244. t. 89. f. 2.—Duh. arb. ed. nov. fasc. 20. p. 239. t. 69. Branches and leaves green. Leaves size of those of the *Privet.* Corolla reddish, large, drooping. Fruit roundish.

Shining-leaved Halleria. Fl. June, Aug. Clt. 1752. Shrub 4 to 6 feet.

2 H. ELLI'PTICA (Thunb. nov. act. ups. 6. p. 39.) leaves oblong, acute, toothed, cuneiform at the base, and quite entire; corollas equal; calyx 4-lobed ; stamens inclosed. ^ . G. Native of the Cape of Good Hope. H. lucida, /2, Lin. spec. 872.—Burm. afr. 243. t. 89. f. 1 Corolla red, drooping. Fruit oblong. "Leaves elliptic. Corollas truncate. Calyx 5-leaved." ex Thunb. 1. c.

Elliptic-leaved Halleria. Fl. ? Clt. 1816. Shrub 4 to 6 feet.

Cult. These shrubs may be treated like other hardy greenhouse plants, by being housed with myrtles in the winter. A light rich earth is the best for them ; and cuttings root readily under a hand glass. They require to be exposed as much as possible to the air, and to have plenty of water given to them during summer.

f *Genera probably belonging to the order, but are not sufficiently known.*

CVII. PI'KRIA (from *TTLKoOQ, pikros,* bitter; from the bitterness of the plant.) Lour. coch. p. *393.* Pers. ench. 2. p. 165.

LIN. SYST. *Didynamia, Angiosfermia.* Calyx 4-leaved, deciduous, longer than the corolla; alternate leaves linear, and shorter. Corolla tubular, ringent, bilabiate; tube constricted in the middle : upper lip spatulate, emarginate : lower lip larger and trifid, with equal, roundish segments. Stamens 4, didynamous ; the 2 longer filaments streaked by a papillose tube, and bearing 1-celled anthers, and the two shorter ones bearing 2-celled, connected anthers. Berry ovate, 2-celled, many-seeded. —A very bitter, medicinal plant, with ovate serrated leaves, and crowded flowers.

1 P. FE'L-TE'RRJE (Lour. 1. c.) 1/. ? G. Native of China and Cochinchina. Stem tetragonal.

Earth-gall Pikria. PI. \\ foot.

Cult. For culture and propagation see *Castillēja,* p. 616.

CVIII. DIPLANTHE^XRA (from *SLTTXOOQ, diploos,* double ; and *avOripa, anther a,* an anther ; in reference to the cells of the anthers being distinct and diverging, therefore they appear double.) R. Br. prod. p. 548.

LIN. SYST. *Didynamia, Angiospermia.* Calyx trifid; upper segment entire : lateral ones bifid. Corolla bilabiate ; throat compressed; upper lip obcordate : lower one tripartite, with roundish lobes. Stamens 4, inserted in the bottom of the corolla, exserted, nearly equal, ascending; cells of anthers distinct, diverging, reflexed to the sides of the filaments in aestivation. Ovarium 2-celled, many-seeded ; placentas 2, adnate in each cell. Stigma bilamellate. Pericarp unknown.—A middle-sized tree, with a diffuse, irregular tufted top. Branches terete, tomentose. Leaves 4 in a whorl, large, petiolate, *entire,* biglandular above the base. Thyrse terminal, roundish, depressed. Partial peduncles verticillate; pedicels trichotomous. Flowers showy. Calyx half coloured. Corolla yellow. This genus is probably nearer allied to *Hallēria* than to any other.

1 D. TETRAPHY'LLA (R. Br. 1. c. p. 449.) *?. S. Native of New Holland, within the tropic.

Four-leaved Diplanthera. Tree.

Cult. For culture and propagation see *Halleria* above.

CIX, GOMA^XRA (Lopez de Gomara, a Spanish botanist, mentioned by Tournefort in his Isagoge Flore du Perou.) Ruiz. et Pav. fl. per. syst. 168.

LIN. SYST. ***Didynamia, Angiospermia.*** **Calyx 4-cleft.** Corolla irregular ; tube curved, coarctate in the middle; nectary cup-shaped, membranous. Stigma capitate. Capsule 2-celled, 2-valved, many-seeded.

1 C. RACEMOSA (Ruiz, et Pav. l. c.) leaves oblong-lanceolate, denticulated at apex ; flowers racemose.—Native of Peru, in woods ; flowering in the autumn.

Racemose-Cowered Gomara. PI. 1 to *2* feet.

Cult. For culture and propagation see *Angelonia,* p. 609.

CX. RHYNCHOGLOSSUM (from *pvyxoQ, rhynchos,* a beak; and *yXijjcraa, glossa,* a tongue.) Blum, bijdr. p. 741.

LIN. SYST. *Didynamia, Angiospermia.* Calyx bilabiate : upper lip trifid : lower one bifid. Corolla ringent: upper lip bifid, reflexed : lower lip larger and semi-trifid : middle segment the largest ; throat bicallous. Stamens 4, almost inclosed, *2* of these sterile, and very small; anthers connected. Stigma obtuse. Capsule beaked, 1-celled, 2-valved ; dissepiment double, incomplete, contrary to the valves ; valves inflexed on both sides, and placentiferous.—A much branched, rather downy herb. Leaves alternate, (one being supra-axillary, and stipule-formed,) oblong, very oblique. Raceme terminal, drooping; pedicels secund. Said by Blum, to be nearly allied to *Gerdrdia.*

I R. OBLI^VQUUM (Blum. 1. c.) *!(..* S. Native of Java, on the Seribu mountains.—Rheed. mal. 9. t. 80.

O&^we-leaved Rhynchoglossum. PI. *2* to 3 feet.

Cult. For culture and propagation see *Angeldnia,* p. 609.

ORDER CLXX. RHINANTHA^NCE.E (this order contains plants agreeing with the genus *Rhinánthus* in the characters given below.) D. C. fl. fr. 3. p. 454. D. Don. in edinb. phil. journ. vol. *S3.* p. 112. July 1835. Melampyraceae Richard. Pedicularès part, Juss. gen. p, 99. ed. Usteri. p. 111.

Calyx tubular, 4-5-cleft, permanent. Corolla tubular, hypogynous, deciduous, irregular, imbricate in aestivation; upper lip usually galeate. Stamens 4, didynamous, all fertile ; anthers spurred at the base. Ovarium 2-celled. Stigma undivided. Capsule 2-celled, 2-4-valved, many-seeded. Testa of seeds membranous. Albumen copious, fleshy. Embryo inverted, terete ; radicle centrifugal, remote from the umbilicus.—Usually humble, herbaceous, rarely suffruticose plants, natives of Europe, Asia, and North America. Leaves usually opposite, and pinnatifid. Flowers terminal, spicate, bracteate. This is intimately allied to the preceding order, but is satisfactorily distinguished by its inverted embryo, with the radicle directed to the opposite extremity of the seed. The tribe *Euphrasies* of *Scrophularinece* have been included by most botanists in this family, and were they to be retained, the separation between it and the preceding order would be impossible. *Cymbaria* differs from the rest of the genera in the very considerable degree of developement of its embryo.

Synopsis of the genera.

TRIBE I.

RHINANTHIE\E. Embryo minute at the apex of the albumen.

1 RHINANTHUS. Calyx compressed, membranaceously inflated. Upper lip of corolla galeate. Seeds few, girded by the membranous wing.—Alector61ophus, Stev.

2 E'LEPHAS. Superior lip of corolla linear, beak-h[illegible] Seeds few, striated.—Rhinánthus, Stev. [illegible]manthus; Stev.

3 PEDICWRIS. Calyx 5-cleft, or unequally *Z-3-cle,* [illegible] Upper lip of corolla galeate, elongated, usually incurved, beeas[illegible] g by a membrane. [illegible] repli-

4 MELAMPYW. Galea of corolla compressed, with *V* cate lobes. Seeds large, wingless, one in each cell.

5 PARENTUCE'LLIA. Upper lip of corolla galeat[illegible] lower one linear at the base, channelled, S-lobed at top 5-toothed, inflated. Seeds wingless.

6 TRIPHYSAW Superior lip of corolla sub[illegible]late^ ^ tripartite, with saccate segments ; anthers 1-ce 4-cleft. Seeds wingless.

TBIBE II.

CYMBARIE^XJE. Embryo rather foliaceous, almost the length of the albumen.

7 CYMBA^VRIA. Corolla tubularly ventricose. **Calyx** 10-parted.

I. RHINA'NTHUS (from *far, rhin,* a snout; [illegible] *in. genanthos,* a flower; so named from its ringent coron[illegible]; ^ ^^ no. 740. Schreb. gen. no. 997. Juss. gen- p. LIN. SYST. ***Didynamia, Angiospermia.*** [illegible] membranous, inflated, 4-toothed. [illegible] spreading; ate, compressed, bidentate at apex :: lowei [illegible] lobed. Anthers bipartite, mutic, viUous. [illegible] obtuse, compressed. Seeds compressed, [illegible] by a membranous wing—Marsh annual Plan[illegible] Europe. Leaves opposite, sessile, lanceolate, [illegible] cordate at the base. Flowers opposite, bra[illegible] terminal, secund spikes or racemes. [illegible]

] R. CRISTA-GA'LLI (Lin. spec, p[illegible] ed; leaves lanceolate, serrated ; calyx sm[illegible] seeds with a dilated, membranous border. [illegible] Europe and America, in barren pastures an[illegible] in Britain. Smith, engl. bot. *651.* [illegible] dan. 981.? Mart. fl. rust. 148. R[illegible] beitr. 6. p. *UY.* Alectorolophos crista-gal[illegible] p. 68. Mimulus crista-gálli, Scop. fl. [illegible] torolophus glaber, All. ped. no. 206. Hall, helv.no. 313. Crista-galli femina, Bauh. hist. 3. p. 436. f. 3. Dill. giss. append. 44. Crista-galli, Riv. mon. irr. 92. f. 3. Stem branched, quadrangular. Calyx greenish yellow ; segments of the upper lip short, bluish. The plant has the name of yellow-rattle from the yellow flowers and rattling of the seeds in the capsule when ripe ; and for the same reason it is called rattle-boxes in Ireland. It is known in some counties by the name of *renny*-grass, and in Yorkshire by that of Henpenny, from the shag and size of the seed-vessels, like

FIG. 60.

the silver penny. Its other appellation of Cockscomb is derived from the appearance of the upper leaves, or bracteas, which accompany the flowers. Mr. Miller says, that the Dutch formerly carried on a trade with the seeds and seed vessels of a species of Rhinanthus to Germany. They call it Semen Savage use. It appears very like the seed vessels of this sort. They boil them in water, with the seeds and capsules in common water, and with it wash their wainscot, bedsteads, &c. effectually to destroy the insects.

Cockvalent.

Britain, pi\ Or Common Yellow Rattle. Fl. June, July. 2 R. foot.

branched MA i R Eh rh herb 56 beitr 6 P U4) stem much Pointed leaves linear-lanceolate, serrated; bracteas tapered. (7). Native of Europe, in corn fields; in the R. Crista-galli, m Yorkshire, Northumberland, Durham, &c. Rhinanthus Pollii ?/ of authors, Willd. spec. 840. R. Alectorogerin. D. no. 580. Hoffm. fl. Germ. 215. Roth. fl. Upper Jun. 1 7. 2, P. 53. Corolla yellow, with a purple tube. Yellow Rattle. FJ. July, Aug. Britain. PI. 2 to 3 feet.

lanceolate, serrated, 5 style inclosed; calyx hairy; seeds with a membrane. Native of Middle Europe, as France, Switzerland, &c. in dry pastures. Mimulus Alectorolophus Willd. spec. 840. Alectorolophus hirsutus, All. fl. ped. no. 752. Crista-galli mas. Bauh. pin. 166. Hall helv. no. 314. R. crista-galli, y, Lin. spec. 840. Corolla yellow, with a purplish upper lip? Perhaps a variety of *R. Crista-galli?*

Hairy-calyxed Yellow Rattle. Pl. 1 foot.

Cult. Sow the seeds in moist soil, and they will grow and flower in cultivation.

II. ELEPHAS

Elephas (from elephas, an elephant; from the resemblance of the upper lip of the corolla to the proboscis of that animal.) Upper lip of the corolla to the proboscis of that animal. Linn. gen. 794. Schreb. gen. no. 1067. Rottb. in coll. hafn. 2. p. 255. Gaertn. fruct. 1. p. 186. t. 181. Tourn. cor. 48. Lam. ill. 517. Schkuhr, handb. t. 171. Stev. mon. ped. Rhinanthus species of authors. Led. fl. alt. 1. p. 424.

LIN. SYST. *Angiosperma.* Calyx bipartite, even at the base: upper lip entire, or bidentate. Corolla bipartite: upper lip bifid, beaked, tubular = lower lip trifid. Capsule 2-celled, 2-valved, obtuse, compressed. Seeds few, simple, rarely serrated, winged. Annuals. Leaves opposite or sometimes alternate, opposite, disposed in terminal bracteate spikes. Corollas yellow/

Upper lip of corolla subulate, incurved; flexed under the beak of the corolla, the lateral sides and the fourth straight and obtuse, bifid. Native of the Levant. Rhinanthus orientalis, Lin. wild. no. 2. E'lephas orientalis flore magno, Tourn. cor. p. 48. itin. 2. p. 96. & 12[6]! Plants that Tournefort says this is one *of* the most showy

[illegible] Plants.

Long-beaked Elephas. FJ. July, Aug. Clt. 1759. PI. 2 to 3 feet.

Upper lip of corolla subulate, straight; calyx 4-cleft, segments reflexed, and the third larger, straight, also of Caucasus. Native of Italy and Siberia, in the coast of the Black Sea, by Tournefort; Rhinanthus Elephas, Lin. has orientalis, Bieb. cauc. 2. p. 69. N. C. 65. spec. 840. Lerchc. in nov. act. A. p. 1 86. t. 188. Elephas Campoclarensium, Col. cephl. Elephas Italica, flore magno, proboscide surrecta, Tourn. cor. 48.—Mor. hist. 3. p. *432.* sect. 11. t. 24. f. 14. Habit of the preceding.

Var. ft, parviflbra; flowers smaller. ©. H. Native of the Levant. E'lephas orientalis flore parvo, proboscide surrecta, Tourn. cor. p. 48. itin. *3.* p. 54.

Straight-beaked Elephas. Fl. July, Aug. Clt. 1759. PL 1 foot.

Cult. For culture and propagation see *Rhindnlhus* above.

III. PEDICULA'RIS

PEDICULARIS (from *pediculus,* a louse; from its supposed quality of making sheep that feed on it lousy.) Tourn. cor. t. *77.* Lin. gen. 794. Schreb. gen. no. 1067. Rottb. in coll. hafn. *2.* p. 255. Gaertn. fruct. 1. p. 246. t. *53.* f. 5. Lam. ill. 517. Schkuhr, handb. t. 171. Stev. mon. ped. Led. fl. alt. 1. p. 424.

LIN. SYST. *Didynamia, Angiospermia.* Calyx 5-cleft or 5-toothed, or unequally 2-3-toothed. Upper lip of corolla galeate, elongated, usually incurved: lower lip trifid, closed, or often spreading. Stamens didynamous. Cells of anthers usually acute, but sometimes obtuse and spurred. Stigma subcapitate. Capsule obliquely mucronate, rarely globose and straight; valves entire. Seeds girded by a membranous testa, rarely naked.—Usually simple herbs. Leaves alternate, opposite, or verticillate, deeply toothed or pinnatifid. Flowers sessile, disposed in dense, terminal, interrupted spikes.

SECT. I. PERSONA'T^: (SO named from the personate corollas.) Stev. mon. ped. p. 17. Leaves opposite. Lower lip *of* corolla erect, ex Stev. Lips of corolla closed, ex Benth.

1 P. GRANDIFLÒRA (Fisch, in. mem. nat. cur. mosq. *3.* p. 60. no. *3.* Stev. mon. p. 17. t. 2.) galea of the corolla, which is closed, falcate; leaves tripinnatifid. 1/. H. Native of Dauria. Plant glabrous. Radical leaves a span long. Flowers rather remote. Bracteas broad, jagged. Calyx of *P. scèpirum.* Corollas purple. Filaments villous at the base. Cells of anthers awned.

Great-flowered Lousewort. PL ^ foot.

2 P. scEPTRUM CAROLÌNUM (Lin. spec. 845.) lips closed; corolla nearly equal; galea obtuse; leaves pinnatifid: lobes ovate, crenulated; stem few-leaved. 1/. H. Native from Bothnia to Dauria, in boggy or spongy parts of woods; in Russia, to lat. 550; in Europe, not further south than the tops of the alps *of* Salisburgh. Fl. dan. t. 26. Rudb. itin. 1. t. 1. Lin. fl. lapp. no. 243. t. 4. f. 4, 5. Plant glabrous. Spike interrupted. Flowers twin or tern. Lower bracteas leafy: upper ones ovate, serrated. Corollas an inch long, golden-yellow: lower lip tinged with purple or blood-colour. Filaments glabrous. Cells of anthers obtuse. Rudbeck named this plant *Scèpirum Carolìnum,* in honour of Charles II. king of Sweden, from its manner of growth like a sceptre. The plant is common in Norway, Denmark, and Lapland. In the plant figured in Flora Danica, the leaves, bracteas, and flowers are 3-4 in a whorl.

Charles's Sceptre. FL Aug. Clt. 1793. PL 3 to 4 feet.

3 P. LANCEOLA'TA (Michx. fl. bor. amer. 2. p. 18. Stev. mon. p. 18.) lips of closed corolla nearly equal; galea somewhat beaked; stem leafy; leaves lanceolate, opposite. 1/. H. Native of North America, in the States. Pursh, fl. 2. p. 425. P. Virginica, Poir. diet. 5. p. 126. P. pdllida, Nutt. gen. amer. 2. p. 50. Pursh, 1. c. P. serótina, Muhl. cat. Stem usually simple, glabrous at top, but furnished with 2 rows of villi at base. Leaves doubly crenated, cut, downy beneath. Spikes dense, H inch long. Bracteas ovate, crenated. Calyx obliquely 2-lobed: lobes crenulated. Corollas yellow, smaller than those of *P. sceptrum Carolìnum.* Filaments glabrous. Cells of anthers obtuse.

Lanceolate-leaved Lousewort. PL 1 to 3 feet.

4 P. CAPITA'TA (Adams, in mem. nat. cur. mosc. 5. p. 100. no. 8. Stev. mon. p» 19. t. 3. f. 2.) lower lip of corolla, which is closed, about half the length of the upper one : galea obtuse ; stem nearly naked ; leaves bipinnatifid ; heads few-flowered. 1/. H. Native of Siberia, at the mouth of the Lena, Adams ; Kamtschatka, Steller; Unalaschka, Langsdorf; Russian America, Chamisso. Stem downy, 2-edged at top, and twisted. Leaves downy beneath: radical ones few : cauline one usually solitary. Bracteas foliaceous, villous. Corollas yellow, size of those of *P. sceptrum Carolinum.* Calyx 5-cleft; segments toothed, oblong. Anthers hardly cordate.

Capitate-flowered Lousewort. PI. \ to f foot.

5 P. STRIA^TA (Pall. itin. 3. p. 266. 321. 435. *737.* no. 98. t. R. f. 2. Willd. spec. 3. p. 208. no. 12. Stev. mon. p. 20.) corolla closed; galea acutely bidentate; leaves pinnate, with linear, serrulated segments. %. H. Native of Dauria, in high exposed places about Kjachta and elsewhere. P. vendsa, Pall, herb. Corollas size of those of *P. sceptrum.* Galea drawn out into a beak, as in *P. comosa.* Two of the filaments bearded. Capsule acuminated. Cells of anthers acute.

Striated Lousewort. PI. 1 to 2 feet. ?

6 P. AVA'NA (Wall. cat. no. 1007. Benth. scroph. ind. p. *52.)* diffuse, hairy ; leaves opposite, pinnatifid ; with short, lanceolate, rather cut segments ; calyx 5-parted, with linear, quite entire segments; both lips of corolla nearly equal ; galea straight, obtuse : lower lip shortly 3-lobed. 1/. H. Native of the Birman Empire, near Ava, towards Mount Taong Dong. Perhaps not a species of this genus.

Ava Lousewort. PI. ?

SECT. II. VERTICILLA'TVE (SO named from the leaves being disposed in whorls or verticils.) Stev. mon. ped. p. 20. Corolla ringent. Leaves verticillate.

§ 1. ROSTRA'T^:. *Galea beaked.*

7 P. CHAMISSONIS (Stev. mon. p. 20, t. 4.) leaves pinnatifid, 4 in a whorl, with lanceolate segments : lower segments pinnatifid : upper ones serrated ; galea uncinate. ©. H. Native of Siberia, on the Corgon alps frequent, Pallas ; Unalaschka, Langsdorf and Chamisso. P. hamata, Bieb. herb.—A showy glabrous plant. Calyx 5-toothed. Corolla yellow, drying purple. Galea drawn out into an acute, deflexed, or straight, toothless beak. Capsule very oblique, with a long mucrone.

Chamisso's Lousewort. PL 1 foot.

8 P. MYRIOPHY'LLA (Pall. itin. 3. pp. 331. 446. 737. no. 99. t. S. f. 1. A.) leaves 4 in a whorl, bipinnatifid, with linear segments; galea of corolla hooked. 1/. H. Native of Siberia, on rocks at the river Jenesee ; in alpine marshes of Dauria, at the river Kirkun, among the Altaian mountains. Radical leaves length of stem, bipinnate. Whorls of flowers crowded, spicate. Calyx 5-toothed. Beak of galea hooked, bidentate. Two of the filaments bearded. Anthers sagittate. Capsule oblique, acuminated.

Myriad-leaved Lousewort. Fl. May, July. Clt. 1816. PI. 1 foot.

9 P. ABROTANIFOLIA (Bieb. in Stev. mon. p. 22. t. 5. f. 1. Led. fl. ross. alt. ill. t. 275.) leaves 4 in a whorl, bipinnatifid, with linear segments ; galea of corolla straight, a little beaked. ©. H. Native of Ulterior Siberia. P. verticillata, /3, Willd. spec. 3. p. 214. Plant downy. Stem branched at base. Spike dense, hairy. Calyx hairy, 5-toothed : teeth linear, and are, as well as the bracteas, hairy, ciliated : lower one usually serrated. Corolla sulphur-coloured. Beak of galea short, obtuse. Stamens glabrous. Capsule oblique, hardly mucronate.

Far jS, *glabrescens* (Ledeb. fl. alt. 2. p. 426.) plant earlier and taller than the species ; calyxes and bracteas smoothish ; spike interrupted at the base. $. ? H. Native of Altai* on dry mountains at the river Tschuja.

Southern-wood-leaved Lousewort. FL

10 P. INTERRU'PTA (Stephan, in litt. ex Wild. spec. Stev. mon. p. *23.* t. 6.) leaves 4 in a whorl, pinnatifid, ceolate, deeply serrated segments ; galea hemispherical, with a very short beak. Altaian mountains. Ledeb. fl. ross. alt. Hi. t. Stem flowered, pie. Spike interrupted. Whorles of spikes Lower bracteas denticulated. Calyx smoothish ments serrated. Corollas pale yellow, glabrous. Capsule oblique, mucroiate. toothless.

Interrupted-spiked Lousewort. PL 2

11 P. LOCILIS (Wall. cat. no. 413. Benth. »cwp 52.) tall, and paniculately branched; stem leaves 4 in a whorl, pinnatifid, with oblong, obtuse, cut segments ; flowers distant ? calyx short, obtuse, quite entire ; beak of galea Native of Nipaul, in Gosainthan and Kamaon, ree, Royle. P. stricta, Wall. cat. no. 414. Wall. cat. no. 422. There are varieties of more or less cut.

Slender Lousewort. PI. tall.

12 P. PECTINA'TA (Wall. cat. no 420. p. 52.) erect, tall, nearly simple, with lanceolate, acute, serrated, or pinnatihd rather loose ; teeth of calyx short, entire ; beak twisted at apex. 1/.?H. Native of Kamaon, Pyr Pundjal, and towards Cashmere, Koyle.

Pectinate-leaved Lousewort. PI. tall.

13 P. PYRAMIDA^TA (Royle, mss. ex Ben *52.)* erect, tall, nearly simple; stem leaves pinnatifid, with oblong-lanceolate, interrupted ai nated, or somewhat pinnatifid segments ; spike the base ; calyx hairy, with short, acute, beak linear, twisted, twice as long as the galea the Himalaya, towards Cashmere, Royle.

Pyramidal-spiked Lousewort. PI. tall.

14 P. TENUIROSTRIS (Benth. scroph. ind. neaily simple ; stem quadrifariously pilose , with ovate-oblong, obtuse, crenulated imbricate ; calyxes hairy, with short, slender, and a little twisted at top, hardly long itself.—Native at Pyr Pundjal, Royle.

Slender-beaked Lousewort. PI. tall.

15 P. PORRE'CTA (Wall. cat. no. 423.) nearly simple ; stem furnished with 2-3 rows pinnatifid, with oblong, obtuse, deeply serrated rather loose, few-flowered ; calyx glabrous, crested teeth; beak of galea long, twisted. %. H. Native of Kamaon, Wall, towards Cashmere, Royle.

Stretched Lousewort. PI. f foot.

16 P. BREYIF&UA (D. Don' prod. fl. villous, pinnatifid, with short, deeply rather dense; calyx hairy, with short galea slender, long, straight. Gosainthan, Wall. P. laciniata, Wall. purple.

Short-leaved Lousewort. H. ?

17 P- *uL* (Wall. cat. no 53.) stem erect, tall, branched, hairy at

Pinnatifid or bipinnatifid, with oblong-lanceolate, deeply serrated segments; spikes interrupted, slender; calycine teeth oblong, erected-Dahurian, galea straight, toothless and beakless.—Native of Nilona, in Gosainsthan, Wallich. Corolla slender, hardly 4 lines long. Lousewort. Pl. tall.

VERTICILLATA (Linn. spec 846.) erect, nearly simple, smooth; leaves pinnate or pinnatifid, with oblong or linear toothed segments; spikes dense, or interrupted at the base; calycine teeth 5-toothed: teeth short, entire; galea beakless. toothless and beakless. %. H. Native of the western Europe; Kanaour, Royle. Jacq. fl. austr. 3. t. 206. fig. 2. Hall. helv. ed. 2. no. 318. Fl. Dan. t. 1723. Hall. helv. ed. 1. no. 323. Fl. Dan. t. 1723. Pall. itin. 3. p. 444. no. 23. t. 17. f. 1.—Gmel. sib. 3. p. 206. no. 18. Hardly distinct from the species.

Flowers white. Fl. May, June. Clt. 1790. Pl. 1 to 1 foot.

PECTINATA (Meyer, verz. pflanz. p. 108.) stem simple; leaves 4 in a whorl, pinnatifid; segments short, obtuse, deeply serrated; flowers densely spicate; calyx smoothish, semiquinquefid; corolla purple, ringent; galea straight, with a short beak. Native of Caucasus, in alpine meadows, at the height of 1200 to 1400 hexapods. Leaves of *P. verticillata,* and *P. comosa.* Flowers purple. Fl. June. Pl. 1 foot.

ASCENDENS (Bunge, in Ledeb. fl. alt. 2. p. 427.) plant ascending, hairy; leaves 4 in a whorl, pinnatifid; segments ovate, obtuse, doubly serrated, imbricated; calyx smoothish, semiquinquefid; corolla purple; galea straight, obtuse, shorter than the calyx; beak of galea short, straight, obtuse; capsule ovate, acuminated, nearly as long as the calyx. Native of Dauria and Altaia, in humid places at the river Jebagan. P. verticillata, Pall. itin. 3. p. 444. no. 23. t. 17. f. 2. Hall. helv. ed. 2. no. 318. Fl. Dan. t. 1723. Hall. helv. ed. 1. no. 323. Fl. Dan. t. 1723. Pall. itin. 3. p. 444. no. 23. t. 17. f. 1.—Gmel. sib. 3. p. 206. no. 18. Hardly distinct from the species.

Flowers purple. Fl. June, July. Pl. 1 to 1 foot.

TAURICA (Pall. itin. 3. p. 444. no. 23. t. 17. f. 2.) stem simple; leaves 4 in a whorl, pinnatifid, with obtuse segments; calyx 5-cleft; galea of corolla straight, obtuse. 2. H. Native of Dauria, in meadows; in shady places at Imgula. Stem branched, quite entire, sometimes 5 in a whorl: the uppermost ones often opposite. Spikes dense, elongated. Calyx hairy: lobes of the calyx unequal, obsolete toothed. Corollas purple, like those of *P. verticillata.* Galea shorter than the lower lip. Capsule ovate, acuminated.

Flowers purple. Fl. June, July. Pl. 1 foot.

ADUNCA (Adams, ex Stev. mon. p. 25. t. 7.) leaves 4 in a whorl, pinnatifid, with obtuse segments; calyx 5-cleft, with serrated segments; galea straight, obtuse, very short. 1£. H. Native of Caucasus, on alps, Casbek and Schagdag; and on the alps in the north of Persia, Hablitz. Spikes terminal, short. Calyx hairy.

Caucasian Lousewort. Pl. 1 foot.

SECT. III. SIPHONA'NTHA (from *oifpiov, siphon,* a tube; and *arOog, anthos,* a flower; in allusion to the long tube of corolla.) Leaves alternate. Corolla ringent; tube much exserted; galea falcate, beaked; beak proboscis-like, twisted or hooked.

24 P. SIPHONA'NTHA (D. Don, prod. fl. nep. p. *95.)* plant humble, tufted, smoothish; leaves elongated, pinnate: leaflets short, oblong, serrated; spikes short; calyx hairy, cleft on one side or bifid, crested; tube of corolla 4 times longer than the calyx; beak of galea proboscis-like, twisted and emarginate. %. F. Native of Nipaul, on Gosainthan, where it is called *Cheelomoote Swa* by the natives. Stem and petioles villous. Leaves glabrous. Lateral lobes of calyx 2-lobed or toothed. Corolla purple. Lobes of lower lip of corolla and filaments ciliated.

Tube-flowered Lousewort. Pl. \ foot, tufted.

25 P. HOOKERIA'NA (Wall. cat. no. 421. Benth. scroph. ind. p. 53.) plant ascending, a little branched, smoothish; leaves pinnate or pinnatifid, with oblong or ovate, toothed or pinnatifid segments; calyx hairy, cleft on one side or bifid, crested; tube of corolla about 3 times longer than the calyx; beak of galea proboscis-like, twisted, and emarginate. %. ? F. Native of Kamaon, Wall.; at Simla, and in Cashmere, Royle. Corolla reddish purple or white.

Hooker's Lousewort. Pl. ascending.

26 P. MEGALA'NTHA (D. Don, fl. nep. p. 94.) plant erect, glabrous or hairy at top; leaves pinnatifid, with oblong or ovate, pinnatifid or serrated segments; spikes at length elongated, interrupted; calyx 5-toothed, crested; tube of corolla twice as long as the calyx; beak of galea proboscis-like, twisted, and trifid. %. F. Native of Kamaon and Gosainthan, Wall.; at Choor, in Mussoree and Cashmere, Royle. Stems simple. Leaves glabrous. Pedicels and calyxes villous. Corolla large, yellow. Filaments hairy.

Large-flowered Lousewort. Pl. J to 1 foot.

27 P. ELEPHANTOI'DES (Benth. scroph. ind. p. 53.) plant erect, pubescent; leaves pinnatifid, with ovate-oblong, pinnatifid or toothed segments; spikes elongated, dense; calyx 5-toothed, crested, cleft on one side; tube of corolla one half longer than the calyx; beak of galea proboscis-like, ascending, incurved and emarginate at top. %. *1* H. Native at Pyr Pundjal, Royle.

Elephas-Uke Lousewort. Pl. \ to 1 foot. ?

SECT. IV. FAUCIDE'NTES (from *faux,* the throat, and *dens,* a tooth; in reference to the upper lip or galea being toothed beneath the middle.) Stev. mon. ped. p. 27. Corolla ringent. Superior lip of corolla or galea with a tooth beneath the middle on both sides. Stem branched. Leaves alternate.

28 P. WLASSOVIA'NA (Stev. mon. p. 27. t. 9. f. 1.) superior lip of corolla straight, with a toothlet on both sides beneath the middle; leaves narrower, less divided than those *of P. jwlustris.* 0. H. Native of Dauria, about Doroninsk, Wlassow. Habit of *P. palustris.* Plant glabrous. Flowers on short pedicels: lower ones remote: upper ones spicate. Calyx unequally 5-toothed; larger teeth serrated. Corolla size of that of *P.fldmmea;* upper lip dark purple: lower one paler. Filaments ciliated. Capsule roundish, very oblique, with a straight nmcrone.

(Bieb. ff. cauc. 2. p. 72. Stev. in mem. mosq. 3. p. 267. mon. p. 26. t. 8.) stems simple; leaves 4 in a whorl, pinnatifid, with obtuse, sharply serrated segments; calyx 5-cleft, with serrated segments; galea straight, obtuse, very short. 1£. H. Native of Caucasus, on alps, Casbek and Schagdag; and on the alps in the north of Persia, Hablitz. Spikes terminal, short. Calyx hairy.

Wlassow's Lousewort. PL 1 foot.

29 P. PALU'STRIS (Lin. spec. 845.) upper lip of corolla furnished with a tooth on each side below the middle; galea dilated, gibbous. ©. H. Native of Europe, in marshes '; plentiful in Britain, North of Russia, Siberia, Altaia, Aleutian Islands Smith, engl. bot. t. 399.—Riv. mon. t. 92. f. 1. Petiv. brit t' 36. f. 3. Branches spreading. Leaves bipinnate or pinnate' with pinnatifid segments, Spikes loose. Corolla purple vary- «w. ^ivu* purple, varying to' white; lower lip fringed. In marshes and wet meadows this is rather common, particularly in the North ; it is said to be disagreeable to cattle, and thought by some to be destructive to sheep.

Marsh Lousewort. Fl. June, July. Britain. PL 1 foot.

30 P. MACRODONTIS (R. Br. in Richards, fl. no. 233.) stem almost simple ; leaves pinnatifid; segments linear, obtuse, sinuately toothed or crenated ; flowers axillary, sessile ; calyx 2-lobed, curled; galea very blunt, toothed at the throat. If. H. Native of Hudson's Bay. Flowers like those *of P. palustris.*

Large-toothed-calyxed Lousewort. PL 1 to 1J foot.

31 P. ADU'NCA (Bieb. ex Stev. mon. p. 29. t. 5. f. 2.) upper lip of corolla furnished with a tooth on each side beneath the middle; galea falcate, beaked. ©. H. Native of Siberia and Kamtschatka. P. palustris, var. Willd. spec. 3. p. 203. Plant glabrous, branched. Leaves an inch long, deeply pinnatifid, with toothed segments. Calyx 2-lobed: lobes ovate, denticulated. Corollas smaller than those of *P. palustris.* Two of the filaments ciliated at top. Capsule very oblique, mucronate.

Hooked Lousewort. PL \ foot.

SECT. V. ROSTRA'T^E (from *rostra,* a beak ; in allusion to the galea of corolla being beaked.) Stev. mon. ped. p. 30. Leaves alternate. Corolla ringent; tube hardly exserted. Galea toothless at the base, falcate ; beak straight.

32 P. CARNOSA (Wall. pi. rar. asiat. 2. p. 44. t. 154.) erect, pubescent ; leaves oblong, obtuse, crenated, narrowed at the base : lower ones petiolate ; spikes few-flowered, at length elongated, interrupted ; calyx cleft on one side, obliquely 2-3-cleft, crested a little ; corollas straight; beak of galea slender, straight; lip very broad. 0. H. Native of Nipaul, at Narainhetty, Flarajlt.; at Choor, and in Mussooree, Royle. Corollas large, rose-coloured.

Fleshy Lousewort. PL 1 to 2 feet.

33 P. FURFURA'CEA (Wall. cat. no. 412. Benth. scroph. ind. p. 54.) plant ascending, branched a little; leaves petiolate, ovate : lower ones ample, half pinnatifid: lobes ovate, deeply toothed or pinnatifid ; superior leaves small, deeply toothed, or somewhat pinnatifid; calyx cleft on one side, and 2-3-toothed on the other ; beak of galea slender, straight, emarginate ; lower lip very broad. ©. ? H. Native of Nipaul, on Gosainsthan.

Scurfy Lousewort. PL | to 1 foot. ?

34 P. ASPLENIFOLIA (Wall. cat. no. 416. Benth. scroph. ind. p. 54. but not of Floerke) humble; leaves lanceolate, pinnatifid : segments ovate-lanceolate, serrulated; raceme few-flowered ; calyx 5-toothed at apex, crested ; galea of corolla elongated, falcate, with a straight beak.—Native of Kamaon, Wall. Corolla more open than in *P.* [illegible] only a variety.

Spleenwort-leaved Lousewort. PL J to 1 foot.

35 P. ROSTRA'TA (Lin. spec. 845.) stems declinate; leaves pinnate : leaflets or segments pinnatifid ; raceme few-flowered • calyx cylindrical, 5-cleft: teeth dilated, serrated; galea fall cately beaked. %. H. Native of the West of Europe, on the alps ; as of France, Italy, Savoy, Switzerland, Austria, &c. Jacq. austr. tr. 3. t. 205.—Hall. helv. no. *322.* t. 8. f. 1. p. [illegible]

asplenifolia, Floerke, spicul. fl. salisb. med. ex Willd. p. 208. Plant sometimes glabrous, and sometimes [illegible] of the rollas purple. Beak of galea truncate at apex. [illegible] jn a filaments are bearded. Capsule ovate, oblique, enaw[illegible] hooked mucrone. pi \ to

Beaked Lousewort. FL July, Aug. Clt. 1819. *ru* i foot. *58.*

86 P. TUBEROSA (Fischer in mem. nat. cur. mosc Stev. mon. p. 30.) glabrous ; leaves pinn[illegible] crenated segments: floral ones with [illegible] calyx downy, 2-lobed : lobes deeply toothed, sometim[illegible] is a small third lobe ; tube of corolla very long [illegible] lately and circinately incurved. %• H. Native at lake Baical, among moss. P. longiflora, Rudolph acad. petrop. 4. (1811.) p. 345. t. 3. Filaments [illegible] top of the tube, not at the base, as in other species. short, compact. Corollas yellow ; tube narrow, 3 mci Stamens all bearded.

Tube-flowered Lousewort. PL \ foot.

37 P. TEUCRIIFOLIA (Bieb. ex Stev. mon. p. 31. t. [illegible] stems many, simple ; leaves lanceolate, doubly crena[illegible] tose on both surfaces ; calyx more deeply cleft above, bifid ; galea of corolla subulate, falcate. %. H. [illegible] Curil Islands, Bieb. et Pallas. Very like the P[illegible] differs in the form of the corolla. Root tufted. half the size.

Germander-leaved Lousewort. PL § foot.

38 P. RESUPINVTA (Lin. spec. *846.* Stev. *mon.*, p. [illegible] branched; leaves nearly sessile, lanceolate^ doubly smoothish ; calyx more or less downy, oblique, [illegible] circinately hooked. If. H. Native throughout shady humid places. Pall. itin. 3. p. 316. 319. A[illegible] 42.—Gmel. sib. 3. p. 204. no. 16. t. 44. Stem [illegible] often pubescent. Leaves generally glabrous, rarely beneath. Flowers sessile in the upper axils, [illegible] length aggregate into a dense head or short spike. pie, flesh-coloured, or white. Beak of galea acuminate. Longer filaments bearded. Capsule obliquely mueron[illegible]

Resupinate Lousewort. FL May, July Clt. 1° foot.

39 P. GRCENLA'NDICA (Retz. scand. ed. 1st. p. [illegible] spec. 3. p. 212. Stev. mon. p. 32.) stem simple ; leav[illegible] pinnatifid, with lanceolate, acuminated, serrated segme[illegible] glabrous, 5-toothed; corolla closed ; beak *of f[illegible]* arched upwards. 1/. H. Native of Greenland. 1166. P. incarnata, e. Grcenlandia, Retz. obs. 4. p- Filaments all glabrous. Corolla red.

Greenland Lousewort. PL

40 P. PROBOSCIDEA (Stev. mon. p. *33.)* leaves deep[illegible] tifid ; segments doubly serrated ; spik[illegible] campanulate, bilabiate, 5-toothed, glabrous, [illegible] ovate, acuminated, rostrately beaked, with a villous [illegible] H. Native of Dauria, at Angura, Gmelin; [illegible] in fertile meadows, Pallas. P. uncinata, labio coroi villoso, Steph. in Willd. spec. 3. p. 213.—Gmel. siu. no. 20. t. 45. Pall. itin. 2. p. *523.* but [illegible] rous, and nearly imbricated. Bracteas all lanceola[illegible] entire, with villous edges. Corolla yellow. straight, acuminated, truncate at apex. Oaiea lower lip.

Proboscis-like Lousewort. PL 2 to 3 feet. Stev.

41 P. UNCINATA (Steph. in Willd. spec. 3. p. [illegible] mon. p. 34. t. 12.) glabrous; stem simple; lea[illegible] natifid, with lanceolate, serrated segments; [illegible] campanulate, 5-toothed;

acuminated, emarginate, twice as long as the lower

Native of Siberia, from the Jenesee even to Dahuria, in cold sandy places. Root annual. Stem simple, or branched from the base, 1 to 2 feet high. Leaves on short petioles; serratures acute. Corolla yellow; galea sometimes falcate at the apex. Capsule ovate, oblique, mucronate. Two of the filaments are bearded. Fl. July, Aug. Clt. 1815. Pl. 2 to 3 feet.

42 P. FLAVESCENS (Willd. spec. 3. p. 219.) stem downy, simple; leaves deeply pinnatifid: segments lanceolate-linear, acutely serrated; spike short, few-flowered; calyx 5-toothed, rather hairy; galea beaked, arcuately inflexed, ciliated, equal in length to the lower lip, and inclosed in it. %. H. Native of Altaia, between the rivers Katunga and Kelujin. Root annual. Stem 1 to 2 feet. Leaves bipinnatifid; segments deeply serrated: upper ones subconfluent. Bracteas deeply serrated: upper ones subulate, serrated. Calyx 5-cleft almost to the base; segments acute, serrated. Corolla cream-coloured, with a short beak. Galea and habit of P. procera. Two of the filaments are bearded.

Short-spiked Lousewort. Pl. 1 to 2 feet. ?

43 P. RECUTITA (Lin. spec. 847.) stem simple; leaves nearly pinnatifid, with serrated segments; spike short, loose; calyx 5-cleft, with serrated segments; corolla 5-cleft on the under side; galea beaked, ciliated, with a short beak. %. H. Native of Lapland, Greenland, Kamtschatka, and Siberia, even to the mouth of the river Lena, in stony places; also of the Caucasian alps. Oed. fl. dan. t. 2. Willd. spec. 3. p. 220. Hall. helv. no. 334. 444.—Lin. fl. lapp. 242. t. 4. f. 1. Stem downy at top. Calyx 2-3-toothed, rarely 5-toothed. Beak of galea truncate at apex. Filaments glabrous. Capsule ovate, oblique, mucronate. Corolla yellow.

Lapland Lousewort. Pl. \ foot. ?

44 P. COMPACTA (Steph. in Willd. spec. 3. p. 219. Stev. mon. p. 36.) stem simple; leaves bipinnatifid, with serrulated segments: upper pinnae imbricate and confluent; spike dense, many-flowered; calyx inflated, membranous, 5-toothed; galea of corolla falcately beaked, furnished with a rectangular deflexed hook. %. H. Native of Siberia, in meadows; Soongaria, Altaia, &c. P. brevis, Herb. Gorenki. Stem downy at top. Calyx glabrous, cleft almost to the middle on the under side. Corolla yellow, beak

Lousewort. Fl. July, Aug. Clt. 1815. Pl. 1 to 1½ foot.

45 P. INCARNATA (Jacq. austr. 2. t. 140. Stev. mon. p. 38.) stem simple; leaves deeply pinnatifid, with unequally toothed, linear lanceolate segments; spike loose; calyx ovate, 5-cleft, clothed with hoary pubescence; galea of corolla falcately beaked. %. H. Native of the alps of Switzerland, Austria, Carniola, Carinthia, &c. P. roseato-spicata Crantz. austr. p. 317.—Hall. helv. no. 318. Corolla pale red. Beak of galea obtuse or emarginate. Filaments glabrous. (fig. 61.)

Flesh-coloured-flowered Lousewort. Fl. June, July. Clt. 1796. Pl. 1 foot.

FIG. 61.

46 P. TUBEROSA (Lin. spec. p. 847.) stem simple; leaves bipinnatifid: segments toothed; spike loose; calyx campanulate, 5-cleft, smoothish; galea of corolla falcately beaked. %. H. Native of the alps of Europe; as of France, Switzerland, and Italy. Vill. dauph. 2. p. 430. Willd. spec. 3. p. 217. exclusive of var. /3.—Hall. helv. no. 323. t. 10. P. alpina lutea, Segu. pi. ver. 3. p. 126. Angles of stem downy. Superior bracteas palmately jagged. Teeth of calyx usually quite entire. Corolla yellow; beak of galea emarginate. P. adscendens, Sternb. et Hoppe. in act. soc. bot. bav. 2. p. 22. bot. zeit. 1820. p. 62. is more hairy, and the teeth of calyx ciliated; but it is hardly a species; it appertains to P. tuberosa, v. Bertol. amoen. ital. p. 381.

Tuberous-rooted Lousewort. Fl. July, Aug. Clt. 1799. Pl. \ to 1 foot. ?

47 P. ATRORUBENS (Schleicher, cat. pl. helv. 1817. p. 21. D. C. syn. fl. fr. 212.) glabrous; stem simple; leaves bipinnatifid; spike compact, calyx 5-cleft; galea of corolla arched, with a short beak, which is somewhat bidentate at apex. %. H. Native of Switzerland, on Mount St. Bernard. P. pennina, Gaudin. Habit of P. *recutita,* with which it is mixed in herbaria. Bracteas ciliated. Calyxes hairy, usually entire. Corolla dark purple. Two of the filaments bearded, and the other two furnished with a few hairs under their top. Capsule ovate, oblique, mucronate.

Dark purple-flowered Lousewort. Fl. June, Aug. Clt. 1819. Pl. 1 foot.

48 P. GYROFLEXA (Vill. dauph. 2. p. 426. t. 9. Stev. mon. p. 40.) stem hairy, simple; leaves pinnate; leaflets bipinnatifid; spike elongated, loose; calyx downy, 5-cleft, with serrated segments; galea of corolla arched, with a short conical beak. %. H. Native of the alps of Dauphiny; Mount Cenis; and the Apennines, Switzerland, &c.—Hall. helv. no. 324. t. 11. P. tuberosa, All. ped. no. 131.? Flowers purple. Beak of galea emarginate. Filaments all more or less bearded.

Circular Lousewort. Fl. July, Aug. Clt. 1819. Pl. \ to 1 foot.

SECT. VI. BICUSPIDATAE (so called in consequence of the bidentate top of the galea of the corolla.) Leaves alternate. Upper lip of corolla toothless at the base; galea short, bidentate at apex, without a beak.

49 P. JEQUINOXIALIS (H. B. et Kunth. nov. gen. amer. 2. p. 332. Stev. mon. p. 41. t. 3. f. 1.) stem simple; leaves lanceolate, crenately pinnatifid, with very blunt, emarginate, toothed segments; calyx obliquely 2-lobed; galea of corolla convex, bidentate. %. G. Native of Mexico, on the mountains, in shady places. Habit of *P. Canadensis;* but the leaves are more numerous, and the segments dense and obtuse.

Equinoxial Lousewort. Pl. 1 foot.

50 P. CANADENSIS (Lin mant. 86.) stems simple; leaves pinnatifid, with obtuse, crenated segments; calyx hairy, obliquely 2-lobed: galea of corolla obtuse, bidentate. %. H. Native of North America. Pursh, fl. 2. p. 425. Nutt. gen. amer. 2. p. 50. Sweet, fl. gard. t. 67. P. mariana, & Plukn. phyt. t. 437. f. 3. Very like *P. euphrasidides,* but differs in the compact hairy spike. Lobes of calyx obtuse, entire. Corollas like those of *P. comosa,* wholly cream-coloured, or the galea is purple. Two of the stamens bearded at top. Capsule obliquely acuminated.

Far. β, *gladiata;* spike elongated. *H.* H. Native of North America. *Pl* gladiata, Michx. fl. bor. amer. 2. p. 18. Pursh. l. c. Nutt. l. c.

Canadian Lousewort. Fl. July, Aug. Clt. 1780. Pl. ½ to 1 foot.

51 P. EUPHRASIOIDES (Steph. in Willd. spec. 3. p. 204.) stem branched; leaves linear-lanceolate, pinnatifidly toothed: upper ones becoming entire; racemes terminal, loose; calyx cleft on the lower side, and shortly tridentate on the other; galea of corolla convex, bidentate. ©. H. Native on the eastern part of the Ural mountains; at the Lena; beyond the Baical; in Kamtschatka, and Aleutian Islands; Labrador, &c. P. paniculata, Pall. itin. 3. p. 34, 265, 287, 316. P. corymbosa, Pall, in herb. Bieb. P. heterophylla, Patrin, in herb. D. C. P. ramosa, Wormskiold, in herb. D. C. P. Labradorica, Houtt. pfl. syst. 8. p. 39. t. 57. C—Gmel. sib. 3. p. 203. no. 15. t. 43. Stem downy at top. Lower leaves similar to those of P. *palustris,* but becoming gradually entire as they ascend. Corollas size of those of *P. palustris,* yellow, fulvous, spotted with purple, or altogether purple. Two of the filaments bearded. Capsule lanceolate, obliquely acuminated. The Labrador, Kamtschatka, and Greenland plants have pure yellow flowers.

Eyebright-like Lousewort. Fl. ? Clt. 1816. PL | to 1 foot.

52 P. NASUTA (Bieb. ex Stev. mon. p. 43. t. 15. f. 1.) stem or scape naked, or furnished with 1 leaf; leaves bipinnatifid: segments linear, serrated; calyx downy, 5-cleft; galea of corolla arched, with a very short, bidentate beak. %. H. Native of Kamtschatka and the neighbouring islands. Plant glabrous, with the habit of the preceding. Spike terminal, ovate, dense; lower bracteas like the leaves: upper one ovate, hairy. Corollas purple, size of those *of P. palustris.* Filaments all glabrous.

Beaked-flowered Lousewort. PI. § foot.

53 P. SUDETICA (Willd. spec. 3, p. 209. Stev. mon. p. 44. t. 15. f. 2.) stems simple; leaves pinnatifid, with lanceolate, serrated segments; calyx 5-cleft: segment entire, or finely serrulated; galea of corolla convex, obtuse, bidentate. %. H. Native of Savoy; Siberia, on the sea-shore, about the mouth of the river Lena; Kamtschatka, &c. Richards, in Frankl. journ. ed. 2d. append. 25. P. hirsuta, Hsenke, sud. p. 86. ? P. incarnata, Krok. siles., no. 984. P. comosa, Mattuschk. siles. no. 600. Stem downy under the spike. Filaments all glabrous. Corollas purple. The Siberian plant has the calyx more densely woolly than that from Savoy; and the colour of the flowers is purple; this is *P. serotina,* Adams. There is also a variety from the Lena, *(P. Stevenii,* Adams,) which has the corolla yellow, with a purple helmet.

Savoy Lousewort. PI. \ to § foot.

54 P. SYLVATICA (Lin. spec. 845.) stem branched at the base; leaves pinnate; leaflets ovate, deeply toothed; spikes few-flowered; calyx glabrous, 5-toothed, inflated in the fructiferous state; galea of corolla very blunt, bidentate. ©. H. Native of Europe and Siberia, in wet marshes and heaths, also in woods. Smith, engl. bot. t. 400. Fl. dan. t. *225.*—Petiv. brit. t. 36. f. 4. P. minor, Riv. mon. t. 92. f. 2. Aletorolophus III. Clus. 2. p. 211. f. 1.—Gmel. sib. 3. p. 203. no. 13. Habit of P. *palustris,* but differs in the want of the teeth on the sides of the galea of the corolla. Two of the filaments bearded at top. Capsule inclosed, oblique, mucronate. Corollas purple. Four of the calycine teeth are said to be crested. The expressed juice of the herb, or a decoction, has been used with advantage as an injection in sinous ulcers. The plant is said to be injurious *to* sheep which feed upon it.

Wood Lousewort. Fl. June. Britain. PI. J to 2 feet.

55 P. FLAVA (Pall. itin. 3. append, no. 97. t. R. f. 1. Stev. mon. p. 45. Ledeb. fl. ross. alt. ill. t. 439.) stem simple, pubescent'; leaves fleshy, deeply pinnatifid, with distant, oblong, coarsely and doubly toothed segments; calyx woolly, 5-toothed: teeth serrated, shorter than the foliaceous bracteas; galea of corolla obtuse, bidentate; filaments all glabrous. ^. H. Native of D*huria, in gravelly places at the river Onon-Borsa and of Altaia, in grassy places. P. sulphurea, Fisch. itin. 230, 321. Corolla like that of P. gyrosa, Sibth. et Smith, yellow, striped with red. Galea very convex. What is P. flava, Georgi. ?

Yellow-dowered Lousewort. PI. 1 *toot.*

56 P. COMOSA (Lin. spec. 847. Stev. mon. p. 46. t. 54.) root fascicled; stem simple, downy; leaves; pinnate, leaflets pinnatifid and toothed; calyx 5-toothed, only the entire bracteas; galea of corolla obtuse, bidenta to Calabria. of the Pyrenees, alps of France, and Italy, even Native throughout the Russian empire, in tieias, Bieb. fl. cane. no. 1195. Pall. itin. 1. p. 148. t. 3. All. ped. no. 229. t. 4. f. 1. Steph. con. mosc. spec. 50. t. 11. f. 1. P. tuberosa, Pall. itm. p. foliosa, itin. 2. p. 211. 57 P. ALTAW (Steph. mon. p. 48. 1.14. A. ross. ill. t. 442. fl. alt. 2. p. 436.) stem "P1«' ted leaflets-pinnate, with ovate, bluntish, coarsely crenate-ser lobes; upper cauline leaves deeply pinnatifid, with serrulatea most ones linear, crenated; spike loose, elongate, canescent, aceous, cylindrical, obsoletely and bluntly S-tooth spotted about eq.,al in length to the pinnatifid bracteas; two of the filaments are bearded. and in Corolla yei- of Altaia, in grassy places at the river Kirghisean Steppe. Stem spotted with purple-low; galea furnished with very short teeth.

Altaian Lousewort. Fl. July. PI. 1 to 2 feet.

58 P. RUMENS (Steph. in Willd. spec. 3. p. fl. ross. alt. ill. t. 435. fl. alt. 2. p. 435.) stem ish, pilose; leaves lanceolate, bipinnate: segm unequally brous; spike leafy; calyx foliaceous, cylmO. ri gerrated; 5-toothed: teeth and bracteas foliaceous, Na<> teeth of galea drawn out into thickish beaks. of Siberia and Altaia, in marshes at the rivei places. Ursul. P. incarnata, Pall. itin. 2 & 3, ". J. 210. comosa, var. *y,* Steph. mon. p. 48—Gmel. sib. 81—Amm. ruth. p. 32. no. 41. Bracteas bearded-the calyx. Corolla purple. Two of the filam Capsule twice as long as the calyx.

Reddish-flowered Lousewort. PI. i to 1 foot.

59 P. ACHILLEAEFOLIA (Steph. in W.Hd. spec. deb. fl. ross. alt. ill. t. 446.) plant canescent innatifid; *#f-* simple; leaves pinnate: leaflets distant, deeply foliaceous ments deeply toothed: spike dense, elongated, cylindrical, acutely 5-toothed, about equal in the filaments, oreaceous, deeply toothed bracteas; two of the filaments bearded. %.H. Native of Altaia, on dry ground of Caucasus. Tscharysch, Kurtschum, and Tschuja; and plant at comosa, var. *(3,* Stev. mon. p. 47. et **o.*

first canescent, but at length becoming glabrous. Spikes naked, crowded pale yellow, or white ; galea furnished with short teeth. Capsule ovate-lanceolate, acuminated.

Hair-foil-leaved Lousewort. PL 1 to 1 ½ foot.

60 P. LASIOSTACHYS (Bunge, in Ledeb". fl. alt. ross. ill. t. 440. n. alt. 2. p. 4?40) stem downy ; leaves pinnate : leaflets dense, linear, pinnatifid ; spike short, dense, leafy ; calyx membranous, funnel-shaped, acutely 5-toothed, densely woolly, shorter than the bracte^ Corolla ringent, pale yellow, hardly twice the length of the calyx, and serrulated at top ; filaments all glabrous. *%.* H. Native of Altaia, in marshes on the tops of the mountains at the river Tschuja, near the mouth of the river Tschelowiah. Root fascicled. Branches and calyxes clothed with yellowish down. Style less exserted than in *P. flavescens,* but that has no teeth at the top of the galea.

Yellow-spiked Lousewort. FL July. PL \ to \ foot.

61 P. ARCTICA (R. Br. in Frankl. journ. append, p. 742.) stem ascending, pubescent, woolly ; leaves pinnatifid : lobes subovate, deeply cut, glabrous in the adult state; petioles of cauline leaves dilated; calyx woolly, 5-cleft; galea obtuse, truncate, longer filaments hairy. *%.* H. Native of Melville Island, Arctic America, on the tops of the mountains, and allied to *P. sudetica.*

Arctic Lousewort. PL \ foot.

62 P. LANGSDORFII (Fisch. in Stev. mon. p. 49. t. 9. f. 2.) stem simple, woolly ; leaves pinnatifid : segments more or less cut: the uppermost leaves dilated ; calyx 5-cleft, 4 times shorter than the galea obtuse, truncate. *%.* H. Native of Arctic Siberia, about the mouth of the river Lena; Kamtschatka ; and other parts of Russian America and the Aleutian Islands. **Stem hairy, or woolly at top.** Spike more or less dense, leafy. Corolla purple. Filaments all more or less ciliated. Capsule a little longer than the calyx, oblique, mucronate.

Var. β. calyx woolly. *If.* H. P. alopecuroides, Adams, mss. in Pall. in Bieb. herb. Willd. herb. no. 11310. Cham. *Lanata* Linnæus, 2. p. *583.* Perhaps a species.

63 P. HIRSUTA (Lin. spec. p. 848. Stev. mon. p. 51.) stem simple, hairy ; leaves pinnatifid, with lanceolate, bluntly toothed segments ; cauline leaves dilated into foliaceous petioles ; corolla twice as long as the calyx ; galea very blunt. Native of Lapland; and of Siberia, at the South' ?" **' Native of Lapland; and of Siberia, at the river Lena. Pall. itin. 3. p. 34. Wahl. fl. lapp. no. 310. *Arctica,* Adams, mss.—Lin. fl. lapp. 245. t. 4. f. 3. Petiolus of cauline leaves stem-clasping. Segments of the leaves more or less cut. Calyx often woolly. Filaments all glabrous. Capsule longer than the calyx, oblique, mucronate.

Hairy Lousewort. PI. 1 foot. ?

64 P. FLAMMEA (Lin. spec. 846. Stev. mon. p. 51.) stem simple ; leaves pinnate: leaflets roundish, imbricated backwards, blunt, fourfold crenate-cleft, glabrous ; galea of corolla very obtuse. Segments of the lower lip linear. *%.* H. Native of Siberia, and Greenland. **Willd. spec. 3. p. 215,** most of the synonymes. Wahl. fl. lapp. no. 310. *β.* Lin. fl. lapp. 244. t. 4. f. 2. Filaments all glabrous. Corolla pale red.

Royle, ill. himal. t. 72. f. 1. P. flammea, of German and Swiss authors. — Fl. dan. t. 30. P. filicifolia, Adams, mss.—Hall. helv. no. 315. t. 8. f. 3. Root fasciculately tuberous. Petioles of lower cauline leaves slender: of the upper ones dilated at the base, and supporting the flowers. Apex of galea reflexed. Two of the filaments bearded. Corolla party-coloured, ? red and yellow, or pure yellow.

Party-coloured-flowered Lousewort. FL June, Aug. Clt. 1819. PL I to 1 foot.

66 P. ZEYLANICA (Benth. scroph. ind. p. 54.) erect, simple; leaves oblong, obtuse, cartilaginous, doubly crenated, clothed with scurfy down beneath ; raceme elongated, loose ; calyx cleft on one side, and 5-toothed on the other, crested ; galea straight, obtuse, rather angular in front.—Native of Ceylon, Macrae.

Ceylon Lousewort. PL ?

67 P. ELATA (Willd. spec. 3. p. 210. Stev. mon. p. *53.* t. 11. f. 2.) glabrous; stem simple ; leaves pinnatifid, with lanceolate, serrulated segments ; spike loose, elongated ; calyx ovate, glabrous, with 5 short teeth ; galea of corolla obtuse, obsoletely toothed, glabrous. *If.* H. Native of Siberia, at the Oby ; about Kranojarsk ; and about Smejof, Patrin. P. punicea, Pall.—Gmel. sib. 3. p. 211. no. 22, exclusive of the synonymes. Root fascicled. Corolla purple. Two longer filaments bearded. Capsule mucronate, rather oblique.

Tall Lousewort. PL H to 2 feet.

68 P. ORIZABE (Schlecht. et Cham, in Linnaea, 5. p. 103.) stem erect, simple ; leaves pectinately pinnatifid, with lobately pinnatifid segments, glabrous ; calyx 5-toothed : teeth lobulate ; galea short, rostrately truncate.—Native of Mexico, on Mount Orizaba. Radical leaves 3-4 inches. Corolla purple: lower lip trifid. Allied to P. *elata.*

Orizaba Lousewort. PL \ to \\ foot.

69 P. ROSEA (Jacq. icon. rar. 1. t. 115. Wulf. in Jacq. misc. 2. p. *57.)* stem simple ; leaves pinnate : leaflets linear, pinnatifid ; calyx hairy, tubular, unequally 5-toothed, or 5-cleft; galea of corolla obtuse. *If.* H. Native of the Alps, as of Carinthia, Italy, and France ; also of Siberia. P. hirsuta, All. ped. *227.* t. 341. spec. 52. t. 12. f. 1. Stems naked, or few-leaved. Flowers few, purple. Two of the filaments bearded. Capsule longer than the calyx, obliquely mucronate.

Rose-coloured-flowered Lousewort. PL \ foot.

70 P. RECUTITA (Lin. spec. p. 846.) stem simple ; leaves pinnatifid, with deeply toothed segments ; spike compact, leafy; calyx glabrous, about equally 5-toothed; galea of corolla very blunt. *%.* H. Native of the alps of Middle Europe, as of Switzerland, Italy, Austria, &c. ; and on the confines of Russia. Jacq. austr. 3. t. 258. P. obsoleta, Crantz. austr. p. 316, —Hall. helv. no. 316. t. 8. f. 2. Habit singular, from the leaves being collected under the spike. Calyx usually glabrous, but sometimes hairy. Corolla purple. Two of the filaments bearded. Capsule mucronate, very oblique.

Surrounded-spiked Lousewort. Fl. July, Aug. Clt. 1787. PL 1 to 1½ foot.

71 P. WILHELMSIANA (Stev. mon. p. *55.* t. 16. Bieb. fl. taur. 3. p. 412.) stem simple; leaves pinnate: segments or leaflets ovate, pinnatifid; spike dense ; calyx ovate, woolly, 5-cleft, with linear, elongated segments ; galea of corolla very short. 1/. H. Native of Caucasus, on Mount Beschtau, and about Nartzana. Habit of *P. foliosa.* Root yellow, divided into oblong tubers. Stem downy, with few leaves, or even naked

0 the spike. Radical leaves similar to those of *Spiraea Jill-éndula.* Bracteas large, foliaceous. Corolla cream-coloured, laments all bearded. Capsule length of calyx.

Wilhelms's Lousewort. PI. ^ to l£ foot.

73 P. FOLIOSA (Lin. syst. 552. mant. 86. Stev. mon. p. 56.) tem simple ; leaves pinnate : leaflets pinnatifid, with lanceolate, nequally toothed segments; spike dense; calyx obliquely 5-tothed; galea of corolla very blunt. %. H. Native of !urope, as of Switzerland, Hungary, Daupbiny, Italy, even to ie Crimea. Jacq. austr. 2. t. 139. P. comosa, Scop. cam. *0.* 765.—Hall. helv. no. 317- t. 9. f. 3. P. sumana, Poll. pi. er. 16. Stem short, and almost naked, or tall and leafy, alyx glabrous, or hairy. Corolla cream-coloured ; galea owny, or glabrous.

Leafy Lousewort. FL July. Clt. 1786. PI. £ to 3 feet.

73 P. CONDENSATA (Bieb. fl. taur. 2. p. 73. nor 1193.) stem mple ; leaves pinnate : leaflets pinnatifid, with lanceolate, uneually toothed segments ; calyx woolly, tubular, with a straight, -toothed mouth; galea of corolla very blunt. %. H. Nave of Caucasus, in humid, alpine meadows ; Iberia, above schala ; and of Hyrcania. This is a very showy species; the saves and flowers as they ascend give the stem a pyramidal ppearance. Corolla exactly of *P.folibsa.* Filaments all beard-*1,* more or less.

Dense Lousewort. PI. 1 foot. ?

74 P. TRISTIS (Lin. spec. 846. Stev. mon. p. 57, t. 10. f. .) stem simple ; leaves pinnatifid, with short, obtuse, sharply id doubly denticulated segments; spike dense; calyx 5-cleft; alea of corolla furnished with a short mucrone, villous on the Iges. 0, H. Native of the Altaian mountains, in Dauria, id beyond the Lena, &c.; also of Kamtschatka. Pall. itin. 2. . 566, 8. p. 444. P. maerocarpos, Pall. herb.—Gmel. sib. 3. . 21 a. no. 23. Plant trailing. Corolla yellow. Filaments labrous. Capsule hardly exceeding the calyx.

tW-flowered Lousewort. PI. $ to 1 foot.

75 P. ACAU'LIS (Wulf. in Jacq. coll. 1. p. 207. t. 14.) stem-IKS ; leaves pinnate: leaflets ovate, obtuse, toothed; scapes or eduacles 1-flowered, shorter than the leaves; calyx 5-cleft, •itli toothed segments ; galea obtuse, with a villous margin. (.. H. Native of the alps of Carmola and Carinthia.—Scop. arii. no. 761, t. 31. Flowers showy, very unlike those of ther species. Corolla whitish. Filaments all villous at the ase, or only 2 of them.

Slemless Lousewort. PI. dwarf.

Cult. All the species of *Pedlcularis* are extremely shy of cultivation. Peat soil and a moist situation suit the generality of be species. All foreign species require the protection of a rame, or other covering in winter, and for this purpose they ad better be grown in pots. Tragus affirms, and others take *1* from him, tl»t these plants in pastures breed lice on animals hat feed on them.' The truth, however, seems to be, that they ndicate a very bad pasture, and the want of proper food may occasion the cattle to be in bad condition, and to breed vermin,

Daurian Cymbaria. Fl. June, July. Clt. 1796. PL 1 foot.

2 C. ? BORYSTHE'NICA (Pall, ex Spreng. syst. 2. p. 815.) leaves linear; calyx 5-cleft; upper lip of corolla entire, erect. 1(.H. Native of the province of Cherson, between Borysthene and Hypanim.

Borysthene Cymbaria. PI. 1 foot. ?

Cult. For culture and propagation see *Pediculàris,* p. 626.

ORDER CLXXI. OROBA'NCHEJE (this order contains plants agreeing with *Orobdnche* in the characters given below.) Juss. ann. mus. 12. p. 445.—Rich.—Ledeb. fl. alt. 2. p. 450. D. Don, in edinb. phil. journ. vol. 37. p. 113. July, 1835.—Pediculares, sect. III. Juss. gen. p. 101. ed. Usteri, 113.

Calyx divided, permanent. Corolla tubular, hypogynous, irregular, permanent, imbricate in aestivation. Stamens 4, didynamous, all fertile; anthers usually spurred at the base. Ovarium 1-celled; stigma 2-lobed, or undivided. Capsule 1-celled, 2-valved, many-seeded. Seeds inserted into narrow, parietal placentas, which rise from the margins of the valves; testa very thin, membranous, reticulated by nearly square areolae. Albumen copious, cartilaginous. Embryo inverted in the top of the albumen, excentric, minfite, nearly globose, usually undivided.

Radicle superior, remote from the umbilicus.—Usually parasitical, leafless, rather fleshy, rufescent, scaly herbs. Flowers terminal, solitary, spicate, or racemose.

This is a very natural family, well distinguished from the preceding by their permanent corolla, unilocular ovarium, centrifugal embryo, and peculiar economy, in being for the most part parasitical herbs, destitute of proper leaves, and of the green colour common to other plants. The seeds are attached to the narrow, depressed placentae, formed by the united edges of the valves. The embryo is placed in the ventral side of the seed, and at the opposite extremity from the hilum, resembling a minute, nearly globular homogeneous mass, and is, therefore, probably devoid of true cotyledons. In all these respects the genera *Obolaria* and *Tozzia* seem to agree, but differ in having proper leaves, and in being terrestrial.

Synopsis of the genera.

TRIBE I.

OROBANCHIE *JE.* Parasitical, leafless herbs.

1 OROBA'NCHE. Calyx bractless, somewhat 1-2-parted.

2 PHELIPJE'A. Calyx tubular, bibracteate, 4-5-toothed, or 4-5-cleft.

3 ANOPLON. Calyx bractless, 5-cleft, sub-bilabiate.

4 BOSCHNIA'KIA. All as in *Orobdnche,* but the calyx is truncate, and unequally 5-toothed ; the capsule opens laterally, the stigma sub-bilabiate, and terminated by a stigmatose margin.

5 CANOPHOLIS. Calyx ventricose, 5-parted, bibracteate. Corolla incurved : upper lip entire : lower one bifid.

6 EPIPHE^GUS. Calyx short, 5-toothed, bractless.

7 LATHR/E^A. Calyx bibracteate, campanulate, 4-cleft.

8 HYOBA'NCHE. Calyx tubular, 7-cleft, unequal, bibracteate.

9 ALE'CTRA. Calyx bilabiate, bractless ? upper lip 2-cleft; lower one trifid.

10 -/EGINE^TIA. Calyx spathaceous. Capsule many-celled.

11 AMBLA'TUM. Calyx campanulate, 4-cleft. Both lips of corolla entire.

TRIBE II.

OBOLARIE'JE. Terrestrial, leafy plants.

12 OBOLA'RIA. Calyx 5-cleft, bibracteate. Corolla campanulate.

13 TOZZIA. Caylx 5-toothed, bractless. ? Corolla ringent, tubular. Capsule 1-seeded by abortion. ?

Tribe I.

OROBANCHIE'^E (this tribe contains plants agreeing with the genus *Orobdnche.)* Parasitical, leafless, fleshy, scaly plants.

1 OROBA'NCHE (of Pliny, *Opoftav^r,* of Theophrastus and Dioscorides ; from *opofioq, orobos,* a vetch ; and ay^w, *ancho,* to strangle ; because it is supposed to strangle and kill the plants on which it grows.) Tourn. inst. p. 176. t. 81. Lin. gen. no. 779. Schreb. gen. no. 1045. Juss. gen. p. 101. ed. Usteri, p. 113. Gsertn. fruct. 3. p. 42. t. 185. f. 4. Lam. ill. t. 551. Wallr. orob. sect. 1. Osproleon. Led. fl. alt. 2. p. 450.—.Aphyllon, Michel, gen. t. *25.*

LIN. SYST. *Didynamia, Angiosptrmia.* Calyx bractless, 1-2-parted ; sepals distinct, or combined on one side at the base. Corolla tubular, ringent: upper lip 2-lobed: lower one 3-lobed. Stamens 4, didynamous. Stigma capitate, emarginately trifid. Ovarium glandular at the base. Capsule 1-celled, 2-valves dehiscing laterally, but joined at the base, and ap centas parietal, 2 in each valve.—Parasitical, fleshy, simple, rarely branched, scaly, erect herbs. Flowers fleshy erect, solitary, in the axils of the floral scales. Here is a gland that girds the ovarium. Filaments usually Dairy the base. Anthers glabrous ; cells mucronate at the Da

SECT. I. Sepals free, or combined in front at the lower par open behind.

§ 1. *Upper lip of corolla emarginate, or retuse, never*

* *Corolla dilated, sub-campanulate, never narrow, or cylw*

1 O. CARYOPHYLLA^CEA (Smith, in Lin. trans. 4. p. fl. alt. 2. p. 452.) hairy, or pubescent; floral scales lanc equal in length to the flowers ; sepals bifid : lobes linear- late, equal; corolla sub-campanulate, straightish : lower little snorter than the upper : lobes equal, obtuse, curled ; filaments hairy at the base, glandular, as well style at the apex; stigma emarginate. %. H. Siberia ; Italy ; and about Lauterine in the Palatinate; also Himalaya at Pungee. Wallr. orob. p. 36. Bieb. taur. 0. major, Poll. pal. no. 600. Vill. dauph. 2. p. 407. topog. beytr. 2. p. 212. thickened ^L" ^Dubt bot* S all# *• p. 349.) scape moderately cine sp6 ^ ^ baSe, Sca^y, sca*es lanceolate, blackish ; calyup per ^ments lanceolate, or irregularly bifid; corolla inflated ; ro undish^ fl rcbe^» sub-emarginate : lower lip 3-lobed : lobes dark red ents inflexed; anthers blackish; stigma 2-lobed, roots of *r>-* ^" Native of France, in gravelly places, on the 7. Sca Uallum *Molluao.* O. Galii Molluginis, Vauch. 1. c. t. Scarlet Flowers purplish.

Italian Broom-Rape. PL 1 foot.

7 O. HEDERAE (Vauch. mon. p. *56.* t. 8.) scape thickened into a spurious scaly bulb ; scales lanceolate, fewer ; bracteas attenuated at the apex, reflexed; upper lip of corolla entire : lower lip 3-lobed : lobes rounded ; calycine segments nearly entire ; Wet stamens approximate : superior ones divaricate ; stigma emarginate, yellowish. %• H. Native of Vascony, parasitical °n ivy,

^8 Broom-Rape. Pj. i foot.

0. CRASSICAULIS (Smith, in Lin. trans. 4. p. 172.) pubescent; scape simple ; floral scales shorter than the flowers ; corolla inflated • lower lip very short, with the segments obcordate, Unequal, . ? ger 1 and curled ; stamens and style beset with 2/ • H. Native near Genoa, in hilly pastures lipi sot a Sese- Corolla size of that of *0. major*; but the upper Ovarium dark or purplish colour, and less fringed and curled, 0. minor in smooth. Stamens rather exserted. It differs from stainens, and the larger inflated corolla, short lower lip, longer hairy style.

Slender Broom.

9 O. CYTISI (Lib y, b0t, galL M9<) Scape PL *l* to *lh* foot- yond the b Scurfy hairs ^ j ^oaleS ovate-oblong, remote, clothed with Corolla ventricose, calycine segments divided into linear segments; entire : lower glandular outside ; upper lip short, nearly Nat*ve of Pro one 3-lobed; stigma deeply divided. %. H. venees, Colosu, and Vasconv. O- fe'tida, Duby, bot. gall. p. *0. *D* C fl fr- 5. p. 392. O. variegata, Wallr. diask. p. °fth sLa' sco Parii> Vauch. mon. p. *37.* This is the largest Cytil \T' Flowers fulvous.

"" Broom.Rape. PL U to 2 feet.

Corolla cylindrical, not campanulate, more or less incurved.

10 O. ^M^o/pH^A (C. A. Meyer, in Led. fl. ross. alt. ill. t. 8S9. fl. a|t ?Vat e-lai)c \ ' P* ^54.) clothed with white wool; floral scales lobes lance°l ate, ec*uallin g the flowers in length; sepals bifid : ro Ua. Hich O-t nearly equal, shorter than the tube of the co- e lob lS l !? curve(l and cylindrical; lips of corolla nearly o tne nts a J o I ^0We r lip obtuse, denticulated, nearly equal; pre adino> s St^e ^r y > stigma sub-bipartite, with very the rivers gmentS- ^' H, Native of AItaia, in Sandy plaCes, Pals fV^. r^y sch and Bekun, and at the mines of Loktewsk. -This is said to differ from *0. ccerulea,* in the deeply cleft; in the shorter tube of corolla, and in being deeper blue ; and in the filaments and style being always hairy.

Sand-loving Broom-Rape. PL } to 1 foot.

11 O. CRINITA (Viv. fl. cors. p. 11.) scape furnished with linear, elongated scales at the base; floral scales linear, acuminated, hairy outside, exceeding the flowers ; corolla 4-cleft, incurved, subcylindrical; lobes rounded, crenately ciliated; filaments and capsule quite glabrous; stigma 2-lobed, recurved. *y..* H. Native of Corsica, near Bonifacio. Flowers fulvous.? Spike elongated, compact, comose by bracteas at top.

Long-haired Broom-Rape. PL ^ to 1 foot.

12 O. SPARSIFLORA (Wallr. sched. crit. 1. p. 310.) pubescent; flowers remote, spicate ; floral scales equal in length to the flowers; corolla hairy; upper lip subemarginate; lobes of the lower lip obovate: middle one the largest: stamens ciliated. %. H. Native of Middle Germany.

Scattered-flowered Broom-Rape. PL \ to 1 foot.

13 O. CERULESCENS (Steph. in. Willd. spec. 3. p. 349.) plant pubescent; scape simple ; lower scales adpressed : upper ones spreading, and clothed with white villi: floral ones ovate, long-acuminated, length of flowers ; spike dense, elongated; •calyx bifid, with bipartite, subulate, unequal segments, nearly the length of the tube of the corolla; genitals glabrous ; upper lip *o£* corolla emarginate. %. H. Native of Siberia, towards the Caspian sea; and of Caucasus, about the river Terek. Bieb. cauc. 2. p. *82.* Spike 3 inches long. Corollas bluish. Floral scales and calyxes white from hairs.

Bluish-flowered Broom-Rape. PL \ to 1 foot.

14 O. MEDICAGINIS (Duby, bot. gall. p. 349.) scape hardly inflated at the base ; lower scales numerous, lanceolate, blackish : floral ones short, and fewer ; calycine segments 2-lobed ; corolla elongated, with a constricted throat; lower lip 3-lobed ; galea subemarginate ; stigma bifid, reflexed, yellowish-red. %. H. Native of France, growing from the roots of *Medicago sativa.* O. Medicaginis sativae, Vaucher, mon. t. 2. Plant yellowish.

Lucern Broom-Rape. PL ^ to 1 foot.

15 M. MINOR (Sutt. in Lin. trans. 4. p. 179. t. 17. f. 1, 2, 3.) hairy; scape thickened at the base, moderately scaly; floral scales lanceolate, pilose; calycine segments sometimes simple and sometimes bifid; corolla arcuately cylindrical ; upper lip rounded and crenulated : lower one trifid, with equal, rounded, crenulated lobes; stamens inserted beyond the base of the corolla, beset with glandular hairs below ; stigma retuse, ex Sutton ; 2-lobed, purplish, with transverse chinks, ex Duby ; anthers blackish; style smooth at top. 3/. Fl. Native of Europe, in fields and pastures, growing from the roots of *Trifblium pratense;* plentiful in some parts of Britain, as in Norfolk, Smith, engl. bot. 422. O. major, Loefl. hisp. no. 35. O. major, /3, Haller, helv. ed. 1. p. 610. ed. 2d. no. 209. O. barbata, Lam. diet. 4. p. 621. O. flore minore, Ray. syn. 288. O. ramdsa, /3, Huds. engl. ed. 2. p. 266. O. trifolii-pratensis, Vauch. mon. t. 5. Plant flesh-coloured. Flowers whitish-yellow, with purple veins, varying to full yellow, finally becoming of a rust-colour or purplish.

Smaller Broom-Rape. FL July, Aug. Britain. PL \ to 1 foot.

16 O. ELATIOR (Sutt. in Lin. trans. 4. p. 178. t. 17. f. 4.) clothed with clammy hairs ; scape nearly equal; scales lanceolate ; flowers remote ; calycine segments bifid, with linear lobes; corolla tubular, cylindrical, recurved, veiny ; limb plicate or fringed ; upper lip emarginate : lower *one* 3-lobed ; stamens beset with hairs below; stigma bifid, obcordate, brownish-yellow ; style smooth above. %. H. Native of Europe, in woods and fields, growing from the roots of *Centaurea scabiosa,* in England, in clover-fields, thickets, and bushy, hilly places, on a gravelly soil. Egyptian Broom-Rape. PL

Cult. Singular parasitical plants, none of *which* are proj>er/y cultivatable.

II. PHELIPiE'A (so named by Tournefort, after the illustrious family Phelipeaux ; great patrons of the natural sciences, and *of* Tournefort.) Tourn. inst, p. 47. Desf. fl. atl. *2.* p. 60. t. 145. Led. fl. alt. *2.* p. 459. Orobánche, Lin. and other authors. Gaertn. fruct. *3.* p. 43. t. 185. f. 4. Lam. ill. t. 971.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx bibracteate, tubular, 4-5-cleft or 4-5-toothed. Corolla bilabiate ; upper lip bifid : lower one trifid. Stigma capitate, 2-lobed. Capsule 1-celled, 2-valved ; valves dehiscing at top, but cohering at the base ; placentas parietal, *2* in each valve.—Plants with th* habit of *Orobdnchc;* but are readily duistinguished by the tubular, bibracteate calyx, and in the capsule dehiscing at top instead of at the side.

SECT. I. TRIONY'CHION (from *rpiv; rpia, treis tria,* three; and *ovvyjiovy onychion,* a little claw ; in reference to there being *3* bracteas to each flower; that is, *2* bracteas to the calyx, and one floral scale.) Ledeb. fl. alt. *2.* p. 460. Orobánche, sect. Trionychion, Wallr. diask. p. *58.* Vauch. mon. p. *65.* Kopsia, Du-

mont. Calyx 4-5-cleft: lobes elongated, unequal, acuminated. Anthers with glabrous superfices, and villous dehiscing cells. Capsule crowned by the base of the deciduous style.

1 P. LANUGINOSA (C. A. Meyer, in Led. fl. ross. alt. ill. t. 377. fl. alt. 2. p. 460.) clothed with white wool; floral scales ovate-lanceolate, longer tlian the calyxes ; lobes of calyx lanceolate^nearly equal; throat of corolla inflated a little; superior lip rather the longest: lobes of lower lip nearly equal, elliptic, obtuse, a Httle denticujpted; filaments and anthers glabrous ; style glandular ; stigma 2-lobed. 2/ . H. Native of Altaia, in grassy places at the rivers Talitza and Katunga, and near Barnaoul ; and of Caucasus. Orobanche cae'sia, Rchb. icon. t. 698. Scape yellowish. Corolla bluish. This is said to be intermediate between *P. combsa* and *P. ccerulea,* but differs from both in being clothed with white wool, &c.

Woolly Phelipaea. PI. \ to f foot.

2 P. RAMOSA (Meyer, verz. pflanz. p. 104.) root a solid bulb ; scape naked, or furnished with a very few scales, hairy, swelling at the root, branched; spikes acute, terminal ; bracteas hardly as long as the calyxes ; calyx suburceolate, 4-5-cleft, unequal, acuminated; corolla tubularly funnel-shaped, swollen at the base, and yellow : upper part and lips blue, hairy outside: upper lip roundish, bifid : lower lip trifid; segments rounded, obtuse: the middle segment largest, with 2 yellow prominences at the mouth ; stamens inclosed, downy at the base ; stigma emarginate, white, *y.*. H. Native of Europe ; as of the South of France, Germany, and Britain ; also of Caucasus, Barbary, and the Grecian Islands ; in many parts of Britain, from the roots of hemp, in moist, rich fields, particularly in Norfolk nnd Suffolk, on *Galeopsis Tetrahit.* Orobanche »mosa, Lin. spec. 882. Smith, engl. bot. 184. Sutton, in Lin. trans. 4. p. 18.5. Lam. ill. 551. f. 2. Rchb. icon. t. G96. Orobanche ^annabis, Vaucher. mon. t. 16.—Mor. hist. sect. 12. t. 16. f. 7. Root furnished with one or two ovate-lanceolate, sessile scales. Stem and branches brown, or dirty yellow, or yellow tinged with purple. Filaments and style bluish ; anthers yellow. Stigma blunt. It is distinguished frgm *P. ccerulea* by its sharp spikes, the few scales on the stem and branches ; the calyxes and bracteas being shorter by half than the corolla, the tube of which becomes globular at bottom after florescence. The stem is sometimes, though seldom, unbranched.

Far. ft, violacea; this differs from the European plant in the corollas being wholly blue. ***Ift*** H. Native of Barbary and the Levant. O. ramosa, Desf. fl. atl. 2. p. 60. Smith, fl. ursec. t. 608. Orobanche ramosa, floribus purpurascentibus, Baub. pin. p. 88. Tourn. inst. p. 136.

Branched Phelipsea. Fl. Aug. Sept. Britain. PI. \ to 1 foot.

6 P. CJERU'LEA (Meyer, verz. pflanz. p. 104.) root fibrous; scape simple, hairy; scales ovate-lanceolate, hairy; spikes loose, bluntish ; bracteas linear-lanceolate, scarcely equal in length to the calyx; calyx 4-cleft, with the rudiment of a fifth, lanceolate, acuminated, exceeding the capsule; corolla hairy; tube cylindrical below, incurved in the middle : segments of the lower lip equal ; filaments naked ; stigma 2-lobed, yellowish. %. H. Native of Europe, on the borders of fields ; as of Switzerland, Austria, Germany, South of France ; also *of* Cauasus ; in Britain, but rare, in grassy pastures near the sea; on the borders of fields in Hampshire ; near Northreps, Norfolk. Orobanche caerulea, Vill. dauph. 2. p. 406. Sutton, in Lin. trans. 4. p. 182. bmitn, encrl. bot. t. 423. Rchb. icon. t. *692.* Orobanche purpurea, ^ Jacq. austr. t. 276. O. ltfvis, Lin. spec. 882. Orobanche purpurascens, Gmel. syst. p. 954. t. 14. Orobanche ramosa, *p,* With. arr. ed< 3d. p. *558.* Orobanche Artimiseae vulgaris, Vauch. mon. t. 14. P. cernua, Pall. ind. tanr.—Buxb. cent.**. p. 2. t. 1. f. 2.^-Gmel. sib. 3. p. 215. t. 46. f. 1. Scape simple, of a yellowish olive colour. Flowers bluish-violet. Stigm capitate.

FIG. 62.

Blue-ftowered Phelipsea. Fl. July. Britain. PL 2 lo 5 * foot

4' P. I'NDICA ; plant branched, hairy ; scape with a scale - k ^ each ramification only ; calyx subunilateral, 5-cleft ; spi li-- dense, clavate; corolla tubular : upper lip 2-lobed : lower y 3-lohed ; anthers woolly, 2-lobed: cells spurred; filaments smooth ; stigma 2-lobed. 7J. S. Native of Hindostan, Nipaul, at the roots of Tobacco. Orobanche I'ndica, K ind. 3. p. 27. This species is said to be nearly allied to *r. cernua* and *P. ramosa ;* but differs from both, in the flowers being twice the size, but also blue. Root fibrous.

Indian Phelipaea. PI. \ to 1 foot.

5 P. COMOSA ; scape nearly simple : scales hairy; calyx - - lobed : lobes linear; corolla funnel-shaped, tubular, wide, 0 cleft: lobes roundish : lower one smaller: anthers at leng pilose; stigma 2-lobed, rufescent. %. H. Native ot the southern provinces of France, parasitical on the roots of many kinds "of plants. Orobanche comosa, Wallr. sched. cnt.. 1.. p. 314. Orobanche vagabunda, Vauch. mon. t. 15. Scape bluisn, Corollas blue.

Comose Phelipaea. PI. \ to § foot.

6 P. LONGIFLORA; pubescent; floral scales ovate, obtuse, calyx 4-5-parted ; spikes loose ; cordlla 3 times as long as the calyx: lower lip elongated ; stamens downy. 7J. H. Native of Siberia, at the Volga. Orobanche longiflora, Trev. in nov. soc. nat. berol. 1813. 2. p. 150. t. 2. f. 10, 11. Said by bieb. to be a variety of *P. ccerulea.*

Long-flowered Phelipaea. PI. 1 to 1\ foot. ?

7 P. LUDOVICIANA ; clothed with powdery pubescence; scape low and simple ; flowers and ovate scales subimbricated ; calyx unequally and deeply 5-cleft; corolla recurved, 5-cleft; stamens inclosed, smooth. *1/.*. H. Native of North America, in sandy alluvial soil, around Fort Mandan abundant, but not apparently parasitical. Flowers very numerous and crowded, much longer than the bracteas. Segments of calyx long, linear, and acute. Upper lip of corolla bifid : lower one trifid and plaited, purple. Anthers whitish : lobes acute at the base.

Louisiana Phelipaea. PI. 3 to 4 inches.

8 P. CALIFORNIA ; clothed with viscid down ; scape simple ; flowers corymbose ; scales broad-lanceolate, acute, short, numerous at the base; corolla straight, tubular : upper lip flat, 2-lobed at apex : lower one trifid : segments distant, linear, acute; anthers sagittate, with a villous chink ; stigma orbicular, peltate. %. H. Native of California, at Port St. Francisco. Orobanche Calif6rnica,Cham. et Schlecht. in Linn«a, 3. p. 1JJ. Flowers pedicellate. Calyx bibracteate, campanula, deeply^ 5-toothed ; segments linear-narrow, dilated at the base.

Californian Phelipaea. PI. \ foot.

9 P.COMPA'CTA; scape simple, imbricated with scales flon ferous from the base; spike ovate, ^any-flowered bracteas ovate; upper lip of corolla bifid; segments ovate, acute. J. H. Native on the shores of the Great ^rtu, Ongjche compacta, Viv. fl. libyc. p. 34. t. 1o. *t. i.* »cap nt the base. Floral scales one half the length ot the, flouers Calyx 4-leaved ; segments ovate, obtuse, sometimes truncate,

tubes shorter than the corolla, dilated to the mouth: lobes nearly equal. Stamens of unequal length, hoft«be; filamS[8] 'Und V'^.nearly equal. Stamens inserted near the mouth of the tube, and anthers hairy from inbracteas, floral »cale, anHkly curved; ljjj P'fid; dalvx-S. Tr.xr ""r theCape *T*? PP'fid; dalvx-S. SlTi? Tr.xr ""r 97. ood Hope. Orobanrl ? * ^ Native of u»obanche squammata, Thunb. prod, Cape Phelipsea. PI. 1 foot.

Corolla incurved, gradually acute; ^Cg" ?e Iovv er hp'roundish[1]. "TT"P^ T^ I c" ll. Compact-flowered Phelipsea. . ½ to ⅔ fOO# 10 P. Cape NSIs» dahr [1]

Floral scales lanceolate, obtuse, longer than the calyxes; upper or posterior segments of calyx linear: lower or anterior one spathformed, and 4-toothed; teeth obtuser corolla violaceous, straightish, campanulately tubular, with nearly equal, semiorbicular, spreading lobes; filaments nearly equal, drawn the base; anthers inucronate, drawn at the base; anthers mucronate, stigma capitate. Allied to the preceding; but differs in the corolla being yellow, in the tube being narrower at the base, and in the limb being widened below.

Violaceous-flowered Phelipaea. PI. i to 1 foot.

15 R LuVrEA (Desf atL ~' P' GL '• U 6') scape flesh y> f«r. rowed; corolla arched, narrowed at the base. £. H. Native of Barbary, in humid, sandy places on the shores of the river Elhammah, near Mascar; and of Portugal. Orobanche tinctoria, Forsk. desc. p. 112. Vahl, symb. 2. p. 70. Phelipsea Lusitanica flore luteo, Tourn. cor. 47. Lathrsea Phelipaea, Lin. spec. 844. Very nearly allied to the preceding; but differs in the corolla being yellow, in the tube being narrower at the base, and in the limb being widened below.

Yellow-Cowered Phelipaea. PI. * to 1 foot.

16 P.-? SUBACAU'LIS (Benth. scroph. ind. p. *55.)* stem very short, thick, scaly; peduncles 3-4 on each stem, shorter than the scales, 1-flowered; calyx *6-7* lines long, tubular, inflated a ^ltt^ at the base, irregularly 4-5-toothed at apex- corolla 2½ inches long: tube slender at the base, but widened at length jnjo an ample dilated throat: limb short, and broadly somewhat bilabiate, 5-lobed; stamens 4, glabrous; anthers glabrous; cells spurred; stigma capitate;? capsule not seen. %. S. Native °L the In(3ian Peninsula. In the Madras herbarium along with */Egmetia abbreviata.*

Almost-stemless Phelipaea. PI ? CulL Plants TM cultivatable-'

III. ANOTLON (from a priv. and *birXov, hoplon,* a shield; in reference to the scapes being without scales.) Wallr. diask. p. *78.* Meyer, verz. pflanz. p. 103. Phelipee'a species, Desf. Spreng. Orobánche species of authors. *

LIN. SYST. *Didyniimia, Angiospérmia.* Flowers hermaphrodite, bractless. Calyx campanulate, 5-cleft, sub-bilabiate; upper lip of corolla bifid: lower one trifid. Stigma capitate, quite entire, or sub-emarginate. Capsule 1-celled, 2-valved; valves dehiscing at top, combined at the base; placentas parietal, 2 to each valve.—Plants with the habit of *Orobánche.*

1 A. TOURNEFORTH; scape simple, villous, 1-flowered, naked, but involved in scale-like sheaths at the base, which rise from the root; lobes of corolla spreading, circinate. 1/. H. Native of Armenia. Phelipaea Tournefortii, Desf. ann. mus. 10. p. 298. t. 21. Phelipaea orientalis flore coccineo, Tourn. cor. p. 47. Calycine segments ovate-lanceolate, unequal. Corolla large, scarlet, with 2 large, bearded, black plicae in the throat. Style recurved. Stigma capitate, entire.

TourneforVs Anoplon. PI.^ ibot.

2 A. BiEBERSTEiMi (Meyer, verz. pflanz. p. 104.) scape simple, 1-flowered, remotely scaly; lobes of corolla equal, orbicular, spreading. *11.* H. Native of Tauria and Caucasus, in alpine regions, at the elevation of 800 to 1200 hexapods; also of Siberia, towards the Caspian sea. Phelipae'a foliata, Spreng. syst. *2.* p. 818. Orobánche coccinea, Bieb. casp. p. *58.* pi. rar. ross. *2.* t. *56.* Phelipaea coccinea, Pers. ench. 2. p. 181. Lathree'a Phelipaea, Guild, itin. 1. p. 422. Calyx unequally 5-parted. Corolla inflated, 5-cleft, sub-bilabiate, scarlet.

Bicberstexris Anoplon. PI. \ foot.

3 A. FASCICULA^TUM \ stem short and simple; peduncles many, naked, nearly terminal, and about the length of the stem; scales few, ovate, and concave, pubescent; lobes of corolla very short, rounded, and naked on fife margins. "2/. H. Native in sandy alluvial soils around Fort Mandan. Orobánche fasciculata, Nutt. gen. amer. 2. p. *59.* Phelipaea fasciculata, Spreng. syst. 2. p. 818. Stem clothed with powdery pubescence, terminating in 6 or more naked, filiform peduncles. Calyx campanulate, semiquinquefid; segments sublanceolate, acute. Corolla curved, tubular, pale purple: segments short: lower lip producing a grooved palate. Stamens smooth. Lobes of anthers parallel.

Fascicled Anoplon. PI. \ to \ foot.

4 A. BIFLÒRUM ; stem very short, usually obsolete, mostly 2-flowered; peduncles scape-formed, naked ; scales smooth, concave ; lobes of corolla oblong-oval, with a pubescent, coloured margin. %. H. Native in shady woods throughout the Atlantic States, Nutt.; Carolina to Virginia, Pursh. Orobànche uniflòra, Lin. spec. 882. Pursh. fl. amer. sept. 2. 431. Orobànche bifldra, Nutt. gen. amer. 2. p. 59. Phelipae'a biflòra, Spreng. syst. 2. p. 818. Calyx and corolla as in the preceding; but the lobes of the corolla are deeper, the whole yellowish white, the segments bordered with an azure blue line ; plicae in the throat yellow, as in the preceding. Stamens smooth. Anthers pubescent on the margins of the cells.. Stigma bilamellate. Plant of a tan-colour.

Two-jlorvered Anoplon. PI. £ foot.

Cult. Plants not cultivatable.

IV. BOSCHNIAKIA (in memory of —— Boschniak, a Russian bfitanist.) Meyer, mss. ex Bongard, in mem. acad. imp. st. petersb. 2. p. 157. Orobànche species, Cham, et Schlecht.

LIN. SYST. *Didynàmia, Angiospèrmia.* Calyx unequally 5-toothed, bractless. Corolla bilabiate; tube short; upper lip arched, stretched out, bifid : lower lip short, somewhat 3-lobed. Stamens exserted ; cells of anthers mutic at the base. Style tubular at top, sub-bilabiate, terminated by a stigmatose margin. Capsule 1-celled, dehiscing laterally, with a solitary, parietal placentae to each valve.—A plant with the habit *Orobànche,* from which genus if is principally distinguished by the capsule dehiscing laterally, by the style being tubular at top, and somewhat bilabiate, terminated by a stigmatose margin, and by the placentas in both valves being solitary and very distant.

1 B. GLA'BRA (Meyer, mss. ex Bongard, 1. c.) *If.*. H. Native of Siberia, at the Lena; Kamtschatka ; Chamisso's Island; Island of Sitka, &c. Orobànche Rossica, Cham, et Schlecht, in Linnsea, *3.* p. 132.—Gmel. sib. 3. p. 216. t. 46. f. 2. Tuber naked, usually with many scapes rising from it. Spikes dense. Floral scales, calyxes, and corollas ciliated. Plant reddish. Anthers glabrous. The scales of the scape are shorter, and less pergamaceous than those of *Canopholis Americànus.*

Glabrous Boschniakia. PI. \ to 1 foot.

Cult. Plant uncultivatable.

V. CANO'PHOLIS (from iravuv, *kanon,* a rule; and <f>o\iQ, *pholis,* a scale ; the scales are imbricated in 4 rows.) Wallr. diask. p. 78. Orobànche species, Lin.

LIN. SYST. *Didynàmia, Angiospèrmia.* Calyx ventricose, 5-parted, unequal, bibracteate. Corolla incurved, bilabiate : upper lip entire : lower lip 2-parted, erect. Stamens exserted. Stigma capitate. Capsule 1-celled.—A parasitical plant, with the habit of *Orobanche.* Scapes simple. Corollas nearly white.

1 C. AMERICA'NUS (Wallr. 1. c.) %. H. Native from Carolina to Pennsylvania, often growing in vast clusters at the roots *of* trees, in moist shady forests. Orobànche Americàna, Lin. syst. *57S.* mant. p. 88. Pursh. fl. amer. sept. 2.*p. 431. Plant of a brownish yellow colour, gJRibrous. Scapes simple. Scales oval-lanceolate, imbricate. Spike dense, imbricate, glabrous • bracteas equal in length to the tube of the corolla.

American Canopholis. PI. £ to % foot.

Cult. An uncultivatable plant.

VI. EPIPHFGUS (from £*«, *epi,* upon; and *fryoc, phegos,* beech; the plant is parasitical on the roots of beech.) Nutt. gen. amer. 2. p. 60. under Epifàgus. Orobànche species oi L.

'"LIN. SYST. *Didynàmia, Angiospermia.* Flowers polygamous. Calyx short, 5-toothed. Corolla of the infertile flower ringent, compressed, 4-cleft : lower lip flat; fertile flower minute, 4-toothed, deciduous. Capsule truncate, oblique, imperfectly 2-valved, opening only on one side.—A rather neb herbaceous plant, parasitical only on the roots ot *neecn,* virgately branched ; branches simple, every where floriferous. Scales small, and remote, commencing extremity of the root; upper parts of the branches P^ perfect flowers, but abortive fruit; lower imperfectly flowers fructiferous. Capsule coriaceous and small, racter *of Mdampy' rum,* but truncated, and at length by moisture in the form of a cup.

1 E. AMERICANUS (Nutt. 1. c.) %. H. Native ot^ part of North America, equally indigenous. Orobanche niàna, Lin. spec. 882.—Mor. hist. *3.* p. 502. sect. *IZ>. 9.* ? Root tuberous, fleshy, scaly. Upper lip of corolla ginate : lower one 3-toothed, white, with dark, but purple stripes ; plicae in the throat wanting. Stamens exserted, smooth. Anthers pubescent.

American Beech Drops. PI. 1 to \\ foot.

Cult. Plant not cultivatable.

Tribe II.

OBOLARIE'^E (this tribe contains plants agreeing with *Obolaria* in being terrestrial, not parasitical.) D. Don, *in* edinh* phil. journ. vol. 37. p. 113. July, 1835.

Xll. OBOLA'RIA (from *obolus,* a small coin ; in allusion to the bracteas being round, like a piece of money.) Lin. gen. no. *778.* Schreb. gen. no. 1044. Juss. gen. 101. ed. Usteri. p. 113. Nutt. gen. amer. 1. p. 103.

LIN. SYST. *Didynamia, Angiospermia,* or *Tetrdndria, Alonogynia.* Calyx none, or in the form of two bracteas. Corolla campanulate, 4-cleft; segments entire (the margins sometimes crenulately torn). Stamens 4, equal, or nearly so, proceeding from the clefts of the corolla. Stigma emarginate. Capsule ovate, 1-celled, 2-valved, many-seeded. Seeds minute.—A very small vernal plant, with a simple stem, and opposite leaves. Flowers terminal, sessile, and marcescent, collected by pairs, or by threes, towards the summit of the stem. Stigma minutely bifid.

1 O. VIRGI'NICA (Lin. spec. 881. Nutt. gen. 1. p. 103) *11.* ? H. Native of Pennsylvania, in the neighbourhood of Philadelphia rare ; and near West Chester ; abundant in the shady forests of Lake Erie.—Mor. hist. 3. p. 504. sect. 12. t. 16. f. 33.—Pluk. aim. *209.* f. 6. Plant about 3-4 inches high, with a small, branching root. Leaves thick, green, almost fleshy, frequently purplish *on* the under side. Flowers bluish-white, or pale red, supported by foliaceous bracteas.

J'irginian Obolaria. PI. 3-4 inches.

Cult. For culture and propagation see *Pediculdris,* p. 626.

XIII. TO'ZZIA (so named by Micheli, in honour of Bruno Tozzi, Abbot of Vallambrosa, F.R.S., Micheli's companion *in* his botanical excursions, in one of which he found this plant.) Michel. gen. p. 20. t. 16. Lin. gen. no. 745. Schreb. gen. no. lOOS. Juss. gen. 97. ed. Usteri, p. 109. Lam. ill. t. *522.*

LIN. SYST. *Didynanna, Angiospermia.* Calyx campanulate, sub-bilabiate, 4-toothed, 5-toothed. ? Corolla tubular ; limb bilabiate, nearly equal: upper lip 2-lobed : lower one 3-lobed. Stamens 4, didynamous ; cells of anthers awned at the base. Stigma capitate. Ovarium 2-celled ; cells 2-seeded ; ovula fixed their whole length, free at bottom. Capsule spherical, 2-valved,. 1-seeded by abortion.—An erect herb, having the stem scaly at the base, as in *Orobánche.* Leaves opposite. Flowers solitary, axillary, pedicellate.

1 T. ALPI'NA (Lin. spec. 844.) stem weak; flowers axillary, disposed into an interrupted, leafy spike. %. H. Native of the Alps of Jura, and the Pyrenees, Switzerland, Austria, Italy, in rough, moist places. D. C. fl. fr. 3. p. 487. Lam. ill. t. 522. Jacq. austr. 2. t. 165.—Mentz. pug. t. 9. f. 3, 4.—Mor. hist. 3. sect. 12. t. 16.—Col. ecphr. 2. p. 49. t. 50. Root formed of many scales (fig. *63.* b.) Stem tetragonal, branched. The whole habit succulent and tender. Leaves roundish, bluntly notcfied, pale. Corollas yellow; the 3 lower segments spotted *of* a deeper yellow (fig. *63.)*

FIG. *63.*

Alpine Tozzia. PL

Cult. For culture and propagation see *Pediculàris,* p. 626.

ORDER CLXXII. CHELO NE£) (this order contains plants agreeing with *Cheldne* in the characters given below.) D. Don, in edinb. phil. journ. vol. 19. no. *37,* July, 1835. Genera of Scrophularineae of authors.

Calyx 5-parted, permanent. Corolla tubular, hypogynous, irregular, deciduous; limb 5-lobed. Stamens 4, didynamous, fertile, with the rudiment of a fifth; anthers 2-celled, mutic; cells confluent at apex. Stigma undivided. Capsule 2-celled, many-seeded. Seeds erect, angular, or compressed, with membranous edges. Albumen fleshy. Embryo erect, foliaceous.—Herbs or under shrubs natives of North America. Leaves opposite. Inflorescence panicled, or spicate. This order approaches *Bignoniàcece* and *Pedalinece,* but is readily distinguished from both in its many-parted calyx, undivided stigma, and erect, albuminose seeds. All the plants contained in this order are extremely showy.—This group is well entitled to be retained apart from *Scrophularinece,* on account of the greater degree of developement of the embryo, its compressed, winged seeds, and of the presence of a rudimentary stamen, all of which characters bring it near to *Pedalinece* and *Bignoniàcece,* from which it is distinguished by its albuminous seeds.

Synopsis of the genera.

1 PENTSTE'MON. Seed angular.

2 CHEL6NE. Seed surrounded by a membranous margin.

I. PENTSTE'MON (from Trey™, *pente, five;* and στι ‰v, *stemon,* a stamen; in reference to the 4 fertile stamens, and the one sterile.) Micheli, gen. 14. and in act. nat. cur. 8. append. 214. Schreb. gen. no. 1758. p. 808. Ait. hort. kew. 3. p. 511. Nutt. gen. amer. 2. p. 51. Cheldne, Spreng.

LIN. SYST. *Didynamia, Angiospermia.* Calyx 5-parted, with a distant, solitary bractea. Corolla ventricose, bilabiate. Stamens didynamous, with the rudiment of the fifth, which is usually filiform and bearded on the upper side; anthers separate, usually alabrous. Capsule ovate, 2-celled, 2-valved, mauy-seeded. Seeds angular.—Herbs or under shrubs, natives of North America. Leaves opposite, smooth, acuminated, entire, or serrated. Flowers paniculately racemose, purple, blue, rose-co white, or pale yellow, rarely scarlet. The corolla is bilabiate, oblong, and tubular: the upper lip shorter, and coarctate; the orifice generally pubescent; in species the corolla appears campanulate, and with almost equally 5-lobed; in these the sterile filament is spicuous. The anthers in some species are woolly or

SECT. I. *VE'RJE* (this section contains the true species genus.) Anthers glabrous.

§ 1. CAMPANULAS. Corolla sub-campanulate: hmb equally 5-lobed.

1 P. CRISTVTUM (Fras. cat. 1813. Nutt. gen. 52.) pubescent; radical leaves lanceolate, denticulated ones sessile, linear-oblong, sub-lanceolate; peduncles and terminal, 1-3-flowered, very short; calyx segments linear lanceolate, acuminated; sterile filam exserted, very conspicuously and crestedly bearded, as the orifice of the lower lip. 3/. H. Native of A arid, naked, argillaceous hills, from the confluence of the river and the Missouri to the mountains. P. erianthera, fl. amer. sept. 2. p. 737. Chelone cristata, Spreng. 813. Corolla large and violaceous, ventricose; border spreading.

Crested Pentstemon. Fl. Aug. Sept. Clt. 1811- 1 foot.

2 P. CERU'LEUM (Nutt. gen. amer. 2. p. *52.)* P and glaucous; radical leaves sub-linear: cauline ones olate-linear, all entire and sessile, minutely margin; segments of the calyx lanceolate, acute; many-flowered; sterile filament short and bearded. H. Native on the plains of the Missouri, near and the Indian towns. P. angustifolium, Fraser, Pursh, fl. amer. sept. 2. p. 738. Chelone caerulea, Corollas sub-campanulate, azure blue.

tf/we-flowered Pentstemon. Fl. July, Sept. Clt. 1 1^ foot.

3 P. A'LBIDUM (Nutt. gen. amer. 2. p. *53.)* ovate-lanceolate, sub-serrulated, smooth, and sessile, partly fascicled, axillary, and terminal; sterile filament and interruptedly bearded; corolla internally smooth tubular, with an almost equally 5-cleft, spreading downy, with linear-lanceolate segments. 1{. H. the plains of the Missouri, common from the confluence river Platte to the mountains. P. teretiflora, Fraser, Stems rather angular. Leaves approximate. Flowers white.

Whilish-Qovrered Pentstemon. Fl. June, Sept. PL *i* to I foot.

4 P. GRANDIFLORUM (Fras. cat. 1813. Nutt. gen. 52.) smooth and glaucous; leaves entire: oval: cauline stem-clasping, roundish-oval, point; flowers large, mostly solitary and axillary, panulate, with a 5-lobed, spreading limb; pubescent at the summit. %. H. Native of plains of the Missouri; common from the con river Platte to the mountains; also near the Mississippi. P. Bradburii, Pursh, 2. p. 738. burii, Spreng. A beautiful species. Flowers as large as those of *Digitalis purpurea,* which they resemble.

Great-jlowered Pentstemon. Fl. July, ^ept. 2 to *3* feet.

ed, sessile; superior bracteas entire; flowers verticillate; calyxes and bracteas villous; corolla glabrous, twice as long as the calyx; segments of the limb roundish, entire. 1/. H. Native of North-west America, near the Priest's Rapid, on the Columbia river. Plant pruinose. Radical leaves tufted, downy. Peduncles many-flowered, short. Corollas blue, rivalling in brilliancy those of *P. speciosum.*

Pruinose Pentstemon. FL June, Sept. Clt. 1827. PL J to lfbot.

§ 3. *Corolla bilabiate. Upper lip of corolla compressed; the lower plaited.*

16 P. GLAU'CUM (Graham, in edinb. phil. journ. 1829. p. 348. Lindl. bot. reg. 1286.) stem smoothish ; leaves all glabrous: radical ones lanceolate, petiolate, quite entire, or denticulated : eauline leaves and bracteas ovate-lanceolate, sessile, stem-clasping panicle thyrsoid ; corollas inflated, and are, as well as the calyxes, clothed with glandular down outside; sterile filament stretched out, bearded, i/. H. Native of Arctic America. P. gracile, Hook. bot. mag. 2945, description, but not the figure. Corollas bluish-purple, with a pale or whitish throat.

Glaucous Pentstemon. FL June, Sept. Clt. 1827. PL 1 foot.

17 P. ATTENUA'TUM (Dougl. in bot. reg. 1295.) stem erect, pilose at top; radical leaves elliptic, acute, petiolate : superior ones ovate-oblong, stem-clasping, sessile, all quite glabrous and quite entire; panicle strict, and are, as well as the calyxes and corollas, downy ; capsule glabrous ; sterile filament bearded. *If.*. H. Native of North-West America, on the mountains of. Lewis and Clark's river. Leaves dark green : radical ones sometimes cuneated and cuspidate. Corollas cream-coloured.

Attemiatcd-\?axed Pentstemon. Fl. June, Sept. Clt. 1827. PL 1± to 2 feet.

18 P. DEU'STUM (Dougl. in. bot. reg. 1318.) stem almost simple, ascending, glabrous ; leaves deeply toothed : radical ones ovate-oblong: those near them spatulate ; eauline leaves oblong, acute, Sessile: upper ones almost quite entire ; calyxes glabrous ; limb of corolla flat, with retuse segments : upper ones the smallest. %. H. Native of North-west America, on scorched rocky plains in the interior. Peduncles axillary, many-flowered, the whole fonning a panicle. Radical leaves on long petioles : upper eauline leaves half stem-clasping, all coarsely and unequally toothed. Corollas cream-coloured. Calyxes and corollas glabrous.

Burned Pentstemon: Fl. June, Sept. Clt. 1827. PL 1 foot.

19 P. DIFFU'SUM (Dougl. in bot. reg. t. 1132.) stem branched ; leaves ovate-oblong, glabrous, unequally serrated ; peduncles axillary, many-flowered, the whole forming a terminal panicle ; calyx turbinate, with jagged segments ; sterile filament length of tube, bearded. 2/. H. Native of North-west America, in the district around the mouth of the Columbia river. Root creeping. Stems decumbent, radicant, branched, purple. Leaves evergreen. Inflorescence downy. Corolla purple, an inch long ; upper lip retuse.

Diffuse Pentstemon. FL June, Oct. Clt. 1827. PL \\ to 2 feet.

20 P. STATICIFOLIUM (Lindl. bot. reg. 1779.) stems aseend-\ng9 pubescent; radical leaves oblong-lanceolate, narrowed to the base, entire, glabrous ; eauline leaves sessile, cordate-ovate, toothed, pubescent; cymes nearly sessile, tomentose ; corolla ventricose, pubescent. 3/. H. Native of California. Radical leaves 7 inches long. Corolla violet, an inch long. The cymes *ht* im? sessile, the flowers appear somewhat verticillate.

SLS-torrf Pentstemon. FL June, Oct. Clt. 1834. PL 2 f...

21 P. CORDIFOLIUM (Benth. in scroph. ind. p. 7.) stem pruinose; leaves on short petioles, ^road, ovate, obtuse, quite entire, cordate at the base, bullate, nerved beneath , panicle loose: corollas tubular, deeply bilabiate ; upper lip emarginate: lower one trifid; sterile filament bearded. %. native of California, Douglas.

Heart-leaved Pentstemon. PL? humble;

22 P. TMPHY'LLUM (Dougl. in bot. reg. 1 oblong: leaves 3-4 in a whorl, glabrous, bluntly cut: lower peduncles floral ones entire, linear-lanceolate, usually alternate 2-3-flowered, and are, as well as the calyxes, clothed webbed down ; segments of corolla oblong, Native the lower lip equal ; sterile filament bearded. district of North-west America, on the blue mountains, California. watered by the river Columbia; and of Nortner geg- Stem branched. Flowers sparingly panicled. Kurrea. ments ovate, acute. Corolla ventricose at the base,

Gentian-like Pentstemon. Fl. July, Sept. Clt. 1825. PI. 3 to 4 feet.

SECT. II. ERIANTHE'RA (from *epiov, erion,* wool; and *avdrjpa, anthera,* an anther; the anthers are ciliated or downy, not glabrous, as in the last section.

33 P. HETEROPHY'LLUM (Lindl. bot. reg. 1899.) leaves glaucescent, quite entire: lower ones linear-lanceolate: superior ones linear; raceme twiggy; sepals ovate, acuminated; corolla ventricose, beardless; sterile stamen glabrous; anthers sagittate, fringed at top. %. H. Native of California, Douglas. Leaves hardly ever serrulated. Peduncles 1-2-flowered, bibracteate above the middle. Corolla bilabiate; sterile filament sub-emarginate.

Fariable-leaved Pentstemon. Fl. June, Sept. Clt. 1834. PI. H to 2 feet.

34 P. GLA'BRUM (Pursh, fl. amer. sept. *2.* p. 738.) very smooth; leaves sessile, ovate-lanceolate, entire, having the margins partly undulated; peduncles many-flowered, secund; segments of calyx roundish-oval, acuminated; corolla subcampanulate; sterile filament slightly bearded under the refuse apex; anthers pubescent. %• H. Native *of* North America, in arid soils near the confluence *of* the Shian river, and towards the sources *of* the Columbia river. Curt. bot. mag. 1672. P. erianthera, Nutt. gen. amer. *2.* p. *52.* but not of Pursh. Flowers numerous, purple.

Glabrous Pentstemon. Fl. July, Sept. Clt. 1811. PI. 1J foot.

35 P. GLANDULOSUM (Dougl. in bot. reg. 12G2..) plant clothed with glandular pubescence; radical leaves ovate, coarsely toothed: cauline ones stem-clasping, acute, almost quite entire; peduncles many-flowered; calyx loose, with ovate segments; corolla ventricose; anthers ciliated; sterile filament glabrous. 7/. H. Native of North America, on the banks of the Kooskooskee river, 6300 feet above the level of the sea. Radical leaves on long petioles: cauline ones cordate-ovate. Peduncles forming a racemose panicle. Corolla large, pale rose-coloured, striped with purple inside. Anthers white. Capsule glabrous, equal in length to the calyx.

Glandular Pentstemon. Fl. June, July. Clt. *1827.* PI. 2 to *2* feet.

36 P. VENU'STUM ^Dougl. in bot. *reg. 1309.)* stein suflfruticose, erect, glabrous; leaves Sessile, ovate-lanceolate, acuminated, denticulated, glabrous; peduncles many-flowered, the whole forming a panicle; calyx glabrous; corolla ventricose, ciliated; anthers pilose; sterile filament bearded at top. 1-. H. Native of North-west America, in dry channels of rivers, among the mountains. Very nearly allied to *P. diffusum;* but differs in the stem being more erect; in the leaves being sessile, longer, straighter; in the corolla being of a more obscure colour; in the calyx being glabrous; and in the anthers being pilose.

Graceful Pentstemon. Fl. June, Sept. Clt. 1827. PL *2* feet.

37 P. RICHARDSONII (Dougl. in bot. reg. 1121.) herbaceous; leaves sessile, pinnatifid; peduncles few-flowered; calyx clothed with glandular pubescence: with ovate-acute segments; corolla ventricose; anthers ciliated; sterile filament bearded with a few hairs at apex. %. H. Native *of* North-west America, on dry rocks in the vicinity *of* the Columbia. Hook. bot. mag.

3391. Plant a little branched, minutely downy. Calycine segments oblong-lanceolate. Corolla purple, nearly glabrous outside. Valves of anthers ciliated towards the apex.

Richardson's Pentstemon. Fl. June, Sept. Clt. 1825. PI. 1^foot.

38 P. DISSE'CTUM (Ell. car. 2. p. 129.) leaves opposite, sessile, compoundly dissected: the segments linear, and generally blunt; flowers in panicles. %. H. Native of Georgia, Louisville. Stem slightly pubescent. Corolla purple; segments of the upper lip larger than those of the lower, and more blunt. Stamens inclosed; anthers downy, or hairy. ?

DissectedAeaved Pentstemon. PI. 2 feet.

39 P. SCOULE^RI (Dougl. in bot. reg. 1277.) suffruticose; leaves obovate-lanceolate, serrulated: upper ones quite entire; peduncles 1-flowered, racemose; calyx downy, with acuminated segments; corolla ventricose; anthers woolly. %. H. Native of North-west America, on the Kettle falls of the Columbia. Branchlets pilose. Corolla purple, nearly 2 inches long; palae open. Mr. Douglas considered this a species of *Chelone* from the woolly anthers; but it has the angular seeds of *Pentstemon.* (fig. 64.)

FIG. 64.

Sconlers' Pentstemon. Fl. May, July. Clt. 1827. Shrub 2 to 3 feet.

SECT. III. GENTIANOI'DES (from *gentiana,* gentian; and *idea, like;* habit of species.) Sterile filament glabrous. Anthers glabrous. Leaves narrow, entire, glaucous: radical ones crowded. Flowers panicled.

40 P. HUMBOLDTII; stems simple, downy; leaves linear, quite entire, glabrous; peduncles 2-flowered, disposed in a panicle; calycine segments roundish-ovate, acute; corollas beardless; sterile filament glabrous. 1/. H. Native of Mexico, in mountain places between Puerto de Varientos and Santa Rosa, at the altitude of 1350 hexapods. Chelone imberbis, H. B. et Kunth, nov. gen. amer. 2. p. *363.* Leaves bluntish, 2-3 inches long, itnd \\ *to 2* lines broad. Calyx downy. Corollas similar to those of *P. barbatum,* but smaller and beardless. Stamens exserted.

Humboldt's Pentstemon. PL 1 to 1| foot.

41 P. BARBA^TUM(Nutt.gen.amer.2. p.51.)glaucous,glabrous; stems branched; leaves connate, sessile, linear-lanceolate, quite entire, very long, channelled: radical ones crowded, spatulate; peduncles axillary, opposite, 2-flowered: the whole forming a panicle; limb of calyx scarious; corolla bearded on the lower lip with yellow hairs. %. H. Native of Mexico. Chelone barbata, Cav. 3. p. 22. t. 242. Ker. bot. reg. t. 116. Chelone ruelloides, Andr. bot. reg. t. 34. Corollas showy, scarlet outside, and white inside, drooping. Sterile filament glabrous.

Bearded-flowered Pentstemon. Fl. June, Sept. Clt. 1794. PL 4 to 5 feet.

42 P. CENTRANTHIFOLIUM (Benth. scroph. ind. p. 7.) glabrous, glaucous; leaves ovate-lanceolate, quite entire, cordately stem-clasping at the base; peduncles axillary, many-flowered, disposed in an elongated, terminal panicle; corolla tubular, pendulous, glabrous; throat naked; limb almost equally 5-parted; sterile filament beardless. 7/. H. Native of California. Corolla scarlet. Chelone ceiftranthifolia, Benth. in hort. tran ser. 2d. vol. 1. p. 481. Lindl. bot. reg. t. *1737.* 1832.

Centranthus-leaved Pentstemon. Fl. July, Nov. wt. PI. 3 to 7 feet.

Cult. The species *of Pentstemon* are amongst the most showy border flowers we possess in our gardens. They grow in light rich soil, and are readily increased by cuttings. They are rather tender, being usually killed by severe frosts or damp in winter, if allowed to remaining it is therefore safest to keep a few plants of each species so that they may be readily sheltered by placing them frame in winter.

II. CHELONE (from *x^»>"1> chelone,* a tortoise, the back of the upper lip of the corolla is compared to a t no. 100^ Dill. gen. p. 11. Lin. gen. no. 748. Schreb. gen Juss. gen. 137. ed. Usteri, p. 153. Gaertn. fruct. t. 54.—Anonymos, Gron. virg. 71, 72. Act. par. p. 87. Pentstemon species of authors.

LIN. SYST. *Didynamia, Angiosj)ermia.* Calyx 5 parted> bracteate. Corollaringent,ventricose: upperlipemargin one trifid, sterile, Stamens didynamous, with a sterile filament, which is shorter than the rest; anthers woolly. Capsule 2-celled, 2-valved. Seeds surrounded by a membranous margin. —Herbaceous plants, with opposite leaves; flowers spiked, terminal. Lower lip of corolla internally bearded. Capsule oval.

1 CTG'LAW (Lin. spec. 849.) leaves lanceolate-obtuse, terminated, serrated, nearly sessile, glabrous. %. H. Native of the United States.—Trew, ehrh. t. *83.* C. glabra Pursh, fl. amer. sept. 2. p. 427. Corollas white.

Far. /3, *lanceolata* (Nutt. gen. amer. 2. p. leaves lanceolate, conspicuously acuminated, serrated, sessile, downy beneath; bracteas scarcely dilated; segments of calyx oblong-ovate. %. H. Probably a distinct species according to Nutt.

Glabrous Chelone. Fl. Aug. Oct. Clt.,.1730. ri. feet.

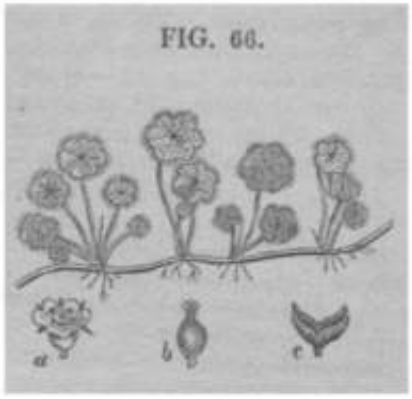
2 C. OBLIW (Lin. syst. *553.)* leaves petiolate, oblique, lanceolate. %. H. Native of North America, in the southern States. Ker. bot. reg. 175. A. glabra, *(3,* Lin. spec. 849. C. glabra, /?, purpurea, Michx. fl. bor. ^'yf'j^^ C. purpurea, Mill. diet. no. 2. fig. t. 93. Digitalis «urnea, Ray, suppl. 397. Plenk. mant. t. 348. f. 4. Corollas yellow.

Oblique Chelone. FL Aug. Oct. Clt. 1752. *ri.* feet.

FIG. 65.

3 C. LYONI (Pursh, fl. amer. sept. *2.* p. *737.)* glabrous, branched; leaves petiolate, cordate-ovate, serrated; spikes terminal, with the flowers clustered. 1/. H. Native of North Carolina, near Wilmington; and of Georgia. C. major, Sims, bot. mag. 1864. Flowers purple, (fig. *65.)*

Lyons Chelone. FL July, Sept. Clt. 1812. PL 3 to 4 feet.



4 C. LATIFOLIA (Muhl, cat. ex Ell. car. 2. p. 127.) glabrous; leaves wide-ovate, or oval, serrated, abruptly acuminated, tapering at the base, petiolate; sterile filament bearded near the summit. %. H. Native of Carolina. Corollas pale purple.

Cheldne Pentstemon, Walt. car. p.

Broad-leaved Chelone. pi. 1 to % feet.

—Small, creeping, rooting, tufted herbs, with small, alternate, reniform leaves, and axillary, solitary, pedicellate, inconspicuous flowers.

1 S. EUROP^A (Lin. spec. p. 880.) plant hairy, creeping; leaves on long petioles, reniform, 7-9-lobed ; flowers tetrandrous, somewhat didynamous. %. H. Native *of* the South of Europe, as of Portugal, Spain, West *of* France, &c, in shady places about springs; in England, as in Devonshire and Cornwall plentiful ; and about Longledale in Westmoreland, Smith, engl. bot. G49. S. prostrata,Salisb.icon. II. t. C—Plukn. phyt. t. 7. f. 6.—Petiv. brit, t. 6. f. 11. Calyx hispid. Corolla pale yellow, with a purplish tinge on the *3* upper segments. Seeds plano-convex, or sub-angular, brown, (fig. 6(i.)

FIG. 66.

European Sibthorpia. Fl. June, Sept. Britain. P). creeping.

% S. PICHINCHE'NSIS (H. B. et Kunth, nov, gen, amer. 2. p. 390. t. 1 7G.) plant hispid, creeping ; leaves on Jong petioles, reniform, 7-9-lobed : lobes obtuse; flowers pentandrous. %. F. Native on the burning mount of Pichinca, in rugged places between the plains *of* Verdecuchu and Chorro de Cantuna, at the altitude of 1800 hexapods. Flowers purple. Seeds very minute. Habit of-5". *Europa'a.*

Pich'mcha Sibthorpia. J[1]. creeping.

3 S. RETI/SA (H. B. et Kunth, 1. c. p. 391. t. 177.) plant hispid, creeping ; leaves on long petioles, reniform, many-lobed : lobes retuse ; flowers pentandrous. %. F. Native of New-Spain, near Tiangillo, at the altitude of 1500 hexapods. Leaves twice or three times the size of those of *S. Europcea.* Flowers double the size of those of *S. P'tchinchensis,* purplish violet.

,fte(«se-Iobec] Sibthorpia. PI. creeping.

Cult. Sihthorpia is a genus of singular plants, but of no beauty ; ihey are, therefore, only grown in botanic gardens, or those of the curious. They succeed best in peat soil and moist situations, and are readily increased by division. *S. Pichinchensis* and *S, rctusa* require protection from frost in winter.

II- DISA'NDRA (from *?t^,dls,* twice; and *avtjp avSpoc, aner andros,* a male; in reference to the stamens being sometimes 4 and sometimes 8, therefore often double the common number 4.) **Lin.** syst. *$52.* Scbreb. gen. no. 627. Juss. gen. 99. ed. listen, p. 111. Lam.ill. t. 275. f. *2.* Sibtborpia species, Lin.

FIG. *67.*

LIN. SVST. *Pertta-Oct/mdria, Monogynta.* Calyx 5-8-parted. CoroJIa rotate, 5-8-)obed. Stamens 5-8. Stigma simple. Capsule ovate. Seeds ovate.—Herbs with the habit of *Sibthorpia.* The number of floral parts are variable, but usually 7.

1 D. I>ROSTRA[1]TA (Lin. syst. 352.) prostrate, pubescent ; leaves reniform, crenatod ; pedicels twin. *11.* G. Native of Madeira. Curt. bot. mag. 218. Sibthorpia peregrina, Lin. spec. p. 880. amœn. 3. p. 20.—

Broad-leaved Chelone. pi. 1 to % feet.

Cult. The species of Chelone are extremely handsome flowering plants. They grow in any common garden soil, but prefer peat earth. They are readily increased by dividing at the root.

ORDER CLXXIII. SIBTHORPIA'CEÆ (this order contains plants agreeing with *Sibthórpia* in the characters given below.)

vol. 19. no. 37. July, 1835.—

Calyx 4-8-parted, Permanent. Corolla rotate, 4-8-cleft, regular, deciduous, imbricate in estivation. Stamens 4-8, equal, alternate with the lobes of the corolla ; anthers 2-celled ; cells parallel. Style one; Stigma capitate, undivided. Capsule 2-celled, 2-valved, many-seeded, erect, placenta large, spongy, globose. Seeds numerous, membranous ? albumen copious, dense, fleshy. Embryo obtuse, cylindrical, erect, inclosed. **Radicle** long, **eylindrical,** ascending, umbilicary to the umbilicus, centripetal—Herbs, with alternate, undivided leaves, and axillary, solitary, pedunculate flowers, in small racemes. Gen. and sp. char. The family is intermediate between *Scrophulariaceæ;* and *Primulàceæ;* and is distinguished from the first by the regular tubular, hardly campanulate, 4-cleft, deciduous calyx; and globose placenta; and from the second by the regular tubular, hardly campanulate, 4-cleft, deciduous calyx; and globose placenta; and the regular monopetalous flowers, in the stamens being alternate with the lobes of the corolla, not opposite them, and in the 2-celled capsule.

Synopsis of the genera.

1 SIBTHÓRPIA. Corolla rotate, 5-cleft. Stamens 4-5.

2 DISA'NDRA. Corolla **rotate,** G-8-cleft. Stamens 7.

3 CAPRA'RIA. Corolla campanulate, 5-parted. Stamens 4, subdidynamous.

4 XUARE'ZIA. Corolla campanulas, 5-parted. Stamens *5,* equal.

5 LEUCÓSPORA. Corolla tubular, hardly campanulate, 4-cleft. Upper lobe emarginate. Stamens 4, subdidynamous. Capsule at length 1-celled.

6 SCOPA'RIA. Corolla rotate, 4-cleft. Stamens 4, equal.

7 ROMANZÒVIA. Corolla salver-shaped, 5-cleft. Stamens 5, equal.

I. SIBTHORPIA (after Humphry Sibthorp, M.D. Professor of Botany Oxford, successor to Sherard, who collected in the Levant, and author of "Flora Graeca," and "Prodromus Florae Graecae Oxoniensis") **Lin. gen. 775. Schreb. gen.** H. B. et Kunth, nov. gen. amer. 2. Corolla sub-rotate, 5-lobed. Stamens 4-5, nearly equal. Stigma capitate. Capsule sub-orbicular, compressed, dehiscing at top.

Plukn. phyt. *257.* f. 5. Leaves on long petioles, resembling those of Ground-ivy. Pedicels usually twin, but sometimes solitary and by threes. Corollas yellow, (fig. G7.)

Prostrate Disandra. Fl. May, Aug. Clt! 1771. Pl. pros.

2 D. AFRICA'NA (Lin. syst. ed. Reich, p. 137.) prostrate, pubescent ; leaves orbicular, crenated ; pedicels solitary. *V* ' G. Native of the North of Africa. Sibthorpia Africana, Lin' spec. 880. amcen. 3. p. 22.—Shaw. afr. f. 149.

African Disandra. Pl. prostrate.

Cult. A light rich soil is the best for the species of *Disandra,* and they are readily increased by division.

III. CAPRA'RIA (from caper, a goat; goat-weed.) Lin. gen. no. 768. Schreb. gen. no. 1077. Vahl. eclog. 1. p. 50. t. *53.* Juss. gen. p. 118. ed. Usteri. p. 133. Lam. ill. t. 534. f. 2. H. B. et Kunth, nov. gen. 2. p. 354.

LIN. SYST. *Didyndmia, Angiospérmia.* Calyx 5-parted, equal. Corolla campanulate, with a short tube, and a 5-cleft, nearly equal limb. Stamens 4, nearly equal, inclosed. Stigma capitate, 2-lobed, ex Bonpl. Capsule ovate, compressed ; valves bifid.—Annual herbs, with alternate leaves, and axillary pedicellate flowers.

1 C. BIFLORA (Lin. spec. 875.) branches pilose; leaves oblong, serrated, narrowed and quite entire at the base, ciliated, smoothish ; pedicels twin, elongated, capillary, pilose. 0.? S. Native of the warmer parts of America, common. Jacq. amer. 182. t. 115. pict. 90. t. 174. Swartz. obs. 239. Lam. ill. 534. f, 2. C. Curassávica, Herm. par. t. 110.—Comm. hort. 1. p. 79. t. 40.—Plukn. aim. 237. t. 98. f. 4. Feuil). per. 1. p. 764. t. 48. Corollas white. Pedicels solitary, or twin, rarely bv threes.

" *Two-flowered* Goatweed. Fl. July, Aug. Clt. 1752. Pl. 2 to 4 feet.

2 C. HIRSU'TA (H. B. et Kunth, nov. gen. amer. 2. p. *355.)* branches hairy ; leaves oblong, serrated, cuneated at the base, and quite entire, hairy; pedicels twin, short, hairy. ©.? S. Native of Mexico, between La Venta del Exido and Acapulco, at the altitude of 200 hexapods, and elsewhere. Corolla white ; lower segments marked by a pilose red spot. Very like the preceding, but the flowers are smaller, pedicels shorter, &c.

Hairy Goatweed. Pl. 1 to 2 feet.

3 C. SEMI-SERRVTA (Vahl, eclog. 2. p. 47.) branches hairy ; leaves lanceolate, serrated from the top to the middle ; peduncles 1-4-flowered, solitary.? ©.? S. Native of the Island of St. Martha. Leaves *2-3* inches long, quite entire at the base. Calycine segments subulate. Corolla with a villous throat, and linear, oblong segments. Stigma capitate. Capsule oblong. Placenta linear, free.

Half-serrated'leavcd Goatweed. Pl. 1 to 2 feet.

4 C. SAXIFRAOIFÓLIA (Cham, et Schlecht, in Linnaea, 5. p. 105.) plant branched, hairy; leaves spatulately obovate, cuneated, doubly and deeply serrated, rather pilose ; peduncles almost solitary, short, hairy. ©.? S. Native of Mexico, near Vera Cruz. Said to be allied to *C. hirsuta.*

Sax frage-leaved Capraria. Pl. 1 to *2* feet. ?

f *A species hardly known.*

5 C. ? HU'MILIS (Ait. hort. kew. 2. p. 354.) pubescent ; leaves opposite, or 3 in a whorl, ovate serrated, petiolate; peduncles axillary, shorter than the petioles. ©. S. Native of

^ S J A Fl. J«i* Au* Ch- 1781- Pl- * » i

Cult. The seeds of the species of *Caprària* require to be reared on a hot bed in spring, and when the plants are of sufficient size, they require to be planted in separate pots and placed in the greenhouse or stove; and some of them may set out in the open ground in a warm, sheltered situation.

IV. XUARE'ZIA (named after Caspar Xuarez, a Spanish botanist, who has written a work on the plants of Italy.; et Pav. prod. p. 24. t. 4. fl. per. 2. p. *123.* f. a. Fers. 1. p. 176. H. B. et Kunth, nov. gen. 2. p 355.

LIN. SYST. *Pentdndria, Monogynia.* Calyx 5-partea. Corolla sub-campanulate, with a very short tube, and a equal limb. Stamens 5, equal. Stigma bilarnellate. oblong, obtuse, rather compressed; valves bifid; partral, at length free.—A shrub with alternate, entire leave , axillary, twin, white, pedicellate flowers.

1 X. BIFLORA (Ruiz, et Pav. 1. c.) *h* . G. Native and the neighbouring parts of South America. Paviana, Feuill. per. 2. p. 764. t. 48. Shrub much glabrous. Leaves lanceolate, remotely serrated, narrow the petioles, and quite entire at the base. Corolla small yellow, campanulately rotate. Called Tea in Peru.

Two-flowered Xuarezia. Shrub 4 to 6 feet.

Cult. A light rich soil will suit this plant, and cutting readily rooted.

V. LEUCOSPORA (from *XEVKOC, leucos,* white ; *spora,* a seed ; seeds white.) Nutt. journ. acad. nat. 7. p. 87. Caprària multifida, Michx.

LIN. sm, *Tetrdndria, Monogynia.* Calyx 5-parted, rolla tubular, hardly campanulate, obtuse, 4-cleft: ment emarginate. Stamens 4, nearly equal. Capsule at length 4-valved, many-seeded.—An annual, erect, vis Leaves 3 in a whorl, trifid. Flowers solitary, axillary. Nuttall to be nearly allied to *Gratiola.*

1 L. MULTI'FIDA (Nutt. 1. c.) ©. H. Native of America, on the banks of the large western Mississippi, Missouri, and Arkansas. Capraria multifida; fl. bor. amer. 2. p. 22. t. 23. Leaves lyrate, partly the segments linear, oblong, and blunt. Capsule ovate ; placenta central, narrow, and almost columnar. Seeds white, diaphanous. Flowers pale red, and very fugaceous.

Multifld-lenved Leucospora. Pl. ½ foot.

Cult. For culture and propagation see *Capraria,* p«

VI. SCOPA'RIA (from *seopa,* a broom; to which it is adapted.) Lin. gen. no. 143. Schreb. gen. 187. Juss. gen. p. 118. ed. Usteri. p. 132. fruct. 1. p. 251. t. *53.* R. Br. prod. p. 443. H. B. et Kunth, nov. gen. amer. 2. p. 354. Cham, et Schlecht, in Linnaea, 2. p. 603.

LIN. SYST. *TetrAndria, Monogynia.* Calyx 4-5-partea, segments usually 3-nerved. Corolla rotate, 4-clett, throat girded by a crown of hairs. Stamens 4, equal. obtuse. Capsule 2-valved, with a septicidal semi-bifid ; placenta central, large, bipartible, at length free — Glabrous herbs or under shrubs. Leaves dotted, opposite, 3 in a whorl. Peduncles axillary, 1-flowered. Calyx ura Corollas small, white.

Radical leaves roundish-reniform, 1> or crenated; cauline leaves few, similar to the radical ones. Flowers white, bractless, marked with veins, racemose; raceme secund, revolute at top.

1 R. UNALASCHE'NSIS (Cham. 1. c.) radical leaves on long petioles, reniformly-cordate, many-lobed, or crenated, pilose; petioles channelled, pilose; stem usually simple, tufted, few-leaved ; flowers racemose. %. H. Native of the Island of Unalascha, in valleys, growing in the fissures of rocks. Saxifraga ntitans, D. Don, in Lin. trans. 13. no. 2. Saxifraga secunda, Willd. herb. no. S408. Calycine segments lanceolate, bluntish. Lobes of corolla equal, roundish. Filaments capillary ; anthers 2-celled, incumbent. Placentas 4, linear, 2 in each cell, adnate longitudinally to the dissepiment along the axis. Seeds numerous, minute, angular, scrobiculate. Albumen cartilaginous. Embryo in the axis of the seed, cylindrical, erect.

Unalascha Romanzoffia. PI. \ to ^ foot.

2 R. SITCHE'NSIS (Bongard, mem. acad. imp. st. petersb. *2.* p. 156.) radical leaves on long petioles, roundish-reniform, coarsely-toothed, glabrous, rarely furnished with a few hairs; petioles glabrous, or pilose dilated; stems tufted, simple, or dichotomous, furnished with 1-2 leaves, similar to the radical ones; flowers racemose. If. H. Native of the Island of Sitcha. Plant a span high. Petioles dilated at the base, 2-4 inches long. Calycine segments lanceolate. Corollas largish, 5-cleft, rarely 4-cleft. Stamens 4-5, alternating with the lobes of the corolla. Stigma 2-lobed.

Sitcha Romanzoffia. PI. £ to \ foot.

Cult. Should any of these plants ever be introduced to our gardens, we would recommend their being grown in pots in a mixture of peat soil and sand.

ORDER CLXXIV. GESNERIA^CEJE (this order agrees with *Gesnéria* in the characters given below.) Gesnéreae, Richard, et Juss. in ann. mus. 5. p. 427. H. B. et Kunth, now gen. amer. 2. p. 392. Mart. nov. gen. 3. p. *68.* Cyrtandráceae, Jack, in Lin. trans. 14. p. 23. Didymocárpeae, D. Don, prod, fl. nep. p. 122.

Calyx 5-cleft. Corolla oblique ; tube drawn out behind and in front above, or tubular at the base; limb 5-cleft, sub-bilabiate. Stamens 4, didynamous, with usually the rudiment of a fifth, alternating with the divisions of the corolla: the upper one or more of them abortive. Anthers distinct, cohering by pairs, or altogether. Ovarium 1-celled; placentas 2, parietal, bilamellate. Fruit capsular or baccate, silique-formed, or round. Seeds numerous, hanging by long funicles, or erect. Albumen copious or wanting. Embryo straight, slender.—Herbs or shrubs, usually tuberescent at the base. Leaves opposite or verticillate, rarely alternate, thickish, entire. Inflorescence cymose, rarely racemose. Down or hairs simple. Cymes axillary or racemose, from the flowers being axillary and solitary. Corollas beautiful, of various colouring, scarlet, violet, blue, lilac, rose-coloured, green, cream-coloured, and white; *of* one colour or spotted, or marked with other colours. Roots usually tuberous. Stems erect, decumbent or parasitical, and climbing on trees. Leaves entire or quite entire, thickish, green above, but often purple or reddish beneath. Leaves emollient.

Synopsis of the genera.

TRIBE I.

GESNERIE*:. Calyx usually adhering to the ovarium at the

base; the ovarium is therefore half inferior. Seeds albuminous.

SUBTRIBE I.

GLOXINIE^. Calyx adnate to the ovarium. Corolla half inferior, perigynous.

1 TREVERAVIA. Ring round the ovarium entire. Corolla oblique; limb spreading.

2 GESNE'RIA. Glands around the ovarium free. Corolla straightish, tubular, furnished with 5 gibbosities at the base.

3 GLOXINIA. Glands as in *Gesneria.* Corolla very oblique, campanulately ringent, with only one gibbosity at the base.

SUBTRIBE II.

CONRADIE^E. Calyx adnate to the ovarium. Corolla superior. Leaves alternate or scattered.

4 RYTIDOCA'RPUM. Epigynous ring thick and sinuated. Leaves stipulate.

5 CONRA^DIA. Ring or glands scarcely present.

SUBTRIBE III.

BESLERIE\E. Calyx free. Corolla inferior.

6 SARMIE'NTA. Fruit baccate. Ring hypogynous. Stamens 4, 2 hind ones perfect: front ones abortive.

7 BESLE'RIA. Fruit baccate. Ring hypogynous. Stamens 4, all perfect, with a chaff-formed rudiment of a fifth.

8 HYPOCY'RTA. Fruit baccate. Glands hypogynous. Anthers connected. Corolla tubular, ventricose in front,

9 COLU'MNEA. Fruit baccate. Glands hypogynous. Anthers connected. Corolla tubular, ringent: hind lip arched.

10 MITRA^RIA. Fruit baccate. Glands hypogynous. Anthers free. Bracteas mitre-formed.

11 DRYMONIA. Fruit capsular. Rudiment of a fifth stamen wanting. Corolla very oblique, campanulately ringent; throat ample.

12 KLU'GIA. Fruit capsular. Rudiment of a fifth stamen wanting. Stigma capitately truncate. Corolla tubular, ringent.

13 TAPI^NA. Fruit capsular. Rudiment of a fifth stamen present. Corolla very oblique, campanulately ringent, with a constricted throat.

14 NEMATA'NTHUS. All as in *Tapina;* except that the corolla is campanulate, and its limb nearly equal and spreading.

15 ALLOPLE'CTUS. Fruit capsular. Rudiment of a fifth stamen present. Corolla straightish, club-shaped or funnel-shaped. Stigma capitately funnel-shaped.

10 EPI'SCIA. All^as in *AllopUclus;* except that the corolla is tubularly funnel-shaped, and the stigma 2-lobed.

TRIBE II.

CYSTANDRA%CE;E. Ovarium wholly superior. Seeds exalbu**minous.**

SuBTRIBE I.

TRICHOSPOREVE. Capsule silique-formed, terete. Seeds pendulous, expanded at both ends, or only at the apex or base into a setaceous or membranous wing.

17 TROMSDORFFIA. Calyx tubular, somewhat 5-cleft. Stamens 4, 2 of which are sometimes sterile, inclosed. Stigma sub-bilamellate. Seeds furnished with a membranous wing at the base.

18 JESCHYNA'NTHUS. Calyx ventricose, tubular, 5-cleft. Stamens 4, fertile, exserted, with the rudiment of a fifth, inclose Stigma somewhat funnel-shaped. Seeds drawn out into a bristle-formed tail at both ends.

19 LYSIONOTIS. Calyx deeply 5-cleft, or 5-parted. Stigma capitate. Anthers, capsule, and seeds as in *Mschynanthus.*

20 AGALMY'LA. Calyx 5-parted. Stamens 5, *2* or 4 of which are fertile, and exserted. Stigma bilamellate. Caps" and seeds as in ^*Eschyndnthus,*

SUBTRIBE II.

DIDYMOCA'RPE*:. Capsule silique-formed. Seeds pendulous, minute, naked.

21 STREPTOCA'RPUS. Calyx 5-cleft. Corolla tubularly fo»," nel-shaped; limb 5-lobed, nearly equal, oblique. Stamens *2* front ones fertile ; and the other *2* tubercle-formed and ste Valves of capsule twisted. Stigma 2-lobed. Seeds minu» naked.

22 DIDYMOCA'RPUS. Calyx campanulate, bluntly 5-toothet, o 5-lobed. Corolla tubular ; limb spreading. Stamens 4, rarefy 5, inclosed, *2* or 4 of which are antheriferous. Cells *of* anther^ divaricate. Stigma obtuse, or simple. Seeds subulate, roundish.

23 CHIRA'TA. Calyx 5-cleft, inflated, 5-angled. Cot^ funnel-shaped ; limb bilabiate. Stamens 5, inclosed, 2 1° ones fertile; anthers reniform, 1-celled. Stigma funnel-snap 2-lobed. Seeds subulate, acute at both ends.

SUBTRIBE III.

CYRTA'NDREJE. Fruit baccate. Seeds pendulous, naked.

24 CYRTA'NDRA. Calyx tubular, 5-cleft. Stamens 5, 3 o them sterile. Cells of anthers parallel. Stigma capitate, sometimes emarginate. Berry a little longer than the calyx.

25 WHI^TIA. Calyx small, 5-parted. Stamens as in *Cyrtandra,* but exserted ; cells of anthers unequal in insertion. Stigma somewhat funnel-shaped. Berry much longer than the calyx.

26 RHYNCIIOTE^CUM. Calyx 5-cleft. Stamens 4, fertile, inclosed; anthers 1-celled. Stigma obtuse. Berry globose, inclosed.

27 LOXO^NIA. Calyx tubular, 5-cleft. Stamens 4, fertile, inclosed; anthers sagittate. Stigma bilamellate. Berry oblong, nclosed.

28 CENTROVIA. Calyx spathaceous, cleft. Stamens 4, fertile, inclosed ; anthers 1-celled, spurred at the base. Stigma capitate. Berry longer than the calyx.

anthers *; Calyx 5-cleft. Stamens 5, fertile, exserted; ovate, longer than the calyx.

bractea V. DIA. Parted, inclosed in a spath-formed cose. Corolla tubularly ventricose, equal, 5-lobed, sub-bilabiate. Stamens 5, 4 fertile and sterile one included. Stigma bilamellate. Berry spongy, longer than the calyx. ?

SUBTRIBE IV.

Loxonieæ. Naked. Capsule 2-valved, or circumcised. Seeds erect,

§ 1. *Capsule 2-valved.*

short, bin. Calyx tubular, 5-cleft. Corolla tubular; limb minute, 4-cleft. Stamens 2, fertile; sterile ones none, or very small. Capsule 2-valved.

32 CLISSANTHUS. Calyx tubular, 5-cleft. Corolla tubular; limb very short: lower one large, convex. ?

33 PAGAMEA. Capsule 2-valved.

bilabiate. Calyx ovate, 5-cleft. Corolla rotatory, 5-cleft, without any tube. Stamens 4, very short, roundish. Stigma capitate, entire. Ovarium ovate, 2-celled.

34 ORTHOSIA. Calyx 5-parted. Corolla funnel-shaped; limb 4-cleft. Stamens 4, fertile. Stigma capitate, emarginate. Placenta 2, obovate, adnate to the dissepiment.

§ 2. *Fruit capsular, circumcised.*

35 STAUROSTEMMA. Calyx subrotately campanulate, 5-plicate, somewhat 10-cleft. Corolla with a very short tube, ampliate, obliquely 10-cleft. Stamens fertile, 4; anthers shortly 2-cleft at top. Stamens fertile, 4; sterile, 2, subulate, converging in a cruciate manner. Capsule fading, 2-celled, circumcised.

36 ALLOPLECTUS. Calyx tubular, 5-cleft. Corolla bilabiate, 5-cleft. Stamens 4, lower ones sterile. Capsule girded by the calyx, 1-celled, circumcised.

† *Genitus dubitful whether belonging to Gesneriaceæ or Bignoniaceæ.*

37 ANEMOPAEGMA. Calyx tubular, 5-toothed. Corolla tubular, ventricose near the base; limb 5-lobed, ciliated. Stamens 4, didynamous, with the rudiment of a fifth. Stigma bilamellate. Capsule linear-oblong, 4-cornered. Seeds winged at both ends, and bearded.

I. TREVERANIA (named in honour of Lud. Christ. Treveranus, M.D., professor of botany in the university of Bonn, on the Rhine.) Willd. enum. *2.* p. 638. Mart. nov. gen. bras. 3. p. *56.*—Cyrilla, Lher.—Achimenes species, P. Browne.—Achimenes, Pers.—Columnea species, Lam.

LIN. SYST. *Didynamia, Angiospermia.* Calyx adnate to the ovarium; limb 5-parted, nearly equal. Corolla funnel-shaped; tube rather oblique, gibbous behind at the base; limb nearly equal, spreading, 5-lobed. Stamens didynamous, with the rudiment of a fifth; anthers connected. Ovarium girded by a ring. Capsule dry, 1-celled, or half 2-celled; placentas *2,* parietal. Seeds many, scobiform.—Branched, pubescent, perennial herbs, furnished with scaly ament-formed stolons under ground, and sometimes from the axils of the leaves. Leaves opposite, or 3 in a whorl, serrated. Flowers axillary, solitary, or few and aggregate.

1 T. PULCHE'LLA (Willd. enum. *2.* p. *638.)* plant tomentosely hairy; leaves 3 in a Whorl, ovate, acuminated at both ends, serrated, with minute leaves in the axils; peduncles solitary, axillary. 7/. S. Native of Jamaica, among the mountains in steep places. Cyrilla pulchella, Lher. stirp. 1. p. 147. t. 71. Curt. bot. mag. 374. Buchnera coccinea, Scop, insubr. *2.* p. 10. t. 5. Columnea erecta, Lam. diet. *2.* p. *66.* Achimenes minor, P. Browne, jam. 271. t. 38. Achimenes coccinea, Pers. ench. *2.* p. 165. Gesneria pulchella, Swartz. prod. p. *90.* Corollas scarlet. Genitals inclosed. Capsule somewhat 2-celled.

iVW Treverania. Fl. Aug. Sept. Clt. 1778. PJ. 1 to 1| foot.

2 T. GRANDIFLORA (Schiede, in Linnaea, 8. p. *247.)* beset with spreading hairs; leaves opposite, equal, ovate, acute, oblique at the base, coarsely serrated. %. S. Native of Mexico, on shady places near the Hacienda de La Laguna. Leaves green above, and reddish beneath, very like those of elm; the largest ones \-½ to *2* inches long. Corollas large, of a violet purple colour. Genitals inclosed. Lobes of corolla roundish, quite entire.

Great-flowered Treverania. Pl. 1 foot.

3 T. HETEROPHY'LLA (Mart. nov. gen. bras. 3. p. *56.)* plant sparingly pilose; leaves opposite, the one smaller than the other, cordate ovate, acuminated, coarsely serrated. 1/. S. Native of Mexico, Karwinski. Largest leaves 1-3 inches long. Flowers solitary, or twin. Corolla scarlet; lobes roundish, ciliated. Genitals inclosed.

Variable-leaved Treverania. Pl. \ to 1 foot.

Cult. The species of this genus are exceedingly beautiful when in flower, like most of the other genera of the present order. A mixture *of* sand, loam, and peat is the best soil for them. As soon as the plants are done flowering they should not have any water given to them until the roots begin again to vegetate, when they should be taken out of the pots and divided. Five or six strong roots are sufficient for a sixty size pot. After this has been done, they require moisture and warmth to make them grow strong, and flower in perfection.

Tribe I.

Gloxinieæ. The genus Gloxinia is the only one that we are aware of which contains plants agreeing with the characters given below.) Calyx usually adhering to the ovarium; therefore half inferior.

Subtribe I.

Unis subtribe contains plants agreeing with the characters given below.) Calyx adnate to the ovarium. Corolla half inferior, perigynous.

II. GESNERIA (name given by Plumier in honour of Conrad Gesner, of Zurich, the famous botanist and naturalist.) Lin. gen. no. 749. Gsertn. fruct. 2. p. 472. t. 177. Juss. gen. 165. ed. Usteri. p. 184. H. B. et Kunth, nov. gen. 3. p. 392. Mart. nov. gen. bras. 3. p. *27.*

LIN. SYST. *Didynamia, Angiospermia.* Calyx adnate to the ovarium; limb nearly equally 5-lobed, free. Corolla semisuperior, tubular, with 5 gibbosities at the base; limb sub-bilabiate: upper lip drawn out, emarginately 2-lobed: lower lip 3-lobed. Stamens didynamous, with the rudiment of a fifth

behind ; anthers at first cohering into a round head. Glands 5, or fewer around the ovarium. Capsule dry in the calyx, 1-eelled, incompletely 2-valved ; placentas 2, parietal, many-seeded. Seeds scobiform.—Perennial plants, furnished with solid fleshy tubers of various forms; but in most of the species these tubers are nearly globose or placentiform, which send forth the stems every year. The plants are beset with compound, articulated hairs, and often with glandular, clammy pili. Stems simple, or branched, woody, or annual, terete, rarely angular. Leaves opposite, or verticillate, on short petioles, entire, toothed, or serrated, thickish, clothed with soft villi, which is often silky, but paler and more densely villous beneath. Buds naked. Leaves complicate. Flowers disposed in opposite cymes, constituting a terminal thyrse; the peduncles furnished with floral leaves, or bracteas at the base: rarely disposed in racemes or spikes. Corollas scarlet, or purple, rarely green, of one colour, or spotted with others, usually pubescent. This beautiful genus is diffused throughout the tropical parts of America, particularly in the fissures of moist rocks, and in shady, moist places.

* *Peduncles radical.*

1 G. TUBEROSA (Mart. nov. gen. bras. 3. p. 29. t. 212.) stem rhizomatoid, horizontal, marked by the cicatrices of the fallen leaves ; leaves opposite, broad-ovate, toothed, cordate at the base, clothed with soft pubescence, but hairy on the nerve and veins beneath ; peduncles from the base of the rhizomatose roots ; limb of corolla erectish, nearly equal ; hypogynous glands twin behind. %. S. Native of Brazil, in the mine provinces near Villa Rica, in the fissures of rocks. Tuber nearly globose, 1 to 1| inch in diameter. Peduncles radical, erect, numerous. Corollas tubular, erect, scarlet.

Tuberous-rooted Gesneria. PI. \ foot.

* * *Cymes terminal, umbellate,*

2 G. RUPICOLA (Mart. nov. gen. bras. 3. p. 30. t. 213.) the whole plant villously pubescent; stem a span high, leafless at top; leaves opposite, on short petioles, broad ovate, or obovate, purplish beneath, crenated ; cymes terminal; limb of corolla erectish, nearly equal; hypogynous glands 5. %.&. Native of Brazil, in the mine provinces, in high, exposed places. Tuber size of a filbert or walnut. Superior part of stem scape-formed. Floral leaves 2, sessile, under the cyme. Corollas tubular, scarlet.

Rock Gesneria. PI. \ to f foot.

3 G. CANESCENS (Mart. 1. c. p. *36.)* clothed with hoary villi; stem erect; leaves opposite, and 4 in a whorl, broad-ovate, acutish at both ends, a little toothed ; cymes terminal, few-flowered ; corolla clavately cylindrical: limb short, nearly equal; hypogynous glands 2, behind, *y..* S. Native of Brazil, in shady rocky places in the province of St. Paul, and on Serra do Mar. Stem purplish. Leaves 1 to lj inch long. Cyme of 3-G-8 flowers. Floral leaves under the cyme sometimes 4. Corolla scarlet, an inch long. Hypogynous glands linear-oblong, truncate.

Canescent Gesneria. PL f to 1 foot.

4 G. DOUGLA'SII (Lindl. in bot. reg. t. 1110. Mart. nov. gen. bras. *3.* p. *33.)* clothed with fine pubescence ; stem erect; leaves falsely verticillate, 4-5-6, rarely opposite, ovate, acute, crenately toothed; cyme terminal, simple, or compound ; limb of corolla nearly equal; hypogynous glands twin behind. %. H. Native of Brazil, in woods near Rio Janeiro, and in the tract of mountains of Serra do Mar, in various places. G. maculata, Mart. nov. gen. bras. t. 215. G. verticillata, Hook. bot. mag. t. 2776. Tuber nearly globose, *I?* to 2 inches in diameter. Stems solitary, or numerous from the tuberous, irregularly Corollas 1| inches long, drooping, rose-coloured, blood-marked with longitudinal, blood-coloured, or brownish coloured stripes and spots. 2fi pi. 2 to

Douglas's Gesneria. Fl. Aug. Sept. Clt. 1826. 3 feet.

* * * *Peduncles axillary,* 2, *or many-flowered, cymose.*

5 G. LATIFOLIA (Mart, in Otto, et Link, verh. 218. t. 1. nov. gen. bras. p. 34.) plant * Jjfviilous; stem erect; leaves opposite, broad, ovate-oblong, obtuse, upwards or elliptic, coarsely toothed; cymes axillary, equal tube into a terminal thyrse ; corolla cylindrical, with an 4, bebin(1. limb short, erect, nearly equal; hypogynous glana *V.* S. Native of Brazil, in the provinces of St. r* dianiet er, Geraes, in shady, rocky places. Tuber large, a span placenta-formed. Stems simple, numerous Irony Corolla all Leaves 4-7 inches long. Cymes 5-12-nowerea. bi- inch long, beautiful scarlet, villous outside ; tuu gibbous from the base downwards.

Broad-leaved Gesneria. PL l£ to 2 feet.

6 G. AGGREGATA (Ker. bot. reg. t. 329.) clothed with subviscid villi; stem erect, branched; leaves opposite, especially a whorl, oblong-ovate, acutish at both ends, villous on the veins beneath, crenated ; peduncles axillary, coarsely bi' ered, verticillate, 2 to 8, length of corolla, wine erect 5 gibbous behind, clavately cylindrical : limb nearly woods hypogynous glands 4-5. %. S. Native of Brazil, about Rio Janeiro, and elsewhere. G. penduhna, G. reg. t. 1032. This species agrees in some points Jla before. *latifblia,* particularly in the form of the corolla, yel!o florescence often tricoloured ; that is, scarlet at- mbous in the middle, and greenish at top; tube broadly often the base downwards. The 2 hind hypogynous giai combined in one. Clt.

Aggregate-flowered Gesneria. FL July, PL 2 feet.

7 G. DEPPEAVA (Cham, et Schlecht, in not s tomentum on the superior surfaces of the leave wish gosely scabrous; that on the lower surfaces y not fuscescent; the crense, tomentum of stems, calyx spreading, not reflexed; anthers exserted ; ate narrower, more acute, triangular, and the of than in (7. *elongdta,* H. B. et Kunth. If. S. - guna. ico, in the woods of Jalapa ; and at the Hacienda G. vetulina, Willd. herb. no. 11253. Nearly ainecalyxes, and the smaller corollas, which are also s

Deppe's Gesneria. PL

8 G. BULBOSA (Ker. bot. reg. t. 343.) tely leaves opposite, broad-ovate, cordate, acutish; axils of nated; cymes many-flowered, spreading from V- leaves, and disposed upwards into a terminal thyrse. lip of corolla very long; hypogynous glands Native of Brazil, in shady rocky places at Villa the mountains of Serra dos Orgaos, at the altitu 3000 feet. Leaves very like those of *G.* variable J tinguished by the figure of the corolla. It is the size of the corolla; and the cymes are some ed into a terminal thyrse, and sometimes otnei Corollas scarlet. pi. 181^.

^M/6ow5-rooted Gesneria. FL May, July. ft. anched; leaves

9 G. SELL6WII (Mart. 1. c.) stem pilose,

Pposite, on short petioles, cordate-ovate, acute, serrated, hairy above, and hoary from tomentum beneath ; cymes many-flowered, disposed into a long thyrse ; corollas clavately cylindrical; hmb short, nearly equal; hypogynous glands 4. %. S. Native of Brazil, in the province of Rio Grande do Sul, on Mount Butucaray, Sello. Leaves 5 inches long, and nearly 3 wide. Cymes opposite.

Selo's Gesneria. PI. *2* to 3 feet.

10 G. MICELIA (H. B. et Kunth, nov. gen. amer. 2. p. 395, t. 189.) acuminated, lanceolate ; leaves opposite, obliquely ovate-oblong, densely pilose, rounded at the base, sub-cordate, serrately crenated, pedunculate, and pilosely pubescent above, silvery and pilose beneath ; peduncles axillary, 3-flowered ; corolla tubular, inflated at top, bilabiate, limb 5-cleft, nearly equal, spreading ; hypogynous glands twin. %. S. Native of New Granada. Leaves 3 inches long, and lj inch broad. Corolla scarlet; limb spotted.

Sofic Gesneria. PI. ?

hoary d. MACROSTACHYA (Lindl. bot reg. t. *1202.)* clothed with cordate, ovate, crenated, wrinkled ; cymes from the axils of the upper leaves, terminal, compound raceme ; corolla tubular, bilabiate: limb nearly equal, short ; hypogynous glands twin behind the rest. %. S. Native of Rio Janeiro. Root tuberous, like *Lnn* ; Ora scarlet; limb spotted.

Long-spi/ced Gesneria. Fl. Aug. Clt. 1825. PI. 2 feet, clothed. LONGIFLORA (H. B. et Kunth, 1. c. p. 396.) branches acute, pilose, with woolly hairs; leaves opposite, obliquely ovate, finely acuminated into the short petioles at the base, crenated, 2fi. above and pubescent beneath ; peduncles axillary, 2-flowered ; corolla spreading, tubular, woolly : limb nearly equal, 5-cleft, hypogynous glands unknown. %. S. Native of New Granada. Leaves 4-5 inches long, and 2\ broad. Corolla purplish, ventricose at top ; limb spotted.

Long-flowered Gesneria. PI.?

13 G. LONGIFLORA (H. B. et Kunth, 1. c. p. 396.) branches tetragonal, clothed with woolly hairs ; leaves opposite, oblong or lanceolate, acute at the base, somewhat crenated, scabrous from the above, and clothed with fuscescent, woolly tomentum beneath ; peduncles axillary, 4-flowered, elongated ; corolla tubular, ventricose at top, hairy; limb 5-cleft, nearly equal, hypogynous glands unknown. %. S. Native of Quito. Leaves 7 inches long, veins purplish beneath. Corolla scarlet: limb spotted.

Plunged-flowered Gesneria. Shrub ?

U. CORDATA (Swartz, Prod. p. 89. fl. ind. occ. 2. p. 1016. US) rough, subdivided; leaves opposite, ovate, acute, serrated, short petioled, clothed with hoary tomentum beneath, cordate at the base ; peduncles terminal and axillary, many-flowered ; corolla cylindrical, incurved : 2 upper segments of the limb concave : the 3 lower ones longer, with crenated edges. %. S. Native of the South of Jamaica, in rocky places, on the banks of rivers. Leaves 2 inches long. Corollas scarlet.

Pl. Gesneria. Fl. June, Aug. Clt. 1822.

305. JASIANTHA (ZUCC. abhandl. acad. wiss. 1829, 1830. p. 1. t. 1.) Stem shrubby, branched, hairy; leaves petiolate, silky hairy, ovate-lanceolate, acuminated, serrulated, clothed with hairs at the base, with 4-flowered peduncles 4-flowered ; tube of corolla equal at the base, with 4 sinuosities; hypogynous glands 5, minute. F?. S. Native of Mexico. Corolla downy. Nearly allied to *G. Deppeana* Schlecht. et Cham. in Linnsea, 5. p. 110.

Many-flowered Gesneria. Shrub 2 to 3 feet.

* * * * *flowers verticillate, spicate, or racemose,*

16 G. SCEPTRUM (Mart. nov. gen. bras. 3. p. 32. t. 214.) villous ; leaves on short petioles, opposite, or 3 in a whorl, from subcordate at the base to oblong, bluntly serrated; whorls of flowers almost leafless at top, disposed in an elongated thyrse ; pedicels about the length of the corolla; upper lip of corolla drawn out; hypogynous glands 4 or 5. %. S. Native of Brazil, in the province of St. Paul, at Mogy das Cruce, along the banks of the Sapucahy river. Tuber large, depressed, globose. Leaves 2-3 inches long, villous. Stems simple.

Far. a, *rubra* (Mart. 1. c.) leaves with more parallel margins, lanceolate-oblong, acute, *3-5* inches long; peduncles loose and longer ; corollas red, or scarlet.

Far. y,fldvida (Mart. 1. c.) leaves broader, broad ovate-oblong, 4-6 inches long; peduncles loose and longer ; corolla pale yellow.

Far. y, *ignea* (Mart. 1. c.) leaves smaller, lj to 2 inches long, obtuse, rarely crenated, more densely pubescent beneath and canescent; peduncles shorter, strict; corollas pale fire coloured, reddish towards the edge of the limb.

Sceptre Gesneria. PI. 3 to 4 feet.

17 G. CHELONIOIDES (H. B. et Kunth, nov. gen. 2. p. *392.)* stem nearly simple, hairy ; leaves opposite, on short petioles, oblong, acutish, obtuse at the base, coarsely crenated, hairy *on* both surfaces, canescent beneath ; flowers spicate, opposite, solitary or twin; corolla tubular, hairy, gibbous above at the base : throat wide; hypogynous glands 5. 1/. S. Native of New Granada, in shady places in the valleys of Gualguase and Smitha, between Popayan and Almaguer, at the altitude of 580 to 700 hexapods. Leaves 3 inches long. Flowers pedicellate. Limb of corolla bilabiate: lobes all rounded. Corolla pale red. Ovarium only adhering to the calyx at the base.

Chelone-Rke Gesneria. PI. 3 to 4 feet.

18 G. ELATIOR (H. B. et Kunth, nov. gen. 2. p. 393.) stem simple ? pilose; leaves 3 in a whorl, nearly sessile, lanceolate, obtuse at both ends, crenated, pilose, but more densely so beneath ; spikes terminal, verticillate; whorles 3-flowered, remote ; corolla clavately cylindrical, villous; hypogynous glands 5. %. H. Native of New Andalusia, in shady places on Mount Tumiriquiri, at the altitude of 600 hexapods. Leaves on short petioles, canescent beneath, *2* inches long, and 7 lines broad. Flowers pedicellate, drooping. Corolla tubular, inflated at top, red.

Taller Gesneria. PI. 3 to 4 feet.

19 G. SYLVATICA (H. B. et Kunth, 1. c.) stem simple, pilose; leaves 3 or 4 in a whorl, lanceolate-oblong, acuminated, quite entire, strigosely pilose on both surfaces, but especially beneath; spike terminal, verticillate; whorles 2-4-flowered : lower ones distant; corolla tubularly ventricose; limb 5-lobed, reflexed ; hypogynous glands unknown. %.. S. Native of the province of Bracomoros, between Jaen and the river Amazon, at the altitude of 230 hexapods. Leaves canescent beneath, \\ inch long, and \ an inch broad. Flowers pedicellate. Corolla 8 lines long, scarlet, pilose outside.

Wood Gesneria. PI. 2 to 3 feet.

20 G. SPICATA (H. B. et Kunth, 1. c. t. 188.) stem subTruticose, simple, pilose ; leaves 3 in a whorl, on short petioles, lanceolate-oblong, acuminated, crenated, densely pilose above, and clothed with woolly tomentum beneath ; spike terminal, verticillate; whorles 10-flowered, approximate ; corolla tubular, incurved, hairy: limb 5-cleft: the 2 upper segments rather the largest; hypogynous glands 5. Tj . S. Native of New Granada, in boggy places near Ibrgue, at the foot of Mount Quindiu; also near the Hacienda de La Laguna, in Mexico, at the

altitude of 1730 hexapods. Leaves 5 inches long, and lj inch broad. Flowers pedicellate. Corolla scarlet. The Mexican plant usually has 4 leaves in a whorl, very scabrous above. The hairs of the stem are sometimes adpressed, of a fulvescent colour, not purplish. Corollas purplish.

Spicate-fiowered Gesneria. Clt. 1831. PL 3 to 4 feet.

21 G. ALLAGOPHY'LLA (Mart. 1. c.) stem erect, pilose, usually trigonal; leaves villous, nearly sessile, 3 in a whorl, or opposite, or scattered, linear-oblong or spatuiate, obtuse, crenated; flowers sessile, in whorls, disposed in a long terminal spike; tube of corolla cylindrical, pilose; limb equal, spreading, glabrous; hypogynous glands 2, behind. 1/. S. Native of Brazil, in the mine provinces, in various places. Lindl. bot. reg. t. 1767. Tuber large, often a span in diameter, placentiform. Superior leaves more approximate than the others. Floral leaves ovate, acutish, serrated. Lower whorles of flowers 2-3 inches distant, but more approximate upwards; sometimes the peduncles are scattered, and therefore constituting a long spike. Corolla scarlet, pilose.

Changeable-leaved Gesneria. FL May, July. Clt. 1835. PL 2\ to 3 feet.

* * * * * *Peduncles axillary, l-Jlowcred, solitary, or aggregate.*

22 G. PRASINA'TA (Ker. bot. reg. t. 428. Mart. 1. c. p. 37.) villous; stem erect; leaves opposite or 3 in a whorl, ovate or ovate-oblong, serrated; peduncles axillary, shorter than the corolla, which is campanulate, villous outside, with a nearly equal limb; hypogynous glands 5. %. S. Native of Brazil, in fields at Villa Rica, and elsewhere, in the mine provinces. Codonophora grandiflora, Lindl. in bot. reg. under no. 1112. Corollas scarlet? larger than those of *G. allagophylla,* campanulate.

Green Gesneria. FL May, July. Clt. 1818. PL lj to 2 feet.

23 G. RUVTILA (Lindl. bot. reg. 1158. Mart. 1. c. p. 34.) villous; stem erect; leaves opposite, oblong-lanceolate, acutish at both ends, coarsely crenated; peduncles axillary, shorter than the corolla; superior lip of corolla drawn out; hypogynous glands 2, behind. 1/. S. Native of Brazil, in shady woods, in a moist soil, and in the fissures of rocks near Rio Janeiro, and in the tract of the mountains called Serra dos Orgaos, in various places. This species differs from Cr. *sceptrum* in the smaller stature, slenderer, usually purplish, stem, opposite, narrower, more or less attenuated leaves, shorter, interfoliaceous peduncles, which are not disposed into a terminal thyrse; and in the corolla, which is always scarlet, of a deeper colour towards the margins, more constricted towards the base, and more ventricose towards the mouth, and in the hypogynous glands being only 2.

Var. /3, *atrosanguinea* (Bot. reg. 1279.) Corolla deep scarlet.

Brilliant Gesneria. FL Aug. Sept. Clt. 1825. PL 1 to 2 feet.

24 G. ULMIFOLIA (H. B. et Kunth, nov. gen. 2. p. 394.) shrubby? branches subtetragonal, and pilose; leaves opposite, ovate, acute, obliquely cordate at the base, crenated, blistered and scabrous above, reticulated and clothed with hairy pubescence beneath; peduncles axillary, 1-flowered, by threes or fours; corolla tubular, inflated at top, pilose outside; limb quinqnefid; *2* superior lobes the largest; ovarium girded by a yellow ring. ^ • S. Native of Quito, between Chillo and Sangolgui, at the altitude of 1350 hexapods. Leaves petiolate, 32-33 lines long. Flowers erect. Corolla scarlet, 4 times longer than the calyx. This belongs to a different genus, if the ovarium is really surrounded by a ring instead of glands.

Elm-leaved Gesneria. Shrub. ?

25 G. HIRSU'TA (H. B. et Kunth, 1. c. p. 394. t 1890 shrubby; branches very hairy; leaves opposite. °blong-o%a natcd, rounded at the base, tomentosely pilose above, a ed with woolly tomentum beneath :: peduncles appary, ered, twin; corolla tubular, inflated, hairy outside; glands hairy. I; S. S. Nti Native of the province of the monastery of Caripe, at the altitude of ^. 0 V veins Leaves on short petioles, about 3 inches long, having and margins purplish beneath. Flowers looping times longer than the calyx, ventncose at top, purpi 5 roundish spreading, spotted lobes.

Hairy Gesneria. HFIJ June, Aug. Clt. 18^.

26 G. HONDE'NSIS (H. B. et Kunth, L c. ?'**£ oppOstem nearly terete, clothed with silky white wool leav^ J ^ site, somewhat obliquely ovate-oblong, acumin f TV with white base, crenulated, very scabrous above, and cfome twoS and wool beneath; peduncles axillary, 1-flowereel, vv outside; limb threes; corolla tubular, ventricose at top, nany bidentate#. nearly equal; hypogynous glands 5, truncate, SUD- S. Native of New Granada, in rocky places near U J ^ 4j Honda, at the altitude of 150 hexapods. Leaves f. hajrs: inches long. Corolla yellowish green, beset with scan limb spotted with purple.

Honda Gesneria. PL 1 to 3 feet.

27 G. SUTTONI (Booth, in bot. reg. 1637.) stei- tevete, to- mentose; leaves ovate-cordate, crenated, tomento peduncles axillary, solitary, 1-flowered; upper lip of corolla dulated: lower one small, revolute. ^ • &• - Native of R,o Janeiro, near the bay of Bomviaga. £ oot ^ [£ large, scaropposite, green above, and hoary beneath. l^oroi let, downy, swelling at the base. pi. 2 feet-

'Sultan's Gesneria. FL July, Aug. Clt. 18<W.

28 G. TUBIFLORA (Cav. icon. 6. p. 61. t. 5S^ tetJ·ag0- *ried,* tonal, tomentose; leaves ovate, acuminated, cr or mentose; peduncles 1-flowered, axillary, by t*os corolla tomentose, tubularly ventncose, st^c renatures or contracted: limb small, equal, of 5 diverging, ere teeth. %. S. Native of Panama. . ^ V ^ W n t o s e, Peduncles unequal, longer than the petioles, Jong, adherent, with lanceolate segments. Cor°"a £ ^^ perscarlet. Hypogynous glands 5, obtuse, ^ap haps a distinct genus.

Tube-Lowered Gesneria. PL 1| to 2 feet.

29 G. VERTICILLA^TA (Cav. icon. 6. p. f L) stem tetragonal, villous; leaves ovate, crenulated, vi beneath; sile, hispid above, and clothed with hoary-tornei and appearing peduncles 1-flowered, numerous, axillary, villous, urceolate* as if they were verticillate; corolla villous, tuDUf , spreading throat contracted: limb equal, of 5 short, 'ounae, crenatures or teeth. %. S. Native of New G ^ f * an incb Guaranda and Chimborazo. Leaves opposite, nar long. Corolla scarlet, 3 lines long.

Whorled-flowered Gesneria. PL 1 foot.

N.B. What is Gesneria acaulis, Lin. *i*

Cult. All the species *of* this genus are very flower; they are, therefore, great favourites with cc light rich soil, or a mixture of loam, peat, ana them best. Most of the species are readily P r ^ o ^ s while in tings, and by the tubers of the root. dormant state should have no water given to tliem.

III. GLOXI'NIA (so named by L ' H e ^ ^ S Benj. Petr. Gloxin, of Colmar, author of U nicse." Argent. 1785. 4to.) Lher. stirp. i* kew. 2. p. 331. Mart. nov. gen. bras. 3. P« *

species Lin.—Paliava, Velloz. in Vand. script, t. 7. f. 17. Sinningia, Nees.

LIN. SYST. *Didynamia, Angiospermia.* Calyx adnate to the ovarium, to the middle : limb 5-parted, free. Corolla semisuperior> oblique, funnel-shaped, or campanulately subringent, gibbous behind at the base ; tube ventricose: limb spreading : upper lip 2-lobed : lower one 3-lobed. Stamens 4, didynamous, with the rudiment of a fifth behind. Glands 5, perigynous. Style 1. Capsule 1-celled, 2-valved ; placentas 2, parietal, 2-lobed. Seeds numerous, oblong. Root a thick unequal tuber.—Plants sometimes stemless, therefore the flowers and leaves rise immediately from the root, sometimes with simple, terete, soft stems. Leaves opposite, petiolate, thick, for the most part crenated or serrated. Gemmation naked. Flowers large, axillary, solitary, or many, aggregate, drooping, violaceous, greenish-yellow, or white, of one colour, or obscurely spotted, and striped with other colours. Native of tropical America, on the east coast, in wet shady places of woods, and on humid rocks, and sometimes at the roots of trees.

SECT. I. EUGLOXI'NIA. (This section is supposed to contain the true species of the genus.) Calyx terete. Corollas violaceous, bluish or white.

1 G. CAULESCE'NS (Mart. nov. gen. bras. *3.* p. 64. t. 226.) caulescent; stems elongated, rather pilose, as well as the leaves ; leaves oblong, attenuated at both ends, acute, serrated; flowers axillary> solitary or twin; calyx terete, with long, acuminated segments; corolla downy. 1/. S. Native of the province of St. Janeiro, in humid places, upon stones at Mount Corcovado, near Tejuco. Tuber size of a small apple, nearly globose. Stem 1 to 2 feet high, distant> stout, inches long, pale, and rather reddish below. Corolla an inch and a half long, blue or pale violet, very like that of *G. cauUscens* and *G. speciósa.*

Reader Gloxinia. PL 2 to 4 feet.

2 G. CAULE'SCENS (Lindl. bot. reg. 1127.) caulescent; leaves ovate, crenated, obtuse, tomentose, with revolute edges; pedunncles solitary> axillary> elongated; corolla downy: segments oblong, equal: middle one cordate-ovate, all undulated ; calyx cibsa, with acuminated segments, exactly like that of *G. speciósa.* Native of Pernambuco. Corolla large, a little archp drooping> bluish purple.

Cm Gloxinia. FL July, Aug. Clt. 1826. PL \ to 1 foot.

3 G. MACROPHY/LLA (Nees et Mart, in nov. act. bonn. 11. p. 66) Nearly stemless 5 leaves ovate, clothed with soft pubescence sessile, shorter than the flowers, crenated, obtuse ; flowers nutant; calyx large, 5-cleft, with triangular acuminated Segments. Leaves 8 inches long, and *b*\ inches-broad. Corolla blue Native of Brazil. Sims, bot. mag. 1191. Martynia perennis, Lin. spec. 862. Mill, diet. no. 2. Med. bot. beot. 1783. p. 238.—Martynia foliis serratis, Lin. hort. cliff, p. 322. t. 18.—Ehret. pict. t. 9. f. *2.* Root scaly, like that of *Dentária.* Corolla purplish-blue.

similar to the *Speciósa,* but smaller. This species is sessile, or *G. speciósa,* but differs in the flowers being in nearly the flowering smaller.

4 *Downy-leaved* Gloxinia. PL \ to | foot.

5 G. MACULVTA (Lher. stirp. t. 149.) caulescent ; stems simple, spotted ; radical leaves cordate, obtuse, doubly toothed, shining above, and reddish beneath ; cauline leaves petiolate, roundish-ovate, simply toothed ; peduncles axillary, 1-flowered, solitary ; calyx glabrous, with oblong obtuse segments ; corolla downy. 1£. S. Native of America, about Carthagena. Sims, bot. mag. 1191. Martynia perennis, Lin. spec. 862. Mill, diet. no. 2. Med. bot. beot. 1783. p. 238.—Martynia foliis serratis, Lin. hort. cliff, p. 322. t. 18.—Ehret. pict. t. 9. f. *2.* Root scaly, like that of *Dentária.* Corolla purplish-blue.

Spotted-stemmed Gloxinia. FL July, Oct. Clt. 1739. PL 1 foot.

6 G. HIRSU'TA (Lindl. bot. reg. t. 1004. Hook. bot. mag. 2690.) stemless, very hairy; leaves ovate-roundish, wrinkled, hispid, rather cordate at the base; scapes or peduncles aggregate, 1-flowered ; calyx tubular below, with lanceolate segments ; corolla funnel-shaped : tube narrow : limb spreading, with obtuse or retuse unequal lobes.]/. S. Native of Brazil. Leaves lying flat on the ground. Corolla pale blue, downy, striped with darker veins; the interior of the tube yellow, with darker spots.

Hairy Gloxinia. FL June, Aug. Clt. 1824. PL ± foot.

SECT. II. SINNI'NGIA (W. Sinning, gardener to the University of Bonne, on the Rhine.) Mart. nov. gen. bras. *3.* p. 64. Sinningia, Nees, in ann. scienc. nat. 6. p. 297. t. 12. The whole of the calyx, or only the bottom of it, angular or winged. Flowers white, yellowish green, or pale yellow.

7 G. SCHOTTII (Mikan. del. bras, p. 4.) leaves glabrous, cordate, ovate, serrated, ciliated ; calyx turbinate, twice as long as the ovarium. %. S. Native of Rio Janeiro. Sinningia Helleri, Nees, 1. c. Lindl. bot. reg. 997. Corolla pale yellow or greenish yellow.

SchotCs Gloxinia. FL June, July. Clt. 1820. PL 1 foot.

8 G. GUTTA'TA (Mart. 1. c.) leaves oblong-lanceolate, attenuated at the base, pubescent, lucid, serrated ; corollas spotted ; calyx cylindrically campanulate, 3 times as long as the ovarium. %. S. Native of Brazil. Sinningia guttata, Lindl. bot. reg. t. 1112. Corolla downy, pale, almost white, spotted inside with livid purple.

AS^offcd-flowered Gloxinia. FL July. Clt. 1826. Shrub 1| foot.

9 G. VELUTINA (Mart. 1. c.) leaves oblong, subcordate, velvety ; calyx cylindrically campanulate, 3 times as long as the ovarium. 1/. S. Native of Brazil. Sinningia velutina, Lindl. bot. reg. under no. 1112. Corolla pale yellow.

Velvety Gloxinia. FL July. Clt. 1826. PL 1| foot.

10 G. VILLOSA (Mart. 1. c.) stem and leaves villous; calyxes 5-parted, length of ovarium ; flowers aggregate. %. S. Native of Brazil. Sinningia villosa, Lindl. bot. reg. 1134. Larger than other species of this section. Corolla pale yellowish green.

Villous Gloxinia. FL July. Clt. 1826. PL 1| foot.

11 G. DU'BIA; calyx tubular, 5-angled, foliaceously winged, with a 5-cleft mouth ; corolla with an inflated sub-bilabiate limb ; rudiment of fifth filament inserted above the base of the corolla ; hypogynous glands 5, alternating with the filaments ; fruit capsular, rather fleshy. J?. S. Native of Mexico. Gesneriacese, Genus nova, Nees, in Linnsea, 1. p. *305.*

Doubtful Gloxinia. Shrub.

Cult. Gloxinia is a genus of splendid plants, and great favourites with gardeners. A light rich soil, or a mixture of sand, loam, and peat, suits them well. *G. maculata* is increased by dividing at the root; and it should be kept free from suck-

ers, and only a single stem in a pot, or it will not grow strong enough to flower. The rest of the species flower freely, and strike readily from cuttings. The leaves of *G. speciosa,* and probably of most others, if taken off close to the stem, and planted, will strike root, and make each a plant.

Subtribe II.

CONRADIE^N^ (this section agrees with *Conradia* in the character given below.) Calyx adnate to the ovarium. Corolla superior. Leaves alternate or scattered, not opposite, as in the last section.

IV. RYTIDOPHY'LLUM (from *fane fanSog, rytis rytidos,* a wrinkle; and <*pv\\ov, phyllon,* a leaf; leaves blistered.) Mart. nov. gen. bras. 3. p. 38.—Gesnèria species, Lin. and Swartz.

LIN. SYST. *Didyndmia, Angiospermia.* Calyx wholly adnate to the ovarium ; limb 5-toothed or 5-cleft. Corolla superior, campanulate, constricted in the middle; limb 5-lobed. Stamefts 4, didynamous, with the rudiment of a fifth behind ; anthers free or anisogeneous, and cohering. Disk epigynous, thick, annular, sinuous. Capsule dry, combined with the somewhat 5-ribbed calyx; top flat, 2-valved ; placentas 2, parietal, many-seeded.—Small trees and shrubs, with fibrous roots. Branches alternate and scattered, hairy. Leaves stipulate, on short petioles, scattered, very hairy beneath ; the parenchyma in the upper surface elevated into small blisters, each bearing a hair at apex. Flowers cymose, on peduncles which rise from the axils of the superior leaves, green, of one colour, or spotted with blood-colour, or wholly blood-coloured.

1 R. TOMENTOSUM (Mart. 1. c. p. 39.) branches hairy ; stipulas roundish, revolute, crenated, tomentose ; leaves oblong, acuminated, narrowed at both ends, serrated, reticulated, and clothed with hoary pubescence beneath, and papillosely rough above; corymbs axillary, on long peduncles ; calyx villous, with a 5-parted equal limb. f? . S. Native of tropical America, on the banks of rivers and rivulets. Gesnèria tomentdsa, Lin. spec. 851. Mill. diet. no. 1. Jacq. amer. 179. t. 175. f. 64. pict. 89. t. 261. f. 2. Sims. bot. mag. 1023. Codonophora lanceolata, Lindl.—Sloane, hist. 1. p. 162. t. 104. f. 2. Corollas spotted with yellow and dark purple. What is Gesnèria tomentosa, H. B. et Kunth, nov. gen. 2. p. 396, which is described as a herbaceous plant, with a fusiform root, a simple procumbent stem, and opposite leaves.

Tomentose Rytidophyllum. Clt. 1759. Shrub 2 to 4 feet.

2 R. GRA'NDE (Mart. 1. c.) branches hairy; leaves broad-lanceolate, very long, denticulated, hairy, scabrous above, petiolate ; peduncles long, terminal and axillary, dichotomous ; pedicels usually 3-flowered ; segments of calyx acute, equal. J? . S. Native of Jamaica, on the mountains. Gesnèria grandis, Swartz. prod. 89. fl. ind. occ. 2. p. 1018. Leaves scabrous and white beneath. Flowers large, greenish-yellow. Corolla irregular, dilated at the base ; limb ventricose towards the top ; upper lip large, arched, bifid.

Great Rytidophyllum. Shrub 6 to 15 feet.

3 R. BERTEROANUM (Mart. 1. c.) branches densely hairy; stipulas subulate; leaves lanceolate, acuminated at both ends, doubly toothed, scabrous from hairs beneath, and papillosely rough above ; calyx villous, with setaceously elongated segments. *? . S. Native of the island of St. Domingo, on rocks. Gesnèria seabra, Spreng. syst. 2. p. 838. but not of Swartz.

Berteros Rytidophyllum. Shrub.

Cult. This is a beautiful genus, like the rest of the present order. A light rich earth, vegetable mould, or a «ixtur? of ngs loam, sand, and peat, is good soil for the species; and cutti o strike root readily in heat.

V. CONRADIA (named after Conrad Gesner, see Gesnèria.) Plum. and Mart. nov. gen. bras. 3. p. 38. Gesnèria species, Swartz. . . r'oi.rv wholly adnate

LIN. SYST. ***Didynamia, Angiospermia.*** **Calyx** vv olla, ^^ to the ovarium ; limb 5-cleft or 5-toothed, free, do ^^ rior, tubular or campanulate; limb somewhat e bel)ind. Stamens 4, didynamous, with the rudiment ol djsk anthers usually cohering into a round head, ribbed ca,yX(wanting. Capsule dry, clothed with a 5 or iu- seeded. flat on the top, 2-valved; placentas *, pane tal,ornan^ ^ Seeds scobiform.—Shrubs, rarely herbs, with n alternate M> or Branches alternate or scattered. Leaves petiolate, gtiffigh scattered, towards the tops of the branches, rougn labrolis, white hairs, particularly on the nerves and veins, lare Qn usually toothed. Flowers disposed in few-Howereu Qt peduncles which rise from the axils of the upper lea green, spotted with blood-colour, white or pale.

SECT. I. SYNANTHE^RA (from *aw, syn,* togethei; and *anthera,* an anther.) Stamens inclosed. Antner all connected into a round head.

1 C. HiTMiLis (Mart. 1. c.) leaves lanceolate, serrated, sessile; peduncles dichotomous, 3-7-flowered, very long ; calyx rampa- nulate, 5-toothed ; corolla campanulate, humilis, live of Tropical America, and the West Indies p', gen. «• Lin. spec. 850. G. humilis flore flavescente, PJum. spots icon. 133. f. 2. Corolla yellowish green, vwtl. within.

Humble Conradia. Shrub 2 feet.

2 C. CRAHIOLA'EIA (Mart. 1. c.) leaves ovate, acu«» sub-runcinate, toothed, glabrous above and "«ry ^ calyx camdowny, with linear lanceolate, reflexed Begnenis of Hispaniola, panulate ; limb nearly regular, h • S- N^ Ve craniolar«. among broken rocks on the mountains. **sneria fr ^^ Swartz, prod. 89. fl. ind. occ. 2. p. 1015. Cianiou Leave g 4 6 Lin. spec. 861.-Plum. gen. £7, icon, t.187. dark pu ^ inches long. Corolla green outside, hairy, ana la lacinately Margins of the segments of the lower lip oi coro.

^cla'niolaria-Wke Conradia. Shrub 3 to 4 ^et- serrated,

3 C. SCAWA (Mart. 1. c.) leaves ovate-lanceolate, scabrous ; calyx scabrous, with ovate, ac«te, blood ual. ^ - g. ments ; corolla incurved, cylindncal: limb nearly eq^^ scabr8(Native of Jamaica, on calcareous rocks. Leaves petiolate, Swartz, prod. 89. fl. ind. occ, 2. p. 1020. beneath. Corolla scabrous above, wrinkled, hispid, and lioary small, blood red.

Scabrous Conradia. Shrub 2 to 4 feet.

SECT. II. DITTANTHE^A (from « ™ J ^ *uyOvpa, anthera,* an anther.) Stamens exserted , nected by pairs.

4 C. VENTRICOSA (Mart. 1. c.) let, veS/Ser'edrcalyc crenated, glabrous; peduncles usually *-J°*leal, incurved- segments subulate, elongated ; corolla cylin. g> Native of segments of the lower lip crenately ciliated. p. 90. Jamaica, Martinique. Gesnèria ventricosa, bwa Leaves fl. ind. occ. 2. p. 1028. Pentaraphia long.flo.a, ^

6-8 inches long. Flowers large, scarlet. Capsule turbinately-oblong.

Ventricose-flowered Conradia. Fl. June, July. Clt. 1823. Shrub 6 to 8 feet.

5 C. EXSERTA (Mart. 1. c.) leaves oblong-lanceolate, crenated, glabrous, reflexed; peduncles 3-flowered; calycine segments long, acute, tra[illegible] corolla with the tube dilated at the base, and constricted in the middle, gibbose behind, and ventricose in front. Fl. fc. Native of Jamaica, on the top of the mountains. Gesneria exserta, Swartz, prod. p. 89. fl. ind. occ. p. 1024. Leaves lanceolate, pale beneath. Corolla large, yellow, an inch long.

Exerted-stamened Conradia. Shrub 8 to 10 feet.

6 C. CALYCINA (Mart. 1. c.) leaves ovate-lanceolate, acuminate, calyx [illegible] glabrous; peduncles 3-flowered; erect-[illegible] campanulate, 5-toothed: teeth ovate, acute, sulcate. Corolla like that of *C. exserta;* genitals exserted; capsule [illegible]. Native of Jamaica, in mountain woods. Gesneria calycina, Swartz, prod. p. 90. fl. ind. occ. 2. p. 1026. Gesneria calycina, Hon. ex Loud. hort. brit. p. 241. Leaves lanceolate, 4-6 inches long.

Green-calyxed Conradia. Fl. July, Aug. Clt. 1826. Shrub [illegible] feet.

CHORISANTHERA (from χωρίζω *chorizo,* to separate, and ἄνθηρα *anthera,* an anther; anthers separate, not like those of the other species. Stamens a little exserted; anthers distinct. Fruit

7 C. PUMILA (Mart. 1. c.) stemless; leaves cuneate-obovate, crenated, nearly sessile, rather hairy; peduncles usually 2-flowered, shorter than the leaves; calycine segments ovate-lanceolate, acute, 10 times shorter than the ovate-lanceolate, reflexed corolla with a funnel-shaped tube dilated and sub-campanulate above: limb nearly regular, 5-crenately ciliated segments: upper 2 erect. Native of Jamaica. leaves rather scabrous. Corolla whitish, covered with blood-coloured hairs.

Culture. Conradla. Pl. 1 foot.

For Culture and propagation see *Rytidophyllum,* p. 650.

Subtribe **III.**

BESLERIEÆ. Anther-cells with [illegible] (the genera contained in this subtribe agree with Vl. [illegible]) Calyx free. Corolla inferior.

Botanist Nat. [illegible] et Pav. fl. per. 1. p. 8. t. 7. f. b. Mart, nov. gen. bras. 3. p. *66.* t. 219. f. 2. Urceolaria, Feuill. per. 3. p. *69.* t. 43.

ESSENTIAL SYST. *Didynamia, Monogynia.* Calyx inferior: limb 5-parted, nearly equal. Corolla urceolate: limb 5-lobed, nearly equal. Stamens perfect, with the rudiments of three others; the hind one of these subulate and smaller. Ovary inferior. Capsule 1-celled, circumcised, ex Ruiz. Placentas 2, parietal, many-seeded.—A branched, scandent, parasitical herb, with strong, wiry roots. Peduncles opposite, thickish, hairy, dotted. Flowers on long scarlet, bibracteate.

1 B. REPENS (Ruiz, et Pav. 1. c) V- S. Native of woods. Urceolaria scandens, Feuill. per. *3.* p. *69.* t. 43.

Sarmientas. Pl. climbing.

For culture and propagation see *Rytidophyllum,* p. 650.

VII. BESLERIA (SO named by Plumier after Basil Besler, an apothecary of Nuremberg, editor, with the assistance of Jungermann, of a large work, entitled " Hortus Eystettensis, 1613." The garden belonged to Conrada Gemmingen, a bishop, and the plates were engraved at his expense.) Plum. gen. 5. in part. Lin. gen. no. *755.* in part. Schreb. gen. no. 1012. Jacq. amer. 187. in part. Juss. gen. p. 121. in part. H. B. et Kunth, nov. gen. amer. 2. p. 397. in part. Gaertn. fruct. 1. p. 24. t. *52,* Mart. nov. gen. bras. 3. p. 43.—Eriphia, Browne, jam. 270.

LIN. SYST. *Didynamia, Angiospermia.* Calyx coloured, 5-cleft, free; segments quite entire. Corolla campanulately-ringent: upper lip 2-lobed: lower one 3-lobed. Stamens 4, didynamous, rising above the base of the tube, with a chaff-formed rudiment of a fifth behind. Hypogynous ring, without any gland. Berry globose, 1-celled. Seeds very minute, numerous, attached to two parietal, 2-lobed placentas.—Erect, branched shrubs. Stems sub-tetragonal. Leaves opposite, petiolate, thickish; nerves and veins very prominent beneath. Peduncles axillary, few-flowered. Down and hairs on the plants simple. All inhabitants of Tropical America, in shady, moist places.

1 B. UMBROSA (Mart. 1. c. p. 44. t. 218.) leaves oblong, acuminated, attenuated at the base, or cordate, quite entire, ciliated in the young state, and with the nerve and veins strigillosely pubescent beneath; peduncles axillary, solitary, usually 3-flowered, exceeding the petioles, fy . S. Native of Brazil, in shady woods, at fountains near Mandiocca, and elsewhere in the tract of the mountains called Serra dos Orgaos, at the altitude of 500 feet. Leaves *3-5* lines long. Corollas white, glabrous.

Shaded Besleria. Shrub 3 to *5* feet.

2 B. LUXTEA (Lin. spec. 863. Swartz, obs. 231.) leaves broad-oblong, acuminated, contracted behind, coarsely-toothed in front, glabrous; peduncles axillary, 1-flowered, about equal in length to the petioles. J? . S. Native of Jamaica, in humid places; Guiana and Para.—Plum. gen. 29. p. *36.* t. 49. f. 1. Eriphja, &c. Browne, jam. p. 271. Corolla yellow.

Yellow-flowered Besleria. Fl. July, Aug. Clt. 1739. Shrub 3 to 5 feet.

3 B. LUTEO-VIRENS (Nees, et Mart. nov. act. bonn. 11. p. 49. Mart. nov. gen. bras. 3. p. 45.) leaves oblong-lanceolate, acuminated, cuneated at the base, serrated, especially in front, rather pilose; cymes axillary, many-flowered, contracted, equal in length to the petioles. *fy.* S. Native of Brazil, in boggy parts of woods near St. Petro de Alcantara, in the district of Ilheos. Corolla greenish-yellow.

Greenish-yellojv-fiowered Besleria. Shrub.

4 B. EAEGANS (H. B. et Kunth, nov. gen. amer. 2. p. *397.)* leaves somewhat obliquely elliptic-oblong, acuminated, quite entire, glabrous; peduncles axillary, generally twin, and usually 3-flowered, shorter than the petioles. *2. S. Native of New Granada, on the Andes of Quindiu, between Quebrada de Tucheacto and the river San Rafall, at the altitude of 1350 hexapods, Branches terete, twisted, hairy while young. Leaves 7 inches long, and 3 broad. Calyx glabrous. Corolla scarlet, glabrous.

Elegant Besleria. Shrub.

5 B. SOLANOIDES (H. B. et Kunth, 1. c.) leaves lanceolate-oblong, acuminated, narrowed at the base, remotely and obsoletely denticulated, glabrous; peduncles axillary, usually by threes, 1-flowered, about equal in length to the petioles. J? . S. Native of the valley of San Lorenzo, on the banks of the river Pansitara, between the city of Popayan and Almaguer, at the altitude of 1050 hexapods. Stems wrinkled, glabrous. Leaves opposite. ? Peduncles solitary, twin, or by threes. Corolla orange-coloured, glabrous. Said to be nearly allied to the preceding.

Solanum-like Besleria. Shrub 3 to 6 feet.

6 B. INCARNA'TA (Aubl. guian. *2.* p. *635.* t. *256.)* leaves oblong, crenated, tomentose on both surfaces; peduncles axillary, solitary, 1-flowered ; genitals exserted. *%.* S. Native of Guiana. Plant erect, herbaceous, tomentose. Stem tetragonal. Corollas purplish; tube long, ventricose : lobes of limb reflexed, roundish, unequal, fringed.

Flesh-coloured-Cowered Besleria. Fl. ? Clt. 1820. PL *2 feet.*

7 B. ? VIOLA'CEA (Aubl. guian. *2.* p. 637. t. 254.) leaves ovate, acute, quite entire; peduncles racemosely panicled, terminal; stem scandent. T? . S. Native of Guiana, in woods. Leaves glabrous, stiff. Flowers purple, size of those of *Lilac.* Calyx ventricose, 5-toothed, purple. Corolla with a curved tube and spreading limb. Berry purple, edible.

Var. /3, ccerulea (Aubl. guian. *2.* p. 631.) berries blue.

Fiolet-berried Besleria. Shrub climbing.

Cult. For culture and propagation see *Rytidophyllum*^ p. 650.

VIII. HYPOCY'RTA (from *vîro, hypo,* under; and *Kvprog, cyrtosy-* gibbous ; the under part of the tube of the corolla exhibits a conspicuous gibbosity.) Mart. nov. gen. bras. 3. p. 48.

LIN. SYST. *Didyndmia, Angiospérmia.* Calyx free, deeply 5-parted. Corolla inferior, tubular, gibbous behind at the base, but, with the tube, ventricose in front : limb 5-lobed, or 5-toothed, nearly equal. Stamens 4, didynamous, with the rudiment of a fifth behind, which rises from the base of the tube; anthers cohering by pairs. Hypogynous ring bearing a gland behind. Berry globose, juicy, coloured, 1-celled. Seeds many, fixed to *2* 2-lobed, parietal placentas (f. 68. f.)—Glabrous, or hairy shrubs, inordinately branched, extending and radicant, rarely erect. Leaves opposite, thickish, paler beneath, and shining, and often reddish. Flowers axillary, solitary, or aggregate, of a beautiful colour, such as scarlet, white, cream-coloured, and rose-coloured.—Some of the species grow upon old trees^or in humid places throughout tropical Brazil.

SECT. I. CODONA'NTHE (from /cwcW, *kodon,* a bell; and *CLVQOQ, anthosy* a flower ; in reference to the campanulate tube of corolla.) Mart. nov. gen. bras. 3. p. 49. Tube of corolla sub-campanulate, a little more ventricose on the lower side ; limb broadish.

1 H. GRA'CILIS (Mart. nov. gen. bras. 3. p. 50. t. 220.) glabrous ; branches inordinate, ascending, rooting every where, loose, epidermis shining; leaves on short petioles, ovate, with sub-undulately-toothed edges ; peduncles axillary, solitary, or twin ; corollas sub-campanulately tubular : lobes rounded, spreading. ^ • S. Native of Brazil, in various places among stones, in humid places from Rio Janeiro to Para. Corollas glabrous, white outside, yellow inside, and spotted with red at the base. Branches obsoletely tetragonal.

Slender Hypocyrta. Shrub creeping.

2 H. AGGREGA^TA (Mart. 1. c. p. 51. t. 221.) stem erect, nearly simple, hairy ; leaves oblong, acuminated at both ends, quite entire, pilose in the young state ; petioles and nerves hairy beneath ; peduncles axillary, aggregate ; calyxes vermillion coloured ; corollas urceolate : lobes roundish, spreading. ^ . S. Native of Brazil, in the province of Rio Negro, in woods along the river Japura, near Manacuru and elsewhere. Stem terete, or obsoletely tetragonal. Corolla fine scarlet, finely pubescent outside.

Aggregate-flowered Hypocyrta. Shrub 4 to 6 feet.

SECT. II. ONCOGA'STRA (from oy/coc, *oncos,* a hook; and yaoriyp, *gaster,* a belly ; in allusion to the tube being gibbously ventricose downwards on the lower side.) Mart. nov. gen. bras. 3. p. 49. Tube of corolla very much gibbously ventricose downwards ; limb short, toothed, erect.

3 H. HIRSU^TA (Mart. 1. c. p. 52. t. 222.) stem erectish, or as-, cending, villously hairy at top; leaves on short petioles, obovate, bluntish, hairy; flowers axillary, solitary; corollas greatly swollen in front: limb contracted, erect, 5-toothed, fj . S. Native of Brazil, in the mine provinces, in shady, stony places on the edges of woods, near Villa Rica and elsewhere. Stem flexuous, or obsoletely tetragonal. Corolla an inch long, scarlet, pubescent, (fig. 68.)

FIG. 68.

Hairy Hypocyrta. Shrub 1 to \\ foot.

4 H. sTRiGiLLosA^(Mart. I.e. p. 52.) stem erectish, villous at top; leaves on short petioles, oblong, acutish, ^mucron flowers axillary, solitary ; corollas coarsely ventricose limb contracted, erect, 5-toothed. J? • S. Native of the mine provinces, on the rocks of Mount Lenbei, João d' El Rey and elsewhere ; also on the; mountain cora, in the province of Bahia. Flowers preceding, except the calyx, which has the segments acute, and the strigie on the nerves of the leavei spicuous than in the other parts, and the coroiia cent. Perhaps belonging to the first section *Codonani*

Strisillose Hypocyrta. Shrub 1 to 1 5 loot.

5 H. CILIOSA (Mart. 1. c. p. 53.) hairy ; / J h spreading: lower one with bent in cihae. T? . » the diocess of Japura, in woods at Manacuru. KK on trees, terete, purplish. Corolla more than an cream-coloured, pubescent; tube calcarately base behind, and widened upwards.

CWiflfcd-flowered Hypocyrta. Shrub creeprng- 650.

Cult. For culture and propagation see *Rytidofhyl*[lurn,] 1

IX. COLU'MNEA (a name given by ^"'Yi"ciSrui"' "f Fabius Columna, as he is commonly called, or i-ao ^ ^ the noble family of Colonna, in Italy ; author ot "(phyto banitarum stirpium Ecphrasis," Rome, I[616,] sanos," 1 vol. 4to. Naples, 1592.) Plum. 33. ^ j . p. 792. Schreb. gen. no.-1060. Juss. gen. 135. Mart. nov. gen. bras. 3. p. 56. t. 224. *i,-•*

LIN. SYST. *Didynmma,Anglosj>ermia.* ^W* parted. Corolla tubular, straightish, g.bbous base, ringent : upper lip erect, arched : lo spreading. Stamens 4, didynamous; anthers c the rudiment of a fifth behind. Glands 1-5 Berry 1-celled; placentas 2, parietal, 2-lobed. —Stems flexile, erect, or scandent. Leaves posite, thickish, hairy, or pubescent, duncles axillary, solitary, or crowded. Corollas *t,*

1 C. SCA'NDLS (Lin. spec. 891.) leaves £.* * rather villous ; segments of calyx denticulated, as the corollas, pubescent; upper lip of corona w. S. Native of Guiana, and the West Indies, in woods, climbing upon -trees. Jacq. amer. pici-

quadrangular. Leaves petiolate. Flowers French in the West Indies *Liane de Sirop.* The plant is flowers yellow ; fruit white. T? . ^. S. Columnea

Columnea flore lutescente, fructu albo, Plum. gen. 28.

climbing. Columnea - Fl - Aug. Sept. Clt. 1759. Shrub

IIIRSIJXTA (Swartz, prod. 94. fl. ind. occ. 2. p. 1080.) nated, serrated, hairy above ; calycine segments S. and are, as well as the corollas, hairy. *hc .* dense aica, at the roots of trees on the mountains in Brown, Ait, hort kew - P- 366.—Archimenes, &c. 1. Jam- ^70. t. 30. f. 3.—Sloan, hist. 1. p. 157. t. 100. f. Flowp. Petiolate. Corollas villous, purplish, or pale red. *fr.* usually twin.

8 Columnea. Fl. Aug. Nov. Clt. J 780. Shrub climbing, RUTILANS (Swartz, prod. p. 94. fl. ind. occid. 2. p. 1083.) denticulated, rather scabrous, hairy, and the enroll- heath 5 calycine segments jagged, and are, as well as a8fuVinous - ^ *yj'* S- Native of the interior of Jaon the trunks of trees in dense woods. Corallas

imbi- ed Colurnnea - Fl. Aug. Sept. Clt. 1823. Shrub

HISPIDA (Swartz, prod. p. 94. fl. ind. occid. 2. p. 1083.) denticulated, hairy ; calycine segments of the of Jamaica, on shady rocks. Calyx blood- West white.

Columnea - Shrub 1 to 3 feet.

ANTA (Schlecht, in Linnsea, 8. p. 249.) stems ovate, crenated, rather hispid above, and some- beneath. S. Native of San Carlos de peduncles terminal, solitary. Calycine segments tri- corolla scarlet, beset with white hairs. Capsule 2- ex Lav.

Columnea. Shrub creeping.

HIEDEANA (Schlecht, in Linnsea, 8. p. 249.) stems ovate-lanceolate, entire, and are, as well as the corolla potted and villous. S. Native of Mexico, near Misantla, and near the Hacienda de La smoothish at bottom, but clothed with broad - Corolla *2* inches long, clothed with white Variegated with yellow and brown. Berry glo- oblong, acutish at both ends.

Columnea - Shrub.

Cult. Stella, Loir. coch. p. 384. ?

Culture and propagation see *Rytidophyllum,* p. 650.

X. MITRARIA (from *fiirpa, mitra,* a mitre; in reference to the mitre P- 57 - formed bractea which covers the calyx.) Cav. icon. Lin, 5 79 . Mart. nov. gen. bras. 3. p. *66,*

Parted *Angiospermia.* Calyx inferior; limb calycinately 2-lobed, mitre-formed bractea. one %-oh A- y- ntricose ; upper lip *of* limb 2-lobed ; lower ment of Stamens 4, didynamous, exserted, with the rudiabit of *Columnea.* Stems scandent. Leaves ovate, lowers axillary. Corallas scarlet.

COCINEA Native of San Carlos de Chiloe. *Scarlet-fl*

Cult, Mitraria. **Shrub** scandent.

Culture and propagation see *Rytidophyllum,* p. 650.

XI. DRYMCTNIA (from ^pv/xoc, *drymos,* an oak wood ; in allusion to the plant growing on trees in woods.) Mart. nov. gen. bras. 3. p. *51.*—Gesnèria species, Jacq. et Kunth.

LIN. SYST. *Didynamia, Angiospermia.* Calyx free, oblique, 5-leaved; leaflets imbricate, *2* interior. Corolla oblique, campanulately sub-ringent, gibbous at the base behind; throat spreading ; upper lip 2-lobed ; lower *one* 3-lobed. Stamens 4, didynamous, without any rudiment of a fifth ; anthers free. Hypogynous disk, bearing an ovate gland behind. Capsule baccate, ovate, coriaceous, 1-celled, 2-vaived ; placentas 2, parietal, bilamellate. Seeds numerous, fusiform.—Shrubs climbing, and fixed by strong roots to trees, or lying upon the earth. Stems flexile, nearly terete, with a shining epidermis, inordinately branched. Leaves opposite, petiolate, serrated, pubescent fronj simple hairs, like all the herbaceous parts of the plant, thickish. Peduncles axillary, solitary, shortish, bractless. Corollas large, painted.

1 D. CALCARATA (Mart. i. c. p. *58.* t. 224.) leaves ovate, rounded at the base, cordate, acute at the apex, and are, as well as the obliquely cordate-ovate, toothed segments of the calyx, downy; segments of corolla denticulated; anthers spurred at the base. T? . S. Native of Brazil, in the province of Rio Negro, along the river Japura, on trees. Corolla large, white, striped with yellow, and spotted with purple. Calyx large.

/#pw/T£G?-anthered Drymonia. Shrub climbing.

2 D. SPECTABILIS (Mart. 1. c. p. 59.) leaves elliptic-oblong, acute, obsoletely toothed, clothed with adpressed pili; calycine, segments ovate-oblong, obsoletely denticulated, clothed with adpressed hairs ; segments of corolla crenulated, fringed, ex Bonpl. J? . S. Native of New Granada, in woods on the banks of the river Smitha, between Villa La Sequia and the town of Popayan, at the altitude of *600* hexapods. Leaves 2-3 inches long. Corolla large, white, campanulate, downy outside ; limb reddish.

Showy Drymonia. Shrub climbing.

3 D. JACQUINI ; leaves oblong, acuminated at both ends, hairy, toothed; calycine segments serrated; limb of corolla sharply serrulated. P? . S. Native of the West Indies. Besleria serrulata, Jacq. hort. schoenbr, 3. p. 21. t. 290. Leaves hairy, greenish above, and brownish purple beneath. Calyx large green. Corolla cream-coloured.

Jacquin's Drymonia. Fl. ? Clt. 1806. Shrub climbing.

4 D. ? GRANDIFLORA ; leaves ovate-oblong, acuminated, crenated, densely pilose above, villous beneath, as well as *on* the branchlets ; peduncles axillary, elongated, many-flowered ; calycine segments ovate-oblong, acute, quite entire, densely pilose ; corollas campanulate, villous ; throat open. J? . S. Native of New Granada, in humid woods between Paramo de San Fortunato and Fusagasuga, at the altitude of 1000 hexapods. Besleria grandiflora, H. B. et Kunth, nov. gen. amer. 2. p. 401. Leaves purplish beneath. Calyx purplish. Corolla campanulate, sub-gibbous at the base, villous outside, white, and glabrous inside: limb bilabiate, spotted with red. Anthers cohering cruciately with the rudiment of a fifth stamen.

Great-flowered Drymonia. Shrub.

Cult. For culture and propagation see *Rytidophijllum,* p. 650.

XII. KLIPGIA (named after Fr. Klug, M.D.) Schlecht, in Linnsea, 8. p. 248.

LIN. SYST. *Didynamia> Angiospermia.* Calyx free, pentagonally 5-winged, 5-toothed. Corolla tubular : limb bilabiate : upper lip large, roundish entire : lower *one* small, 3-lobed. Stamens 4, nearly equal, without any rudiment of a fifth. Anthers approximating by pairs. Hypogynous disk narrow, glandular. Capsule membranous, free, 2-valved ; placentas 2,

bilamellate. Seeds numerous, cylindrical.—An herb with alternate leaves, and somewhat grumose from minute down. Leaves unequal-sized. Flowers disposed in a terminal raceme. Habit of a species of *Cuphea.*

1 K. AZUˣREA (Schlecht, 1. c.) %. S. Native of Mexico, at Cueste grande de Chiconquiaco. Root creeping. Stems simple, or branched, roughish from minute, spreading, stiff hairs. Leaves oblong-ovate, acuminated, vertical, entire, or repand, or obsoletely and sinuately-toothed, bluntish at the base, green above, and beset with short, thick, rufous hairs, paler beneath, and clothed with somewhat grumose, minute down ; largest ones 4-5 inches long. Racemes usually solitary, downy. Corolla blue, 1\ inch long. Capsule elliptic, attenuated at both ends, 1-celled.

Azure-Cowered Klugia. PI. \ to 1 foot.

Cult. For culture and propagation *see Rytidophyllum,* p. 650.

XIII. TAPPNA (from *TCLTTUVOQ, tapeinos,* humble; dwarf plants.) Mart. nov. gen. bras. 3. p. 59.

LIN. SYST. *Didynamia, Angiospermia.* Calyx free, 5-parted, unequal. Corolla funnel-shaped, sub-ringent, gibbous in front at the base ; tube coarsely ventricose behind ; throat contracted ; limb erect; upper lip 2-lobed ; lower one 3-lobed. Stamens 4, didynamous, with the rudiment of a fifth behind ; anthers cohering. Hypogynous ring swelling into a gland behind. Capsule ovate, coriaceous, 1-celled, 2-valved; placentas 2, parietal, bilamellate. Seeds numerous, oblong.—Stems simple, or branched, rising from an underground tuber, and, like all the herb, soft and fleshy. Leaves petiolate, opposite. Peduncles axillary, 1-flowered, solitary, rarely twin.

1 T. BARBA'TA (Mart. 1. c. p. 60. t. 225. f. 1.) stem branched ; leaves oblong, or oblong-lanceolate, attenuated at both ends, acute, toothed ; segments of calyx cordately sub-deltoid ; corolla hairy outside. %. S. Native of Brazil, in the mine provinces, in dense woods near Almada ; and in like marshy places on the road to Felisbert. Gesnèria barbàta, Nees, et Mart, in nov. act. bonn. 11. p. 48. Stems decumbent, throwing out roots at the base. Corolla white, suffused with red inside, above an inch long, much inflated below, (f. 6M. a.)

FIG. 69.

Bearded-Covered Tapina. PL decumbent.

2 T, PUSI'LLA (Mart. 1. c. p. 61. t. 225. f. 2.) stem simple, an inch high ; leaves orbicularly-ovate, obtuse, crenated ; calycine segments triangular; corolla downy outside. ^. S. Native of the province of Rio Janeiro, in shady woods on Serra d' Estrella, Beyrich. Tuber size of a pea. Corolla 4-lines long, white, ventricose in the throat below.

Least Tapina. PI. 1 inch.

Cult. For culture and propagation see *Rytidophyllum,* p. 650.

XIV. NEMATA'NTHUS (from *vwa, nema,* a thread; and *avdog, anthos,* a flower ; in allusion to the flowers being hairy.) Schrad. in gött. gel. anz. 1821. 1. p. 719. Maximil. reise bras. 2. p. 108. and 343. Mart. nov. gen. bras. 3. p. 46.

LIN. SYST. *Didynamia, Angiospermia.* Calyx free, deeply 5-parted, oblique. Corolla inferior, campanulately funnel-shaped, oblique, gibbous at the base behind ; throat spreading ; limb equally 5-lobed. Stamens 4, didynamous, with a small rudiment of a fifth, or without; anthers coluering. Hypogynous ring swollen into an oblong gland behind. Cuuule pyramidal, coriaceous, 1-celled, 2-valved ; placentas 2, parietal, bilani Seeds numerous, oblong.-Shrubs with simple or branched stems, furnished with sh.ning, cinereoiis ep tumid at the nodi, climbing upon trees, and adl^rin by their roots. Leaves opposite, petiolate, thick.si nation naked, with complicate leaves. Peduncles a flowered, bractless, very long and filiform, pendulous, large, showy, scarlet.

1 N. CHLORONEˣMA (Mart. 1. c. p. 47. t. 21J"Y" glincies 2-4 lanceolate, acuminated at both ends ; calyxes ana p g inches long, green, clothed with white hairs. *I* on of the province of Rio Janeiro, in shady parts "oi" Yeddish Mount Corcovado; and on Serra dos Orgaos. beneath, or pale, glabrous, or ciliated. Calyx 1 a g inclies with glandularly denticulated margins. Corollas a long, scarlet, beset with white hairs outside, *ilamen

Green-threaded Nematanthus. Shrub climbing.

2 N. JONE\UA (Schrad. 1. c.) leaves broad-lanceoia minated at both ends; calyx of a violaceous colour with hoary villi; peduncles 6 to 12 inches long, violaceous and white villi. *?. ^ S. Native woods between Ilheos and St. Petro de Alcantal*, shorter the preceding. Calyx obscurely violaceous ; *ᵉB™ a little and narrower, hoary from white hairs. Corolla scd smaller, beset with scattered, minute hairs.

Violet-threaded Nematanthus. Shrub climbing.

Cult. For culture and propagation see *Rytidophyuu , i*

XV. ALLOPLE'CTUS (from *aXXoc, alias* ^^*Jtfin ITXFKU, pleco,* to plait; the calyx appears as it it w^fc^jja, diverse directions.) Mart, nov/gen. bras. *6.* p. *o*. Scop.—Orobànche species,Vellos. in Vand. script, t. Gesneria species, Lin., Aubl., Swartz, and £untn, coloured,

LIN. SYST. *Didynamia, Angiospermia.* Calyx i Jnterior. 5-cleft; segments imbricate, more or less combine Corolla inferior, tubular or club-shaped, straigntisii 5-lobed or 5-toothed. Stamens 4, didynamous, rudiment of a fifth from the base of the tube, ring swollen into a gland behind. Capsule baccate, o shrubs ceous, 1-celled, 2-^valved. Seeds numerous, oblong.^ the climbing on trees, and adhering to them by the roo clasping of the branches. Stems somewhat tetra fiHed and somewhat thickened at the nodi, rather ^ᵉKU one in with medulla. Branches opposite. Leaves °ppos gcattered each pair smaller than the other, petiolate, fleshy, * red- or decumbent, or erect down, the under ^ c \ ^ l j e f vildish. Gemmation naked, with the young leaves con lous, or hairy. Flowers axillary or many, *S&* soii- sessile or racemose, furnished with coboured biacte tary, on long peduncles. Calyxes and bracteas scar red Corolla yellow. The species inhabit the > ^ J e n i B t 0 woods in tropical America, in which they are great o the trees, from the vivid colour of the calyxes and brac^ ^ f.

1 A. SPARSIPLORUS (Mart. nov. gen. bras. j.^p. • ^ base, 1.) leaves oblong, or oblong-lanceolate, attenuatea acuminated, beset with fine stngee ; flowers nearly » illary, aggregate, or scattered; bracteas smaller tna cularly triangular segments of the calyx, winch are the bracteas of a deep blood colour, and almost quit limb of corolla villous, 5-toothed. hlr •»»• ^ u trees, in the province of Rio Janeiro, climbing "P⁰™™⁰** here on Serra shady humid places near Corrego Seco, and eisew the dos Orgaos; as well as on Serra de St. Geraldo, in

provinces. Leaves 3-7 inches long, yellowish beneath. Corolla yellow.

Scattered-flowered Alloplectus. Shrub climbing.

2 A. CIRCINNATUS (Mart. 1. c. p. *56.* t. *223.* f. *2.)* leaves obstriate, broad-oblong, attenuated at the base, acuminated, finely serrulate; peduncles racemed, axillary; peduncles nodulose; bracteas three, ovate, acuminated, calycine segments, and are, as well as the petals, pubescent; limb of corolla shortly 5-lobed, revolute. ?. ?. S. Native almost throughout Brazil, in moist parts of woods, climbing upon trees. Besleria [illegible] Schott, Sturm, medi. jahrb. 42, P. 8, ? Corolla yellow.

Circinate Alloplectus. Fl. July, Aug. Clt. 1824. Shrub climbing.

3 A. HISPIDUS (Mart. 1. c. p. *57.)* leaves oblong-elliptic, serrately crenated, hispid; peduncles axillary, solitary, 1-flowered; calycine segments ovate-lanceolate, sharply serrated, hispid; bracteas unknown. ?. S. Native of New Granada, in the Andes of Popayan, and in the Pastoyo, between Mamendoy and the town of B, at the altitude of 1040 hexapods. Besleria hispida, H. B. et Kunth, nov. gen. amer. 2. p. 399. Branches warted, hispid, yellowish. Leaves 2 inches long, and 1 broad. Corolla to be [illegible] from the limb oblique, 5-cleft, reflexed. Said to be [illegible] allied to *Besleria cristata.*

4 A. KUNTHII; leaves ovate-oblong, subacuminated, denticulate, [illegible] above, and pilosely pubescent beneath, and pursea[illegible] peduncles axillary, few together, 1-flowered; calycine bract[illegible] segments ovate, acuminated, denticulated, pilose, purplish; shadv[illegible] Unknown. ?. S. Native of New Granada, in La [illegible] On the Andes, about Quindiu, and near the Villa Almaj[illegible] and in the Plains of Sacandonoy, between the town of Pasto and [illegible] fever, at the altitude of 1000 to 1200 hexapods. Br[illegible] Color, H. B. et Kunth, nov. gen. amer. 2, p. 398. [illegible] on the [illegible] and so[illegible] somewhat gibbous at the base; limb somewhat [illegible]-bilabiate.

5 A. VELLOSIANUS. Shrub climbing.

serrated. CALCARATUS; leaves oblong, subacuminated, crenately hairy, [illegible] apex, pilose; peduncles axillary, 2-4-flowered; calycine limb of [illegible] acuminated, denticulated, coloured segments; the And[illegible] 5-lobed; bracteas unknown. ?. S. Native of hexapods [illegible] Quindiu, near La Pamilla, at the altitude of 1130 2. p. 399. Besleria calcarata, H. B. et Kunth, nov. gen. amer. rolla or[illegible] fuscous, pilose, hispid while young. Coabove at [illegible] glabrous, tubularly calceolate, spurred Spur sho[illegible] saccately inflated under the lower lip; rounded [illegible] obtuse; throat constricted; lobes of limb [illegible] superior ones larger.

6 A. [illegible]nowered Alloplectus. Shrub 2 to *3* feet.

Hated [illegible] SAGULNEUS (Mart. 1. c.) leaves obovate-oblong, acumiWith [illegible] furnished with a few adpressed hairs, marked segment [illegible] Spots beneath; flowers axillary, sessile; calycine of st[illegible] deeply serrated, very hairy, coloured. ?. S. Native Quindiu, [illegible] and the Antilles; of New Granada, on Mount Pods [illegible] near El Passo del Machin, at the altitude of 1030 hexPhoenl[illegible] Besleria sanguinea, Pers. syn. 2. p. 165. Dalbergaria [illegible] Jacq. obs. 1. p. 9. t. 141. Jacq. ic. rar. 1. p. 141. t. *30.* Calyxes more jagged [illegible] Corolla tubular, villous, gibbous, sub-bilabiate, [illegible] rudiment of a fifth stamen wanting.

7 A. [illegible]calyxed Alloplectus. Shrub climbing. ?

Cles[illegible] axillary. CRISTANUS (Mart. 1. c.) leaves ovate, serrated; peduncles solitary, 1-flowered; bracteas cordate, toothed, [illegible] Scarlet, as well as the calycine segments, which are serrated, hairy outside; lobes rounded, entire. ?. ?. S. Native of Guiana and Martinico, in humid woods. Besleria cristata, Lin. syst. p. 4G8. Aubl. guian. *2.* p. *637.* Svvartz, obs. *232.* Jacq. amer. p. 188. t. 119. Mill. diet. no. 3.—Plum. gen. 29, with a figure. Corolla yellowish.

Crested-calyxed Alloplectus. Fl. June, Aug. Clt. 1739. Shrub climbing.

8 A. COCCINEUS (Mart. J. c.) leaves ovate, glabrous, stiff, a little toothed; peduncles axillary, bearing *3-6* flowers in an umbel at top; bracteas 2, at the division of the common peduncle, orbicularly cordate, toothed, scarlet, like the calycine segments, which are serrated. I?. ?. S. Native of Guiana, in marshy parts of woods. Besleria coccinea, Aubl. guian. *2.* p. 632. t. *255.* Corolla and fruit yellow.

yScflr/^-calyxed Alloplectus. Fl. ? Clt. 1819. Shrub climbing.

9 A. SCHOTTII; leaves ovate-lanceolate, quite entire, pubescent; flowers axillary, crowded, nearly sessile; calyxes red, denticulated, roundish; limb of corolla, which is clavate, erectish. *2.* y,. S. Native of Brazil. Besleria bicolor, SchoU. in oestr. med. jahrh. 4. *2.* p. 8. Besleria dichrous, Spreng. syst. *2.* p. 840.

SchotVs Alloplectus. Shrub climbing.

Cult. For culture and propagation see *Rytidophyllum,* p. 650.

XVI. EPFSCIA (from *em, epi,* upon; and o-Kta, *scia,* a shadow; so named because the species delight *in* shady places.) Mart. nov. gen. bras. 3. p. 39. Besleria species of authors.

LIN. SYST. *Didynamia, Angiospermia.* Calyx free, 5-cleft or 5-parted. Corolla inferior, funnel-shaped; tube straightish, gibbous behind at the base; limb 5-lobed. Stamens 4, didynamous, furnished with the rudiment of a fifth behind, which rises from the base of the tube. Hypojynous ring swelling into a gland behind. Capsule nearly globose, membranous, 2-valved; placentas 2, parietal, bilamellate. Seeds numerous, oblong.—Soft, juicy, glabrous, or villous, decumbent herbs, rooting upon the earth or decayed trees. Leaves opposite, petiolate; the middle nerve prominent beneath, and with the veins thick, anastomosing, and juicy. Flowers axillary, solitary, or in little cymes, and bracteate, of various colours.

1 E. DECUMBENS (Mart. 1. c. p. 40. t. 216.) plant smoothish; stems decumbent and creeping; leaves oblong, subcordate at the base, acute, crenated; cymes axillary and terminal; calyx about half as long as the corolla, with lanceolate, acuminated subserrated segments; lobes of corolla quite entire. %. S. Native of Brazil, in the province of Rio Negro, in marshy parts of dense woods, along the river Japura, &c, creeping on the trunks of decayed trees. Leaves *3-5* inches long, reddish beneath. Corolla white, 1J inch long.

Decumbent Episcia. PI. 1 to 3 feet.

2 E. REPTANS (Mart. I. c. p. 41. t. 217.) plant pilosely hairy; stem sarmentose,radicant; leaves ovate, obtuse, crenated; peduncles solitary, axillary, 1-flowered; calycine segments linear-subspatulate, obtuse; lobes of corolla toothed. %. S. Native of Brazil, in thickets along the river Japura and elsewhere. Leaves whitish beneath. Corolla scarlet, hairy outside, (fig. 70.)

FIG. 70.

Creeping Episcia. PI. creeping.

3 E. MELITTIFOLIA (Mart. 1. c. p. 42.) pilose; stem erect; leaves ovate, acutish at both

ends, coarsely crenated ; cymes axillary and terminal; calyx nearly equal in length to the tube of the corolla ; calycine segments lanceolate, acuminated, subserrated ; lobes of corolla quite entire. 2J.. S. Native of Guiana and the Antilles. Besleria melittifblia, Lin. spec. p. *862.* Aubl. guian. *2.* p. 636. Smith, exot. bot. 1. t. 54. Besleria melissae Tragi folio, Plum, gen. p. 29. t. 5. icon. t. 48. Corolla purple. Capsule globose, size of a large pea, and, without doubt, 2-valved, but probably baccate from the umbilical funicles being long and fleshy. Seeds as in *E. reptans.*

Balm-leaved Epi^cia. Fl. July, Aug. Clt. 1789. Shrub 1 to 3 feet.

4 E. ? PULCHE'LLA (Mart. 1. c.) stem erect; leaves oblong-ovate, wrinkled, crenated, running into the petioles, which are connate ; cymes axillary ; calyx pentagonal, coloured ; lobes of corolla entire : lower ones the largest. %. S. Native of Trinidad. Besleria pulchella, Donn, hort. cant. p. 140. Sims, bot. mag. 1146. Besleria umbellata, Herb. Banks. Bracteas *X,* opposite, under the corymbs. Calyx scarlet; segments serrated. Corolla yellow, striped with red. This differs from the other species of *Episcia,* in the calyx being tubular and 5-toothed, and of a reddish colour. The rudiment of the fifth stamen wanting. It is said to be nearly allied to *Besleria littea,* and *B. coccinea,* Lin. but is probably a species of *Alloplectvs.*

Neat Episcia. Fl. July, Aug. Clt. 1806. PI. *2* to *3* feet.

Cult. For culture and propagation see *Rytidophyllum,* p. 650.

Tribe II.

CYRTANDRA'CEJE (this tribe agrees with the genus *Cyrttindra* in the characters given below.) Calyx inferior. Fruit capsular and baccate, superior. Seeds exalbuminous.

Sublribe I.

TRICHOSPORE^E (the plants contained in this tribe agree with the genus */Eschyndnthus,* in the seeds being furnished with hairs at ends.) Blum, bijdr. 779. Fruit capsular, siliquose. Seeds pendulous, expanded at both ends, or only at the base or apex, into a setaceous or membranous wing.

XVII. TROMSDO'RFFIA (named in honour of J. B. Tromsdorff[1], who has written various works on the use of many plants, as well as analyzing their chemical parts.) Blum, bijdr. p. 762.

LIN. SYST. *Didynamia, Angiospermia.* Calyx tubular, 4-5-cleft; segments equal. Corolla funnel-shaped, widened upwards, with an unequal, somewhat bilabiate limb. Stamens 4, *2* of which only bear anthers; anthers 2-celled, cohering; cells equal in their insertion. Stigma broad, somewhat bilamellate. Capsule silique-formed, elongated, falsely 4-celled, 2-valved ; lobes of the dissepiment, which is contrary, bearing the seeds on the margins, which are revolute. Seeds minute, pendulous, expanded at the base into a membranous wing. Erect or radicant shrubs, with opposite or alternate, serrated leaves, and elongated, axillary peduncles. This genus is nearly allied to *Didymocdrpus,* from which it differs in the seeds being furnished with a membranous wing at the base.

I T. SPECIOSA (Blum, bijdr. p. 763.) stem erect; leaves opposite, nearly equal, elliptic-oblong, acuminated, unequally toothed, clothed with rough hairs above, downy beneath ; peduncles crowded, bifid, or sometimes dichotomous; flowers diandrous. f? . S. Native of Java, on the west side of the island, on the banks of rivers. Flowers showy, having the tube of a deep violet colour at bottom, and the throat sulphur-coloured. Filaments 4, villous at top.

Showy Tromsdorffia. Fl. Year. Shrub erect.

2 T. ? PTONGA'TA (Blum. bijdr. p. 765.) stem climbing, radicant; leaves alternate, or the opposite one is very small, elliptic, attenuated at both ends, doubly serrated, downy ; peduncles solitary, very long, bearing ^ ^ *f* ^ ^ *J* . The flowers didynamous. tj . ^. h. Native of Java. Corolla and fruit has not been seen, but the structure of the ovar ovula agree with those of the first species.

Elongated Tronisdorffia. Shrub climbing.

Cult. For culture and propagation see *Rytidophyllum, y*

XVIII. ESCHYNDNTHUS (from *a%uvw,* to be ashamed; and *avdog, anthos,* a flower.) Jack. ^. Trich6sporum, D. Don. prod. fl. nep. p. 124- Blum. bijdr. p. 763. Incavillea species of Roxb.

LIN. SYST. *Didynamia, Angiospermia.* ^alyx ventricosely dilated tubular, 5-cleft. Corolla tubular, incurved with campanulate throat, and an oblique, sub-bilabriate limb. Stamens 4, didynamous, exserted, usually with the rudiment of a fifth; anthers at first conniving by pairs ; cells parallel, excavated, somewhat funnel-shaped. Capsule ^ ^ formed, 2-valved, falsely 4-celled. Seeds small, fibrous from papillae ending in a bristle-like tail at the simple, Twining, radicant, parasitical shrubs 5 with opposite entire leaves, and axillary and terminal, few-flowered peduncles.

1 *M.* RADIANS (Jack, in Lin. trans. 14. p. 3 cordate at the base, villous in the young state, veinless ; calary, sometimes terminal, 2-flowered, villous, lyxes villous. Tj. ^. S. Native of Java and woods, rooting on old trees. Trichosporum Blum, bijdr. p. 764. Leaves 1-2 inches long. Corolla of a crimson colour, and villous outside, phur coloured inside. The rudiment of the sterile small.

Radicant iEschynanthus. Shrub climbing. leaves

2 M. VOLU^BILIS (Jack. 1. c. p. 4«.) stem, twining, oval, acute at both ends, glabrous, with indistinct peduncles axillary, 2-flowered, bibracteate ; pedicel the peduncle; calyxes glabrous. neighbourhood of Bencoolen. The axils of the times furnished with a flower-bearing branchlet, appearance of a many-flowered peduncle, coloured.

Twining iEschynanthus. Shrub twining.

3 *JE.* PU'LCHER ; stem radicant; leaves lanceolate, at the base ; peduncles 2-flowered, axillary and terminal fascicles. *2 • v* *f* axillary and terminal fascicles. along with *JE. radicans.* Trichosporum pulchrum, -D 764. Corollas scarlet.

Fair JEschynanthus. Fl. Year. Shrub creeping. leaves oval-lanceolate, nerveless ; umbels terminal, many-flowered ; rounded, nearly equal. f? . w. S. Nat.ve of the gal, in forests of Silhet, and on the Garrow hills, trees. Incarvillea parasitica, Roxb. cor. 2. p. p. 112. Tricl.6sporum grandiflorum, D. *Von,* journ. and prod. fl. nep. p. 125. Flowers large, lour of a beautiful mixture of orange and of *Digitalis.* Segments of calyx ovate. Myle

Great-flowered JSschynanthus. Shrub creeping.

5 *M.* PARVIFLORUS ;' stem radicant; leaves nated, nerved ; umbels terminal, few-flowered. of corolla shorter, and acutisb. Nipaul, creeping on the trunks of trees. Incnosp

from the preceding, in the flowers being not one-third the size ; lobes of the calyx being linear; in the 2 superior lobes of the corolla being shorter, and acutish ; and, lastly, in the upper lobe twice as broad, shorter, and nerved ; as well as in the style being inclosed.

Small-flowered Eschynanthus. Shrub creeping, uncertain ; BLONGIFOLIUS ; downy ; stem thick, tetragonal; leaves axillary, ovate-oblong, acuminated, downy, serrulated ; cymes commonly Incarvillea ; peduncles solitary, dichotomous, with a flower in each fork; large flowers, all very villous. Corollas like those of *Martynia didndra,* colour a mixture of white and red, tinged with yellow ; one pair of the filaments large and fertile, the other abortive ; the fertile pair thick and villous, bearing large 2-lobed anthers. The capsule is shorter and thicker than in the Preceding species. The seeds are flat, and winged by a membrane all round. Perhaps a new genus.

Oblong-leaved JEschynanthus. Shrub.

RHIZOMORPHA (Wall. pl. rar. asiat. 1B p. *55, t. 7L.*) umbels terminal, branched radicant; leaves oblong, acuminated; with axillary many-flowered ; corolla subclavate, clothed with glandular down. P?. ^. S. Native of Nipaul, in woods, creeping upon trees and on rocks. Capsule 4-angled, and 4-furrowed, inches in length, compressed, 10 Seed, oblong, Celled, 4-valved. 2 bristles in the middle, and ending in a tail, at the base. Calyx tubular, 4-toothed. Corolla curved : tube slightly ventricose, upper one bifid. Stigma clavate, planu convex at top. Corolla orange-coloured, reddish above. Very nearly allied to *M. grandiflorus* (fig. 71.)

FIG. 71.

Much-branched Eschynanthus. Shrub creeping. *Cult.* For culture and propagation see ***Kytidophyllum,*** **p. 650.**

XIX. LYSIONOTUS (from λυω, *iluo,* to release ; and νωτος, *notus,* the back ; in reference to the capsule opening with elastic dorsal suture.) D. Don, in edinb. phil. journ. 7. p. 124. Blum, bijdr. 764. Incarvillea species. Willd. Chirita, Hamilt. mss.

Calyx deeply 5-cleft or 5-parted, equal. Corolla tubular, incurved, with a dilated throat, and an oblique, bilabiate, 5-lobed limb. The 2 lower ones sterile, and shorter : and upper ones antheriferous ; anthers linear, combined ; cells excavated, Capsule long, silique-formed, 2-valved, falsely 4-celled, opening with elasticity from the dorsal suture. Seeds terete, ending in a hair at both ends, as in the following herbs. Terrestrial or Parasitical glabrous, perennial herbs with creeping roots and stems. Leaves opposite or verticillate, simple. Peduncles axillary and terminal, 1-flowered, solitary or in fascicles, furnished with two opposite, involucrate leaves at the base, and bibracteate in the middle.

1 L. ARRECTA (D. Don, l. c.) root creeping; stems erect, rather fleshy; leaves 3 in a whorl, oblong-lanceolate, acuminated, coriaceous, serrated, reticulately veined ; corymbs pedunculate, 5-10-flowered, below the top of the stem. %. S. Native of Nipaul, upon trunks of trees and on rocks. L. ternifòlia, Wall. pl. asiat. rar. *2.* p. 2. t. 118. Chirita ternifòlia, Hamilt. mss. Plant glabrous. Peduncles verticillate or opposite, like the leaves. Corymbs twice or thrice trichotomous, furnished with *2* opposite bracteas under each division. Seeds terminated by a long simple hair at each end. Corollas large, pale blue.

Serrated-leaved Lysionotus. PL 1 foot.

2 L. ANGUSTIFÒLIUS (Blum, bijdr. p. *765.)* stem radicant; lower leaves opposite : superior ones subverticillate, linear-lanceolate, bluntish, veinless; axillary flowers solitary : terminal ones aggregate. %. S. Native of Java, near Buitenzorg, creeping upon trees. Bignònia angustifòlia, Blum. hort. buit. p. 82. bat. verh. 9. p. 194. Trichósporum angustifòlium, Blum, in bot. zeit. no. 9. 1825.

Narrow-leaved Lysionotus. Fl. Year. PI. creeping.

3 L. ALBIDUS (Blum, bijdr. p. *765.)* stem radicant; leaves oblong-lanceolate, rather crenulated, glabrous, veinless ; peduncles disposed in axillary and terminal fascicles; bracteas minute, subulate. 1/. S. Native *of* Java, in the western provinces, in woods, where it is called *Mengando-Manjal.* Bignònia álbida, Blum. cat. hort. buit. p. 81. bat. verh. 9. p. 195. Thichósporum álbidum, Blum. bot. zeit. no. 9. 1825. Flowers whitish.

Whitish-Cowered Lysionotus. PI. creeping.

4 L. LONGIFLÒRUS (Blum, bijdr. p. *766.)* stem radicant; leaves opposite, oblong-lanceolate, or ovate-oblong, long-acuminated, quite entire, almost veinless, glabrous; flowers disposed in terminal fascicles. If. S. Native *of* Java, in the provinces of Tjanjor, Buitenzorg ; and Bamtam, in woods on the mountains.

Far. fi; leaves narrower. 1/. S. Native of Java, among the elevated woods of Mount Gede, upon old trees.

Long-Lowered Lysionotus. Fl. Year. PI. creeping.

Cult. For culture and propagation see *Rytidophýllum,* p. 650.

XX. AGALMYNLA"(from αγαλμα, *agalma,* an ornament; and ὑλη, *hule,* a wood ; the species are great ornaments to the woods in which they grow wild.) Blum, bijdr. p. 766.

LIN. SYST. *Didyndmia, Angiospermia.* Calyx 5-parted, equal. Corolla tubular, incurved, with a dilated throat, and an oblique, 5-lobed, sub-bilabiate limb. Stamens 5, exserted, of which 2 or 4 are fertile ; anthers linear, connected, with parallel cells. Stigma biiamellate. Capsule very long, silique-formed, 2-valved, falsely 4-celled. Seeds minute, ending in a hair at both ends.—Climbing or radicant herbs, with simple leaves, and axillary fascicles of flowers. This genus is nearly allied to *Lysionòtus,* from which it differs in the biiamellate stigma, and in habit.

1 A. STAMINEA (Blum, bijdr. *767.)* stem radicant, and is, as well as the petioles, hairy; leaves alternate, oblong, acuminated, denticulated, nearly equal at the base, downy beneath and on the edges ; flowers diandrous, disposed in axillary fascicles. *1/.* S. Native of Java, in mountain woods. Justicia parasitica, Lam. ill. 1. p. 42. Cyrtándra staminea, Vahl, enum. 1. p. 105.

Long-stamened Agalmyla. PI. creeping.

2 A. ASPERIFÒLIA (Blum, bijdr. p. *767.)* stem rather scandent ; leaves opposite, elliptic-oblong, acuminated, denticulated, nearly equal at the base, rather hispid ; flowers didynamous, disposed in axillary fascicles. 1/. S. Native of Java, in humid parts of woods in the province of Tjanjor.

Rough-leaved Agalmyla. Fl. Aug. PI. climbing.

Cult. For culture and propagation see *Rytidophyllum,* p. 650.

Subtribe II.

DIDYMOCARPEJE (the plants contained in this subtribe agree with the genus *Didymocarpus,* in the siliquose capsules and naked seeds.) All as in *Trichospbrece,* except the seeds, which are not furnished with any hair at either end.

XXI. STREPTOCA'RPUS (from *arpsTTTog, slreptos,* twisted ; and *Kapnog, carpos,* a fruit; the capsule is spirally twisted.) (fig. 72. f.) Lindl. bot. reg. 1173. Didymocarpus species, Hook.

LIN. SYST. ***Didndria, Monogynia.*** Calyx 5-parted (fig. 72. a.) Corolla tubularly funnel-shaped ; throat ventricose ; limb oblique, 5-lobed, nearly equal. Stamens 4, the 2 anterior ones fertile, and the 2 sterile ones tubercle-formed (f. 72. d.) ; anthers glabrous, connate (f. 72. c.) : cells divaricate. Style compressed; stigma bilabiately dilated : lips rtfniform. Capsule siliquose, spirally twisted ; placentas bilamellate, conniving in the middle; margins revolute, seminiferous. Seeds numerous, minute, glabrous.—A tufted, stemless herb. Leaves wrinkled, flat on the ground. Peduncles radical, 1-flowered, bibracteate above the middle. Corollas pale blue.

1 S. RE'XII (Lindl. 1. c.) %. S. Native of South Africa, in the lands of Mr. G. Rex, at the Knysna, where it was discovered by Mr. Bowie. Didymocarpus Rexii, Hook. exot. fl. t. 227. Leaves ovate, crenated, 6-9 inches long, and 3-4 broad. Peduncles on the axils of the leaves. Corolla 2 inches long, pubescent. (Fig. 72.)

Rex's Streptocarpus. Fl. Year. Clt. 1824. ? PI. ½ foot.

Cult. A light rich earth or vegetable mould is a good soil for this plant; which is readily increased by division.

XXII. DIDYMOCA'RPUS (from &%xoc, *didymos,* twin ; and *Kapwog, karpos,* a fruit; in reference to the twin capsules.) Wall, ex Jack, in Lin. trans. 14. p. *32.* D. Don, prod. fl. nep. p. 122.

LIN. SYST. *Didynamia, Angiospermia.* Calyx 5-cleft. Corolla funnel-shaped, with a ventricose throat; limb 5-lobed ; upper lip the shortest. Stamens 4, rarely 5, 2 of which are antheriferous, inclosed : sterile ones very short; anthers adnate: cells transverse. Stigma lateral, flattish, obtuse. Capsule silique-formed, falsely 4-celled, 2-valved ; valves opening elastically from the dorsal suture. Lobes of dissepiment with revolute, seminiferous edges. Seeds naked, pendulous, ovate. Perennial, stemless, or caulescent herbs. Roots tufted, fibrous. Leaves usually cordate, crenated, wrinkled, hairy. Stems or scapes erect, simple. Flowers rose-coloured or purple, involucrated, disposed in dichotomous umbels.

§ 1. SCAPI'GERJE. *Stemless, scapigerous plants, with radical leaves.*

1 D. MACROPHY'LLA (Wall, in litt. ex D. Don, prod. fl. nep. p. 122.) leaves cordate-oval, dentately serrated or crenate, L. above and nearly naked beneath; scapes glabrous, shorter than the leaves; involucra and involucels quite entire, connate at the base; calycine segments 1/. G. Native of Nipaul and Kamaon; from 3000 to 7000 feet on the Himalayan mountains, towards Mussooree, and near Simla. Koy^ t. 70. f. 2. Leaves large, usually solitary, 3-7 inches long, 2½ or 5 inches broad. Petioles 3 inches long, in height to the petioles, rarely higher. Flowers eels purple.

Long-leaved Didymocarpus. PL ? to 2 tooc.

2 D. CINE^REA (D. Don, prod. fl. nep. p. 1^J. date-oval, obtuse, unequally crenated, clothed tomentum above, as well as the petioles; flowered, shorter than the leaves; involucra and are, as well as the involucels, clothed with turn ; calycine segments ovate, acute. paul. Leaves lj to 2 inclies long, about equal petioles, grey on both surfaces. Scapes large, purple.

Cinereous Didymocarpus. PI. 5 foot.

S D. TLICATA (D. Don, l. c.) leaves twin, cularly cordate, fleshy, rugosely plicate above, lacunosely veined beneath, with revolute edges cent, many-flowered. %. G. Native of N.paul. branched, fibrous, densely tufted. Leaves an men 5 inches high.

Plicate-leaved Didymocarpus. PI. f i

§ 2. *Caulescentes. Caulescent plants*

4 D. VILLOSA (D. Don, l. c. p. 12*0 villous; leaves unequal, oval, petiolate, doubly ci with silky villi on both surfaces ; peduncles many-flowered, glabrous, longer than the leav smooth. IC. G. Native of Nipaul. Leaves 1-^m rounded at the base: radical ones none. very short, rounded. Corolla large, purple.

Villous Didymocarpus. PL \ to \ foot.

5 D. OBLONGA (Wall. pi. rar. asiat. 2. p. »* Don, prod. fl. nep. p. 123.) stem furnished with 2-4 leaves at top, woolly, or downy ; leaves elliptic-oblong, or ovate-oblong, acuminated, rather villous ; peduncles terminal, crowded, twice forked, with 2 sessile, cordate sessile bracteas under each bifurcation, downy. 1(1. G. Native of Nipaul, among rocks on Sheopore. Radical leaves none. Leaves 2\ inches long, and below an inch broad. Middle pedicels 1-flowered, and lateral ones generally 2-flowered. Corollas dark purple. Bracteas or involucral leaves quite entire, and are, as well as the calyxes, coloured. (Fig. 73.)

Oblong-leaved Didymocarpus. PL \ to \ toor.

6 D.AROMA'TICA (Wall, in edinb. phil. J rar. asiat. 2. p. 31. t. 141. D. Don, prod. fl. nep. leafy, pubescent; radical leaves few, pressed to ovate-cordate, obtuse, crenated, on short petioles, cauline ones broad-cordate, on long petioles,

acutely toothed, and with two pairs of others at the top of the stem, which are crowded, ovate, acutely toothed ; peduncles 2-3, terminal, twice or thrice dichotomous or trichotomous; central pedicels twin, or solitary: terminal ones by threes. %. G. Native of Nipaul and Kamaon, on rocks and trunks of trees. Plant pubescent. Bracteas or involucels cordate under each division of the peduncles. Calyx campanulate, fleshy, bluntly 5-toothed. Corollas purple. This species yields an aromatic drug which is in high repute among the Hindoos, especially their ladies, who use it as a perfume. It is called *Kumkuma,* also *Rani-Goindhi,* and consists of the dried primordial leaves, which are wrinkled, small ovate, covered with dense silvery, soft hairs, intermixed with numerous brown, resinous dots. When rubbed between the fingers they assume a reddish tinge. Their fragrance is of a very delightful kind, and continues long after they have been dried. The leaves of all the species possess in a greater or less degree a peculiar fragrance, which is elicited by rubbing the green parts, but is entirely lost in the dried state, except in the present species.

Aromatic Didymocarpus. PL 1 to 1 foot.

D. PRIMULIFOLIA (D. Don, prod, fl. nep. p. 123.) stem procumbent, bearing 4 crowded leaves at top ; leaves cordate-oval, petioled, twice crenated, wrinkled and silky on both surfaces ; peduncles axillary-flowered, and are, as well as the calyxes, at the base bracteas or involucels roundish oval, mucronate, connate. Leaves radical leaves none. Flowers like those of *Primula veris.* Calycine segments roundish. Corolla purple.

Primrose-leaved Didymocarpus. PL \ to \ foot.

33 D. CRININTA (Jack. mal. misc. vol. 1. Lin. trans. 14. p. 33.) stem short, thick, erect; leaves alternate, spatulate, acute, serrated, pilose, red; peduncles 2-5 together, axillary, 1-flowered, cohering with the petioles at the base; flowers reddish, hairy. %. S. Native of Pulo-Penang, in the tall forests, where it is called *Timmu* by the natives. Root long, sessile. The whole plant hairy. Leaves crowded, nearly alternate, 9 inches long. Peduncles furnished each with 2 incurved bracteas. Corolla white, tinged with purple ; tube swelling above ; limb sub-bilabiate. Anthers combined, divaricate, transverse lobes.

Long-haired Didymocarpus. PI. 1 foot with the leaves.

D. RACEMOSA (Jack. in Lin. trans. 14. p. 34.) stem erect; leaves opposite, lanceolate, attenuated at both ends, doubly serrated, glabrous above; peduncles axillary, usually bifid; flowers disposed in two rows along the rachis. %. S. Native of Sumatra, on the west coast at Tappanooly. Leaves on short petioles, spreading about 9 inches long ; all pilose, on the under surface, and the midrib on the upper, purple. Petioles short, stem-clasping. Peduncles covered with ramified glandular hairs. Bracteas lanceolate, acuminated, serrated. Corolla white. Calyx reddish, hairy. Capsule cylindrical, hairy.

10 D. PROSTRATA (Jack. mal. misc. vol. 1. Lin. trans. 14. p. 25.) Prostrate> creeping ; leaves petiolate, elliptic, crenulated; peduncles 1-3 together, axillary, 1-flowered. %. g. Native of Pulo-Penang, in the forests, where it is called *Timmu-Kichel* by the Malays. Stem villous. Leaves (when flat) slightly cordate, opposite, obtuse, covered with white hairs, rather reddish beneath. Petioles villous. Peduncles filiform, villous with reddish hairs. Calyx funnel-shaped with bracteas near the summit. Corolla white, Anthers approximate, reniform, 2-celled. Disk surrounding the ovarium, 5-toothed. Creeping didymocarpus. PL creeping.

11 D. CORNICULATA (Jack, 1. c. p. 3G.) villous; stem erect; leaves alternate, obovate, acuminated, serrated ; flowers fastigiate, secund; peduncles solitary, axillary, elongated. %. S. Native of Sumatra, at Tappanooly. Peduncles bearing several dense fascicles of secund flowers, spreading in a kind of semicircle somewhat in the manner of *Lotus corniculatus.* Pedicels and calyxes covered with glandular hairs. Bracteas linear, acute. Corolla white, form of the genus ; anthers cohering; cells transverse. The capsules spreading horizontally like radii in a semicircle, of which the peduncle is the axis.

Horned Didymocarpus. PL 1 to *2* feet.

12 D. BARBATA (Jack. 1. c. p. 38.) shrubby, erect; leaves opposite, ovate, somewhat unequal sided, hairy ; peduncles slender, axillary, fascicled, 2-6-flowered ; stamens 4, bearded at top, *2* of which are sterile ; calyx smooth, funnel-shaped, f? . S. Native of Sumatra. Branches scabrous. Leaves petiolate, entire, strigose above. Peduncles bifid, or trifid, sometimes again divided, so as to be dichotomous. At each division of the peduncle is situated a funnel-shaped bracteal cup, apparently composed of two opposite bracteas, which are united nearly their whole length. In the axillae at the base of the peduncles the bracteas are distinct and woolly. Mouth of calyx 5-cleft. Corolla with nearly equal, rounded segments. Anthers with transverse lobes. Stigma sublobate.

Bearded-stamened Didymocarpus. Shrub.

13 D. ELONGATA (Jack, 1. c. p. *37.)* erect, pilose; leaves opposite, ovate, acute at both ends, serrated ; spikes axillary, secund ; pedicels binate, remote; calyx tomentose, as well as the spike ; corolla elongated. %. S. Native of Pulo Bintangor, an island lying off the west coast of Sumatra. Leaves petiolate, papillose and pilose above, but villous beneath ; petioles ciliated. Bracteas linear at the base of the pedicels. Corolla tubular, a little curved, white, with a purplish tinge, slightly tomentose ; limb bilabiate : lower lip elongated. Stamens 4, all fertile and didynamous ; anthers connected by pairs, 2-lobed, reniform. Stigma thickened, emarginate.

Elongated-flowered Didymocarpus. PL \ foot.

14 D. FRUTESCENS (Jack, mal. misc. vol. 1. Lin. trans. 1. c. p. 39.) stem suffrutescent, erect; leaves opposite, on long petioles, ovate-lanceolate, attenuated at both ends, glabrous above, canescent beneath ; flowers axillary, fascicled ; stamens didynamous ; calyx tomentose, with glandular hairs. T?. S. Native of Pulo Penang. Stem simple, densely covered with ferruginous, adpressed scales, or chaffy hairs. Leaves slightly serrated, 8-10 inches long, tomentose beneath ; petioles villous. Peduncles 1-3-flowered, shorter than the petioles, purplish. Bracteas lanceolate, acute. Calyx tubular, 5-parted. Corolla white, tomentose, incurved; segments obtuse. Anthers connected by pairs, adnate, consisting of *2* nearly parallel lobes. Stigma truncate.

Shrubby Didymocarpus. Shrub.

Cult. For culture and propagation see *Slreptocdrpus,* p. *658.*

XXIII. CHIRATA (altered from the vernacular name of one of the species.) Hamilt. mss. D. Don, prod. fl. nep. p. 89. Royle, ill. himal. t. 70. Wall. pi. rar. asiat. 1. p. 43. t. 50.—Calosacme, Wall.—Didymocarpus species, Wall.

LIN. SYST. *Didynamia^ Angiospermia.* Calyx deciduous, tubular, 5-cleft. Corolla tubular at the base, ventricose at top ; limb campanulate, 5-lobed, bilabiate; lobes rounded, imbricate in aestivation. Stamens 2, antheriferous, inclosed, sometimes without any rudiments of sterile ones, and sometimes with 3 ; filaments glabrous; anthers roundish, naked, adnate. Stigma bipartite ; lobes linear, obtuse. Capsule siliquose, 2-celled,

many-seeded ; dissepiment parallel. Seeds naked, acute at both ends.—Perennial hairy herbs. Stems simple. Leaves opposite, unequal in size. Peduncles axillary, opposite, bibracteate, usually 1-flowered. Flowers large red, or purple.

1 C. URTICIFŌLIA (Hamilt. mss. ex D. Don, prod. fl. nep. p. 90.) leaves elliptic, acute, nearly equal, serrated ; peduncles 1-flowered, shorter than the leaves ; calycine segments linear-lanceolate, obtuse. 7/. G. Native of Nipaul, at Narainhetty. Didymocárpus specidsus, Wall. mss. Stem ascending, rooting at the base, tetragonal, hairy. Leaves often 4 inches long. Bractea ovate-oblong, bluntish, remote from the flower. Flowers reddish purple, size of those *of Digitālis purpùrea.*

Nettle-leaved Chirata. PI. | to 1 foot.

2 **C.** PU'MILA (D. Don, prod. fl. nep. p. 90.) leaves unequal, elliptic, bluntish, serrated, red beneath ; peduncles 2-flowered, about equal in length to the leaves. *%.* G. Native of Nipaul. Stem low, tetragonal. Larger leaves *2*\ inches long, and \\ inch broad. Peduncles bibracteate in the middle. Very like the preceding, but much more humble, and the flowers smaller.

Dwarf Chirata. PL \ foot.

3 **C.** BIFŌLIA (D. Don, prod. fl. nep. p. 90. Royle, ill. himal. t. 70.) stem 2-leaved'' pubescent; leaves very unequal in size, pubescent, crenated, the one small and petiolate, and the other large, cordate, sessile; peduncle terminal, 1-flowered. 1£.G. Native of Nipaul and Kamaon, Wall. ; from Jurreepanee upwards towards Mussooree, and near Simla, Royle. Didymocárpus bifòlia, Wall, in lit. Calosácme amplectens, Wall. cat. no. 800. Stem filiform. Largest leaf *2* inches long, and 1^ broad, rounded at top. Flowers like those of the preceding, reddish purple, but smaller.

Two-leaved Chirata. PI. \ foot.

4 C. MACROPHY'LLA (Wall. pi. rar. asiat. 1. p. *56.* t. *72.)* root creeping ; leaves on lorfg petioles, ovate-cordate ; scape elongated, few-flowered; corolla cylindrical, ventricose in the middle. 1/. G. Native of Nipaul, on Sheopore, in shady woods.. Corolla yellow. Stamens 5, the *3* sterile ones subcapitate. Anthers oblong.

Large-leaved Chirata. PI. *2* feet.

5 C. GRANDIFLŌRA (Wall. pi. asiat. rar. 1. p. 43. t. 50.) stem ascending ; leaves ovate, acuminated, pilose ; peduncles axillary, few-flowered. *%.* G. Native of Nipaul, on the high mountains in humid places, upon rocks. Flowers large, rose-coloured. Calyx 5-nerved, 5-angled, 5-cleft, inflated. Corolla funnel-shaped, pilose. Stamens 5, the *2* lower fertile, bearing reniform, cohering, 1-celled anthers; the *3* sterile ones subulate, pilose, and subcapitate. Stigma funnel-shaped, 2-lobed. Seeds small, subulate, naked, acute at both ends.

Great-Jlowered Chirata. PI. 1 to *2* feet.

Cult. For culture and propagation see *Streptoc&rpus,* p. *658.*

Subtribe III.

CYRTA'NDREiE (this tribe contains plants agreeing with the genus *Cyrtándra,* in the fruit being baccate, and in the seeds being erect.) Fruit baccate. Seeds pendulous, naked.

XXIV. CYRTA'NDRA (from *KV,TOQ, kyrtos,* a curve ; and *avr)p avdpog, aner andros,* a male.) Forst. gen. *3.* no. 1. Jack, in Lin. trans. 14. p. *25.* t. *2.* f. 1. a. g. Blum, bijdr. 767. Gaud, in Freyc. voy. pt. bot. p. 446. t. *56.* &c. Besléria species, Forst. prod. no. 236.

LIN. SYST. *Didndria, Monogýnia.* Calyx tubular, 5-cleft, nearly equal, or sometimes somewhat bilabiate. Corolla funnel-shaped, having the tube widened upwards; the limb 5-lobed and sub-bilabiate. Stamens 5, ex Blume, 4, ex Jack, *2* of which are antheriferous, the other *2* or 3 stenle; ceUs of thers parallel. Stigma obtuse, or cap.tate, often « Fruit baccate, longer than the calyx. Lobes of d.ssep.mentw revolute, seminiferous margins. Seeds naked, usuallj dotted—Shrubs or herbs with erect or P^umbeD' -ste Leaves opposite, those opposed to each other ™eqi*n one of them being almost abortive. Flowers cap.tate, fascicles, rarely solitary, axillary, bracteate, or involucra white, or of a dull purple colour.

§ I. *Stems herbaceous, procumbent, or erectish. capitate, almost inclosed in the large one-leaved Species natives of Java and Sumatra.*

1 C. GLAW (Jack, in Lin. trans. 14. p. 28. Blurry 768.) almost stemless ; leaves alternate, (the °PP^" sometimes subcordate at the base, serrulated, of flowers on short peduncles, involucrated; campanulate, closely embracing the flowers. %• *>. Java, in the humid parts of woods in the provinces Buitenzorg, &c. Blume. Interior of Bencoolen, large, white, with a pale yellowish throat. Antheriier ments thick. Leaves about 7 inches long by *5* broaa.

Glabrous Cyrtandra. PI. \ to \ foot.

2 **C.** PE'NDULA (Blum, bijdr. p. 768.) stem, mitom ; leaves opposite, on long petioles, elhptic-ooi nated, serrated, smooth above, but rather villous on beneath ; heads of flowers involucrated on pendulous. %. S. Native of Java, in humid place mountains. Flowers dirty white, dotted with bottom. Calyx tubular, 5-cleft, split on one siae. stamens *3,* minute. Nearly allied to *C. bicolor.*

Pendulous-flowered Cyrtandra. PL creeping.

3 **C.** BI'COLOR (Jack, in Lin. trans. 14. p. *27.)* creeping at bottom ; ? leaves opposite, elliptic-lanceo at the base, glabrous above, villous and purple bene the length of the petioles; heads of flowers on' are shorter than the petioles, embraced by a deem crum. %. S. Native of Sumatra. Leaves on 9-10 inches long, the opposite ones nearly abortive. reflexed, bearing each a head of 6-10 flowers. <- white. Sterile filaments *2.*

Two-colouredAeaved Cyrtandra. PI. erectish.

4 C. PI'CTA (Blume, bijdr. p. 769.) stems F torn ; leaves remote, opposite, one of which is aimos on long petioles, broad-ovate, acute, a little attenua base, or subcordate, serrated, but rather villous on beneath ; heads of flowers involucrated, axillary, ? %. S. Native of Java, in humid places on the i Flowers large, white, having the throat dotted wit Stigma dilated, obtuse. Sterile stamens 3, minute. allied to *C. maculdta.*

Painted-flowered Cyrtandra. PI. procumbent.

5 **C.** MACULA TA (Jack, in Lin. trans. 14. p. leaves opposite, one abortive, the other roundish cor serrated, glabrous above, and rather villous beneaui, heads of flowers involucrated, axillary. %- Sumatra. Leaves 4 inches long by H 5-toothed. Corolla white, with a large purple spot o the *3* lower lobes. Sterile stamens *2.* Fruit obion disposed round the lobes of the dissepiment.

Spotted-flowered Cyrtandra. PI. low.

6 C. HU^MILIS (Blum, bijdr. 769.) stem pr°cumben ing; leaves approximate, opposite, on long petioles,

obtuse at both ends, rounded at the base, serrated, glabrous above, but rather downy on the veins beneath ; heads of flowers axillary, involucrated, sessile. 1/. S. Native of the island of ^usae-Kambanga, in woods. Corolla pale yellowish. Filaments of the fertile stamens rather villous on the back. Stigma emarginate. Nearly allied to *C. picta.*

Humble Cyrtandra. PL creeping.

U MACROPHY'LLA (Jack, in Lin. trans. 14. p. 25. t. 2. f. 1. g«) erectish; branches 4-sided, with rounded angles, and two opposite sides deeply furrowed ; leaves roundish-ovate, serrated, glabrous, the opposite ones abortive, on long petioles ; peduncles shorter than the petioles ; flowers capitate, nearly sessile, supported by a 1-leaved involucrum. %. S. Native of the interior of Sumatra. Leaves dark green above, and whitish beneath. Corollas white. Sterile filaments *2.* Stigma funnel-shaped.

Large-leaved Cyrtandra. PI. 1 foot.

C. HIRSUTA (Jack, 1. c. p. 27.) plant ascending, pilose ; leaves elliptic-ovate, cordate at the base, crenated, pilose on both sides, on long petioles, the opposed ones generally unequal; peduncles 5 heads few-flowered, involucrated by a 2-parted involucrum, densely woolly. 1/. S. Native of Sumatra, 6 inches long and 3 broad 5 petioles as long as the leaves, emerging from the stem at the base, and uniting with the base of the opposite one. Peduncles axillary, reflexed, villous. Corolla Cents. Stigma thick, depressed. Sterile fila-

Hairy Cyrtandra. PI. ascending,

C. INCOMPTA (Jack, I.e. p. 29.) plant erect, shaggy with brown hairs ; leaves elliptic-ovate, serrated, on long petioles, leaves opposed ones abortive; heads of flowers propped by a 2-leaved involucrum, densely woolly. 1/. S. Native of Sumatra, where it is called *Langkavang* by the Malays. Leaves villous, villous beneath. Peduncles shorter than the petioles. Corolla ring Ovarium embraced by a nectanal

R ecked Cyrtandra. PI. erect.

Pilose Vom AUXREA (Jack, L c.) sllow, erect; Stem thick) 4-sided, acum adpressed hairs ; leaves opposite, roundish ovate, heads serrated clothed with silky pili, on long petioles ; ativ lowers dense, nearly sessile, involucrated. %. S. B 6 of the interior of Bencoolen, at the foot of Gunong the Leaves both perfect. Involucrum closely investing n Ca of flowers. Corolla yellow, sub-campanulate : limb Stigma bilabiate/

Golden-flowered Cyrtandra. *Pl. erect.

C. PELTATA (Jack, l- c. p. 30.) kaves peltate, ovate, acuminated; heads on very short peduncles, involucrated. %. Leaves of Sumatra. Stem ascending, terete, smooth, serrated, on long Petioles, the opposite petioles, abortive, bluntly White Smooth» Paler beneath, 8-10 inches long. Corolla 2. ^^llrnel-shaped ; limb rather irregular. Sterile filaments Pen^XX\m embraced by a nectarial ring.

We-leaved Cyrtandra. PL ascending.

§ 2. *Stems herbaceous. Peduncles bibracteate, 1-2-3-jlorvered. Flowers not coloured.—Species natives of the Sandwich Islands.*

56. C. COR_DIFOLI/V (GaU(L in Freyc. voy. pt. bot. p. 446. t. hair leaves roundish-ovate, acute, obliquely cordate,, toothed, Pedun 3-flowered but cloth ed with villous tomentum beneath, rusty ; Native of the Sandwich Islands, from the altitude of 100 to 300 along with the following species.

Cordate-leaved Cyrtandra. PI. erect.

IS C. GRANDIFLORA (Gaud. 1. c. p. 447. t. *55.)* leaves oblong, acuminated, narrowed at the base, obsoletely denticulated, ciliated, smoothish above, but paler beneath, with the nerves and veins clothed with powdery down ; peduncles 2-leaved and *2*-flowered at the apex; calyxes glabrous. 1/. S. Native of the Sandwich Islands.

Great-flowered Cyrtandra. PI. erect.

14 C. LESSONIA'NA (Gaud. 1. c. t. 54.) leaves oblong, acuminated, narrowed at the base, denticulated, puberulous above, but clothed with silky tomentum beneath, rusty ; peduncles 1-flowered, bibracteate; calyx rather villous, 5-parted, with the edges of the segments undulately indexed. %. S. Native of the Sandwich Islands.

Lesson's Cyrtandra. PI. erect.

15 C. TRIFLORA (Gaud. 1. c. t. 52.) leaves oblong, sub-acuminated, cuneated at the base, somewhat doubly serrated, glabrous ; nerves and veins clothed with adpressed down beneath ; peduncles 3-flowered; calyxes smoothish. %. S. Native of the Sandwich Islands.

Three-flowered Cyrtandra. PI. erect.

16 C. BIFLORA (Forst. gen. 3. no. 1.) leaves ovate, quite entire; involucrum caducous, inflated; peduncles 2-flowered. 3£. G. Native of Otaheite. Besleria biflora, Forst. floral, no. 236.

Two-flowered Cyrtandra. PI. erect.

17 C. CARNOTIA'NA (Gaud. 1. c. t. *53.)* leaves elliptic-oblong, acute, running into the petioles, remotely serrulated, hairy above, and clothed with soft tomentose pubescence beneath, canescent; peduncles few-flowered, subdichotomous; calyxes villously pubescent. %. S. Native of the Sandwich Islands.

Carnoti's Cyrtandra. PI. erect.

18 C. PALUDOSA (Jack, 1. c. p. 447.) leaves oblong, acuminated, narrowed at the base, coarsely serrated, glabrous, paler beneath; peduncles 1-flowered. %. S, Native of the Sandwich Islands.

Marsh Cyrtandra. PI. erect.

19 C. MENZIE SII (Hook, et Am. in Beech, voy. pt. bot. p. 91.) leaves 4 in a whorl,? oblong, short-acuminated, cuneated at the base, somewhat denticulately ciliated towards the apex, rather scabrous above, glabrous beneath, but the nerves and veins are clothed with adpressed down ; peduncles bearing many flowers, which are disposed in an umbellate manner; calyx hairy, with subulate teeth. 1£. S. Native of the Sandwich Islands.

Menzies's Cyrtandra. PI. erect.

§ 3. *Stems suffrulicose, erect. Corollas bilabiate, dirty purplish, or dirty yellow, for the most part small, and disposed in fascicles. Habit different from the other sections, and have more resemblance to the Didymocarpus frutescens. The species of this section might form a distinct genus, on account of their bilabiate corolla and longer fruit, and in the whole superfees of the lobes of the dissepiment being seminiferous.*

20 C. PILOSA (Blum, bijdr. p. 770.) stem ascending, simple, tetragonal at top ; leaves opposite, obovate-oblong, sharply serrated, sessile, pilose above, and strigose on the veins beneath; fascicles many-flowered, on short peduncles, axillary, involucrated by foliaceous bracteas. T? . S. Native of Java, in humid places on the mountains of Salak, Gede, Seribu, &c. Flowers dirty yellow, having the lower lip reddish inside, and 3-lobed : upper lip emarginate, smaller. Sterile filaments 3, small. Allied to C *rubiginosa.*

Pilose Cyrtandra. Shrub small.

21 C. RUBIGINOSA (Jack, in Lin. trans. 14. p. 32.) stem erect, 4-angled, bristly in the young parts ; leaves opposite, petiolate, obovate-lanceolate, acuminated, acutely serrated; the nerves pilose on the lower surfaces ; peduncles axillary, fascicled, 1-flowered, and, like the calyxes, clothed with clammy pili. f? . S. Native of Sumatra. Bracteas linear, acute. Corolla of a dusky purple colour, pilose outside : lower lip of 3# small shallow lobes : upper lip bifid, shorter. Stigma bluntly bilabiate. Berry cylindrical. Sterile filaments 2.

Rusty Cyrtandra. Shrub small.

22 C. SULCA^TA (Blum, bijdr. p. 770.) stem erect, tetragonal, furrowed above, clothed with brown tomentum; leaves opposite, petiolate, oblong, long-acuminated, unequally narrowed at the base, unequally and sharply serrated at top, smoothish above, but rather villous on the nerves beneath ; fascicles of flowers almost sessile, axillary, bracteate. T? . S. Native of Java, on Mount Megamendung. Corolla dirty purple: upper lip 2-lobed : lower one larger and 3-lobed. Sterile filaments 3, small.

Var. ft; leaves larger; flowers white. *2 • S. Native of Java, on the Seribu mountains.

Furrowed Cyrtandra. Shrub small.

23 C. NEMOROSA (Blum, bijdr. p. 771.) stem erect, tetragonal, downy at top; leaves opposite, petiolate, oblong, acuminated, obliquely attenuated at the base, unequally and deeply serrated, rather downy on the veins on both surfaces ; fascicles of flowers pedunculate. T? . S. Native of Java, in groves. Calyx sub-bilabiate : lower lip bifid : upper trifid. Corolla bilabiate : upper lip emarginate, brown: lower lip 3-lobed, and larger, dirty white, and brownish in the throat. The fertile filaments are thickened at top ; and the middle one of the 3 sterile shortest.

Grove Cyrtandra. Shrub small.

24 C. ROSTRA'TA (Blum, bijdr. 771.) stem almost terete, erectish ; superior leaves alternate, those opposed being very small, petioiate, oblong, beaked, unequally attenuated at the base, and unequally and sharply serrated at top, glabrous above, but rather villous on the ribs beneath ; fascicles of flowers pedunculate, axillary. *1?* • S. Native of Java, in woods on the Seribu mountains, and on mount Salak. Corolla dirty purple, rather villous outside, sub-bilabiate, with a gibbous throat. Sterile filaments 3. Nearly allied to *C. nemorosa* and *C. sulcata.*

Far. ft ; flowers purple and white. ^ • •§.

Beaked-leaved Cyrtandra. Shrub small.

25 C. FLAVE'SCENS (Blum, bijdr. p. *772.)* stem terete, erectish ; leaves opposite, petiolate, oblong-lanceolate, acuminated at both ends, unequally and remotely serrated, downy on the veins beneath ; flowers solitary, axillary, almost sessile. h_c . S. Native of the Island of Nusae-Kambanga, in humid places among bushes. Corolla sulphur-coloured, funnel-shaped, bilabiate, rather villous outside. Sterile filaments 2, minute.

Yellowish-fiovtered Cyrtandra. Shrub small.

26 C. COCCINEA (Blum, bijdr. p. 772.) stem erect, tetragonal; leaves opposite, on long petioles, oblong, acuminated, glandularly serrated, oblique at the base, having the ribs for the most part blood-coloured beneath, smooth ; fascicles of flowers pedunculate, axillary, umbellate. ^ . S. Native of Java, in woods in the interior. Calyx ventricose, 5-cleft, sub-bilabiate. Corolla somewhat bilabiate, scarlet, sometimes whitish-brown. Sterile filaments 3, minute. Berry elongated, beaked.

Scarlet-flowered Cyrtandra. Shrub small.

27 C. CELE'BICA (Blum, bijdr. p. 772.) stem erect, tetragonal; leaves opposite, on long petioles, elliptic-oblong, acuminated, unequally attenuated at the base, crenulated, glabrous, but clothed with cobwebbed down while young; fasoclw o flowers panicled, axillary. *?. S. Native of the Cc'ebes, woods. Allied to *C. coccinea,* from which it diflers in fascicles of flowers being panicled.

Celebes Cyrtandra. Shrub small.

28 C. OJ'NDI. (Blum, bijdr. p. *773.)* terete ; leaves opposite, on long petioles, sometimes obliquely cordate at the base, doubly and g serrated, sometimes tomentose beneath on the nerve* fascicles of flowers pedunculate, axillary, involucre lucrum bifid. T? . S. Native of Java, in the nigne mounts Gede and Salak.

Far. ft ; leaves deeply serrated. *? . S.

Great Cyrtandra. Shrub.

29 C. ARBORE'SCENS (Blum, bijdr. p. *773.)* sterri erec gonal; leaves large, opposite, elliptic-oblong, running petioles at the base, unequally toothed, smoothish rather tomentose beneath ; heads of flowers pedunc lucrated; involucrum large, foliaceous, bifid. *?* humid of Java, in the province of Tjangor, on the mountains, parts of woods.

Arborescent Cyrtandra. Shrub.

30 C. CUNEATA (Blum, bijdr. p. 773.) stem erec leaves opposite, the one smaller than the other, peti ate-oblong, acuminated, obsoletely denticulated at top, above, but rather strigose on the veins beneath ; u lary, on long peduncles. Tj • S. Native of the Moluccas.

CuneateAesLved Cyrtandra. Shrub.

31 C. FRUTE'SCENS (Jack, in Lin. trans. 14. P erect; leaves opposite, lanceolate, serrated, glabrous peduncles axillary, generally 3-flowered, *not* so petioles. Tj.S. Native of Sumatra. Leaves Bracteas linear at the base of the pedicels. subulate. Corolla purplish: lower lip *longer;* shallow. Sterile filaments 2. Stigma dilated, Berry cylindrical: lobes of the dissepiment revoluce, niferous on their whole surfaces, like most of the oi in this section.

Shrubby Cyrtandra. Shrub.

Cult. For culture and propagation of the see *RyU'* see *Streptocdrpus,* p. 658, and for the shrubby specie *dophyllum,* p. 550.

XXV. WHITIA (evidently dedicated to the name of White, of whom we know nothing.) Blum. bijdr. p. 774.

LIN. SYST. *Didndria, Monogynia.* Calyx small, cleft, equal. Corolla funnel-shaped, having the tuo upwards ; limb 5-lobed, irregular, sub-bilabiate. of which are antheriferous and hardly exserted, ana setaceous and sterile. Cells of anthers unequal in Stigma somewhat funnel-shaped. Fruit baccate, siliqu lobes of dissepiment fleshy, and bearing the seeds on lute edges. Seeds naked, striated, surrounded Climbing shrubs, with opposite, simple, entire, o those opposed to each other of unequal size. *I* ers axillary, bracteate, on short peduncles. from *Cyrtdndra,* in the calyx being small, and divi the base, not tubular ; in the stamens being exser closed ; in the insertion of the anthers being lel; in the stigma being funnel-shaped, not capitate nate.

1 W. OBLONGIFOLIA (Blum, bijdr. p. 774.) ceolate, glabrous ; fascicles of flowers on short p

teas lanceolate; fruit elongated. I? . S. Native of Java, in n^am Woods, where *k* is called *Lida-bebek.*

Ublong-leaved Whitia. Fl. Year. Shrub climbing.

* W. CARNOSA (Blum, bijdr. p. 775.) leaves oblong-lanceolate, atlier tomentose beneath ; fascicles of flowers on short pedunES)^xillary, involucrated by 2 bracteas ; fruit oblong. f? . w. • Native of Sumatra, and of Java, in woods on the Seribu mountains. Cyrtandra carnosa, Jack, in Lin. trans. 14. p. *30.* lon Stem obscurely 4-sided, smooth. Largest leaves *7-8* incites : the °Pposite ones small, roundish-cordate. Corolla wh e.

Meshy Whitia. Fl. Year. Shrub climbing.

65o Cult. For culture and propagation see *Rytidophyllum,* p.

XX V. RHYNCHOTECHUM (from *pvyx°£> rhynchos,* a beak, but the application is not evident.) Blum, bijdr. *775.* Coroll' SYST* *DMywmia* Angiospermia.* Calyx 5-cleft, equal, limb a^ tha snort campanulate tube, and an unequal, 5-lobed celled f stamens 4» somewhat didynamous, inclosed; anthers 1-globo' ^ ^tya^e lncurve(^ » stigma obtuse. Fruit baccate, lute S6 glrded by tne calyx : lobes of fleshy dissepiment revo- *Vrt7ii* Seminiferous. Seeds naked. This genus differs from 1-cell T mall 4 stamens being fertile ; in the anthers being x ^ *> and in the berry being globose.

leaver" PARVIFLORUM (Blum. p. *775.)* stem simple, terete; neath • °Pposite> oblong-lanceolate, serrated, rather villous beh . S' °?r^mbs dichotomous, axillary ; pedicels subfasciculate. Sm /; ^ative o^Java J °n the Seribu mountains.

Cub er6d Rhynchotechum. Shrub.

3 L y loxonia. PI ? *' ^CTJ'RRENS (Bl (Blum, bijdr. p. 776.) leaves opposite, oblong, acuminated, cuneated at the base, decurrent, serrated, glabrous ; flowers in fascicles, axillary. %. S. Native of Java, on the Seribu mountains, in humid places.

Decurrent-leaved Loxonia. Fl. Feb. Shrub.

Cult. For culture and propagation see *Streptocdrpus,* p. 658.

XXVIII. CENTRO'NIA (from *Kevrpov, kentron,* a spur; back of anthers spurred at the base.) Blum, bijdr. p. 776.

LIN. SYST. *Didyndmia, Angiospermia.* Calyx spathaceous, cleft on one side. Corolla funnel-shaped, with a bilabiate, nearly equal limb ; upper lip 2-lobed: lower lip 3-lobed, spreading. Stamens 4, inclosed; anthers 1-celled, spurred on the back at the base, free. Style thick; stigma capitate. Fruit baccate, silique-formed ; lobes of fleshy dissepiment revolute, seminiferous. Seeds naked.—A small, rather fleshy, parasitical plant, furnished with ovate obtuse stipulas and bracteas.

1 C. MIRA'BILIS (Blum, bijdr. p. *777.) 1/..* S. Native of Java, on Mount Salak, in humid parts of woods.

Showy Centronia. Fl. Sept. Oct. PL small.

Cult. For culture and propagation see *Streptocdrpus,* p. 658.

XXIX. UTA'NIA (an alteration from its vernacular name Tjankuda-Utan.) Kuhlia, Reinwdt. herb, ex Blum, bijdr. p. 777. but not of Kunth.

LIN. SYST. *Didynamia, Angiospermia.* Calyx 5-cleft; segments imbricate, permanent. Corolla funnel-shaped, with a 5-lobed, nearly equal limb. Stamens 5, exserted ; anthers incumbent, bifid at the base. Style erect; stigma capitate. Fruit baccate, olive-formed ; lobes of fleshy dissepiment revolute, seminiferous. Seeds naked.—A branched shrub, with rather large, opposite, oval leaves, which are acutish at both ends, quite entire, coriaceous, glabrous, and undulated. Panicles terminal, drooping ; pedicels subcorymbose.

1 K. MORINDIEFOLIA ; Tj . S. Native of Java, at the foot of Mount Salak, where it is called *Tjankuda- Utan.* Kuhlia morindaefolia, Blum, bijdr. p. 777.

Morinda-leaved Kuhlia. FL Year. Shrub.

Cult. For culture and propagation see *Rytidophyllum,* p. 650.

XXX. FIELDIA (named after Baron Field, F.L.S., &c. late Judge of the Supreme Court of New South Wales.) Cunningh. in Field's New South Wales, p. *363.* icone. Hook. exot. fl. t. 1. p. *232.*

LIN. SYST. ***Didyndmia, Angiospermia.*** **Calyx deeply 5-**parted, permanent, inclosed in a spath-formed bractea, which is cleft on one side. Corolla tubularly ventricose ; limb 5-lobed, equal, somewhat bilabiate. Stamens 4, didynamous, with the rudiment of a fifth ; filaments dilated ; anthers 2-celled, roundish. Stigma bilamellate. Berry white, spongy, fleshy, 1-celled. Seeds small, numerous, dotted, attached to two fleshy, parietal, bilamellate placentas.—A climbing, radicant shrub, almost parasitical upon the trunks of trees, clothed with dense rusty down when young. Leaves simple, opposite, remote: those opposed to each other, unequal in size, elliptic, acute at both ends, deeply serrated in the upper half, downy, of a deep green colour ; petioles downy. Peduncles axillary, solitary, 1-flowered. Flowers pendulous, greenish-white.

1 F. AUSTRA'LIS (Cunningh. 1. c. Hook. L c.) *h* . ^. G. Native of New South Wales, on the Blue Mountains, Caley, in 1804 ; and upon naked rocks on the Five Islands, Cunningh. in 1822.

Southern Fieldia. Shrub creeping.

Cult, For culture and propagation see *Rytidophyllum,* p. 650.

Subtribe IV.

LOXOTIE'^E (this subtribe agrees with the genus *Loxotis,* in the seeds being erect.) Capsule 2-valved or circumcised. Seeds erect, naked.

§ 1. *Capsule 2-valved.*

XXXI. LOXO'TIS (from *Xo&g, loxos,* oblique ; corollas.) R. Br. ex Benth. scrop. ind. p. *57.* Antonia, R. Br. but not of Pohl. Wulfenia species, Wall.

LIN. SYST. *Didndria, Monogynia.* Calyx tubular, 5-cleft. Corolla with a tubular base, and a short, bilabiate limb. Stamens *2,* fertile ; anthers cohering : sterile ones wanting, or very minute.— Herbaceous plants.

1 L. OBLI QUA (Benth. scroph. ind. p. *57.)* calyx shortly 5-cleft; segments broad-lanceolate, bluntish. *%»I* S. Native of Nipaul and Silhet; common on the Himalaya. Wulfenia obliqua, Wall. tent. fl. nap. p. 45. t. *35.*

Oblique-Cowered ? Loxotis. PL erect.

2 L. INTERMEDIA (Benth. 1. c.) calyx 5-cleft beyond the middle ; segments lanceolate, very acute. 1/. ? S. Native of Martaban, at Moolmyme. Wulfenia intermedia, Wall. cat. no. 408. Habit of the preceding, but the young leaves are often pubescent.

Intermediate Loxotis. PI. erect.

Cult. For culture and propagation see *Streptocdrpus,* p. 658.

XXXII. GLOSSA'NTHUS (from y\w<r<ra, *glossa,* tongue ; and *CLVOOQ, anthos, SL* flower ; in allusion to the large concave lower lip of the corolla.) Klein, mss. ex Benth. scroph. ind. 57. Wulfenia species, Wall.

LIN. SYST. *Didynamia, Angiospermia.* Calyx tubular, 5-cleft. Corolla tubular at the base : limb bilabiate ; upper lip very short: lower one large, convex. ? Stamens 4, fertile ; anthers cohering. Capsule 2-valved.—Herbaceous plants.

1 G. MALABA'RICA (Klein, mss. ex Benth. 1. c.) stem divaricately branched ; leaves and inflorescence of *Loxotis. "If..* ? S. Native of Malabar and the Nielghery mountains, in the Indian Peninsula. Wulfenia Notoniana, Wall. tent. fl. nap. p. 46. cat. no. 409.

Malabar Glossanthus. PL

Cult. For culture and propagation see *Streptocdrpus,* p. 658.

XXXIII. PLATYSTE'MMA (from *nXarvg, platys,* broad; and oTE/u^a, *stemma,* a garland of flowers ; in reference to the broad corollas.) Wall. pi. rar. asiat. *2.* p. 41. t. 151.

LIN. SYST. *Didynamia, Angiospermia.* Calyx ovate, 5-cleft, equal. Corolla rotate, very flat, without a tube: limb bilabiate, 5-lobed : lower lip larger, 3-lobed, contracted at the base : upper lip obcordate. Stamens 4, very short, equal; anthers large, reniform, 1-celled. Style very long and thick; stigma capitate, entire. Ovanum roundish-ovate, 2-celled. Ovula densely inserted in twin placentas—Small, pilose, rock, 1 or *g.* leaved herbs. Flowers few, large, blue, terminal, on long pedicels, twin or subumbellate. Corollas flat, hence the generic name.

1 P. VIOLOI'DES (Wall. pL rar. 2. p. 42. t. 151. Royle, ill. himal. t. 70. f. *2.)* leaves 2, opposite under the peduncles, one smaller than the other, but none radical ; peduncles 2-flowered, one from the axil of each leaf. 1/. (G. Native of Upper Nipaul, upon rocks among moss, Wall.; J... ; r~ pi... inches high, downy. Leaves sessile, orbicularly cordate, ately toothed.

Violet-like Platystemma. PI. 2 to 6 inches.

2 P. MA'JOR (Wall. pi. rar. asiat. 2. p. «;> f ... d'Vnately-nished with one ovate-cordate, acute, ... bearing toothed leaf; peduncles umbellately b.fid, each d.us.or 2 flowers, besides 1 or 2 solitary flowers from the b... under %. G. Native of Kamaon. Bracteas 2 opposite, sma the divisions of the stem or peduncles in both specie.

Larger Platystemma. PL \ to f foot.

Cull For culture and propagation see *Streptocarpu , y* p. 658.

XXXVI. STAURANTHERA (from *cTravpog, stauros,* a cross; and *avdrjpa, anthera,* an anther; in allusion to the anthers cohering in a cruciate manner.) Benth. scroph. ind. p. *57.*

LIN. SYST. *Didynamia, Angiospermia.* Calyx subrotately campanulate, 5-plicate, very broadly sub-10-cleft. Corolla ample, oblique, with a very short tube, spurred behind at the base, subquinquefid at top. Stamens 4, fertile; anthers heart-shaped, cohering cruciately. Capsule circumcised. Ramification of stem, and obliquity of leaves, like that of *Glossdnthus.* Leaves large, wrinkled. Racemes ditrichotomously panicled, 8-20-flowered.

1 S. GRANDIFLORA (Benth. 1. c.) %.l S. Native of Penang, Wall. Glossanthus ? grandiflorus, Benth. in Wall. cat. no. 6395.

Great-flowered Staurantheria. PL branched.

Cult. For culture and propagation see *Streptocdrpus*, p. 658.

f *A genus hardly known whether it belongs to the order Bignoniacece or the present.*

XXXVII. AMPHICOME (from *a^i, amphi,* on both sides; and *Kcofjirj, home,* a head of hair; in reference to the seeds being furnished with a tuft of hairs at both ends.) Royle, ill. himal. t. 72. f. 1. Incarvillea species, R. Br. ex Royle, 1. c.

LIN. SYST. *Didynamia, Angiospermia.* Calyx tubular, pentagonal; angles stiffer than the membranous ciliated sides, 5-toothed; teeth subulate, slightly hairy. Corolla tubular near the base, ventricose above; limb 5-lobed: lobes short, rounded, ciliated, imbricate in aestivation. Stamens 4, didynamous, with the rudiment of a fifth. Cells of anthers converging, each furnished about its middle with a small tail-like process; filaments terminated above in a broad, membranous process. Stigma bilamellate. Capsule long, slender, silique-formed, 2-valved, but only opening on one side; dissepiment free, opposite the valves, bearing on both sides along the margins suspended seeds. Seeds oblong, rough, slightly winged at both ends, and terminated in a much divided coma of fine hairs, exalbuminous. Embryo straight, almond-shaped; radicle above. Cotyledons foliaceous.—A diffuse shrub, with impari-pinnate, alternate leaves, and axillary and terminal racemes of flowers.

1 A. ARGUTA (Royle, 1. c.) f?. G. Native of Himalaya. Incarvillea arguta, Royle, 1. c.) Leaflets opposite, on short petioles, 3-4 pairs, lanceolate, acuminated, unequal at the base, dentately serrated. Corollas red.

***Sharp-serrated-\ea.ved* Amphicome. Shrub *3* feet.**

Cult. For culture and propagation see *Rytidophyllum,* p. 650.

ORDER CLXXV. LABIATE (so named from *labium,* a lip; in consequence of the two-lipped corolla.) Juss. gen. p. 110.

R. Br. prod. p. 499. Mirb. ann. mus. 15. p. *213.* Bartl. ord. nat. 180. Benth. lab. p. xiii.

Calyx tubular, regular, 5-cleft, or 5-10-toothed, or bilabiate; lips entire, or divided. Corolla tubular, irregular, bilabiate ; superior lip undivided or bifid, lying over each other in aestivation: lower lip trifid. Stamens 4, didynamous, *2* of which are sometimes sterile ; filaments inserted under the sinuses of the lower lip and interlabiate ; anthers 2-lobed : lobes usually divaricate; but sometimes dimidiate, and therefore somewhat 1-celled, with an obsolete division and a continuous suture. Ovaria 4, 1-seeded, connected with the base of the style, seated on a glandular disk, and girded at bottom ; ovula erect. Style 1. Stigma bifid, usually acute, sometimes unequal, or dilated. Achenia 4, hidden by the permanent calyx, some of them generally abortive. Albumen wanting, or very sparing. Embryo erect. Cotyledons flat.—Herbs, rarely shrubs. Stems and branches tetragonal. Leaves opposite, exstipulate, simple, undivided, or lobed ; petioles or bases of the leaves not articulated with the branch. Flowers opposite, verticillate, capitate, spicate, racemose, or solitary, axillary or terminal, bracteate or naked.

The order *Labidtce* is one of the most natural and distinctly marked of all. The opposite leaves, monopetalous corolla, *2* or 4 stamens, and the free 4-lobed ovarium, are characters so easily observed, and so constantly accompanying the general habit of the whole series, that from the time of Linnaeus to the present day but two or three genera have been improperly associated with, or separated from it. Its immediate affinities are few. The same 4-lobed ovarium is only found in *Borragmece,* but here the fifth stamen is always present and fertile, and the corolla is usually regular, with gyrate inflorescence. *Scrophulariniece,* and other allied tribes are at once separated by the capsular fruit. In *Verbendcece* alone, having frequently the same inflorescence and many of the characters of *Labidtce,* approach near enough to occasion any hesitation in drawing the line of separation. The ovarium is slightly lobed in *Verbena* and other neighbouring genera, and in *Cymdria* and some *Teucria* it is less lobed than in other *Labidtce,* but yet the distance is considerable in this respect between the former and the two latter genera, ex Bentham.

The species are to be found in more or less abundance over the surface of the globe, but the greater mass within the tropics. Many are extremely odoriferous ; some bear handsome flowers, others are mere weeds. They are remarkable for their tonic, cordial, stomachic virtues; they contain both a bitter and an aromatic principle in different proportions. The bitterness which is given out in decoctions resides in a gum resinous secretion abounding in some *Teucria,* which are particularly employed as stomachics, and sometimes as febrifuges; those which abound in essential oil, and are consequently aromatic, are used as stimulants. From the different degree of combination of these principles in different plants, they have obtained various uses, such as savory, thyme, marjoram for the seasoning of food ; sage, balm, ground ivy for tea ; cat thyme, marjoram, lavender, and thyme for sternutories; others, such as lavender, mint, balm, and rosemary, for perfume. The essential oil of all contain camphor, which is said to exist in such quantity in and lavender, that it has been supposed that the sep sage of it might become an object of commerce.

In the arrangement of this truly natural family, we have followed Mr. Bentham, whose elaborate work, entitled "Labiatarum Genera et Species," is a model for future monograph

Synopsis of the genera.

TRIBE I.

OCYMOIDEÆ. Stamens declinate. Corolla sub-bilabiate; the superior 4 lobes flat, and nearly equal, or the two upper differ- are joined: the lower segment is decimal, ent form from the others, sometimes flat, but usually concave, boat-shaped, or saccate. Old anthers usually saucer-shaped.

§ 1. *Segments of corolla almost of equal length: one the narrowest, declinate, and flatfish.—Tropical plants.*

1 O'CYMUM. Fructiferous calyx deflexed ; the uppermost tooth ovate, large, usually decurrent.—Whorls rarely with so many as 10 flowers.

2 GENIOSFORUM. Fructiferous calyx almost erect or declinate, usually transversely wrinkled at base ; teeth irregular: upper one not decurrent. Filaments naked. Lower subulate.—Whorls many-flowered.

3 MESONA. Upper lip of corolla divided ; lower one sinall and inflexed. Shorter stamens appendiculate at the base.

4 ACROCE'PHALUS. Calyx erectish, having the lower combined into an entire or 4-toothed lip.—Very nor capitate.

5 MOSCHOSMA. Fruit-bearing calyx decimate, upper tooth ovate, not decurrent. Tube of corolla inclosed. Stamens usually digstyle very short.—Whorls few-flowered, secund, us posed in axillary racemules.

6 ORTHOSIPHON. Fructiferous calyx deflexed, superior tooth ovate. Tube of corolla straight, exserted. Stamens by the stigma.—Habit of *O'cymum,*

§ 2. *Lower segment of corolla elongated, concave.—Tropical plants.*

7 HOSLU'NDIA. Superior stamens abortive. Fructiferous calyx baccate.

8 PLECTRA'NTHUS. Fructiferous calyx 5-toothed, not spiny, with an open mouth. Filaments free.

9 COLEUS. Fructiferous calyx toothed, not spiny, with an open mouth. Filaments monadelphous. Whorles of flowers spicate.

10 ANISOCHI'LUS. Fructiferous calyx closed, base in the fructiferous state.

11 (EOLLA'NTHUS. Calyx truncate, circumcised ac

12 PYCHNOSTACHYS. Teeth of fructiferous calyx subulately spinose.—Whorls of flowers spicate.

§ 3. *Lower segment of corolla somewhat stipitate, transversely subcallous at the base, and at length saccate, but bent down abruptly at the time of Jit lorescence.*

13 PE'LTODON. Teeth of calyx subulate, peltate at apex.—*yptls capitata.*

14 MARSYPIA'NTHUS. Achenia concave, boat-shaped, with membranous, involute, fringed margins.—Habit of *Hyptis P[illegible]ata,*

15 HY PTIS. Calyxes not peltate, fructiferous ones not bilate. Achenia not cymbiform.

16 ERIOPE. Floriferous calyx equal, fructiferous one inflating and bilabiate : upper lip tridentate : lower lip bidentate.

§ 4. *Corolla bilabiate : upper Up 2-lobed : lower Up 3-lobed. Stamens inclosed in the tube.*

17 ^AVA'NDULA. Character the same as that of the section.

TRIBE II.

[illegible]DE^, Corolla subcampanulate, or funnel-shaped ; tube shorter than the calyx, or hardly longer; limb 4-5-cleft, the lobes nearly equal, rarely sub-bilabiate. Stamens distant, straight, or diverging, not approximating by pairs, nearly ascending; the lower ones are a little longer; the superior ones sometimes abortive.

§ 1. *Anthers terminal, also the younger ones are confluently l-celled. Stamens somewhat declinate.*

18 POGOSTE^MON. The *3* superior segments of corolla approximate: lowermost one declinate.

DYSOPHY'LLA. Corolla almost regular.

§ 2. *Anthers versatile; cells divaricate, at length confluent. Stamens sometimes somewhat ascending.*

20 Lob[illegible] ^LSH6LTZIA. Corolla tubular ; limb short, bilabiate. [illegible] of gynophore shorter than the ovarium.

TETRADE^NIA. Corolla regular. Lobes of gynophore than the ovarium.

*** 3. *Anthers 2-celled; cells parallel Corolla normal, as in the whole tribe.***

the P°LEBR0®KTA. Fructiferous calyx pappose, adhering to [illegible]Cenia.

ERILLA. Upper tooth of fructiferous calyx small. Style bifid.

Achenia rather large, wrinkled reticulately.

25 Calyx 4-toothed.

Calyx 5-toothed, not pappose. Achenia smooth. Fertile stamens 4.

27 LYCO'PUS. Superior stamens abortive.

§ 4. *Cells of anthers disjoined, with a filiform connective.*

28 MERIA'NDRA. Character the same as that of the section.

TRIBE III.

MONA'RDE.E. Corolla bilabiate. Superior stamens abortive, or if fertile bearing linear, connate anthers: lower stamens fertile, ascending ; anthers linear, sometimes confluently 1-celled, connate, sometimes dimidiate, free, or connate behind, with a linear connective, which is articulated to the filament, and bearing the fertile cell at top, truncate behind, but generally drawn out, filiform, elevated, bearing the other cell, which is sometimes diffbrmed and empty, and sometimes fertile.

§ 1. *Connective filiform, articulated to the filament.*

29 SA'LVIA. Connective drawn out under the insertion, naked or bearing a cell behind.

SO AUDIBE'RTIA. Connective not drawn out under the insertion.

§ 2. *Connective small. Fertile stamens 2.*

31 ROSMARI'NUS. Calyx bilabiate : upper lip entire : lower lip bifid. Filaments toothed at the base.

32 MONA'RDA. Calyx 5-toothed. Lower lip of corolla linear, shortly trifid at apex.

33 BLEPHI'LIA. Calyx 5-toothed, sub-bilabiate ; throat naked inside. Lower lip of corolla broad, trifid.

34 ZIZI'PHORA. Throat of calyx villous inside. Corolla of *Blephilia.*

§ 3. *Connective small Fertile stamens* 4.

35 HORMI'NUM. Character the same as that of the section.

TRIBE IV.

SATUREI'NEJE. Calyx 5-toothed, equal, or bilabiate, f. Tube of corolla exannulate, shorter than the calyx, and imbricating bracteas, or hardly longer ; limb sub-bilabiate: upper lip flat, entire, or emarginately bifid ; lobes of lower lip flat. Stamens straight, diverging, or hardly ascending, equal, or the superior ones are shortest, or abortive. Anthers not dimidiate.

§ 1. *Fertile stamens* 4. *Calyx* 10-13*-nerved.*

36 BYSTROPO'GON. Calyx equal ; throat villous inside—Inflorescence cymose, or spicate.

37 PYCHNA'NTHEMUM. Calyx equal, or sub-bilabiate, naked inside. Upper lip of corolla oblong, entire, or emarginate.—Whorls many-flowered, bracteate.

38 MONARDE'LLA. Throat of calyx naked inside. Segments of corolla 5, oblong, or linear, somewhat bilabiately disposed.

39 AMARA^NCUS. Superior lip of calyx erect, entire: lower one truncate, almost wanting, or shortly bidentate.—Spikelets membranaceously bracteate.

40, ORI'GANUM. Calyx somewhat equally 5-toothed ; throat villous.—Spikelets broadly bracteate, rather loose.

41 MARJORA^NA. Limb of calyx cleft, quite entire above, orbicular, with the margin implicate beneath at the base.

42 THY'MUS. Calyx bilabiate : upper lip tridentate : lower lip bifid ; throat villous.

43 SATURE'IA. Calyx nearly equal; throat almost naked inside. Superior lip of corolla ovate.—Whorles of flowers axillary, or aggregate into an oblong head.

§ 2. *Fertile stamens* 4. *Calyx 15-nerved.*

44 HYSSÒPUS. Character the same as that of the section.

§ 3. *Two lower stamens alone fertile.*

45 COLLINSÒNIA. Lobes of corolla 4 : superior ones nearly equal: lower one large, toothed or fringed.

46 CUNI'LA. Corolla normal with the tribe.

TRIBE V.

MELISSI'NEJE. Calyx 13, rarely 10-nerved, 5-toothed, bilabiate, f, or rarely equal. Tube of corolla exannulate, usually exserted ; limb bilabiate ; lips flat, or the upper one as in *Glèchon,* galeate. Stamens ascending: superior ones shorter, or abortive.

47 HEDEÒMA. Tube of corolla rarely exserted. Throat of calyx villous inside. Superior stamens abortive.

48 MICROME'RIA. Tube of corolla rarely exserted. Calyx nearly equal : superior stamens antheriferous.

49 MELI'SSA. Calyx bilabiate : upper lip tridentate : lower lip bidentate. Tube of corolla usually exserted. Superior stamens antheriferous.

50 GARDÒQUIA. Calyx tubular, somewhat incurved, with an equal or sub-bilabiate mouth. Tube of corolla much exserted. Stamens 1-3, now and then sterile.

51 GLE^CHON. Superior stamens abortive. Superior lip of corolla galeate.

52 KEI^THIA. Superior stamens altogether abortive. Lips of corolla flat; tube exserted.

53 THY'MBRA. Calyx much compressed, flat above. Superior stamens antheriferous.

54 DICERA'NDRA. Stamens 4, antheriferous; anthers bicalcarate.

55 POGO'GYNE. Stamens 4, antheriferous. Style villous.

TRIBE VI.

SCUTELLARI'NE-ffi. Calyx bilabiate ; upper lip truncate, entire or somewhat tridentate. Tube of corolla exserted, ascending: upper lip of limb arched, rarely flat. Stamens ascending: superior ones the shortest.

§ 1. *Gynophore equal, straight; lips of calyx toothed.*

56 PRUNELLA. Style bifid at apex.

57 CLÒNIA. Style quadrifid at apex.

§ 2. *Gynophore elongated, incurved, oblique at apex, of calyx entire.*

58 SCUTBLLA'RIA. Achenia naked. Superior lip of corolla arched. Segments

59 PERIT6MIA. Achenia membranously winged. 0 of corolla flattish.

TRIBE VII.

PROSTANTHE'REJE. Calyx campanulate, sometimes bilabiate ; lips flat, entire, or the lower one bidentate or bifid ; throat naked inside. Corolla with a short ample tube, a campanulate throat, and a bilabiate limb : lips flattish. Stamens di mous, shorter than the corolla: lower ones sometimes longe and sometimes sterile. Achenia coriaceous, reticuia j kled. Style permanent.

§ 1. *Calyx bilabiate: lips entire, or the lower one bidentate.*

60 CHIL'ODIA. Upper lip of calyx entire : lower one Anthers mutic.

61 CRY^PHIA. Both lips of calyx entire Antne

62 PROSTANTHE^RA. Both lips of calyx entire, or Anthers spurred.

63 HEMIA'NDRA. Upper lip of calyx entire: lowe Anthers dimidiate.

§ 2. *Calyx equal, 5-toothed.*

64 HEMIGE^NIA. Anthers all with one of the cells ferti e, the other abortive.

65 WESTRI'NGIA. Anthers of upper stamens brous : lower ones sterile.

66 MICROCORYS. Anthers of upper stamens bearded : lower ones sterile.

TRIBE VIII.

NEPE^TE*. Calyx equal or oblique, or sub-bilabiate, 15-nerved : superior teeth the largest. Corolla bilabial mens didynamous : superior ones the longest, diverging.

§ 1. *Stamens diverging.*

67 LOPHA'NTHUS. Character the same as that of the section.

§ 2. *Stamens ascending.*

68 NE'PETA. Calyx not bilabiate ; upper tooth a little

broader than the rest. Bracteas entire. Cells of anthers Merging or divaricate.

69 MARMORI%TIS. Calyx tubularly campanulate, longer than ^corolla. Cells of anthers parallel.

?° DRACOCE'PHALUM. Calyx bilabiate, or the upper tooth is large, or the bracteas are ciliately toothed.

71 CEDRONE'LLA. Tube of corolla exserted. (fells of anthers parallel.

TRIBE IX.

STACHY'DEE. Calyx irregularly veined, 5-10-nerved, equal, oblique, > or rarely sub-bilabiate, 3-10-toothed. Tube of corolla usually annulate inside ; limb bilabiate. Stamens 4, ascending, didynamous : superior ones the shortest. Achenia dry, not reticulately wrinkled.

§ 1# *Calyx inflated after florescence, or 2-4,-lobed. Corolla much exserted.*

72 MELITTIS, Calyx membranous, campanulate : lobes 3-5, Toothed. 73 P Corolla ample> much exserted.

PHYSOSTE'GIA. Calyx obscurely veined, inflated after florescence. Corolla much exserted, with an ample throat.

MACBRI'DEA. Calyx membranous, campanulate ; lobes *3* : upper one oblong : lower one roundish. Corolla much exserted, with 75 Very ample throat.

KEYSIA'NDRA. Calyx 4»parted. Upper cells *of* superior anthers empty, connate.

§ 2. *Calyx 5-toothed: limb not dilated. Stamens exserted from the tube. Corolla flat tish or arched.*

SUBER'MIUM. Calyx 5-nerved, 5-toothed: teeth not spiny. Upper lip of corolla a little arched or galeate ; lateral segments flat, acute 1 .rcllv anv tooth-formed, or rarely oblong. Achenia ?? ly triquetrous, truncate.—Leaves entire.

LACOCHINLUS. calyx 5-nerved; teeth 5, stiff, somewhat spiny. Upper lip of corolla oblong, bifid at apex. Achenia acuminate, 78 Tetrahedrous> truncate at apex.

SUPERIONUNRUS. Calyx 5-nerved ; teeth 5, stiff, rather spiny. Upper lip of corolla oblong, flattish, or arched; lateral segments broad, ovate; lower one 3-lobed. Achenia acutely triquetrous, truncate.—Leaves jagged; 79 ANISOMELES. Stamens exserted from the short upper lip of the corolla.

80 GALEOPSIS. Calyx somewhat 5-nerved, 5-toothed, somewhat bristly. Cells of anthers transversely and bivalvately dehiscent. 81 Cent! inner valve smaller> ciliated.

Corolla ample. CHYS. Calyx 5-10-nerved, 5-toothed. Throat of corolla ** rdly dilated ; galea a little arched, rarely oblong, flat, rai- ingInate, Stamens exserted from the tube. Achenia obtuse, truncate.

Tube STACHELE. Calyx reticulately veined; teeth nearly equal. 83 Corolla ample. Cells of anthers linear, diverging.

lirjK-i EPECHI/NIA. Calyx bilabiate: upper lip tridentate: lower Pblntate. Corolla small.

§ 3. *Stamens inclosed within the tube.*

84 CRANIOTOME. Superior lip of corolla very short, truncate.

85 SIDERI'TIS. Lower lobe of style dilated, clasping the superior one at the base, which is truncate.

86 MARRU'BIUM. Lobes *of* style nearly equal. Calyx tubular.

§ 4. *Limb of calyx dilated or 5-10-toothed, or with a truncate moulh,rather membranous between the teeth, or broadly and membranaceously campanulate. Superior lip of corolla generally compressedly galeate. Stamens exserted from the tube.*

87 BALLOTA. Calyx regular, somewhat funnel-shaped, 5-10-toothed. Anthers 2-celled.

88 LASIOCORYS. Calyx nearly equal; teeth 5, ovate, rarely with other 5 small acute ones in the recesses between the others, Galea of corolla very hairy. Anthers 2-celled.

89 ROYLEA. Segments of calyx 5, equal, oblong, membranous.

90 OTOSTEVGIA. Limb of calyx somewhat bilabiately and membranously drawn out; lower lip large. Anthers 2-celled.

91 LEU'CAS. Limb of calyx 8-10-toothed. Cells of anthers confluent. Galea of corolla very hairy, short; lower lobe of style very short.

92 LEONOTIS. Calyx of *Leucas section Plagiostoma.* Corolla yellow or scarlet. Galea much longer than the lip.

93 PHLOMIS. Calyx tubular, 5 or 10-striped, usually plicate, 5-toothed, the margins rather membranous between the teeth. Superior filaments generally appendiculate. Cells of anthers confluent.

94 NoTocHiEXTE. Mouth of calyx membranous, with 5 nerves, which are drawn out into as many subulate awns, which are hooked at apex.

95 EREMOSTACHYS. All as in *Phlomis,* except that the calyx is more ample, and the limb often large and membranous.

96 ERIOPHYNTUM. Calyx membranous, amply campanulate. Galea of corolla large, incumbent: lip small, trifid.

97 MOLUCE'LLA. Limb of calyx ample, oblique, with 5-10 mucrones or spines. Filaments naked at the base.

98 HOLMSKIOLDIA. Calyx large, coloured, somewhat rotately campanulate. Ovarium bipartite ; lobes bifid.

99 HYMENOCRA'TER. Calyx 13-nerved, with a 5-cleft spreading limb. Achenia tubercular.

100 ACHYROSPE'RMUM. Achenia covered with scales at top.

101 COLQUHOU'NIA. Achenia membranously drawn out at top.

TRIBE X.

PRASIE'AE. Corolla bilabiate. Stamens 4, ascending: lower ones the longest. Achenia fleshy, sub-baccate.

102 GOMPHOSTE'MMA. Throat of corolla dilated. Cells of anthers transverse, parallel.

103 PHYLLOSTE'GIA. Throat of corolla nearly equal. Cells of anthers diverging. Lobes of style not subulate,

104 STENOGYNE. Throat of corolla dilated. Cells of anthers at length divaricate. Lobes of style subulate.

105 PRA^SIUM. Calyx bilabiate. Tube of corolla inclosed.

TRIBE XI.

AJUGOI'DE*:. Upper lip of corolla sometimes very short, and sometimes cleft; segments cast down, rarely erect, arched : lower one elongated Stamens ascending, usually exserted : superior ones shorter, or abortive.

106 AMETHY'STEA. Superior stamens abortive.

107 TRICHOSTE'MMA. Limb of corolla nearly equally 5-cleft: segments declinate.

108 TEU'CRIUM. Segments of corolla 4, nearly equal, or the 2 superior ones are larger, all declinate, or very shortly truncate : lower one large, rounded or oblong, usually concave. Stamens exserted.

109 A'JUGA. Superior lip of corolla short or very short. Stamens usually exserted.

110 CYMA'RIA. Superior lip of corolla elongated, galeate.

Tribe I.

OCYMOI'DEJE (from *Ocymum,* Basil. ; and *idea,* similar ; because the plants contained in this section agree with *O'cymum* in the characters given below.) Benth. lab. p. 1. Stamens declinate. Corolla sub-bilabiate ; 4 upper lobes flat, and nearly equal: or the 2 uppermost ones are joined: lower one declinate, usually of different form, flat, but more often concave, boat-shaped, or saccate. Old anthers usually saucer-shaped.

I. O'CYMUM (said by Mathiolus to be derived from *o£w, ozo,* to smell; on account of the powerful scent of the plants.) Benth. lab. p. 1. O'cymum species of Lin. and other authors.

LIN. SYST. *Didynàmia, Gymnospérmia.* Calyx ovate or campanulate, 5-toothed: the upper tooth membranous, with winged, decurrent margins, at length deflexed. Corolla with a short tube ; throat usually campanulate : upper lip quadrifid : lower lip hardly longer, declinate, quite entire, flattish. Stamens 4 : lower ones the longest; filaments free : superior ones usually furnished with a tooth or a fascicle of hairs at the base ; anthers ovate-reniform ; cells confluent. Style bifid at top: lobes subulate or flattish ; stigmas minute or marginal. Achenia smooth.—Herbs or subshrubs; whorls 6-flowered, rarely so much as 10-flowered, disposed in interrupted spikes or racemes ; racemes simple, or a little branched at the base, rarely disposed in a thyrsoicl panicle.

SECT. I. OCYMODON (from *Ocymum,* and *odovg OSOVTOG, odous odontos,* a tooth; so called because the upper filaments are furnished with a tooth at the base.) Benth. lab. p. *3.* Superior filaments furnished each with a toothlet at the base.—Whorls usually 6-flowered. Pedicels reflexed, usually shorter than the fructiferous calyxes.

1 O. CA^NUM (Sims bot. mag. t. 2452.) herbaceous, erect, pubescent ; leaves petiolate, ovate, narrowed at both ends, almost quite entire, canescent beneath ; petioles ciliated ; racemes simple ; calyxes longer than the pedicels, reflexed in the fructiferous state: upper tooth of calyx orbicular, concave, shortly acuminated. 0. H. Native of Madagascar, East Indies, China Brazil, &c. O. Americanum, Lin. amcen. 4. p. 276. spec. *833**. but not of Jacq. O. album, Roxb., but not of Lin. O. starni^ neum, Sims, bot. mag. 2452. in text. O. incanescens, Mart et Spix, raise, bras. *2.* p. 787 - Very nearly f- ed to *O. Basilicum,* but the flowers are not half the size, and the habit distinct. Corollas white.

Hoary Basil. Fl. July. Clt. 1822. PI. 1 foot.

2 O.^BASI'LICUM (Lin. spec. 833.) ^rbaceous, glabrous, erect, or ascending ; leaves petiolate, ovate or o W^o n ^ ^ ; at the base, a little toothed ; petioles ciliated ; lacenie calyxes longer than the pedicels, reflexed in he true state : upper tooth ovate, concave, shortly acuminated. Native of the East Indies, and tropical Africa Corolla white. The sweet or larger Basil, *O. Busihcum,* *«*£* *silikum,* Germ. ; *Basilica,* Ital.; is a tender annual g n£ aromatic. The bush, or Least Basil, is the *U. m* also an aromatic plant, but more diminutive^ than Basil, forming a round bushy head. Ihe . branches, or leafy tops of both these species, gathered for culinary purposes, on account ot tmm. vour of cloves, to be used in highly seasoned disnes. leaves are sometimes introduced into salad, and not into soups. Both species are raised from seeds ; and.a *3* feet by lj, to furnish plants for a final transplanting, i^ feet by 12 ; a quarter of an ounce will be sufficient, o bed, in the end of March, and plant out in a warm bore soil; the larger at 8 or 10 inches every way. sorts are sown in the open border; but so treated late and small. In transplanting from the hot-bea, raise the plants in small tufts or single plants, witn ed, by which they receive no check ; and if ing, and in dry weather, will soon produce Seed can only be saved in England in warm dry & under the most favourable circumstances of situati city. In general it is procured from Italy by the see .

18 O. TENU.FtouuM (Lin. spec. 833. exclusive of nymes) stems herbaceous, ? ascending, narrowed at on long petioles, oblong, bluntish, crenated, ratner the base, pubescent; racemes filiform, branchedla base; whorls few-flowered, remote; floral leave sessile ; calyxes on short pedicels, rather nu throat naked inside : upper tooth ovate, short; corolla rather shorter than »e calyx. East Indies. Very nearly related to 0. *saneim,* flowers cemes are shorter, the floral leaves broader, and the small and sessile.

Thin-Jlotvered Basil. PI. 1 foot.? ending, P

19 O. GRA'CIK (Benth. lab. p. 12.) stems ascend panicled at top; leaves on short petioles, oblong crenated, narrowed at the base, pubescent: olate, nearly sessile: floral ones bractea-formed, shorter than the pedicels; racemes numerous, f ferous calyxes longer than the pedicels, decimate inside : upper tooth ovate-obtuse ; corolla the calyx—Native of the Eastern coast ot tropic ; Island of Zanquebar. Very nearly related *turn,* but differs in the leaves being narrower, smaller, and in the calyx being villous inside.

Slender Basil. PI. 1 foot.?

20 O. TEKB'LUJM (Benth. lab. p. 12.) glabrous, creeping; leaves petiolate, ovate-roundish, loose, simple, the whorls 6-flowered ; calyxes on declinate, glabrous: upper tooth ovate, very. naked inside; corolla hardly exceeding the exserted.—Native of Madagascar, Lyall. HaD't. *nclla.* Sterile branches creeping, generally ous ones ascending, glabrous. Leaves like *cymbalana :* floral ones very minute. Corolla oi

. *Slender* Basil. PI. creeping.

SECT. III. GVMNOCYMUM (from yv/»w, ^"t.jSj'nakeJj) *Ocymum;* so called in allusion to the filaments be Benth. lab. 12. Filaments all naked and toothy 6-flowered, rarely 10-flowered. Pedicels shorte.

cal. i r a M ^ H ™ (Willd. enum. 630.) s«m erect, branched, nearly glabrous; leaves pe serrated, rounded at the base, or cuneated, floral ones bractea-formed, deciduous; f'uctiferou flexed, oblong : upper tooth obtuse, concave ; ©. H. Native of Tropical America, from Janeiro. O. frutescens, Sieb. pi. exsic. *O. Am*

jy authors. O. pubescens, Mill. diet. O. montanum, Hook, oot. mag. 2996. Stem bluntly tetragonal. Leaves glabrous, or Pubescent, glandular beneath. Corolla white, or pale purple, inclosed in the calyx.

Small-flowered Basil. Fl. May, Aug. Clt. 1816. PI. 1 foot.

22 O. CAMPECHIA^XNUM (Mill."diet. no. 5.) stem erect, villous, at length glabrous ; leaves petiolate, ovate, or ovate-lanceolate, acute, a little serrated, cuneate or narrowed at the base, canescent beneath ; petioles and nerves of leaves hairy ; floral leaves oractea-formed, broad, deciduous ; fructiferous calyx deflexed, ?blong, hispid : upper tooth obtuse, concave : lower ones ending in long awns like most of the species.—Native of New ^Pain; at Campeachy, Miller. This species differs from 0. *ntcrdnthum* in the stem being hairy, especially at the nodi, as well as on the nerves and petioles of the leaves, and in the leaves being smaller and canescent beneath. Corollas white.

^*Peachy* Basil. PI. 2 feet.

** O. OVA^TUM (Benth. lab. p. 13.) stems erect, a little branched ; leaves nearly sessile, broad-ovate, a little toothed, rounded at the base> smoothish, or hispid : floral ones bracteaformed, deciduous; racemes short; fructiferous calyx ovate, coaffexed, deflexe(1: upper tooth, ovate-oblong, obtuse, concave-; Corolla hardly exceeding the calyx. 1/. S. Native of the mountains of Brazil, Sello. Stem villous. Leaves bluntish, entire, or 1-2-t6othed.

jj«te-leaved Basil. PL } to 1 foot.

lea - O. NUDICAU'LE (Benth. lab. p. 14.) stem simple, naked ; Ves approximate at the base of the stem, hardly petiolate, ovate roundish> rather pilose ; racemes elongated ; calyx ovate, deflexed : Upper tooth rather cornered, twice as long as the calyx ; Bract lo* Sterns rising from a thick woody base, tetra- ^' PLglabrous, or downy.

*J«**d-3temmed* Basil. PI. ascending.

cent • I. RIGIDUM (Benth. I.e.) branches erect, strict, pubestire, leaves sessile> stem-clasping, lanceolate, acute, quite entire, ** decurrent at tbe base> stiff, ciliated: floral ones bracteaformed, coroll Ciliated 5 raceme loose ; whorls 2-flowered ; throat of Native of flexed hlside ; corolla liardlv exceeding the calyx, ^ ' S. Angola. Branches compressedly tetragonal. Rachi %S Clothed with glandular down.

si Shrub>

fruti ^RETICAU'LE (Poir. diet, suppl. 1. p. 595.) stem sufserrat?? ous ? leaves on short petioles, oblong, irregularly Surfac narrowed a long way at the base, pubescent on both ones S: floral ones conform, longer than the flowers : upper hardlv Persistent ; calyx declinate, tubular, hispid ; corolla Thon;- ger than the calyx. er^ ^ d Basil. Shrub diffuse.

Q7 ^-*mmed* Basil. Shrub diffuse.

erect I BRACTEOSUM (Benth. lab. p. 14.) stem herbaceous, olate' Pllos ely hispid ; leaves on short petioles, oblong-lanceish acutl sh, remotely serrated, narrowed at the base, smoothed 98? Veran d rather hispid beneath: floral ones bractea-formiferon tlmes longer than the calyxes, cuneated, coloured ; fructiovatp Calyxes reflexed, ovate, a little inflated: upper tooth coast Stamens a liul e exserted. 0. S. Native of the west Leaves i- ica witllin the tropic- Branches bluntly tetragonaL *Brnn** lncnes long, pale beneath.

? 8 o-T Basil Pl.ltoljfoot.

15) Y^ DIF F^SUM (Benth. in Wall. pi. rar. 2. p. 14. lab. p. crenat sufFruticose, diffuse, villous ; leaves petiolate, ovate, racee ^""dedly cuneated at the base, villously tomentose ; Pes slender, few-flowered ; corolla hardly twice as long as the calyx, with a straight tube, and nearly equal throat; stamens shorter than the corolla, f?. S. Native of the East Indies, in arid places. Shrub much branched, clothed with rather clammy down all over. Whorls 2-4, rarely 6-flowered.

Diffuse Basil. Shrub diffuse, humble.

29 O. ? MEMBRANA'CEUM (Benth. lab. p. 15.) stem erect, villous ; leaves on short petioles, ovate, obtuse, crenated, rounded at the base, wrinkled, villous : lower floral ones conform : superior ones bractea-formed, lanceolate, membranous, villous ; racemes simple; whorls usually 10-flowered; calyxes oblong, pubescent: upper tooth orbicular, hardly decurrent, membranous; stamens shorter than the corolla. ©.? S. Native of Angola. Leaves minutely glandular : floral ones sessile. Corolla hardly exceeding the calyx.

Membranous-calyxed Basil. PI. erect.

•f Species not sufficiently known,

30 O. AFRICA'NUM (Lour. coch. p. 370.) leaves lanceolate, quite entire, pilose; spike terminal, verticillate, interrupted, Q.,S. Native of the eastern coast of Africa, in sandy places. Stem tetragonal, pilose. Leaves pilose, petiolate, ovate-lanceolate. Flowers white, minute. Spikes hairy. Plant sweet-scented.

African Basil. PI. 1 foot.

31 O. ZATARHE'NDI (Forsk. fl. segypt. arab. p, 110.) leaves fleshy, cuneate-oblong, generally 4-toothed on both sides, villous, sessile. Tj . G. Native of Arabia Felix. Stem diffuse. Branches terete, villous. Leaves villous, hoary above, and scattered with rusty dots beneath. Whorls 6-flowered. Plant very fragrant.

Zatarhendis Basil. Shrub 1 foot.

32 O. VAA O2 (Forsk. fl. segypt. p. 111.) stem tetragonal, bracteate ; roots filamentose; fruit pilose.—Native of Arabia Felix. Plant very sweet-scented.

Vaala's Basil. PI.

S3 O. MACROSTA'CHYUM (Poir. diet, suppl. 1. p. 392.) stem suffruticose ; leaves ovate-sublanceolate, obtuse, a little toothed, nearly glabrous ; spike dense, terminal. ^ • S. Native of the East Indies, at Pondicherry. Stem much branched ; branches pilose. Leaves small, hardly petiolate, oval, or oval-oblong, rather fleshy. Flowers dense ; calyxes hairy.

Long-spiked Basil. Shrub.

34 O. VISCOSUM (Roth, nov. spec. 274.) plant clammy, very pilose; leaves obovate-roundish, coarsely and bluntly serrated, reticulately wrinkled beneath ; raceme simple; bracteas ovate, petiolate ; lower lip of calyx 4-toothed : middle teeth the longest,—Native of the East Indies. Whorls 4-6-flowered. Corolla blood red. Filaments toothless. Perhaps a species of *Orthosiphon.*

Clammy Basil. PI. J to 1 foot.

35 O. ACUTUM (Thunb. fl. jap. 248.) racemes filiform ; leaves ovate, acuminated, serrated ; bracteas hairy.—Native of Japan. Stem tetragonal, glabrous. Petioles a little shorter than the leaves, hairy on the midrib beneath. Bracteas ovate, acute, hispid.

Acute-leaved Basil. PI.

36 O. CRI'SPUM (Thunb. fl. jap. 248.) racemes terminal; leaves ovate, serrated, curled ; calyxes hispid.—Native of Japan, about Nagasaki. Stem tetragonal, villous, branched. Leaves petiolate, acuminated, glabrous, purplish, an inch long; petioles villous. A decoction of this species is used in Japan to give a deep red colour to radishes, turnips, and various kinds of fruits.

CWed-leaved Basil. PI. ?

37 O. RUGOSUM (Thunb. fl. jap. p. 249.) racemes terminal;

leaves ovate, acute, serrated, wrinkled beneath. — Native of Japan. Stem tetragonal, furrowed, tomentose. Racemes of flowers terminal, contracted.

Wrinkled-leaved Basil. PL 2 to 3 feet.

38 O. SCABRUM (Thunb. in Lin. trans. 2. p. 338.) racemes simple, erect; leaves ovate, dotted beneath.—Native of Japan. O. punctatum, Thunb. jap. 249. Stem panicled, tetragonal, scabrous from pili, like the whole plant. Leaves oblong, acute, serrated. Racemes terminal; flowers opposite.

Scabrous Basil. PI. 1 foot.

39 O. INFLE'XUM (Thunb. fl. jap. 249.) panicle terminal, racemose ; stem and branches flexuous.—Native of Japan. Stem and branches inflexed at top, tomentose, tetragonal. Leaves ovate, acute, serrated, scabrous. This species powdered is used by the Japanese to perfume their idols.

Inflexed-branched Basil. PI. 1 foot.

40 O. VIRGATUM (Thunb. fl. jap. p. 250.) racemes verticillate, twiggy ; leaves oblong, serrated.—Native of Japan. Stem tetragonal, deeply furrowed, tomentose, branched. Leaves obovate-oblong, tomentose, 1 inch and more long. Whorles 6-flowered.

Twiggy Basil. PI.

41 O. CINE'REUM (R. Br. in append, to Salt. Abyss.) Native of Abyssinia. This species has not yet been described.

Grey Basil. PI.

Cult. Plants of easy culture and propagation. Any light rich soil will suit the species. The shrubby and perennial kinds are readily increased by cuttings. The seeds of annual kinds should be reared on a hgt-bed, and afterwards planted out. See *0. Basilicum*> p. 671.

II. GENIO'SPORUM (meaning unknown to us.) Wall, mss. Benth. lab. 19. O'cymum, species of Lin. and other authors.

LIN. SYST. *Didynamia, Gymnospermia.* Calyx ovate-tubular, with an irregularly, somewhat 5-toothed, membranous margin, when bearing the fruit erectish, or declfnate, usually transversely wrinkled at the base; throat naked inside; upper tooth not decurrent: lateral ones often joined by turns with the upper one and lower ones. Corolla with a straight tube, which is rather shorter than the calyx ; throat campanulate, sub-bilabiate ; upper lip 4-cleft; lower one hardly longer, declinate, quite entire, flattish. Stamens 4, declinate, didynamous : lower ones the longest; filaments free, toothless ; anthers ovate-reniform, with confluent cells. Style shortly bifid at top ; lobes usually flattened ; stigmas submarginal. Achenia smooth, or wrinkled, when examined by a lens. Annual, or perennial herbs, usually procumbent at the base. Whorles many-flowered, disposed in nearly simple racemes or spicate-racemes. Floral leaves usually cartilaginous at the base, white or yellow. Flowers small. The corolla is that of *O'cymum* and *Moschosma,* but the habit is very different. The form of the calyx and the many-flowered whorls separate it from the first; and the calyx, inflorescence, and style readily separate it from the latter.

SECT. I. GENIOSPORUM (see genus for derivation.) Two lower teeth of calyx free.

1 G. MADAGASCARIE'NSIS (Benth. lab p. 20.) stem suffruticose, procumbent, branched; leaves petiolate, ovate, bluntish, crenated, rounded at the base, or cordate, wrinkled, rather villous on both surfaces : floral ones bractea-formed, ovate, acute, white at the base. Native of Madagascar, on Mount Tanonarivan. Stem bluntly tetragonal. Floral leaves small, sessile. Whorles 10-flowered. Genitals exserted. *Madagascar* Geniosporum. Shrub procumbent. Benth.

2 G. STROBILI'FERUM (Wall. pi. asiat. rar. 2. p. 18, lab. p. 20.) stem erect, branched; leaves nearly sessile, oblong, narrowed at both ends toothed, and rather glabrous beneath; whorls many-flowered, the tops of the branches ; lower ones rather remote; leaves ovate, acuminated, exceeding the flowers; sessile, erect in the fructiferous state, tubular, transversely wrinkled at the base, with an irregularly 5-toothed, membranous border. Native of the East Indies ; as of Nipal, Silhet. Plectranthus colorata, D. Don. prod. fl. nep. Cauline leaves 2-3 inches long. Corolla hardly longer than the calyx, blue. Genitals rather shorter than the corolla.

Strobile-bearing Geniosporum. Shrub.

3 G. PARVIFLORUM (Benth. in Wall. pi. rar. asia lab. p. 20.) stem erect, branched; leaves oblong-lanceolate, acute, narrowed at the base, serrated, strigosely pubescent; elongated, loose, many-flowered; calyxes pedicellate, declinate while bearing the fruit, transversely wrinkled at the base, with a bilabiate border: upper lip tridentate: middle tooth larger, ovate ; lower lip quite entire, inflexed, closing the calyx.— Native of Silhet. Stem glabrous at the bottom, but furnished with a fascicle of hairs in the ghort pili at top, and the cauline and floral leaves. Leaves tapering into petioles. Calyx hispid at the base. Corolla small. exserted.

Small-flowered Geniosporum. PI. 1 to 1^ foot.

4 G. ELONGATUM (Benth. lab. p. 21.) stem erect, branched, and are, as well as the erectish, elongated branches, base, and rather hispid ; leaves on short petioles, oblong-lanceolate, acuminate, attenuated at the base, rather hispid ; whorles many, approximate, spicate ; calyxes on short pedicels, declinate in the fructiferous state, ovate, striated at the base, and wrinkled transversely, with a contracted mouth : upper tooth ovate, membranous, obtuse, 4 lower ones smaller, and acute. Native of Ceylon, on the mountains, Macrae. Rninantr Burm. fl. ind. 131. t. 39. f. 1.

Elongated-branched Geniosporum. PL

5 G. GRAW (Benth. lab. p. 21.) quite glabrous, prostrate, much branched; leaves oblong-linear, serrated, narrowed a long way at the base ; whorls many-flowered, racemose : lower ones remote; pedicels capillary, as long as the calyxes; calyxes tubular, striated, transversely wrinkled, with a membranous, acutely sub-bilabiate mouth —Native of Ceylon, on the sea-shore near Colombo, Macrae; Coromandel, Klein. Very near *G. prostrata,* but is distinguished at first sight by narrower leaves, and more loose inflorescence.

Slender Geniosporum. PI. prostrate.

6 G. PROSTRATUM (Benth. in Wall. pi. asiat. rar. 2. lab. p. 21.) stem prostrate, and is, as well as the upper ones lanceolate-linear, serrated, narrowed at the base, and transversely somewhat wrinkled; calyxes pedicellate, declinate in the fructiferous state, bilabiate, membranous mouth; upper lip erect, tridentate, with the middle tooth the largest : lower lip bidentate.— Native of the East Indies, Coromandel, Ceylon, &c. Lunanthera prostrata, Spreng. syst. 2. p. 867. O'cymum prostratum, Lin. mant. p. 366. O'cymum menthoides, Burm. fl. ind. p. 129. Lin. mant. 84. Th/ mus Indicus, Burm. fl. ind. p. 129. Leaves petiolate, oblong-ovate, remotely serrated : floral ones 2-4 under each head, and longer than it, sessile. Heads ovate, pedunculate, or sessile.

Ca^ate-flowered Acrocephalus. Fl. July, Aug. Clt. 1806. PI. procumbent.

2 A. BLU'MEI (Benth. lab. p. 23.) stem diffuse, tetragonal; leaves linear-lanceolate, coarsely serrated; flowers densely capitate, terminal, girded by ovate, nerved bracteas. ©. S. Native of Java, in grassy humid places about Rompien. O'cymum acrocéphalum, Blum, bijdr. p. 834.

Blume's Acrocephalus. PI. diffuse.

3 A. VILLÖSUS (Benth. lab. p. 23.) stem erect, and is, as well as the leaves, hairy ; lower lip of calyx quite entire. ©. S. Native of Madagascar. Stem tetragonal, often glandular, as well as the under sides of the leaves. Floral leaves 2-4 under each head.

Villous Acrocephalus. PI. 1 foot.

Cult. For culture and propagation see *O'cymum,* p. 674.

V. MOSCHO'SMA (from ^ocrxoe, *moschos,* musk; and *osme,* a smell; plant exhaling a smell like that of musk.) Rchb. consp. reg. veg. p. 171. Lumnitzera, Jacq. fil. eel. 2. but not of Willd.—O'cymum species, Lin. and other authors.

LIN. SYST. *Didynamia, Gijmnospermia.* Calyx ovate, 5-toothed; upper tooth the largest, with the margins not decurrent. lower teeth nearl y e qu al > and somewhat declinate after florescence; throat naked inside. Corolla with an inclosed tube, and a sub-bilabiate limb ; upper lip shortly quadrifid : lower one quite entire, flattish; lobes all nearly equal. Stamens 4, declinate; filaments free, toothless; anthers ovate-reniform, with confluent cells. Style clavately capitate, and shortly bifid at apex ; stigmas minute. Achenia ovate, compressed, smooth. — Herbs. Whorls few-flowered, secund, loosely racemose; racemes axillary, subpanicled. The clavate style and form *of* the calyx separates this genus from the preceding genera. Flowers very minute.

1 M. POLYSTA'CHYA (Benth. in Wall. pi. rar. asiat. 2. p. 13. lab. p. 24.) stem acutely tetragonal, with smooth or hardly rough angles; whorls 6-10-flowered. 0. S. Native of the East Indies; Arabia, at Senaar, Bové; tropical New Holland, Bauer. Lumnitzera polystachya, Jacq. 1. c. O'cymum polystachyon, Lin. mant. *567.* Murr. comm. goett. nov. 3. p. 71. t. *3.* O'cymum tenuiflörum, Burm. ind. 129. but not of Lin. Plectránthus parviflörus, R. Br. prod. p. 506. ? Plectránthus micránthus, Spreng. syst. 2. p. 691. Plant branched. Leaves on long petioles, ovate, acutish, crenated, rounded at the base, glabrous, or finely downy above. Corolla minute, pale purple.

Many-spiked Moschosma. Fl. July, Aug. Clt. 1783. PI. 1 to 2 feetf

2 M. AUSTRA'LE (Benth. lab. p. 708.) stem acutely tetragonal, with smooth angles ; leaves ovate or ovate-lanceolate, pubescent; whorls loosely 6-10-flowered, distant; style bifid at apex. ©. S. Native of New Holland, within the tropic. Plectránthus moschátus, R. Br. prod. 506. Lumnitzera moschàta, Spreng. syst. 2. p. 687. Hardly distinct from *M. polystàchya,* except that the leaves are pubescent, the racemes

longer and more loose, the lower teeth of the calyx narrowed, and the style more deeply bifid.

Southern Moschosma. PI. 1 to 2 feet.

3 M. DIMIDIA'TUM (Benth. lab. 24.) stem acutely tetragonal, with smooth angles; racemes elongated; whorls about 10-flowered, glomerate, remotish. 0. S. Native of the west coast of Africa, within the tropics. O'cymum dimidiàtum, Schum. pi. guin. 1. c. p. 41. Very nearly allied to the preceding ; but differs in the larger leaves, longer racemes, smaller flowers, and usually 10-flowered, distant whorls.

Dimidiate Moschosma. PI. 1 to 2 feet.

4 M. OCYMOI'DES (Benth. in Wall. pi. rar. 2. p. IS.) stem tetragonal, with rough angles; whorls loose, 6-flowered. ©. S. Native of the East Indies, in Silhet. Lumnitzera ocymoides, Jacq. 1. c. O'cymum polycladum, Link. enum. 2. p. 119. Habit of *M. polystdchya;* but the leaves are more acutely serrated, hispid above, and canescent beneath. Upper lip of calyx tridentate : teeth ovate : middle tooth the broadest; lower lip bidentate : teeth lanceolate, acute.

Basil-like Moschosma. Fl. July, Sept. Clt. 1823. PI. 1 to *2* feet.

•f *A species doubtful whether belonging to the genus.*

5 M. CE'SIA (Benth. lab. p. *25.)* branches smoothish, terete ; leaves ovate, dentately crenated ; peduncles subverticillate, bracteate at the base. ©. S. Native country unknown. Lumnitzera cae'sia, Spreng. cur. post. 223.

Grey Moschosma. PI. 1 to 2 feet.?

Cult. For culture and propagation see *Ocy'mum,* p. 674.

VI. ORTHOSITHON (from *opQos, orthos,* straight ; and *aupwv, siphon,* a tube; in reference to the straight tube of the corolla.) Benth. in Bot. reg. vol. 15. lab. p. *25.*

LIN. SYST. *Didyndmia, Gymnospérmia.* Calyx ovate-tubular, *5* -toothed; margins of superior tooth, which is ovate, membranous, decurrent, winged, deflexed after florescence. Corolla with a straight or incurved exserted tube, neither gibbous nor refracted; throat equal or rarely inflated, bilabiate ; upper lip 3-4-cleft: lower one quite entire, concave. Stamens 4, declinate ; filaments free, toothless; anthers ovate-reniform, with confluent cells. Style clavately capitate at apex, nearly entire or shortly emarginate; stigmas confluent in the fork, sometimes minute, sometimes capitately thickened. Achenia rugged from minute dots.—Perennial herbs or undershrubs. Racemes simple, usually elongated, rarely ovate-spike-formed ; whorls 6-flowered, distant, loose. Floral leaves bractea-formed, ovate, acuminated, reflexed, usually shorter than the pedicels. Fructiferous pedicels recurved. The chief characters which distinguish this genus are the length of the tube of the corolla, and the capitate apex of the style.

1 O. RUBICU'NDUS (Benth. in Wall. pi. rar. asiat. 2. p. 14.) stems tufted, leafy at the base, branched; leaves oblong-ovate, coarsely toothed, narrowed at the base : lower ones petiolate : superior ones sessile; tube of corolla straight; throat nearly equal, twice as long as the calyx; stamens equal in length to the corolla. %. S. Native of the East Indies. Plectrànthus rubicùnda, D. Don, prod. fl. nep. p. 1J 6. Lumnitzera rubicùnda, Spreng. cur. post. p. 223. Root often tuberous. Stems tetragonal, more or less villous from articulated clammy hairs. Leaves 2-3 inches long, full of glandular dots. Corolla white or pale purple.

Far. a, mollissimus (Benth. lab. p. 26.) leaves clothed with soft villi on both surfaces. 1/. S. Native of Nipaul and Kamaon, Wall. Plectranthus mollissimus, Wall, mss.

Var. j3, canescens (Benth. 1. c.) leaves clothed with short tomentose pubescence. 1(. S. Native of the mountains of Orixa, Roxb. ; and at Segain, in the Birman Empire, Roxb. in Plectranthus tuberòsus, Roxb. mss. O'cymum tuberosum herb. Banks.

Far. y, rígidus (Benth. 1. c.) leaves smoothish, or clothed with very short tomentum. % • S. Native at Nathpur and Monghyr, Hamilt.

Reddish Orthosiphon. PL 1 to 1J foot.

2 O. VIRGA'TUS (Benth. in Wall. pi. rar. 2. p. 14. [illegible] lab. p. 26.) stems tufted at the base ; branches erect, strict; leaves oblong-lanceolate, a little toothed, narrowed at the base, sessile or [illegible] lower ones stand on short petioles ; corolla twice as long about calyx : tube straightish: throat nearly equal; stamens about equal in length to the corolla. 1/. S. Native of East Indies, at Gorakpur, and in the mountains of Morang, Hamilt. Mohun, Jacquemont. Plectrantnu virgatus, Spreng. D. Don, prod. fl. nep. p. 116. Lumnitzera [illegible] syst. cur. post. 223. This species differs from [illegible] in the stems being taller ; in the leaves being [illegible] racemes being shorter and fewer flowered ; in the [illegible] being more remote; in the corollas being smaller ; in the less leafy, and in the whole plant being smoothish.

Twiggy Orthosiphon. PI. 1 foot.

3 O. TOMENTÒSUS (Benth. 1. c.) stem suffruticose, ascending, clothed with tomentose pubescence; leaves [illegible] ovate, cuneated at the base, rounded or subcordate, thickish, both surfaces; clothed with very short tomentose pubescence on both petioles and axils naked ; racemes elongated; corolla [illegible] as long as the calyx : tube incurved a little ; stamens shorter than the corolla. *h* • Native of the East Indies, near Madras, Wight. O'cymum tristè, Rotn. nov. spec. 270. ? Plectranthus tristis, Spreng. syst. 4. 690. Intermediate between *0. viscbsus* and *0. glabrìdus.*

Tomentose Orthosiphon. Shrub.

4 O. PA'LLIDUS (Royle, mss. Benth. in Hook, [illegible] p. 370. lab. p. 708.) glabrous or finely [illegible] toothed, ascending ; leaves ovate, petiolate, bluntly and coarsely toothed, quite entire at the base, cuneated, and running into the petioles; corolla small: tube about equal in length to the throat nearly equal ; stamens shorter than the corolla. Native of the East Indies, on the banks of the Jumna, Cashmere; and the Peninsula. Allied to *O. tomentosus.*

Pale Orthosiphon. PL

5 O. GLABRAVITS (Benth. in Wall. pi. rar. asiat. 2. p. 28.) stems ascending, branched, glabrous ; leaves petiolate, ovate, acute, toothed, rounded or subcordate at the base, smoothish ; corolla incurved a little : tube twice as long as the calyx : throat nearly equal; stamens shorter than the corolla. P? . S. Native of the East Indies, Arabia, Madagascar. O'cymum thymifldrum, Rothj. nov. spec. 269. O'cymum Plectrànthus thymiflòrus, Spreng. syst. 2. p. 690. O'cymum suffruticòsum, Schum. pi. guin. in act. hafn. suppl. Cothonòpsis, Schum. pi. guin. in act. acad. hafn. 4. p. 40. The leaves are rollas small, dark purple. Branches and often purplish, glabrous, or scabrous from minute pin.

Glabrous Orthosiphon. PL 1 to l| foot.

6 O. INCU'RVUS (Benth. 1. c.) stem [illegible] at base ascending; leaves petiolate, oblong, crenated, narrowed at both ends, and clothed with fine pubescence; whorls subsecund; corolla villous, incurved, *3* times longer than the calyx; throat nearly equal; stamens about equal in length to the leaves. 1/. S. Native of the East Indies, in Silhet. [illegible] inches long. Tube of corolla exserted, usually very much incurved : lips spreading, as in *Stdchys* and *Betonica.*

Incurved-flowered Orthosiphon. PL 1 foot.

7 O.. SCA'PIGER (Benth. 1. c.) stems erect, simple, scape"

formed, rising from a thick, creeping, radicant base ; leaves approximate at the base of the stem, petiolate, ovate-oblong, coarsely toothed, narrowed at the base, smoothish ; racemes elongated; corolla about 3 times as long as the calyx : tube straight: throat very wide; stamens hardly longer than the corolla. *11.* G. Native of Nipaul. Stems smoothish. Leaves "early all radical, 3-5 inches long. Corolla blue ; upper lip 4-toothed.

Scape-bearing Orthosiphon. PI. 1 to 2 feet.

8 O. STAMI'NEUS (Benth. 1. c.) stem herbaceous, erect, a little branched; leaves petiolate, ovate, acuminated, coarsely toothed, cuneate and rounded at the base, or the upper ones are subcordate ; racemes loose ; corolla 3 times as long as the calyx : tube erectish : upper lip dilated ; genitals much exserted. %. ?:. Native of the East Indies. O'cymum grandiflorum, Blum. bljdr. p. *SS5.* but not of Lher. Herb smoothish, or clothed with tomentose pubescence. Flowers beautiful white ; upper lip *-toothed. Flowers sometimes lilac.

Loiig-stamened Orthosiphon. PI. 2 to 3 feet.

jf O. CAPITATUS (Benth. lab. p. 29.) stem herbaceous, erect, a "ttle branched ; leaves petiolate, ovate, acuminated, coarsely ot»ed, narrowed at the base ; racemes spike-formed, short, ense, few-flowered ; corolla more or less longer than the ai yx ; genitals much exserted. %. S. Native of the tropical arts of America. Stems with *2* rows of short brown hairs. *f aves 2-3 inches long, with a few short hairs above the rest 8 aorous : floral leaves half stem-clasping. Corollas almost like •°se of 0. *stamineus,* but the segments of the superior lip are narrower.

£«P«'tete-flowered Orthosiphon. PL 1 to 1J foot.

^*iUt.* For culture and propagation see *O'cymum,* p. *674:*

0]VII« HOSLU'NDIA (named by Thonning, in memory of haus Hoslund Smith, a young naturalist, who died of fever on 9,9 Way t0 Aquapim, in Western Africa.) Vahl, enum. 1. p. <!J- Benth. lab. p. 706.

tootkVYST< Corolla *Adynamia, Gymnospermia.* Calyx tubular, 5-wi**k. ringent; upper lip concave. Stamens 4, 2 of ?»ch are fertile. Achenia baccate, within the calyx. Shrubs n:n tetrarrk^ol branches, opposite or verticillate leaves, and ^ a panicles of flowers.

site OI>POSINTA (Beauv. fl. d'ow. 1. p. 53. t. *52.)* leaves oppobran k j Ong"ovate. *fy* • S. Native of Guinea. Shrub much Leav Branches with a villous line between the leaves, enti CS SV eetmScented, *2* inches long, remotely serrated, quite e at the base. Corolla white, twice as long as the calyx.

«P°«te-leaved Hoslundia. Shrub 5 to 6 feet,

late « VERTICILLATA (Vahl, enum. 1. p. 213.) leaves lanceo- * m a whorl, f? . S. Native of Senegal, Dupuis. Branches both T' canesc ent at top. Leaves \\ inch long, tapering to Ca ends> serrated, but entire at base and apex, glabrous above, dots SCeil beneath, and beset with scattered, shining, resinous *Wl icle les s branched than the preceding. Flowers clothed with canescent villi outside.

^or/ec/.leaved Hoslundia. Shrub 4 to 6 feet.

m For culture and propagation see *O'cymum,* p. 674.

snl111, PLECTRA'NTHUS (from *rrX^rpor, plectron,* a cock's bein ; and *apeos> antho»>* a flower 5 in reference to the corolla BenS S?, U rred or Sibbo«s above the base.) in tk V, SYST, *Didyn*mia, Gymnospirmia.* Calyx campanulate ne nonferous state, 5-toothed : teeth equal, or the upper one is largest; increasing in the fructiferous state, sometimes declinate, straight, incurved, or inflated, with equal or variously bilabiate teeth : sometimes erect, tubular, or campanulate, equally 5-toothed. Corolla with an exserted tube, gibbous or spurred above the base, at length declinate, defracted, or straightish ; throat equal, rarely inflated, bilabiate: upper lip 3-4-cleft, lower one entire, usually longer, concave. Stamens 4, declinate, didynamous : lower ones the longest ; filaments free, toothless; anthers ovate, reniform: cells confluent, rarely a little distinct and divaricate. Style shortly bifid at apex : lobes nearly equal, subulate ; stigmas minute, terminal.—Herbs, subshrubs, and shrubs. Whorls of flowers loose, usually cymose, many-flowered, loosely racemose, or panicled.

SECT. I. GERMA'NEA (named after M. de Saint Germain, an amateur, and very distinguished cultivator of plants.) Benth. lab. p. 32. Fructiferous calyx declinate ; upper tooth ovate: the 4 lower ones lanceolate. Corolla spurred above the base.—A shrub, with panicled flowers.

1 P. FRUTICOSUS (Lher. stirp. 1. p. 85. t. 41.) stem shrubby; branches pubescent; leaves petiolate, broad-ovate, subcordate, doubly toothed, smoothish: floral ones bractea-formed; racemes loose, panicled; whorls loosely 6-flowered ; calyx campanulate. T? • G. Native of the Cape of Good Hope. Germanea urticifolia, Lam. diet. 2. p. 682. Corollas blue, elegant. Plant furnished with a few scattered hairs. Leaves 4 inches long.

Shrubby Plectranthus. Fl. June, Sept. % Clt. 1744, Shrub 2 to 4 feet.

SECT. II. COLEOIDES (from *Coleus,* and *idea,* like; plants with the habit of species of *Coleus.)* Fructiferous calyx declinate ; upper tooth ovate: lower ones narrower, and nearly equal: or the lower ones are longer, and subconnate at the base. Corolla gibbous above the base, not spurred, declinate or defracted.—Herbs or shrubs. Flowers racemose or subpanicled.

2 P. VESTITUS (Benth. lab. p. 32.) stem shrubby ; branches densely clothed with rufous villi; leaves petiolate, oblong-elliptic, bluntish, crenulated, cuneated, and quite entire at the base, wrinkled, clothed with fuscous pubescence above, and rufous villi beneath; racemes simple; whorls loose, 6-flowered ; lower teeth of calyx subulate; tube of corolla straight. \/ . S. Native of Madagascar, Bojer. Branches hardly tetragonal.

Clothed Plectranthus. Shrub.

3 P. CANE'SCENS (Benth. lab. p. *33.)* branches clothed with short tomentum; leaves petiolate, cordate-ovate, acute, crenated, clothed with rufous tomentum above, a little wrinkled, canescent beneath, and finely pubescent; upper leaves lanceolate : floral ones bractea-formed ; racemes simple, terminal, exceeding the leaves ; whorls loose, 6-flowered ; calyx campanulate: lower teeth subulate; tube of corolla inflated above, hardly gibbous. 1/. S. Native of Madagascar. Leaves coriaceous, *2-3* inches long.

Canescent Plectranthus. PI. ?

4 P. LONGIFLORUS (Benth. lab. p. 33.) stem nearly simple, densely tomentose ; leaves on long petioles, amply cordate-ovate, acute, coarsely crenated, rather wrinkled, pubescent *on* both surfaces: floral ones bractea-formed; raceme simple, shorter than the leaves ; whorls loose, 6-flowered, approximate ; calyxes campanulate: upper tooth roundish : lower ones subulate; tube of corolla straight. %. S. Native of Madagascar, Bojer. Crenatures of leaves often serrated : floral leaves sessile. Corolla nearly an inch long.

Long-flowered Plectranthus. PI.

5 P. PUNCTATUS (Lher. stirp. 1. p. 87. t. 42.) stem herba-

ceous, erect, thick, pilosely hispid ; leaves on short petioles, ovate, obtuse, crenated, rounded at the base, or subcordate, hispid on the nerves on both surfaces; racemes simple or branched at the base; whorls 6-10-flowered: upper ones approximate ; calyxes hispid, inflated in the fructiferous state : lower teeth lanceolate; upper lip of corolla very short. %. ? S. Native of Abyssinia, Bruce. O'cymum punctatum, Lin. mant. p. 275. Galeopsis maculdsa, Lam. diet. *2.* p. 601. Germanea maculosa, Lam. diet. *2.* p. 691. Germanea punctata, Poir. diet. *2.* p. 763. Stem often spotted. Hairs on the stem and leaves articulated, and often glandular. Leaves *2* inches long. Corollas small, pale blue ; disk of the upper lip lined with purple : lower lip deeply spotted at apex.

Spotted-flowered Plectranthus. Fl. Jan. May. Clt. 1775. PI. 2 feet.

6 P. LESCHENA'ULTII (Benth. lab. p. 34.) stem erect, rather fleshy, smoothish ; leaves on long petioles, oblong, acuminated, bluntly-serrated, cuneately rounded at the base, and quite entire, glabrous : floral ones deciduous ; racemes simple ; whorls loose, many-flowered ; peduncles rather flesjiy, irregularly branched ; lower teeth of calyx ovate-acuminated : middle ones the longest; tube of corolla elongated : throat dilated. ©. S. Native of Java, Leschenault. Allied to *P. cordijolius* and *P. incisus.* Leaves 4-6 inches long, minutely glandular beneath.

LeschenauWs Plectranthus. PL ?

7 P. ROTUNDIFOLIUS (Spreng. syst. *2.* p. 690.) stem procumbent, and rooting at the base; branches erect, thick, smoothish ; leaves petiolate, ovate-roundish, bluntish, crenated, rounded at the base or cuneated, running somewhat down the petioles, quite glabrous, thick, nerved ; floral leaves bractea-formed ; racemes simple ; whorls loose, many-flowered, approximate; calyx campanulate : upper tooth broad-oblong: lateral ones truncate: lower one broad-ovate, connate, shortly acuminated ; corolla declinate: throat scarcely inflated. %. S. Native of the Mauritius and Coromandel. Coleus rugosus, Benth. in Wall. pi. rar. asiat. 2. p. 15. Germanea rotundifolia, Poir. diet. *2.* p. 763. Nepeta Madagascariensis, Lam. diet. 1. p. 712.?__Kurka, Rheed. mal. 11. p. 49. t. 25.? The whole plant, when dried, is beset with minute black glands. Floral leaves minute. Calyx downy. Corollas blue.

Round-leaved Plectranthus. Fl. July, Aug. Clt. 1823. PI. 1 to *2* feet.

8 P. TERNATUS (Sims. bot. mag. t. 2460.) stem erect ; branches clothed with hoary tomentum ; leaves on long petioles, ovate-roundish, acute, coarsely crenated, narrowed a long way at the base, rather fleshy, clothed with fine pubescence above, and canescent beneath ; floral leaves bractea-formed; racemes simple; whorls rather loose, many-flowered, approximate ; calyx campanulate : lower teeth broad-ovate, acute, very short; corolla declinate : throat hardly inflated. 1/. S. Native of Madagascar. Root fibrous, bearing oblong tubercles, for which it is cultivated, as well as the *P. rotundifblius.* Leaves usually 3 in a whorl. Corollas purple.

Terwate-leaved Plectranthus. Fl. Aug. Clt. 1821. PL 1 foot.

9 P. OVATUS (Benth. lab. 709.) plant clothed with fine pubescence; stem herbaceous, erect; leaves on short petioles, ovate, acuminated, crenated, rounded at the base, scabrous above ; floral leaves bractea-formed ; racemes loose, panicled ; whorls equal, usually 10-flowered; fructiferous calyx drooping, ovate, incurved, striated, reticulated, finely pubescent: lower teeth lanceolate, acute. 1£.? S. Native of Arabia Felix, on the mountains. O'cymum gratissimum, Forsk. fl. segypt. p! 110. but not of Lin. This plant differs from the other species contained in this section in the form of the leaves; but the habit is that of *P. cordifolius.* Racemes of *P. Australe.* Flowers of *P. frulicosus,* but the corolla is not spurred.

O^/e-leaved Plectranthus. PL 1 to 2 feet.

10 P. FC^TIDUS (Benth. lab. p. *35.)* stem thick, ym ^ leaves on short petioles, broad-ovate, crenated, truncate . floi base, or cordate, thick, a little wrinkled, very villous whorls ones deciduous ; racemes dense, branched a litue ^ many-flowered, approximate; calyxes villous, ellow®liroat hardly ceous ; tube of corolla defracted in the middle : throat inflated. %. ? S. Native of New Holland, within the t^ at Endeavour river. O'cymum fretidum, Banks, neiu. rufescent. Stem bluntly tetragonal. Floral leaves broacl cordate, acuminated, glabrous above.

Fetid Plectranthus. PL?

11 P. CORDIFOLIUS (D. Don, prod. fl. nep. p. *Villened* clothed with fine pubescence ; stem herbaceous, erect, and fleshy at base; leaves petiolate, broad-ovate, broadly cordate at the base; floral leaves hractea-torm^ cuneated; racemes loose, panicled ; whorls secun ered ; fructiferous calyxes nutant, ovate : lower te late, acuminated; throat of corolla dilated. V«. ^Jlis, the East Indies; Nipaul, Wall.; Himalaya, Koyie. Spreng. syst. 2. p. 69. P- 380 stem Procumbent» bls Pld 5 Petiolate, ovate, obtuse, crenated, cuneated at the base, wrinkled, hispid ; floral leaves minute; racemes nearly simple; whorls loosely 6-10-flowered; calyxes declinate, incurved and striated in the fructiferous state : upper tooth ovate, acute : lower teeth lanceolate, setaceously acuminated; corolla 4 times longer than the calyx: tube rather gibbous at the base, defracted in the middle. If, ? G. Native of the Cape of Good Hope, Masson. O'cymum hirtum, Banks, herb. Nearly allied to *P. Madagascariensis;* but differs in the smaller, more wrinkled, and more hispid leaves, and in the larger corolla, &c.

Hairy Plectranthus. PL procumbent.

20 P. SIEBE'RI (Benth. lab. p. 710.) stem herbaceous, procumbent, pubescent; leaves on short petioles, ovate, bluntish, cuneated at the base, coarsely crenated, cut a little, thickish, pubescent: floral ones almost wanting; racemes loose, simple ; whorls 6-flowered; calyxes pubescent, declinate in the fructiferous state, rather shorter than the pedicels, incurved, striated : upper tooth roundish, acutish, hardly decurrent: lower lateral ones lanceolate : middle ones setaceous ; corolla twice as long as the calyx. 1/ . ? S. Native of New Holland, within the tropic, Sieber. Root thickened at apex. Lower segment of corolla elongated, concave. Allied to the three preceding species.

Sieber's Plectranthus. PL procumbent.

21 FORSTE'RI (Benth. lab. p. 38.) stem herbaceous, erect,? smoothish ; leaves petiolate, ovate, bluntish, cuneated at the base, remotely crenated, smoothish : floral leaves very minute, or almost wanting; racemes loose, simple; whorls loosely 6-10-flowered ; calyx glabrous, declinate in the fructiferous state, shorter than its pedicel : upper tooth ovate, acute, hardly decurrent : lower lateral teeth lanceolate, acute: middle one setaceous ; corolla minute, hardly twice as long as the floriferous calyx. O. ? S. Native of the New Hybrides ; in the islands of Tanna, Forster. Plant slender, nearly glabrous. Racemes slender.

Forster's Plectranthus. PL 1 foot.

SECT. III. HETEROCA'LYX (from *erepoQyheteros,* variable ; and *KaXvZ, calyx,* a calyx.) Benth. lab. p. 39. Fructiferous calyx declinate, bilabiate; both lips almost quite entire, nearly equal. Corolla gibbous above the base, not spurred, defracted.—Herbs. Flowers racemose.

22 P. ? PALISOTI (Benth. lab. p. 39.) stem erect, pubescent; leaves ovate, obtuse, crenated, rounded at the base, or cordate, pubescent on the nerves on both surfaces : floral leaves bracteaformed ; raceme simple; whorls 6-flowered, remote ; corolla about twice as long as the calyx. 0. S. Native of Tropical Africa. O'cymum monostachyum, P.Beauv. fl. dow. *2.* p. 60. t. 95. f. 1.

Palisot de Beauvois's Plectranthus. PL 1 foot.

SECT. IV. MELISSOIDES (SO called from the plants having the habit of species of *Melissa.)* Benth. lab. p. 39. Fructiferous calyx declinate, bilabiate : upper lip tridentate : lower one bidentate. Corolla spurred above the base.—Herbs, with axillary, few-flowered cymes.

23 P. MELISSOIDES (Benth. lab. p. 39.) stem herbaceous, with rough angles; leaves petiolate, broad ovate, cuneated at the base, nearly glabrous, rough : floral ones conform; whorls axillary, loose, remote; peduncles trifid on both sides; calyx campanulate, glabrous; teeth of calyx all ovate, acute.—Native of the East Indies, in Silhet, Leaves small, scabrous from minute bristles on the nerves.

Melissa-like Plectranthus. PL procumbent. ?

SECT. V. I'SODON (from *HTOS, isos,* equal; and *odovg* DtWoc, *odous odontos,* a tooth; in allusion to the teeth of the calyx being all equal.) Schrad. in Benth. lab. p. 40. Fructiferous

calyx declinate ; teeth all equal, or disposed into two lips ; the upper lip tridentate, and the lower one bidentate. Corolla declinate, or defracted, gibbous above the base, not spurred.—Herbs or under shrubs. Flowers panicled, rarely racemose.

24. P. LANCEOLA'TUS (Bojer. mss. ex Benth. lab. p. 40.) stem erect, pubescent ; leaves oblong-lanceolate, stiff, pubescent, narrowed into the short petioles at the base ; racemes simple ; whorls loose, many-flowered ; calyx campanulate, equal, inflated, and incurved in the fruit-bearing state, with a contracted mouth : teeth equal, short, obtuse, connivent ; corolla 5 times longer than the calyx. ©. ? S. Native of Madagascar, Bojer. Stem tetragonal. Leaves bluntish, irregularly serrated. Tube of corolla slender*

LanceolateAeaved Plectranthus. PI.

25 P. oBLo^GiFÒLius (Wall. pi. rar. asiat. 2. p. 16. Benth. lab. p. 40.) stem herbaceous, ascending, branched, glabrous ; leaves petiolate, oblong, toothed, narrowed at both ends, rather hispid above, glabrous beneath : floral ones and bracteas very minute, or almost wanting ; panicles loose, branched, many-flowered ; calyx hardly bilabiate, bluntly toothed, ovate, and seriated in the floriferous state, but lagenaeform and inflated at the base, and with a contracted mouth in the fructiferous state; corolla 3 times as long as the calyx; stamens shorter than the corolla. *%m1* S. Native of Nipaul. Leaves *2* inches long. Branches of peduncle 3-4-flowered. Calyx glabrous, beset with red glands. Corolla hardly gibbous.

Oblong-leaved Plectranthus. PI. 3 to 4 feet.

26 P. scHROPHULAitioIDES (Wall. pi. rar. asiat. *2.* p. 16. Benth. lab. p. 40.) stem herbaceous, erect, branched, nearly glabrous ; leaves on long petioles, broad-ovate, crenated, rounded at the base, unequally cordate, or subcuneated: floral leaves and bracteas minute; panicles loose; fructiferous calyx declinate, inflated, deeply bilabiate: teeth all obtuse ; corolla about 3 times as long as the calyx, inflated above the gibbosity; stamens exserted. 1/. ? S. Native of Nipaul, and Kamaon. Stem much branched, with pubescent angles. Leaves a hand long, rather hispid above, and glandular beneath, with pubescent nerves. Corolla whitish red, inodorous like the rest of the plant.

Scrophularia-like Plectranthus. PI. 3 to 4 feet.

27 P. WI'GHTII (Benth. lab. p. 41.) stem herbaceous, erect, branched ; leaves petiolate, broad-ovate, or roundish, acuminated, cordate at the base, glabrous on both surfaces : lower floral ones like the others : upper ones and bracteas membranous, roundish-spathulate, shorter than the peduncles and pedicels ; panicles much branched, many-flowered; fructiferous calyx declinate, oblong, incurved, striated, glabrous, with an obliquely bilabiate mouth : teeth nearly equal, ovate ; corolla inflated, declinate above the gibbosity : tube one half longer than the calyx ; stamens exserted. %. ? S. Native of the Peninsula of India ; on mountains about Madura and Tenivelly ; and on Mount Kadrougon, Leschenault. Habit of *P. striatus.* Corolla like that of *P. scrophularioides,* but much smaller. Leaves 1^ inch long, and 2 inches broad, long-acuminated, with bluntly serrated edges.

Wight's Plectranthus. PI. 3 to 4 feet.

28 P. NIGRE'SCENS (Benth. lab. 710.) stem herbaceous, erect, branched ; leaves petiolate, broad-ovate, cordate at the base, rounded or narrowed; panicles or racemes many-flowered; fructiferous calyx declinate, ovate, incurved, striated, deeply bilabiate: upper lip truncate shortly tridentate: lower one bifid, with ovate teeth ; corolla decimate, hardly gibbous above, but with the tube twice as long as the calyx ; stamens exserted. *U* ? S. Native of Ceylon. P. Wightn, *ft,* Benth. lab. p. 41. Plant clothed with clammy articulated hairs.

Blackish Plectranthus. PL 3 to 4 feet.

29 P. STEIA'TUS (Benth. in Wall. pi. rar asiat. - Pl. p. 41.) stem herbaceous, erect, branched, nearly leaves nearly sessile, ovate, acuminated, crenated,, ci the base, stiff, hispid above, and glabrous beneaw, loose, much branched, many-flowered ; calyx sub-bilabiate, with obtuse, nearly equal teeth, incur glabrous, but glandular in the fructiferous state, declinate tube, which is rather gibbous above the b a s at the middle; stamens a little exserted. *U>* Dhoon, Silhet and Nipaul, Wall. ; Mussooree, Royle. *Uey* Jacquemont. Stem sometimes pubescent, ^.ea long, and *Ih* broad.

Striated-c\yxe&* Plectranthus. PL 2 to 3 feet.

30 P. HISPIDUS *(Benth.* in Wall. pi. rar. asiat p. 41.) stem herbaceous, erect, branched, P at the base, nearly sessile, ovate, acuminated, toothed, cunea stiff, hispid above, and pubescent beneath, ana u dular ; panicles loose, much branched, many-no declinate, oblong, bluntly 5-toothed, bilabiate in tne state, hardly incurved, very hispid ; tube ot coroi rather gibbous above the base, straight at the mumi . Native of Silhet. Very nearly allied to *P. striatus.*

Hispid Plectranthus. PL *2* to 3 feet.

31 P. GEEAEDIA%KUS (Benth. in Wall, pi. rar. asiat. p. 42.) stem herbaceous, erect, a little hisp glabrous ; leaves ovate, acuminated, crenated, above, and glabrous beneath, sparingly g sessile, petiolate, narrowed at the base: upper ones cordate at the base : floral ones shorter than uppermost ones and bracteas minute; racemes p hardly branched; cymes loose, slender, many-flowere clinate, oblong, bilabiate, with obtuse teeth, mem glabrous, and hardly glandular in the fructiferous corolla declinate, sub-gibbous above the of the middle. %. ? S. Native of Nipaul and K darra and Deyrah Dhoon, Royle. Hyssopus Don, prod. fl. nep. p. HO. Nearly allied to differs in the smaller stature, larger green leave simple raceme, with a pubescent rachis.

Gerard's Plectranthus. PL 2 to 3 feet.

32 P. COE'TSA (D. Don, prod. fl. nep. p. 42.) stem herbaceous, erect, branched, pubescence ; leaves petiolate, ovate, narrowed at crenated in the middle, rather hispid above, beneath; panicles branched, many-flowered; calyx long, bilabiate, with ovate, acutish, nearly equal tee striated, and clothed with hoary pubescence state, but hardly glandular ; tube of corolla base, defracted at the middle. % %.2 S. Indies, in Nipaul, Kamaon, Simla, Mussooree; on i Donff, in the Birmann Empire ; Japan, and Java, laria Japonica, Burm. nid. p. 130. O'cyinuni cur. post. p. 223. Leaves 2 inches long. Corolla

Coetsa Plectranthus. FL Oct. Clt. 1823. PI.

33 P. MENTiioIDEs (Benth. in Wall. pi. rar. p. 42.) stem herbaceous, erect, branched, clothed wn bescence ; leaves petiolate, ovate, narrowed at coarsely toothed, pubescent on both surfaces, na few-flowered; fructiferous calyx declinate, clothed with hoary pubescence : teeth acutish : upp broadest; corolla sub-gibbous above the base, defracted tube, and an inflated throat; anthers s celled, it. ? S. Native of the East Indies, m parts of the Peninsula. Habit of P. *Coetsa,* but are small and few-flowered, &c.

Mint-like Plectranthus. PL 2 to 3 feet.

34 P. MACR^I (Bentb. lab. p. 42.) stem herbaceous, branched, clothed with rufous villi; leaves petiolate, nearly sessile, ovate, acute, toothed a little, rounded at the base, clothed with sou pubescence on both surfaces : floral ones conforming to the rest; panicles branched, many-flowered; calyx declinate, oblong, sub-bilabiate: teeth nearly equal, ovate ; fructiferous calyx incurved, striated, and villous ; corolla 3 times as long as the calyx : tube gibbous above the base, defracted at the middle ; anthers 2-celled. %. ? S. Native of the East Indies, on the Madura mountains, in the Peninsula; Ceylon. P. rugdsus, Wall. mem 6suSj Benth> in, WalL PL rar, asiat# 2, p# 17* Habit of the *Coetsa,* but more humble, and the stem is decumbent at base, &c.

Wtcrae's Plectranthus. PL 2 to 3 feet.

43 P. RUGOSUS (Wall. pi. rar. asiat. 2. p. 17. Benth. lab. p. 43.) stem shrubby, erect; branches hoary; leaves petiolate, ovate, obtuse, crenulated, rounded at the base, pubescent above, white, clothed with hoary tomentum beneath, reticulately veined; panicles branched, many-flowered ; calyxes declinate, fruit hardly bilabiate : teeth lanceolate, acute, nearly equal; corolla Calyx slightly-incurved, striated, pubescent; tube of corolla gibbous above the base, defracted at the middle. T? . G. Native of the East Indies ; at Choor, &c, Royle ; in Sirmore, Coleman. Ocymum densiflorum, Roth, nov. spec. 275. ? Lumnitzera densiflora, Spreng. syst. 2. p. 687. I'sodon plectranthoides, Schrader. Corolla white, or pale blue, smaller than that of P. *densiflorus.*

Woolly Plectranthus. Shrub 4 to 6 feet.

43 P. RENIFORMIS (Wall. pi. rar. asiat. 2. p. 17. Benth. lab. p. 43.) stem creeping at the base, radicant, ascending, nearly simple, quadrangular; leaves Prolate, ovate-roundish, obtuse, coarsely crenated, rounded at the base, or cordate, hairy on both surfaces, deciduous; raceme loose, nearly simple ; cymes pedunculate; calyx hardly bilabiate, oblong, a little incurved, striated, glabrous : teeth unequal, lanceolate, acute; tube of corolla declinate, gibbous above the base, straight to the middle. Native of Nepaul, Wallich. Stamens, shorter than the corolla. Flowers those of *P. stridtus.*

Creeping Plectranthus. PI. J to 1 foot.

44 P. MONTANUS (Benth. in Wall. pi. rar. asiat. 2. p. 17. Pilous) Stem herbaceous, erect, branched above, tomentosely densely leaves On short Petioles, ovate, obtuse, thick, wrinkled, tomentose ; racemes branched, pyramidately panicled, fructiferous whorls rather distinct, dense, many-flowered ; and bracteas calyx declinate, incurved, tomentose, almost equally India, Nepaul, 5-toothed. ©.? S. Native of the Peninsula of Hindostan, Nundy droog- Superior leaves clothed with rufous tomentum *AfouJ!'''* Panicles almost like those of P. *ternifolius.*

^ ° ^ m Plectranthus. PI. 1 foot.

PYRAMI'DIUM (from 7rvpa/xtc, *pyramis,* a pyramid ; in reference to the disposition of the flowers.) Benth. lab. p. 44. Fructiferous calyx erect, tubular, equally 5-toothed. Corolla rolled above the base, not spurred» defracted,—Herbs.

38 P. *pyramidately* panicled.

P. TERNIFOLIUS (D. Don, prod. fl. nep. p. 117.) plant a wijof tomentose; stem erect, a little branched ; leaves *3* in a whorl, lanceolate-oblong, acuminated, serrated, nearly sessile, at the base, wrinkled ; panicle branched, many-flowered, pyramidal ^• G- Native of Nipaul, Silhet, Kamaon, &c. O'cymum ternifolium, Spreng. cur. post. Stem quadrangular. Corolla very villous on the outside Stamens equal in height to the corolla.

Tej 2 to a*i%*lved Plectranthus. Fl. Aug. Sept. Clt. 1820. PL

SECT. VII. AMETHYSTOIDES (so named from the plant having the calyx of *Amethystea ccerulea,)* Benth. lab. p. 45. Fructiferous calyx erect, campanulate, equally 5-toothed. Corolla gibbous above the base, not spurred, defracted. Flowers loosely panicled.

39 P. AMETHYSTOIDES (Benth. lab. p. 45.) stem erect, branched, pubescent; leaves ovate-rounded, crenated, narrowed a long way at the base, and quite entire ; flowers loosely panicled; fructiferous calyx erect, campanulate, quite glabrous, equally 5-toothed. %. ? G. Native of China, Reeves. Stem tetragonal. Corolla 4 times longer than the calyx. Stamens equal in length to the corolla.

Amethystea-like Plectranthus. PL

40 P. DUBIUS (Vahl, mss. ex Benth. lab. p. 711.) stem erect, branched, pubescent; leaves ovate, crenated, cuneated at the base, or narrowed, wrinkled ; flowers loosely panicled ; fructiferous calyx erect, campanulate, clothed with hoary pubescence, equally 5-toothed. *%.1* G. Native of Japan, Thunberg. This differs from P. *amethystoides* in the narrower, wrinkled leaves, more veiny, and finely pubescent beneath, and, like the calyx, canescent.

Doubtful Plectranthus. PL

41 P. INFLE'XUS (Vahl, mss. ex Benth. lab. p. 711.) glabrous ; stem erect, nearly simple ; leaves ovate, acute, coarsely toothed, narrowed a long way at the base ; raceme loose, few-flowered ; fructiferous calyx erect, campanulate, glabrous, equally 5-toothed. *%.t* G. Native of Japan, Thunberg. This differs from *P. amethystoides* in the narrower leaves, and simple few-flowered raceme.

Inflexed Plectranthus. PL

t *Species doubtful whether belonging to the present genus.*

42 P. SALVIOIDES (Benth. lab. p. 45.) leaves ovate-oblong, crenulated, running into the petioles at the base, and quite entire, pilose on both surfaces, ciliated; stem hoary from reversed pili at bottom, but beset with glandular clammy villi above, as well as the calyxes ; raceme terminal, simple ; bracteas roundish-ovate, on short petioles ; lower lip of calyx (superior?) tridentate : middle tooth the smallest. *%,1* G. Native of the East Indies. O'cymum salvioides, Heyne, in Roth. nov. spec, p. *272.* Lumnitzera salvioides, Spreng. syst. *2.* p. 687. Stem quadrangular, hoary. Calyx nerved, sub-bilabiate. Corolla small, brownish purple, hardly one half longer than the calyx, resupinate, villous outside. The inflorescence and form of corolla is that of *O'cymum,* but the calyx is very different. It is perhaps a species of *Moschosma* or *Perilla.*

Salvia-like Plectranthus. PL

43 P. JAVA'NICUS (Benth. lab. p. 45.) panicles twiggy, leafy; pedicels subumbellate; leaves ovate-oblong, coarsely-toothed, pubescent on both surfaces. %. ? S. Native of Java, in mountain marshes. Elsholtzia Javanica, Blum, bijdr, 825. Calyx tubular, 5-toothed; teeth nearly equal. Lower lip of corolla long, concave, almost quite entire : upper one arched, semi-quadrifid. Stamens inclosed. Anthers 1-celled, naked. Stigma semi-trifid. Perhaps a species of *Geniosporum.*

Java Plectranthus. PL

44 P. NUDIFLORUS (Willd. spec. 3. p. 168.) nectarium gibbous; panicle racemose, naked ; leaves cordate, wrinkled ; superior ones stem-clasping. ©.? S. Native of China. Stem quadrangular, pubescent. Lower leaves petiolate, 2-3 inches long, acuminated, coarsely toothed, glabrous, except on the veins beneath. Calyx bilabiate ; segments linear, subulate. Corolla small, closed, pubescent ; tube refracted, gibbous above.

Naked-flowered Plectranthus. PL i foot.

45 P. NANKINE'NSIS (Spreng. syst. *2.* p. 691.) stem erect, glabrous, branched ; leaves reniform, concave, glabrous, but fringed, on long petioles ; spikes prismatic, axillary, tetragonal; calyx 5-cleft, shining, pilose, 6-nerved : the *3* upper segments obtuse, denticulated : the *2* lower ones subulate and longer ; corolla pilose: upper lip 4-cleft : lower lip larger, entire, incurved, inflexed ; anthers shorter than the corolla. ©. H. Native of China, about Nankin. Dentidia Nankinensis, Lour, coch. p. 369. Plant brownish purple. Anthers 2-lobed. Stigma acute, bifid. Aspect of plant elegant, with the scent and colour of *Melissa crefica;* but the leaves, spikes, calyx, and corolla are different. Perhaps a species of *Anisochilus,* or *jEoll&nthus.*

Nankin Plectranthus. PL 1 foot.

Cult. For culture and propagation see *O'cymum,* p. 674.

IX. CO'LEUS (from *KOXEOQ, koleos,* a sheath ; in allusion to the filaments being connected into.a tube at the base, which sheaths the style.) Lour. coch. p. 372. Benth. lab. p. 47. O'cymum species, Lin. and other authors. Plectranthus species, R. Br. and other authors. Solenostemon, Schum. pi. guin.

LIN. SYST. *Didynamia, Gymnospermia.* Calyx ovate-campanulate, erect, or often declinate or reflexed in the fructiferous state : throat naked, or hispid, 5-toothed: upper tooth ovate, membranous, with the margins rarely decUrrent: lower teeth narrower, all acute, or the lateral ones are ovate-truncate ; the two lowermost ones often combined. Corolla with an exserted, defracted tube, an inflated or equal throat, and a bilabiate limb: upper lip short, bluntly 3-4-cleft : lower one entire, elongated, concave, usually boat-shaped, involving the genitals. Stamens 4, declinate : lower ones the longest; filaments toothless, connected at the base into a tube, which sheaths the style ; anthers ovate, reniform, with confluent cells. Style subulate at apex, equally bifid; stigmas subterminal. Achenia roundish, compressed, smooth.—Herbs annual or perennial at the base, rarely suffruticose. Whorls usually 6-flowered, but often many-flowered, sometimes very dense, and sometimes loose, cyme-formed. Floral leaves bractea-formed, more or less comose at the tops of the racemes before florescence, but afterwards deciduous, rarely subpersistent, reflexed. The monadelphous stamens distinguish this genus from all other of the order.

SECT. I. CALCE'OLUS (from *calceolus,* a slipper.) Benth. lab. p. 49. Whorls 6-10-flowered. Fructiferous calyx reflexed ; throat villous inside.

1 C. SPICA'TUS (Benth. in Wall. pi. rar. asiat. *2.* p. 15. lab. p. 49.) stem procumbent at the base ; branches ascending, beset with spreading pili ; leaves petiolate, obovate, narrowed at the base, fleshy : floral leaves membranous, concave, exceeding the flowers, at length deciduous ; spikes simple, elongated, dense ; whorls 6-10-flowered, approximate ; calyx hispid ; upper tooth of calyx roundish, a little decurrent: lower teeth lanceolate, acute, nearly equal ; lower lip of corolla stipitate, boat-shaped. ©. ? H. Native of the Peninsula of India, on the mountains of Dindygul. Plectranthus canlnus, Roth, nov. spec. *279.* Stem bluntly tetragonal. Leaves entire, or sparingly crenated, *1-2* inches long, pubescent on both surfaces : floral leaves very broad, ciliated, the rest glabrous. Corolla like that of *C. barbatus,* but smaller.

Spicate-fiowered Coleus. PI. 1 to ljfoot.

2 C. BARBATUS (Benth. in Wall. pi. rar. asiat. *2.* p. 15. lab. p. 49.) stem shrubby at the base, ascending, tomentosely hispid; leaves petiolate, ovate, crenated, narrowed at the base, clothed with soft tomentum when young, hispid from striga>; floral leaves membranous, broad-ovate, acuminated, the tops of the racemes, deciduous ; racemes simple, flowered, distant; calyx hispid: upper tooth rent: lower teeth lanceolate, acute, nearly equal; of corolla large, stipitate, boat-shaped, *h* . &. East Indies, in the southern mountains of the *I em* sore, Bangalore, Nipaul, and Kamaon. Plectranthus Willd. spec. 3. p. 169. Sims, bot. mag. Forskce'lii, Poir. diet. 2. p. 764. 14 C. MULTIFLORUS (Benth. lab. p. *55.)* stem ascending, villous, pubescent; leaves on long petioles, ovate-oblong, acute, crenately-serrated, cuneated, or narrowed at the base, clothed with soft pubescence ; floral leaves deciduous ; racemes elongated, simple; whorls quadrifariously cyme-formed ; common peduncles almost wanting on both sides, with elongated branches ; pedicels shorter than the calyxes ; calyx clothed with glandular pubescence: upper tooth orbicular, shortly decurrent : lateral ones shorter, very blunt ; corolla with a slender tube, and a sub-inflated limb : lower lip large, very broad, concave. ©. ? S. Native of the Island of Manilla. Habit of *C. acuminatus,* but differs in the leaves being hardly acuminated, in the inflorescence, calyx, and corolla.

Many-flowered **Coleus. PL**

15 C. MACROPHY'LLUS (Benth. lab. p. *55.)* calyx hairy : lower lip trifid, the middle segment the longest, and semi-bifid ; filaments monadelphous at the base ; whorls distinct; peduncles branched; leaves roundish-ovate, acute, unequally and bluntly serrated, scarcely attenuated at the base, quite entire, puberulous on both surfaces. ©. ? S. Native of Java, in humid parts of woods among the mountains. Plectranthus macrophyllus, Blum, bijdr. p. 835. Very nearly allied to *C. ingratus,* but the leaves are purplish beneath.

Large-leaved **Coleus. PL**

16 C. BICOLOR (Benth. lab. p. *55.)* calyx hairy, having the lower lip trifid, the middle segment the longest and semibifid ; filaments monadelphous at the base ; whorls distinct; pedun-

cles ramosely bifid ; leaves unequal, ovate, acuminated, crenated, rounded at the base, or unequally attenuated, and quite entire, puberulous on both surfaces. ©. ? S. Native of Java, at the foot of Mount Salak. Leaves purplish beneath. Allied to *C. macrophýllus.*

Two-coloured-leaved Coleus. PL

17 C. SECUNDIFLORUS (Benth. lab. p. *55.)* plant clothed with fine pubescence ; leaves petiolate, ovate, acuminated, coarsely crenated, roundish, or cordate at the base, wrinkled, rather fleshy; floral leaves deciduous; racemes elongated, simple ; whorls cyme-formed, secund; common peduncles almost wanting on both sides, but with elongated branches; calyxes pendulous, hispid : upper tooth oblcrftg, acute, not decurrent : lateral ones short, ovate, acutish, free : lower ones elongated, acute, combined almost to the top; throat of corolla dilated a little. ©. ? S. Native of the Island of Timor. Allied to *C. grandifldrus,* but differs from it in the inflorescence. Stem bluntly tetragonal.

Secund-fiowered Coleus. PL ?

18 C. BLU'MEI (Benth. lab. p. *56.)* leaves ovate, acuminated, coarsely and bluntly serrated, acute, and quite entire at the base, puberulous on both surfaces ; whorls distinct; pedicels racemose, secund; calyx hairy : lower lip trifid, the middle segments the longest, and semi-bifid ; filaments monadelphous at the base. ©.? S. Native of Java, in gardens. Plectrānthus scutellarioides, Blum, bijdr. 837, but not of Lin. Leaves painted with dark purple spots above.

Blume's Coleus. PL

19 C. LACINIA^TUS (Benth. lab. p. *56.)* leaves ovate, acuminated, jagged, or deeply serrated, acute, and quite entire at the base, puberulous on both surfaces; pedicels branched a little, secund ; calyx hairy : lower lip trifid, the middle segment semibifid, and longer; filaments monadelphous at the base. ©.? S. Native of Java, in gardens. Plectránthus laciniatus, Blum, bijdr. p. *838.* Perhaps a variety of *C. scutellarioides.* Leaves marked with dark purple spots above. Nearly allied to *C. secundiflorus.*

Jagged-lewed Coleus. PL

20 C. GALEA'TUS (Benth. lab. p. *56.)* leaves ovate, acuminated, rounded, or subcordate at the base, acutely and deeply toothed, puberulous on both surfaces ; whorls distinct; pedicels branched; calyx hairy : lower lip trifid, the middle segment longer and bifid ; filaments monadelphous at the base. ©. ? S. Native of Java, in shady, humid, mountainous places. Plectránthus galeatus, Vahl, symb. 1. p. 43. Blum, bijdr. *836.* Stem villous, furrowed. Leaves villous, particularly on the veins beneath. Corolla pubescent. Allied to *C. macrophýllus,* ex Blume.

Galeaie-ftowered Coleus. Fl. July, Aug. Clt. 1820. PL *2 feet.*

§ *2. Lateral teeth of calyx acute, about equal in length to the upper one : lower ones the longest, and combined beyond the middle, and with the lateral ones at the base.*

21 C. MACRŌSTACHYS (Benth. lab. p. 57.) stem pubescent; leaves petiolate, ovate, acuminated, crenately serrated, rounded at the base, hispid above, and on the nerves beneath: floral ones deciduous ; racemes elongated, nearly simple ; whorls remote, loose • common peduncles with the branches and pedicels on both sides, shorter than the fructiferous calyxes ; calyx glabrous, membranous in the fructiferous state: throat naked inside: upper tooth ovate, acute, with revolute edges; corolla with a slender tube, and dilated throat: lower lip elongated, broad, concave © ? S. Native of Java, Commerson. Stem purplish. Leaves minutely glandular beneath; floral ones bracteaformed, concave, ciliated. Whorls 10-15.flowered. and inflorescence of *C. ingrātus.* Calyx and corolla *Malabdrica.*

Long-spiked Coleus. PL

22 C. OVA'TUS (Benth. lab. p. *57.)* stem f^^'scarcely with clammy pubescence above; leaves P base, acuminated, coarsely crenated, rounded or rather hispid above, and glabrous beneath ; floral ous; racemes branched a little; whorls loose, duncles and branches almost wanting ; calyx gw branous, inflated in the fructiferous state : upper with subrevolute edges; corolla with a slender tu dilated throat: lower lip elongated, broad, concave. Native of the Indian Peninsula; Coromandel, nearly allied to the preceding, but much smaller parts. Floral leaves hardly ciliated.

Ovate-leaved Coleus. PL

23 C. MALABA'RICUS (Benth. in Wall. pi. lab. p. *57.)* clothed with fine pubescence; *large,* broad-ovate, shortly acuminated, crenated, cate at the base; floral leaves deciduous; branched; whorls usually 10-flowered, loose; cles almost wanting on both sides, with short ferous calyx deflexed, glabrous, subinflated at the naked inside : upper tooth ovate, acutish ; corolla exserted tube, and a wide throat: lower lip Native of the Peninsula of India, at Travancore, JVI tránthus Malabáricus, Klein, mss. Lower leave* long: floral leaves minute.

Malabar Coleus. PL

24 C. INFLA^TUS (Benth. lab. p. *58.)* glabrous late, ample, ovate, acuminated, toothed, the base, quite entire ; floral leaves deciduous ; race ed a little ; whorls irregularly cyme-formed ; cles almost wanting on both sides: branches alte elongated; pedicels short; fructiferous calyxes brous, inflated, with the throat naked inside : upper lanceolate, acuminated, flat; corolla with an elongai a nearly equal throat: lower lip longer than ©. ? S. Native of Ceylon, Macrae. Allied to Stem rather fleshy. Leaves 1 foot long, with floral ones comose.

Inflated-calyxed Coleus. PL

25 C. MACWI (Benth. lab. p. *58.)* long petioles, ovate, acuminated, rounded or base; floral leaves deciduous; racemes whorls quadrifariously cymose ; common wanting on both sides, with much elongated short pedicels ; fructiferous calyx nutant, flated at the base : throat naked inside : upper acutish, with revolute edges ; corolla with an very wide throat, and an elongated lower lip. of Ceylon, Macrae. Plant clothed with pubescence. Leaves *2-3* inches long. Cjemtai* serted.

Macrae's Coleus. PL

§ 3. *Teeth of calyx* 4 : *lower ones nearly equal, free to base, or hardly combined.*

26 C. GLABRA'TUS (Benth. lab. p. *58)* leaves roundish, serrately crenated, thick, stiff, glabrous, minute, deciduous ; racemes terminal, cle-formed ; whorls loosely cyme-formed ; elongated on both sides, as well as their calyx glabrous, elongated : upper tooth ovate, cone

Wer ones combined at the base, lanceolate-acute. ©. ? S. Native of the Peninsula of India, about Madura, Wight.

Glabrous Coleus. PI. 1 foot. ?

27 C. WioHTii (Benth. lab. p. 58.) stem pubescent; leaves petiolate, ovate, crenated, rounded or subcordate at the base, thick, wrinkled, hispid on both surfaces : floral leaves deciduous ; raceme terminal, simple, panicle-formed; whorls loosely cynie-formed; common peduncle elongated on both sides, as well as its branches; calyxes rather longer than the pedicels, decimate in the fructiferous state, pubescent: upper tooth ovate, flattish : lower ones lanceolate, acute, scarcely connate at the base ; throat of corolla widened; lower lip about 4 times longer than the upper one. ©.? S. Native of the Indian Peninsula, on the Nielgherry mountains.

Wight's Coleus. PI.

lah"8 C- PANICULATUS (Benth. in Wall. pi. rar. asiat. 2. p. 16. . °= -p. 59.) stem procumbent at the base, pubescent; leaves petiolate, broad ovate, deeply toothed, rounded or cuneated at the base, thick, fleshy, hispid: floral ones deciduous ; raceme compound, terminal, panicle-formed ; whorls loosely cyme-formed ; branches mostly peduncles with their branches and pedicels elongated on natural specimens; fructiferous calyx declinate, pubescent: throat lateral, inside: upper tooth ovate, flat: lower lanceolate-subulate, hardly connate at the base ; corolla with an ample throat, and with the lower lip hardly twice as long as the upper one. Dur**. ©. Native of the Indian Peninsula, on the mountains of Travancore. This differs from *C. Wightii* in the broader, thicker, fleshy, more cut leaves, which are cuneated or narrowed at the base, not cordate, &c.

^»«cferf.flowered Coleus. PI.

t *A species not known to which section of the genus it belongs.*

cUneated, TUBEROSUS (Benth. lab. p. *59.)* leaves ovate-crenated, and quite entire at the base, rather scabrous on both surfaces; whorls distinct; pedicels 1-flowered ; calyx hairy; lower lip trifid, the middle segment semi-bifid ; filaments monadelphous at the base. %. ? S. Native of Java, in gardens, p. 372. Plectranthus tuberosus, Blum, bijdr. p. *838.*—Rumph. amb. 5. t. 132. f. 1. ?

ermes-rooted Coleus. PI.

Fleshy Anisochilus. Fl. June, Sept. Clt. 1788. PL 2 feet.

2 A. PALLIDUM (Wall. 1. (5. Benth. 1. c.) stem erect; leaves petiolate, oblong-elliptic, narrowed at both ends, membranous, or hardly fleshy, nearly glabrous ; spikes panicled ; floral leaves lanceolate, acuminated ; lower lip of calyx obliquely truncate, shortly 4-toothed : upper lip lanceolate, acute. *$* . *1* S. ^Native of the Birman Empire, on Mount Taong Dong. Leaves 2-3 inches long, and 1-2 broad, hardly hispid above, and almost glabrous beneath. Spikes pedunculate. Corolla of *A. carnbsum,* but more slender.

Pale Anisochilus. PI. 2 feet.

C6 A. ? POLYSTACHYUM (Benth. in Wall. pi. rar. asiat. 2. p. 19. lab. p. 60.) stem erect, branched; leaves nearly sessile, ovate-oblong, acuminated, serrated, cuneated at the base, clothed with fine pubescence, nerved beneath ;. spikes panicled ; calyx incurved at top, with an obliquely 5-toothed mouth: upper tooth hardly longer than the rest. ©. *1* G. Native of Nipaul, near Hetownrah, in boggy places. Stem bluntly tetragonal, tomentose. Calyx clothed with rufous tomentum. Leaves 2-4 inches long.

Many-spiked Anisochilus. PI.

4 A. DYSOPHYLLOIDES (Benth. 1. c.) stem procumbent at the base; branches ascending, clothed with silky villi ; leaves nearly sessile, oblong-lanceolate, obtuse, quite entire, narrowed at the base; spikes axillary and terminal, pedunculate ; lower lip of calyx minute, truncate : superior one small, acute, deflexed. ©.? G. Native of the Peninsula of India, on the Nielgherry mountains. Habit almost of *Dysophylla rugosa.* Plant clothed with soft, silky, rufescent pubescence. Stamens exserted.

Dysophylla-like Anisochilus, PI. procumbent.

Cult. For culture and propagation see *O'cymum,* p. 674.

XI. (EOLLA'NTHUS (from *atoXXoj, aiollo,* to vary ; and *avdog, anthos,* a flower.) Mart, amcen. bot. monac. 4. Benth. lab. p. 61.

LIN. SYST. *Didynamia, Gymnospermia.* Calyx ovate, campanulate, truncate ; teeth obsolete ; throat naked inside, closed in the fructiferous state, and circumcised at the base. Corolla with an exserted tube, which is decurved beyond the calyx, and somewhat dilated above : limb bilabiate ; upper lip broad, bluntly 4-toothed : lower lip entire, longer, concave. Stamens 4, declinate, didynamous; lower ones the longest; filaments free, toothless ; anthers ovate-reniform, with confluent cells. Style shortly bifid at top ; lobes subulate ; stigmas minute, nearly terminal. This genus is nearly allied to *Anisochllus,* from which it appears to differ only by the calyx.

1 *IE.* SUAVIS (Mart. 1. c. 4. t. 2.) 0 . H. Native of the East Indies. ? Gathered by Martius in the Chinese Gardens at Santa Cruz, in Brasil. Stem obsoletely tetragonal, branched, pubescent. Leaves nearly sessile, obovate, entire, or obsoletely denticulated, narrowed at the base, thickish, pale green, glabrous, marked with impressed dots. Cymes or floriferous branches axillary and terminal, erect, usually trifid, furnished with floral

leaves under the divisions. Flowers secund, lilac. Plant with a sweet odour.

>SWe£-scented (Eollanthus. Fl. July, Aug. Clt. 1825. PL. 1 foot.

Cult. For culture and propagation see *O'cymum,* p. 674.

XII. PYCHNO'STACHYS (from 7n/xvoc, *pychnos,* dense; aed *arraxvQ, stachys,* a spike ; in allusion to the spikes being dense-flowered.) Hook. exot. fl. *2.* t. *202.* Benth. lab. p. 61.

LIN. SYST. *Didynamia, Gymnospermia.* Calyx ovate, nearly equal, with 5 subulately-spinose teeth. Corolla with a defracted exserted tube, and a bilabiate limb ; upper lip 4-toothed: lower one entire, concave. Stamens 4, declinate ; lower *2* the longest; filaments free, toothless ; anthers ovate-reniform, with confluent cells. Style subulate at apex, shortly and equally bifid.—Herbs. Whorls of flowers densely approximate into simple spikes. This genus differs from section *Pyramidium* of *Pleclrdnthus* in the form of the calyx, and in habit.

1 P. CERU'LEA (Hook. I.e.) O. S. Native of Madagascar, Bojer. Stem and branches glabrous, tetragonal. Leaves sessile, oblong-linear, or lanceolate, acute, remotely serrated, narrowed at the base, glabrous, glandular beneath ; floral ones bractea-formed, shorter than the calyx. Spikes dense, terminal, 1-2 inches long. Corollas small, blue.

Z?/w6?-flowered Pychnostachys. Fl. Aug. Clt. 1825. PI. *2* to *3* feet.

Cult. For culture and propagation see *O'cymum,* p. 674.

XIII. PE'LTODON (from *TreXrrf, pelte,* a buckler; and *oSovg ohovroQ, odous odontos,* a tooth ; in reference to the teeth of the calyx being terminated each by a peltate, sub-concave, ciliated, dilated appendage.) Pohl.pl. bras. 1. p. *66.* Benth. lab. p. 62.

LIN. sYst. *Didynamia, Gymnospermia.* Calyx campanulate, equal, 5-toothed; teeth equal, erect, subulate, dilated at top into a peltate, sub-concave, ciliated appendage ; throat bearded ; increasing in the fruit-bearing state, membranous, and a little inflated. Tube of corolla straight, a little inflated, about equal in length to the calycine teeth; limb sub-bilabiate : upper lip bifid, spreading : lower lip trifid, longer and declinate : lateral lobes oblong, spreading : middle one somewhat stipitate, narrowed at the base, transversely somewhat callous, at length oblong, saccate, acute, quite entire, abruptly dejected at the time of expansion. Stamens 4, didynamous: lower ones the longest; filaments free, toothless, glabrous ; anthers ovate-reniform, with sub-confluent cells. Style shortly bifid at apex ; stigmas terminal, or sub-marginal. Achenia roundish, compressed, naked, smooth.—Herbs with the habit of *Hyptis capiāla,* from which they hardly differ, unless by the calyx.

1 P. PUSI'LLUS (Pohl, pi. bras. 1. p. 67. t. 54.) stem humble, nearly simple ; leaves sessile, elliptic, crenated, glabrous, pilose at the nerves; bracteas roundish, or cuneated at the base, pilose, rather exceeding the flowers. %. S. Native of Brazil, in dry pastures in the province of Goyaz, and the South of Brazil. Heads of flowers hemispherical. Corollas white.

Least Peltodon. PI. procumbent, or erectish.

2 P. LONGIPES (St. Hil. mss. ex Benth. lab. p. 63.) stem short, procumbent, nearly simple, glabrous, or pubescent ; leaves sessile, elliptic, crenated, glabrous, or pilose on the nerves ; bracteas rounded, or cuneated at the base, glabrous, or pilose, rather shorter than the flowers. %m ? S. Native of Brazil, about rivulets near Santa porja, in the missions of the Uruguay; and in fields near Cuntiba, m the province of St. Paul. Very nearly allied to *P. pusillus,* but differs in the peduncles being twice as long, in the bracteas being [illegible] shorter, and in the calyxes and corollas being dark purple, not whitisn *y* as in that species.

Long-peduncled Peltodon. PI. procumbent.

S PT iADkANs (Pohl, pi. bras. 1. p. *68.* t. *55.)* stemming, branched, radicant, villous; leaves petiolate, o[illegible] ish, crenated, rounded, or somewhat [illegible] on the nerves on both surfaces ; bracteas crenated in the base. 1/. S. Native of Brazil, in grassy pjce^uth *oi* provinces of Rio Janeiro and Minas Geraes , ai ^^ ^ these provinces. Stem tetragonal, elongatea.. inches long. Inflorescence capitate. Corollas wane.

Rooting Peltodon. PI. creeping.

4 P. TOMENTOSUS (Pohl, pi. bras. 1. p. [illegible] 56#) stem branched, villous; leaves oval, crenated, [illegible] the base, and running into the petioles, puos[illegible] beneath ; outer bracteas cordately auncled, crep[illegible] 1/. ? S. Native of Brazil, in the provinces oi[illegible] Minas Geraes, in dry pastures. Plant [illegible] Stem bluntly tetragonal. Inflorescence capitate, lowish purple.

Tomentose Peltodon. PI. 2 feet, ascending.

Cult. For culture and propagation see *O cymuv,* p. 674.

LIN. SYST. *Didynamia, Gymnospermia.*

&c. Stems rising from a woody base. Leaves 2-3 inches long. Corolla small, dirty purple, hardly downy, about equal in length to the tube of the calyx.

Naked-stemmed Hyptis. PL *2* to *3* feet.

8 H. SERI'CEA (Benth. lab. p. 79.) stems simple, clothed with silky wool, almost leafless at top ; leaves nearly sessile, ovate, obtuse, almost quite entire, thick, nerved, clothed with silky wool on both surfaces ; heads globose, densely many-flowered, on short peduncles, racemose ; bracteas subulate, about equal in length to the heads ; calyx tubular, clothed with silky wool, with subulate teeth, which at length spread a» little. 2/. S. Native of the South of Brazil, Sello. Stems many from a perennial base. Leaves approximate towards the middle of the stem, *2* inches long. Corolla exceeding the calyx. Genitals exserted.

Silky Hyptis. PL 2 feet.

9 H. UNCINA'TA (Benth. lab. p. 80.) branches clothed with rufous tomentum ; leaves nearly sessile, ovate-oblong, serrately crenated, roundly cuneated at the base, rather scabrous above, hispid, but clothed with rufous tomentum on the nerves beneath ; heads globose, densely many-flowered, axillary, sessile ; bracteas lanceolate, about equal in length to the heads, subulate and hooked at top ; calyx campanulate, with stiff, subulately awned, hooked teeth. ©.? S. Native of Peru, Ruiz, et Pav. Throat of calyx clothed with rufous wool inside. Corolla rather shorter than the calycine teeth.

Hooked-calyxed Hyptis. PL *2* to 3 feet. ?

10 H. HIRSU[V]TA (H. B. et Kunth, nov. gen. amer. 2. p. 318. t. 161.) branches clothed with rufous hairs ; leaves sessile, or on short petioles, oblong-ovate, cuneated, and narrowed at the base, erosely crenated, wrinkled, villous ; heads sessile, globose, densely many-flowered; bracteas lanceolate, about equal in length to the calyx ; calyx hispid, with lanceolate-subulate, stiff teeth, which at length spread a little ; achenia wrinkled. ©. ? S. Native of New Andalusia, in arid places on Mount Tumiriquiri, Humb. et Bonpl. ; Brazil, in the province of Minas Geraes, &c, Mart. Sello. Branches tetragonal. Heads sessile, or on short peduncles, the whole forming an interrupted raceme. Corolla hispid outside, a little longer than the calyx. Genitals a little exserted.

Hairy Hyptis. PL 2 to 4 feet. ?

SDCT. IV. PLAGIOTIS (from TrXayioc, *plagios,* transverse ; and *ovç VJTOQ, ous otos,* an ear.) Benth. lab. p. 80. Heads axillary, pedunculate, globose, densely many-flowered. Bracteas numerous, adpressed, ovate. Fructiferous calyx inflated at the base, elongated, with an incurved mouth, and short, ovate, unequal teeth. Habit of species unlike the rest.

11 H. ODORA'TA (Benth. lab. p. 81.) stems clothed with rusty tomentum ; leaves on short petioles, oblong-elliptic, crenated, rounded at the base, scabrous above, and tomentose beneath ; heads globose, densely many-flowered, paniculately much branched ; calyx villous, elongated in the fructiferous state, incurved, with an oblique, shortly 5-toothed mouth. *h* - G. Native of Peru, Ruiz, et Pav. A shrub with the habit of a species *of Buddlea.* Leaves 2-3 inches long. Calyx tomentosely hispid. Corolla a little exserted.

Sweet-scented Hyptis. Shrub.

12 H. ULIGINOSA (St. Hil. mss. ex Benth. lab. p. 81.) herbaceous, small, glabrous ; leaves sessile, lanceolate, acute, serrated, cordately stem-clasping at the base; peduncles axillary, simple ; heads small, globose, dense ; bracteas ovate, about equal in length to the heads ; fructiferous calyx inflated at the base, with a contracted, oblique mouth, and very short, unequal teeth. *TJ.* ? S. Native of Brazil, in the province of St. Paul, in boggy parts of woods. Habit of *Gratwla.* Stem nearly simple. Leaves \ to 1 inch long. Lower peduncles shorter than the leaves. Corolla minute.

Bog Hyptis. PI. \ to \ foot.

SECT. V. CY'RTA (from *KVPTOS, cyrtos,* a curve, in allusion to the curved apex of the fructiferous calyx.) Benth. lab. p. 81. Heads axillary, pedunculate, globose, many-flowered. Bracteas numerous, adpressed, subulate. Fructiferous calyx elongated, recurved at top, with subulate-tubular teeth. The first species of this section come very near the second division of *Cephalohyptis;* the four latter only among *anocephalus* in the ripe calyxes being recurved at the tremity." Benth. 1. c.

13 H. RECURVA[N]TA (Poit. ann. mus. 7. p. 8. t. 1.) petioles, stem herbaceous, erectish, villous; leaves on short petioles, wrinkled, ovate, crenated, rounded at the base, or subcordate, glomerate, villous: upper ones small, nearly sessile; inflorescence naked; densely many-flowered, on long peduncles ; receptacle fructiferous bracteas subulate, about equal in length to the calyx ; fructiferous calyx tubular, villous, recurved, with a regular mouth, and subulate teeth. 1/.? S. Native of America, in tropic, in various places. H. macrocephala, Angles of stem acute, rough. Leaves hardly an inch long, calyx purplish. Corolla pale yellow.

Far. frhirsutior (Benth. lab. p. 81.) stem and calyx densely hairy. %. ? S. Native of Brazil, in the Province of Minas Geraes.

Var. y, *grandifolia* (Benth. 1. c.) leaves of the size of those of the species, membranous, and green UK plant. 1/. ? S. Native near Rio Janeiro.

Recurved-calyxed Hyptis. Fl. July. Ut. 1°-

Thu. PALUDOSA (St. Hil. mss. ex Benth. lab. p. 82.) petiolaceous, clothed with soft, silky villi; leaves on short petioles, ovate, acute, serrated, roundly cuneated at the base, denser clothed with soft villi, canescent beneath ; heads globose, many-flowered ; peduncles *2-3* times longer than the heads ; bracteas subulate, adpressed, about equal in length to the calyxes; receptacle naked ; fructiferous calyx tubular, recurved, with a somewhat dilated mouth, and laciniate-subulate teeth. %. ? S. Native of Brazil, in sea-side. Flowers white. Nearly allied to *Jurvata-*

Marsh Hyptis. PI. *2* to 3 feet. ?

15 H. MICROPHY'LLA (Pohl, icon. med. ex Benth. lab. p. 82.) herbaceous, clothed with hoary pubescence ; leaves on short petioles, ovate, crenated, narrowed at the base, *m* times longer than the heads ; receptacle naked; bracteas subulate, about equal in length to the calyxes; fructiferous calyx tomentose, recurved, with a somewhat dilated mouth, and subulate-subulate segments. %*A* S. Native of Brazil, in the provinces of Minas Geraes and St. Paul, in marshy inundated places. Leaves and heads smaller than in the *recurvata,* and the peduncles shorter. Corolla nebulored.

Small-leaved Hyptis. PL *2* to *3* feet, *t*

16 H. DITAEIC/TA (Pohl, icon. ined. p. 8W. herbaceous, divaricate; branches ascending, with hoary pubescence; leaves ear-lanceolate, remotely serrated at top, narrowed a long way at the base, glabrescent beneath; heads globose, densely many-flowered, about equal in length to the peduncle; bracteas subulate, adpressed, about equal in length to the calyx ; receptacle nearly naked ; calyx tubular, subulate-with the mouth at length rather oblique, and the teeth proving %. ? S. Native of Brazil, in fields near rivulets in the province of Goyaz. Stem much branched at the base, leaiy,

27 H. NERVÒSA (Pohl, icon. ined. ex Benth. lab. p. 85.) suffruticose; branches villously hispid; leaves sessile, ovate-roundish, obtuse, crenated, cordately stem-clasping at the base, wrinkled, pubescent above, and clothed with hoary tomentum beneath; heads on long peduncles, globose, densely many-flowered; receptacle nearly naked; bracteas subulate, about equal in length to the head; calyx straightish: teeth subulate, clothed with soft villi, about equal in length to the tube. Jj. S. Native of Brazil, in the province of Minas Geraes, between Estiva and Rio de Prata.

NervedAeaved Hyptis. Shrub.

28 H. CANDIDA (Pohl, icon. ined. ex Benth. lab. p. 85.) suffruticose; branches clothed with white tomentum; leaves sessile, ovate, bluntish, crenated, cordately stem-clasping at the base, wrinkled, canescent above, but clothed with white tomentum beneath; heads on long peduncles, globose, densely many-flowered; receptacle nearly naked; bracteas subulate, about equal in length to the head; calyx nearly straight: teeth subulate, clothed with soft villi, about equal in length to the tube. *2. S. Native of Brazil, between Rio Jequitinhonha and Barreros, in the province of Minas Geraes.

Whitened Hyptis. Shrub.

29 H. MOLLI'SSIMA (Benth. lab. p. 85.) suffruticose; branches elongated, villous; leaves sessile, ovate-roundish, acutish, crenated, cordately stem-clasping at the base, nervosely wrinkled, clothed with very soft villi on both surfaces; peduncles longer than the leaves; heads globose, densely many-flowered; bracteas subulate, equalling the head; receptacle naked; calyxes nearly straight: teeth subulate, clothed with soft villi, rather longer than the tube. ^ • S. Native of Brazil, in the province of Minas Geraes, &c, in hedges and cultivated plaots. Stem woody at base. Branches almost simple, tetragonal. Corolla obscure violet, shorter than the calycine teeth.

Very soft Hyptis. Shrub 4 to 5 feet.

30 H. ARGUTA (Pohl, icon. ined. ex Benth. lab. p. 86.) suffruticose? tall; branches densely clothed with rufous villi; leaves petiolate, broad-ovate or roundish, sharply toothed, thick, wrinkled, densely villous on both surfaces; heads on long peduncles, globose, densely many-flowered; receptacle naked; bracteas subulate, equal in length to the head; calyx nearly straight: teeth subulate, clothed with very soft villi, about equal in length to the tube. J?. S. Native of Brazil, in pastures of deserts at Rio Parahybuna, in the province of Minas Geraes. This species differs from its nearest allies, in the more densely villous, larger leaves.

Sharp-toothed-leaved Hyptis. Shrub.

31 H. RUGÒSA (Benth. lab. p. *86.)* stem shrubby; branches pubescently villous; leaves on short petioles, ovate-roundish, acute, sharply and serrately crenated, rounded or cordate at the base, wrinkled, clothed with short rufous villi on both surfaces; heads on long peduncles, globose, densely many-flowered; bracteas subulate, about equal in length to the head; calyx nearly straight: teeth subulate, clothed with soft villi, rather longer than the tube. h_c. S. Native of Brazil, on Serra das Carancas, in the province of Minas Geraes, &c. Leaves 6-9 lines long, usually 3 in a whorl, thick, hard.

Wrinkled-leaved Hyptis. Shrub *2* feet.

32 H. CUNEATA (Pohl, icon. ined. ex Benth. lab. p. *86.)* suffruticose?; branches erect, tomentosely pubescent; leaves on short petioles, obovate, broadly crenated, narrowed at the base, stiff, rather scabrous above, reticulated beneath, and clothed with rufous pubescence; heads globose, on long peduncles; receptacle naked; bracteas subulate, equalling the head; calyx straight: teeth subulate, clothed with soft villi, about equal in length to the tube. J?. S. Native of Brazil, in deserts at Rio Parahybuna, in the province of Minas Geraes.

Cuneate-haved Hyptis. Shrub. , , 86.)

33 H. LIPPIOI^DES (Pohl, icon. ined. ex Benth. near Paracatu, in the province of Minas Geraes. Habit of *Bupthdlmum aqudticum.* Corolla pale purplish violet.

Velvety Hyptis. PI. 1 to *2* feet.

48 H. ORIGANOI'DES (Pohl, icon. ined. ex Benth. lab. p. 91.) suffruticose, procumbent, clothed with adpressed pubescence ; leaves oblong-ovate, obtuse, crenated, narrowed a short way into the petioles at the base; heads semiglobose, densely many-flowered, on short peduncles ; receptacle villous ; bracteas lanceolate-linear, about equal in length to the head ; calyx very villous : teeth subulate, shorter than the tube. f? . S. Native of Brazil, in the province of Goyaz, on the tops of the mountains called Chapado do Serra San Marcos, and elsewhere in the same province. Allied to *H. velutina,* but differs in being less woolly, and in the stem being procumbent, &c.

Marjoram-like Hyptis. Shrub procumbent.

49 H. DICTYOI'DEA (Pohl, icon. ined. ex Benth. lab. p. 91.) branches stiff, panicled above, clothed with hoary villi ; leaves on short petioles, oval, obtuse, crenately toothed, roundly cuneated at the base, scabrous above, reticulated beneath, and lacunosely wrinkled, pubescent on the nerves : upper ones acute, canescent beneath ; heads pedunculate, semiglobose ; receptacle woolly; bracteas ovate-lanceolate, villous, equalling the heads ; calyx villous : teeth subulate, stiffish, villous, rather shorter than the tube. J? . ? S. Native of Brazil, at Fazenda Dios and Caldas ; and on Serra San Felix, in the province of Goyaz.

Net-like Hyptis. Shrub. ?

50 H. ADAMA'NTUM (St. Hil. mss. ex Benth. lab. p. 91.) suffruticose, the whole plant velvety from silky hairs; leaves sessile, oval, acute, a little toothed, rounded at the base; heads semiglobose, densely many-flowered, on short peduncles; fbceptacle villous ; bracteas lanceolate, acute, about equal in length to the head ; calyx clothed with woolly villi: teeth short, lanceolate-subulate. J? . S. Native of Brazil, in the province of Minas Geraes, in the diamond district, on the banks of the rivulet called Corrego Novo. Leaves hardly half an inch long. Corolla rose-coloured.

Diamond-district Hyptis. Shrub 2 to 2| feet.

51 H. CJERU^LEA (St. Hil. mss. ex Benth. lab. p. 91.) herbaceous ; stems procumbent, branched, villous ; leaves small, numerous, sessile, ovate, obtuse, crenated, cordate at the base, wrinkled, pubescent; heads semiglobose, densely many-flowered ; peduncles rather longer than the heads; bracteas lanceolate-linear, recurved, equal in length to the head ; receptacle woolly ; calyx very villous ; teeth short, subulate. %. ? S. Native of Brazil, in the province of Minas Geraes, on the mountain called Serra da Canastra. Herb much branched, humble, procumbent. Corollas blue.

Blue-Lowered Hyptis. PI. procumbent.

52 H. ALPE'STRIS (St. Hil. mss. ex Benth. lab. p. 92.) herbaceous ; stems ascending or erect, sparingly branched, clothed with rufous villi; leaves numerous, sessile, ovate-oblong, obtuse, crenated, cordately stem-clasping at the base, reflefted, wrinkled, clothed with velvety pubescence ; heads semiglobose, densely many-flowered ; peduncles about equal in length to the heads ; bracteas lanceolate-linear, equalling the head; receptacle woolly; calyx very villous, with short subulate teeth. }/. .? S. Native of Brazil, in humid grassy places near Serra da Canastra, in the province of Minas Geraes. All parts of the plant are larger than in *H. ccerillea* and *H. gratiolce-*

fol Al$_V$ Hyptis. PL elongated.

53 H. GRATIOL*:FOLIA (St. Hil. mss. ex Benth. lab. p. 92.) herbaceous ; stems erect, branched at the base ; branches twiggy, clothed with rufous villi; leaves small, numerous, sessile, ovate-obtuse, crenated, cordate at the base, wrinkled, clothed with rufous pubescence; heads semiglobose, densely many-flowered; peduncles equal in length to *e heads, receptacle woolly ; bracteas lanceolate-linear, rather longer than the head, recurved at top; receptacle woolly; calyx villous. teeth subulate, about equal^ in length to the tube of the Native of Brazil, in elevated plains in the * ^ 3 " ^ stature, province of Minas Geraes. Very like *H.* ' ^ J ," ine teeth leaves, and heads, but differing in the *TM*TM*TM?^A cobeing longer. Heads few, approximating into a

TyV Gratiolalike Hyptis. PL *2* to *S* feet. ? p- w.)

54 H. GOYAVE'NSIS (St. Hil. mss. ex ^ ' *T branches* herbaceous or suffruticose? ascending or ed, densely villous ; leaves sessile, ovate-elliptic, cordate at the base, wrinkled, villous; heals densely-many-flowered ; peduncles shorter than bracteas linear, straight, equalling the heads, recep calyx very villous : teeth short, subulate. »22- of the province of Goyaz. Plant with a hard or shrubby base, azure blue, downy. Differs from *H. ^rulea in* leaves and leaves and habit; and from *H. crenata* in the mutic short calycine teeth.

Goyaz Hyptis. Shrub 1 foot.

55 H. OVA^TA (Pohl, icon. ined. ex Benth. lab. herbaceous, erect, stiff, villous; leaves sessile, crenated, cordate at the base, reticulately wrinkle> tomentose pubescence on both surfaces ; neaa very densely many-flowered, on short peduncles; villous ; bracteas lanceolate at the base, and are, calyxes, very villous; teeth of calyx long-subulate %!?&. Native of Brazil, between Allegres ana in the province of Minas Geraes. Differing from /*• the broader smoother leaves, &c.

Owite-leaved Hyptis. PI. 1 to *2* feet. ?

56 H. CRENATA (Pohl, icon. ined. ex Benth. herbaceous ; stem erect, stiff, villous ; leaves ovate, obtuse, crenated, rounded at the base, surfaces, reticulately wrinkled ; heads many-flowered; receptacle woolly; bracteas base, long-subulate at apex, exceeding the calyxes, ly villous, with villous subulate teeth, which are than the tube. ? S. Native of Brazil, in Minas Geraes, Goyaz, and Bahia, &c. A very species, beset with long spreading hairs clothed with rusty tomentum. It is distinguis- nearest ally, *H. catrulea,* by the bracteas ending late points.

CrenaledAe&ved Hyptis. PI. 1 foot.

57 H. TURNERIEFOLIA (Mart. mss. ex Benth. suffruticose; branches pubescent; leaves lanceolate, obtuse, a little crenated, rounded at date, clothed with soft adpressed villi, pale beneath globose, densely many-flowered, on short toolly ; bracteas lanceolate-linear, equal m length calyx very villous at top : teeth subulate, shorter F? .S. Native of Brazil, in the province of Serro Frio, &c. Habit of *Puhcfna dyssenter* rather tomentose beneath. Corolla hardly calyx, white : the upper lip marked with purple.

Turnera-leaved Hyptis. Shrub 1 to *2* feet. .

58 H. ASTEROI^DES (St. Hil. mss. ^ B ^ ' f ^ , with reerect, lanceolate, obiuse, crenated, cordate at; tne volute edges, wrinkled, villous; heads densely many-flowered; bracteas lanceolate-siiDi equal in length to the head; receptacle woolly,

—Procumbent or divaricate herbs, with the heads of flowers on long peduncles.

68 H. SIDERI'TIS (Mart. mss. ex Benth. lab. p. 97.) herbaceous, procumbent; branches ascending, very pilose ; lower leaves petiolate: rameal ones nearly sessile, ovate, acute, sharply serrated, rounded or cordate at the base, stiff, green on both surfaces, and pilosely hispid ; heads few, pedunculate, globose, densely many-flowered ; bracteas equal in length to the heads ; receptacle naked; calyx hispid, with 5-10 unequal, subulate, stiff, divaricate teeth. *%.1* S. Native of Brazil, in the province of Minas Geraes, in places which are inundated during the winter. Herb pale green. Corolla violaceous, twice as long as the calyx.

Sideritis-Yke Hyptis. PI. procumbent.

69 H. LOBATA (St. Hil. mss. ex Benth. lab. p. 97.) herbaceous, procumbent, pilosely pubescent; leaves broad-ovate, acute, sinuately lobed, crenated, cordate at the base, green on both surfaces ; heads on long peduncles, globose, densely many-flowered ; bracteas about equal in length to the head ; receptacle naked; calyx hispid, with *5-6* nearly equal, subulate, stiff, pubescent teeth, which are shorter than the tube. *if.*. ? S. Native of Brazil, in pastures near San Joze, in the province of St. Paul. Stems usually rooting at the nodi. Leaves like those of *Althce[K]a hirsuta :* floral ones sessile. Corolla blue. Odour fetid.

Lobed-leaved Hyptis. PI. procumbent.

70 H. LAGENA'RIA (St. Hil. mss. ex Benth. lab. p. 98.) herbaceous ; branches ascending, nearly glabrous; leaves petiolate, ovate, acuminated, acute, doubly toothed, rounded at the base, green, pubescent; heads pedunculate, panicled, nearly globose, densely many-flowered ; receptacle naked ; bracteas about equal in length to the head; calyx glabrous, with subulate teeth, which are shorter than the tube. %. ? S. Native of Brazil. Bracteas, as well as the teeth of the calyx, generally hooked at top. Calyx usually 5-toothed.

2[illegible]-shaped-calyxed Hyptis. PL ascending.

SECT. XI. CEPHALOHY'PTIS (from *KecpaXri, kephale,* a head; and *Hyptis,)* Benth. lab. p. 98. Heads semi-globose, or at length globose, densely many-flowered. Bracteas numerous, adpressed, ovate, lanceolate, linear, rarely subulate. Receptacle glabrous, rarely villous. Calyx campanulate or tubular, straight, glabrous, pubescent, or villously hispid, never woolly: teeth subulate or lanceolate at the base, rarely very short and obtuse. Corolla exceeding the calyx a little.—Herbs or subshrubs, with axillary, pedunculate, or nearly sessile heads of flowers.

§ 1. GNIDUEFOLIA (from *Gnidla and folia;* in reference to the leaves resembling those of the genus *Gnid'ia.)* Benth. lab. **p. 98.** ***Leaves small, quite entire, cordate at the base, with revolute edges. Fructiferous heads globose, villous. Bracteas ovate, or lanceolate.***

71 H. IMBRICATA (Pohl, icon. ined. ex Benth. lab. p. 98.) branches erect or ascending, twiggy, pilose; leaves sessile, erect, adpressed to the stem, imbricate, with revolute ciliated [illegible] glabrous; heads globose, densely many-flowered ; peduncles father shorter than the leaves ; bracteas ovate acute stiff, rather longer than the head; calyx campanulate hispid, glabrous at the base, with subulate villous teeth, which at length spread. *v.* S. Native of Brazil, in the provinces of Ooyaz and Minas Geraes. Corolla with the *2* upper segments red, the lower one rose-coloured and the lateral ones yellowish. Receptacle glabrous.

Imbricate-leaved Hyptis. PI. ascending.

72 H. DITASSOI[N]DES (Mart, mss. ex Benth. lab. p. 99.) suffruticose; branches villous; leaves small, sessile, numerous, spreading, very blunt, quite entire, with revolute edges, stem-clasping at the base, blistered, and quite glabrous one-nerved, and villous beneath; heads densely globose, flowered, on very short peduncles; bracteas lanceolate, calyx nearly glabrous at the base, elongated, with [illegible] of subulate teeth. I?. S. Native of Brazil, in the Minas Geraes, on Serro Frio. Habit of *Pen*a* or Receptacle very pilose.

Ditassa-like Hyptis. Shrub.

§ 2. LAVANDULACEAE (So called from [illegible] those of Lavender.) Benth. lab. p. 99. *Leaves [illegible] the base, and quite entire, a little toothed at tap- ite entire, a little tooth. linear heads globose, villous. Bracteas lanceolate, or linear.*

73 H. LiNARiofDEs (Pohl, icon. ined. ex Benth. lab. p. 99.) suffruticose; branches erect, strict, tall, somewhat [illegible] leaves sessile, linear, almost quite entire, clothed [illegible] pubescence ; heads nearly globose, densely many-flowered, on long peduncles ; bracteas lanceolate, clothed with [illegible] turn : exteror ones exceeding the head ; receptacle naked; calyx villous, with subulate, erect, [illegible] which are about equal in length to the tube. [illegible] in fields. Brazil, in the provinces of Goyaz and Minas Cjerae, [illegible] Corollas white, spotted with purple. Very [illegible] larger and *H. strictissima,* and only differs in the heads being more villous, &c.

Linaria-like Hyptis. Shrub. [illegible] jab. p. *99*)

74 H. STRICTISSIMA (Pohl, icon. ined. ex Benth. lab. [illegible] suffruticose ; branches erect, strict, tall, clothed [illegible] pressed pubescence; leaves sessile, linear, almost [illegible] narrowed at the base, clothed with fine hoary [illegible] heads nearly globose, densely many-flowered, on [illegible] cles; bracteas linear : exterior ones about equal [illegible] the head; receptacle naked; calyx tubularly campanulate, [illegible] lous : teeth subulate, erect, one half shorter than [illegible] S. Native of Brazil, in the provinces of Goyaz [illegible] the mountains called Chapada do Serra San Marcos.

Very-strict Hyptis. Shrub. [illegible] 1 b, p. *l*

75 H. DENSIFOLIA (Pohl, icon. ined. ex Benth. lab. [illegible] suffruticose; branches erect, clothed with short [illegible] bescence; leaves sessile, oblong, quite entire, or [illegible] top, narrowed at the base, veiny, nearly glabrous, with fine tomentose pubescence; heads globose, [illegible] flowered, on long peduncles; bracteas lanceolate [illegible] longer than the heads, obtuse ; receptacle naked [illegible] larly campanulate, villous: teeth subulate, erect, [illegible] than the tube. T?. S. Native of Brazil, in V^/from Goyaz and Minas Geraes. Habit of *H. hnarioides,* it appears to differ only in the broader leaves.

***Dense-flowered* Hyptis. Shrub.**

76 H. VERONIC^FOLIA (Pohl, icon. ined. ex Benth. lab. p. 100.) stem procumbent, pubescent ; leaves sessile, ovate, toothed at top, rounded at the base, crenated, nearly glabrous on both surfaces; heads on long peduncles, nearly glabrous, densely many-flowered ; bracteas lanceolate, obtuse, [illegible] in length to the head ; receptacle naked ; calyx tubular, teeth subulate, erect, one half shorter than the tube. Native of Brazil, in the province of Goyaz, at *w* San Sebastian.

Speedwell-leaved Hyptis. PI. procumbent.

§ 3. PEDUNCULOS^ (so called from the heads being supported by long peduncles.) Benth. lab. p. 100. *Heads of flowers*

leaves petiolate, oblong-lanceolate, acuminated, irregularly serrated, narrowed at the base, a little wrinkled, pubescent on both surfaces; heads at length globose, densely many-flowered, on short peduncles, subcorymbose at the tops of the branches; bracteas lanceolate, acuminated, about equal in length to the calyxes ; calyx campanulate : teeth lanceolate at the base, rigidly and subulately awned. %. S. Native of Brazil, in the province of Entre Rios, Parker; in humid pastures from San Joze, in the province of Rio Grande to Santa Borja, in the missions of the Uruguay, &c. Stem acutely tetragonal. Leaves 1-3 inches long. Corolla white, hardly exceeding the calyx. Nearly allied to *H. radiata.*

Burdock Hyptis. Pl. *2* to 3 feet. ?

87 H. INVOLUCRA'TA (Benth. lab. p. 103.) herbaceous, erect, glabrous, or clothed with fine down ; leaves sessile, elliptic or lanceolate, acute, serrated, cordate at the base ; peduncles longer than the heads ; heads serniglobose, densely many-flowered ; bracteas broad-lanceolate, acute, much exceeding the head ; receptacle naked ; calyx campanulate, pubescent: teeth subulate, equalling the tube in length. %.? S. Native of Mexico, at Saltepec, Karwinski. Nearly allied to *H. capilata* and *H. radiata.*

Involucrated-headed Hyptis. Pl. *2* to 3 feet. ?

88 H. LAPPULA'CEA (Mart. mss. ex Benth. lab. p. 104.) herbaceous, ascending, glabrous or pubescent; leaves petiolate, oblong-ovate, acute, serrated, cuneated at the base, or narrowed ; pedurcles longer than the heads; heads semiglobose, densely many-flowered; bracteas lanceolate or linear, equal in length to the head ; fructiferous calyx campanulate: teeth subulate, stiff, longer than the tube. 1/. S. Native of Brazil, in marshy parts of woods, in the provinces of St. Paul and Rio Janeiro.

Lappula-like Hyptis. Pl. 2 to 3 feet. ?

89 H. RAMOSA (Pohl, icon. ined. ex Benth. lab. p. 104.) erect, glabrous; leaves petiolate, oblong-ovate, deeply serrated, or irregularly and sinuately toothed, quite entire at the base, cuneated or narrowed ; peduncles longer than the heads, which are densely many-flowered ; bracteas lanceolate-linear, obtuse, exceeding the head ; calyx tubularly campanulate : teeth lanceolate, subulate, stiff, shorter than the tube. 1/. S. Native of Brazil, at Fazenda Allegres, in the province of Minas Geraes.

Branched Hyptis. Pl. *2* to 3 feet. ?

90 H. INAM^NA (Benth. lab. p. 104.) herbaceous, erect, glabrous; leaves nearly sessile, broad-ovate, bluntish, crenated, cuneately narrowed at the base; heads few, on long peduncles, globose, densely many-flowered; bracteas lanceolate, obtuse, equal in length to the heads ; receptacle naked ; calyx glabrous, tubular : teeth lanceolate-subulate, shorter than the tube. %. S. Na'tive of Brazil, in fields at Rio Doce, Maximilian.—An inelegant plant, with the habit of *Verbesina.*

Inelegant Hyptis. PL *2* to 3 feet.

91 H. CAPITATA (Jacq. icon. rar. 1. t. 114.) herbaceous, erect, nearly glabrous; leaves petiolate, oblong-ovate, deeply serrated, quite entire at the base, and cuneated or narrowed, glabrous on both surfaces, or hispid from a few pili; peduncles longer than the heads, which are globose and densely many-flowered ; bracteas ovate-lanceolate or linear, shorter than the fructiferous heads; receptacle naked ; fructiferous calyx elongated, tubular, truncate : teeth subulate, strict at length, shorter than the tube. %• S. Native of America, and of Mexico, West India Islands, &c.; also in Manilla, ex Cham. Poit. ann mus. 7. p. 464. t. 27. f. 1. Chnopodium capitatum, Swartzl prod. fl. ind. occ. p. 88. Capitate-flowered Hyptis. Fl. June, July. Ut. *in 3* to 4 feet. stem nearly

92 H. BRE'VIPES (Poit. ann. mus. 7. p. joiate> ovate-glabrous at the base, pubescent above ; leaves P d. at oblong or lanceolate, acute, irregularly , rarely <* the base, rather hispid above, nearly the both surfaces; peduncles shorter, or hardly on heads, which are globose, and densely ^any-Howe , calyx pU. lanceolate-linear, acute, exceeding the longer than bescent, truncate : teeth erect, subulate strict, ratne the tube. %. S. Native of tropical America, bomid Rio Janeiro, Philippines,. Manilla, Celebes, esseq- by the sides of rivers or rivulets. H. globifera, p. 207. ? H. acuta, Benth. in Linnaea, 6. p. *M-* hardly nal ; angles hairy. Heads size of cherries. longer than the calyx, white. stiffer,

Far. /3 ; plant more glabrous ; calycine teen H. more blunt/ %. S. Native of Demerara and radiata, H. B. et Kunth, nov. gen. amer. 2. p- pi. *t*

Short-pedunclcd Hyptis. Fl. June, Aug. to 3 feet. *r n 77-*

93 H. GAUDICHAU'DI (Benth. in Linnsea, pube s- 100.) herbaceous, erectish, glabrous, or ciotnea gerrat e-crescence : leaves petiolate, ovate, acute, base, or *f* nated, or a little cut, rounded or cuneated at near ly gia- upper ones are narrowed, rather hispid above, an brous beneath ; peduncles rather shorter than trie lanceolate, are globose and densely many-flowered; brao about equal in length to the head ; calyx r tubular : teeth linear, erect, much shorter than the S. Native of Brazil, in grassy places at Kio Jan *H. capitala,* but smaller.

Gaudichaud's Hyptis. PI. 1 to 2 feet.

94 H. LANCEOLA'TA (Poir. diet, suppl. entire which base; peduncles shorter than the heads of oblong globose and densely many-flowered; outer bra lanceolate, bluntish, longer than the head ; true smoothish, elongated, truncate: teeth than the tube. 7/.S. Native of Brazil, in Maran

Lanceolate-leaved Hyptis. PI. 2 to 3 feet.

95 H. LONGIFOLIA (Pohl, icon. ined. ex Benth. stem erect, pubescent; leaves petiolate oblong- glabr minated, irregularly toothed, narrowed at tne than above, and rather villous beneath ; peduncles heads, which are densely many-flowered ; bracre ceeding the heads ; calyx tubularly campanulate. late, longer than the tube. %. ? S. Native of province of Goyaz, at Rio Trahiras, and on &err Hardly distinct from *H. lacustris.*

Long-leaved Hyptis. PI. 2 to 3 feet. ?

96 H. LANCE*F6LIA (Schum. pi. gum. m acaa *35.)* stem herbaceous, pubescent; leaves on sbor long-lanceolate, acutish, coarsely serrated, nanr basi, and quite entire ; peduncles shorter than the are globose and densely many-flowered ; braetea obtuse, about eqfial in length to the head ; calyx inflated : teeth lanceolate-subulate, stiff, erect. of tropical Africa, in marshes about the Garnbm- cumbent at the base. Peduncles h.sp.dly villous. pubescent. Probably the same as *H. lacusir* • bluntly tetragonal.

Lance-leaved Hyptis. PI.

H. LACUSTRIS (St. Hil. mss. ex Bentli. lab. p. 107.) glabrous; leaves petiolate, oblong-lanceolate, or the lower ones ovate, acuminated, irregularly serrate-crenated, narrowed at the base, glabrous on both surfaces; peduncles longer than the heads, which are globose and densely many-flowered; bracteas lanceolate, obtuse, about equal in length to the head; fructiferous calyx membranous: teeth linear, shorter than the tube; upper tooth the broadest. %. ? S. Native of Brazil, in water, in the province of St. Paul; and in humid places near Lake das Couchas, in the province of Rio Grande do Sul. Habit *of H. lanceolata.* This species approaches the section *Plagiotis,* in having the calycine teeth being the longest.

Hyptis. PI. 2 to 3 feet.?

H. HOMALOPHYLLA (Pohl, icon. ined. ex Benth. lab. p.) clothed with rufous hairs; leaves on short petioles, oblong or oblong-lanceolate, obtuse, cuneated or narrowed at the base, crenated, wrinkled, villous; heads on short peduncles, semiglobose, densely many-flowered; bracteas lanceolate, falling the calyx; fructiferous calyx tomentose, elongated, inflated at the base: teeth very short, lanceolate, acute. % ? S. Native of Brazil, in elevated fields in the province of Minas Geraes, &c. Allied to *H. hirsuta.* Corolla white, spotted with purple.

Hyptis. PI. 1 to 1J foot.

H. BRACHYODONTES (from *ppaxvg, brachys,* short; and *ovovQ, wovTos, odous odontos,* a tooth; in allusion to the short calycine teeth) Benth. lab. p. 107. *Heads semiglobose, and cam*, hardly globose. Bracteas ovate or lanceolate. Calyx Panulate, with short, ovate, obtuse teeth.*

H. OBTUSIFLORA (Presl, mss. ex Benth. lab. p. 107.) suffruticose; branches clothed with adpressed pubescence; leaves ovate or oblong-lanceolate, bluntish, crenated, narrowed at the base, hispid on both surfaces, or at length glabrous; peduncles shorter than the heads, which are nearly globose and densely many-flowered; bracteas ovate, striated, equalling the Hairs. % S. Native of Peru, on Mount Huanuco, Haenke. Rufescent on the younger branches and lower surfaces of the leaves *fir*. Corolla hardly exceeding the calyx.

flowered Hyptis. Shrub.

H. ARKERI (Benth. lab. p. 108.) stem pubescent at top, leaves sessile, oblong-elliptic, or oblong-linear, acute, serrated, narrowed at the base, nerved, nearly glabrous. Peduncles longer than the leaves; heads globose, rather many-flowered; bracteas lanceolate, linear, obtuse, of Demonger than the head 5 calyx glabrous. %. ? S. Native Fruct. erara. Peduncles pubescent. Leaves an inch long. per?us calyx elongated, inflated at the base.

Hers Hyptis. PI. *2* to 3 feet. ?

od XYLODONTES (from *ZvXov, xylon,* wood; and *OZOVQ OZOV-* being. ?*Usodontos* a tooth; in allusion to the teeth of the calyx *flower,* and rather spiny.) Benth. lab. p. 108. *Heads of very* Semt *globose. Bracteas lanceolate or linear, subulate or base* of A *Pex- Cahjx campanulate: teeth lanceolate at the* ulate, *stiff, glabrous, usually somewhat spinose.*

ceous. ? RADIANTA (Willd. spec. *S.* p. 84.) glabrous, herbaceous; leaves petiolate, ovate-lanceolate, acuminated, crenated, manvfl at the base, or narrowed; heads globose, densely tu$e ered, pedunculate; bracteas oblong-lanceolate, obS. *N an the head; teeth of calyx rather spinose. 1^. ? Carols ? of the southern parts of North America, as of vox, Louisiana, and Mexico, at the Hacienda de La Laguna. Poit. ann. mus. 7. p. 466. t. 27. f. 2. Clinopodium rugosum, Lin. spec. 822.—Dill. hort. elth. 1. p. 88. t. *75.* fig. *86.* Stem acutely tetragonal. Leaves 1-3 inches long. Allied to *H. angustifblia* and *H. capitata.* Corolla pale purple. ?

Rayed Hyptis. Fl. June, July. Clt. 1690. PI. 4 to 5 feet.

H. RUBIGINOSA (Benth. lab. p. 108.) suffruticose; branches divaricate, clothed with rubiginose tomentum; leaves on short petioles, ovate-oblong, very blunt, serrately crenated, cuneated at the base; heads semiglobose, densely many-flowered, on short peduncles; outer bracteas broad-ovate, rather exceeding the head; calyx villous, with stiff teeth. J? . S. Native of Brazil, in the provinces of Goyaz and Minas Geraes, &c, in fields. Leaves \\ inch long, pubescent above, and tomentose beneath, and rusty like the whole plant. Corolla white, spotted with purple.

Rusty Hyptis. Shrub 2 to 2| feet.

H. LUTESCENS (Pohl, icon. ined. ex Benth. lab. p. 109.) herbaceous, procumbent ?, clothed with rusty villi; leaves on short petioles, ovate, obtuse, serrately crenated, cuneated at the base, rather scabrous above, and clothed with rufous pubescence beneath; heads semiglobose, densely many-flowered, on short peduncles; bracteas ovate-lanceolate, rather exceeding the head; calyx nearly glabrous, with stiff teeth, which are equal in length to the tube. %. ? S. Native of Brazil, in the provinces of Goyaz, Minas Geraes, and Bahia. Very nearly allied to *H. rubiginosa.*

Var. ft, hirsuta (Benth. lab. p. 712.) heads numerous, axillary, on short peduncles. 1/ . ? S. Native of Rio Grande.

Yellowish Hyptis. PI. procumbent.

H. AFFINIS (Benth. lab. p. 109.) erect,? clothed with rufous tomentum; leaves on short petioles, ovate, bluntish, narrowed at the base, wrinkled; heads semiglobose, densely many-flowered: superior ones panicled; peduncles rather shorter than the heads; bracteas ovate, acute, about equal in length to the heads; calyx villous, with stiff teeth, which are glabrous at top. %. ? S. Native of Peru. Ruiz, et Pav. and Tafalla. Allied to *H. rubiginosa.*

Allied Hyptis. PI. 2 to 3 feet. ?

H. FERRUGINOSA (Pohl, icon. ined. ex Benth. lab. p. 109.) plant ascending, clothed with dense rubiginose tomentum; leaves on short petioles, roundish, very blunt, crenated, truncate at the base or cordate, very thick, wrinkled, hispid above and tomentose beneath; heads semiglobose, densely many-flowered: lower ones pedunculate: upper ones nearly sessile; outer bracteas ovate, acute, shorter than the calyxes; calyx villous, with stiff erectish teeth. %. ? S. Native of Brazil, in the province of Goyaz, at Rio Pillocas. Allied to *H. rubiginosa.*

Ferruginous Hyptis. PI.

H. LUCIDA (Pohl, icon. ined. ex Benth. lab. p. 109.) shrubby, glabrous; leaves nearly sessile, oval, acutish, scarcely toothed, cuneately rounded at the base, coriaceous, stiff, shining above and veiny beneath: floral ones equal in length to the head; heads ovoid, at length semiglobose, densely many-flowered; bracteas lanceolate, stiff, equalling the heads; calyx villous, with stiff, nearly glabrous teeth. J? . S. Native of Brazil, in the province of Goyaz, at Serra Chrystais.

Shining Hyptis. Shrub.

H. PROTEOIDES (St. Hil. mss. ex Benth. lab. p. 110.) shrubby ? erect, stiff; branches clothed with short rufous tomentum; leaves on very short petioles, broad-ovate, obtuse, crenated, roundly subcordate at the base, coriaceous, stiff, shining above, pubescent on the veins beneath; heads few, subcorymbose, pedunculate, semiglobose, densely many-flowered; bracteas lanceolate, and are, as well as the calycine teeth, stiff

and glabrous. T?. S. Native of Brazil. Leaves 1 to lj inches long. Corolla very villous outside.

Protea-like Hyptis. Shrub.

108 H. CORDATA (Pohl, icon. ined. ex Benth. lab. p. 110.) herbaceous, clothed with rufous villi; leaves nearly sessile, ovate-roundish, very blunt, crenated, roundly subcordate at the base, wrinkled, scabrously hispid above, and clothed with rufous villi on the nerves beneath; heads pedunculate, semiglobose, densely many-flowered; bracteas lanceolate, quite entire, equalling the head; calyx nearly glabrous, with erectish stiff teeth. %.? S. Native of Brazil.

Cordate-leaved Hyptis. PL

109 H. REMOTA (Pohl, icon. ined. ex Benth. lab. p. 110.) herbaceous, tall, clothed with short rufous villi; leaves on short petioles, broad-ovate, very blunt, crenated, roundly cuneated at the base, wrinkled, scabrous above, and clothed with rufous villi at the nerves beneath; heads pedunculate, semiglobose, densely many-flowered, somewhat proliferous; bracteas ovate, quite entire, acute, equalling the head; calyx villous at the base, with erectish, stiff, glabrous teeth. %. S. Native of Brazil, in the province of Minas Geraes, on Serra Santa Isabel, at Paracatu. Perhaps only a variety of *H. cordata.*

Remote Hyptis. PI.

110 H. VILLOSA (Pohl, icon. ined. ex Benth. lab. p. 110.) herbaceous ? densely clothed with rufous villi; leaves sessile, roundish, very blunt, crenated, roundedly cordate at the base, very thick, wrinkled, scabrously hispid above, but clothed with rufous villi beneath; heads semiglobose, densely many-flowered, pedunculate; outer bracteas broad-ovate, foliaceous, toothed, exceeding the calyx; calyx villous, with stiff, nearly glabrous teeth. %. ? S. Native of Brazil, in the province of Goyaz.

Var. /3, reticuBta (Pohl, 1. c.) stem more humble, the leaves more reticulately wrinkled, and the heads larger. 1/. ? S. Native of the province of Minas Geraes, at Padrocino.

Villous Hyptis. PL *2* feet.

111 H. ORBICULATA (Pohl, icon. ined. ex Benth. lab. p. 111.) herbaceous, clothed with rufous villi; leaves sessile, rounded, very blunt, roundly cordate at the base, wrinkled, scabrously hispid above, and pubescent beneath; heads sessile, nearly globose, densely many-flowered; bracteas ovate-lanceolate, quite entire, equalling the head; calyx nearly glabrous, with stiff erect teeth. 2£.? S. Native of Brazil, in the province of Goyaz, on the summits of the mountains called Chapada do Serra San Marcos.

***Orbicular-leaved* Hyptis. PL**

112 H. NIGRESCENS (Pohl, icon. ined. ex Benth. lab. p. 111.) herbaceous, procumbent ? blackish, pubescent; leaves sessile, ovate, obtuse, crenated, cordate at the base, scabrous on both surfaces, lacunosely wrinkled beneath, and pubescent on the nerves; heads few, on very short peduncles, semiglobose, densely many-flowered; outer bracteas ovate, obtuse, wrinkled, shorter than the head: inner ones lanceolate, obtuse, longer than the head; calyx villous, with stiff teeth. %. S. Native of Brazil, in the province of Goyaz, between Rio Corumba and Rio San Marcos.

Blackish Hyptis. PL procumbent. ?

113 H. COMPLICATA (St. Hil. mss. ex Benth. lab. p. 111.) shrubby; branches clothed with long silky pili; leaves numerous, sessile, broad-roundish, obtuse, a little crenated, cordately stem-clasping at the base, complicate, stiff, rather scabrous above, and lacunosely veined beneath; heads few, nearly sessile, semiglobose, densely many-flowered; bracteas lanceolate, acute, equalling the head; calyx pilose at the base, with stiff teeth, which are at length somewhat recurvedly spreading, *h.* S. Native of Brazil, in the province of Minas Geraes, in fields near Sabara. Habit of *H. rotundifblia,* but very different in the form of the leaves, &c.

Complicate-leaved Hyptis. Shrub.

114 H. ROTUNDIFOLIA (Benth. lab. p. 111.) shrubby, clothed with villous tomentum; leaves Prolate, stiff, ish, .crenated, rounded at the base, much globose, brous, rather villous on both surfaces; sigiate; densely many-flowered, pedunculate: "PP villous at the bracteas linear, longer than the calyxes; calyxve*) veaiy base, with stiff teeth, which are at length spreading. *. S. Native of Brazil, in the X d, densely Goyaz and Minas Geraes, &c. Shrub much branched, leafy. Leaves generally 3-4 in a whorl. Corolla n* than the calyx.

***Roundleaved* Hyptis.** Shrub 1 to *2\ feet.* shruD-

115 H. MONTICOLA (Mart. mss. ex »??) J; all, P by; branches clothed with rubiginose villi; leaves coriaceous, late, ovate, obtuse, crenated, cuneated at the rufous rather scabrous above, and reticulated and cioth pubescence beneath; peduncles about equal in ie*d de- leaves, stiff; heads semiglobose, densely ^ " ^ b u l a r, viU°«s teas lanceolate, stiff, equalling the head; W*. of Brazil !n at the base, with short stiff teeth. *? . S. Mati m the provinces of Rio Janeiro, Minas ^eraes, a sandy places. Shrub much branched. Corolla pale Calycine teeth at length somewhat recurved.

Mountain Hyptis. Shrub 5 to 6 feet.

116 H. TRICEWA (St. Hil. mss. ex Benth. J ^ ^ a t suffruticose; branches twiggy, villous; elliptic, obtuse, crenated, cuneately-rounded at ceous, scabrous above, and clothed with rufous neath; peduncles equa lni engit t the leaves; bose, densely many-flowered; bracteas lanceolate, lin g the head; cal y x tubular, villous, with stiff

*2 . S. Native of Brazil, on Serra da Caraca, the of Minas Geraes. Allied to *H. monticola;* bu elongated and less branched; the leaves larger * the calycine teeth shorter.

Three-headed Hyptis. Shrub *2* to 3 feet.

117 H. CONFERTA (Pohl, icon. ined. ex Benth. late, erect, tall, clothed with rubiginose tomentum; ovate-elliptic, obtuse, crenated, cuneated at tne scabrous above, but clothed with rubiginose heads pedunculate, large, semiglobose, densely bracteas ovate, quite entire, foliaceous, head; calyx villous, with stiff, rather spreading Native of Brazil, in the provinces of Goyaz and Leaves 3-4 inches long. Corolla very villous, with rose-colour. /./•#• *10)*

Cro?vded-ftowere& Hyptis. Shrub 4 to 6 feet.

118 H. ALUTVCEA (Pohl, icon. ined. ex Benth. herbaceous, erect or ascending, humble, villous, sessile, oval, obtuse, crenated, cuneated at tne u scabrously hispid above, villous beneath; heads o eles, large, hemispheric, densely many-flo exc ding the head; lanceolate, outer ones calyx villous with stiff erect teeth. %. ? S. Native of Brazil, in the provinces of Goyaz and Minas Geraes. *don humilis.* Leaves *2* inches long. Corolla pale

Tanned Hyptis. PI. \ foot.

119 H. FERRUGINEA (Benth. lab. p. 113.) with rufous tomentum; leaves nearly sessile, obion* crenated, cuneated at the base, wrinkled; heads glo many-flowered, rather panicled; peduncles longer heads; bracteas ovate, acute, equalling the «eaa teeth stiff. %. ? S. Native of New Spain, Mocjno

Stem bluntly tetragonal. Leaves 2-3 inches long. Bracteas densely villous.

Rusty Hyptis. PI.

120 H. XANTHIOCE'PHALA (Mart. mss. ex Benth. lab. p. 113.) herbaceous, ? erect, or ascending, quite glabrous; leaves on short petioles, ovate, serrated, roundly cuneated at the base, coriaceous, quite glabrous on both surfaces, shining above; peduncles stiff, compressed, longer than the leaves; heads semi-globose, densely many-flowered; bracteas ovate-lanceolate, stiff, the inner ones cuneated, a little serrated; calyx woolly at base, with stiff, glabrous teeth. %. ? S. Native of Brazil, in fields in the province of Minas Geraes, in the Diamond district. Heads size of those of *H. conferta* and *H.ferruglnea.*

Yellow-headed Hyptis. PI.

130 H. ANOMALA (Benth. lab. p. 113.) branches clothed with rough pubescence; leaves petiolate, ovate, obtuse, crenated, base rounded, or cuneated, wrinkled, tomentose beneath; heads semi-globose, densely many-flowered, on short peduncles, panicled at the tops of the branches; bracteas ovate, stiff, about equal in length to the calyxes; calycine teeth subulately awned. 1/. ? S. Native of the South of Minas Geraes. Stems many feet high, bluntly tetragonal. Leaves petiolate; bracteas tomentose. Calyx villous. Genitals a little exserted.

Hyptis. PI. tall.

132 H. CASPITOSA (St. Hil. mss. ex Benth. lab. p. 118.) stem numerous, erect, beset with rufous hairs; leaves sessile, ovate, bluntish, coarsely and unequally serrated, rounded at the base, marrowed, rather coriaceous, nerved, nearly glabrous; bracteas semi-globose, densely many-flowered, on long peduncles; lanceolate, exceeding the head; calyx vilious: teeth ovate and subulately awned at apex. %. ? S. Native of Brazil, in the province of St. Paul, and in the South, among bushes, and in fields. Stem nearly simple, tetragonal, calvous. Leaves 1 inch long. Corolla pale red, rather shorter than the calyx: teeth.

Hfted Hyptis. PI. 1 foot.

Sect. XII. POLYDESMIA (from πολυς *polys,* many; and δεσμη, a bundle; in reference to the many heads of flowers.) Heads of flowers nearly sessile, rarely on racemes (or panicles) numerous, disposed in paniculately branched flowered, rarely in simple racemes, dense, sometimes many-times pressed, or irregularly sub-globose, and sometimes few-flowered. Bracteas numerous, adpressed, ovate, lanceolate, or lanceolate, rarely linear. Fructiferous calyx sometimes setaceo mto a cylindrical tube which is truncate at apex, with the short, rarely obsolete teeth, sometimes (in some of the late, with ovoid heads) tubularly campanulate, with lanceolate teeth, or unequal. Tube of corolla generally exserted.—Herbs or shrubs, usually many-flowered.

133 H. VESTITA (Benth. lab. p. 114.) stem shrubby; branches clothed with floccose tomentum: leaves petiolate, roundish, obtuse, or hardly acuminated, erosely crenated, truncate at the base, very much wrinkled, villous on both surfaces; heads sessile; whorls approximate, racemose; racemes panicled; bracteas ovate, or lanceolate, obtuse, equalling the calyxes; fructiferous calyx tubularly inflated, glabrous, with a truncate mouth, and obsolete teeth: throat naked inside. 1} • S. Native of Brazil, in woods in the provinces of Minas Geraes and St. Paul, &c. Shrub many feet high. Branches bluntly tetragonal. Corolla blue, glabrous. Genitals exserted. In Brazil the plant is called *Erm de Santa Anna, Ervo do Pa*, where it is used as a vulnerary.

134 H. DUPLICATO-DENTATA (Pohl, icon. ined. ex Benth. lab. p. 114.) shrubby; branches rather tomentose; leaves petiolate, ovate, bluntish, erosely crenated, rounded or cuneated at the base, scabrous above, and clothed with hoary tomentum beneath; heads sessile; whorls approximate, fasciculately racemose; racemes panicled; bracteas lanceolate, obtuse, thick, tomentose, exceeding the calyxes a little; fructiferous calyx tubularly inflated, villous, with a truncate mouth, and short, unequal, or obsolete teeth. \. S. Native of Brazil, in the provinces of Minas Geraes and Goyaz, in open parts of woods.

Far. (3, virescens (Pohl, 1. c.) ^ • ^- Native of Minas Geraes, at Manuel Pareira.

***Doubly-toothed-leaved* Hyptis. Shrub.**

125 H. ALTHÆFOLIA (Pohl, icon. ined. ex Benth. lab. p. 115.) shrubby; branches clothed with floccose tomentum; leaves petiolate, broad-ovate, bluntish, erosely crenated, truncately cordate at the base, wrinkled, tomentose on both surfaces; heads sessile; whorls approximate, fasciculately racemose; racemes panicled; bracteas lanceolate, thick, tomentose, exceeding the calyxes; fructiferous calyx tubularly inflated, glabrous, with an obsoletely or irregularly toothed mouth: throat naked inside. T?. S. Native of Brazil, in the province of Minas Geraes, in humid places. Allied to the two preceding.

***Althcea-leaved* Hyptis. Shrub.**

126 H. BARBATA (Schranck, in densk. bot. gesell. regensb. 2. p. 52. Benth. lab. p. 115.) stem shrubby; branches tomentose; leaves petiolate, broad-ovate, acuminated, deeply toothed, truncate at the base, thick, wrinkled, clothed with soft villi; heads sessile; whorls loose, approximate, somewhat racemose; racemes panicled; bracteas ovate, acute, equalling the calyxes; calyx tomentose, campanulate, with a truncate mouth, and strict, subulate teeth, which are equal in length to the tube. T?. S. Native of Brazil. Habit of //. *vestita,* but the tomentum is softer, and lower surfaces of the leaves rather silky.

Bearded Hyptis. Shrub.

127 H. OBVALLATA (Spreng. ex Benth. lab. p. 115.) stem shrubby; branches tomentose; leaves on short petioles, ovate, acutish, erosely crenated, truncately cordate at the base, thick, much wrinkled, tomentose on both surfaces; heads sessile; whorls distinct, fasciculately racemose; racemes panicled; bracteas numerous, ovate-lanceolate, acute, 2-3 times longer than the calyxes; calyx villous, with a truncate mouth, and subulate, strict teeth, which are about equal in length to the tube. T2. S. Native of Brazil, in the province of Goyaz, and in the South. Allied to *H. vestita* and *H. barbata.* Corolla pubescent.

Environed Hyptis. Shrub.

128 H. CARPINIFOLIA (Benth. lab. p. 115.) stem shrubby; branches clothed with rufous villi; leaves sessile, ovate-roundish, obtuse, or acuminated, toothed, cordate at the base, coriaceous, nearly glabrous above, rugosely veined beneath, tomentose, at length glabrous; heads sessile; whorls approximate, distinct, fasciculately racemose; racemes panicled; bracteas ovate-lanceolate, acuminated, exceeding the calyxes; fructiferous calyx tubular, glabrous, with a truncate, ciliated mouth, and subulate, strict teeth, which are about equal in length to the tube. T?. S. Native of Brazil, in the provinces of Goyaz, Minas Geraes, &c.; and of Peru, in dry fields and hills. Corolla blue, downy outside. Branches bluntly tetragonal. Odour very aromatic.

Hornbeam-leaved Hyptis. Shrub *S* to 5 feet.

129 H. AQUATICA (Pohl, icon. ined. ex Benth. lab. p. 116.) shrubby; branches beset with spreading hairs; leaves nearly sessile, ovate-oblong, bluntish, toothed, cordate at the base, coriaceous, nearly glabrous above, rugosely veined beneath, and tomentose, but at length glabrous; heads sessile; whorls approximate, distinct, fasciculately racemose; racemes somewhat panicled; bracteas ovate-lanceolate, subulately acuminated, ex-

ceeding the calyxes ; fructiferous calyx tubular, with a truncate ciliated mouth, and subulate, unequal, strict teeth. T? . S. Native of Brazil, in the province of Minas Geraes, at Rio da Prata. Nearly allied to the preceding.

Water Hyptis. Shrub 3 to 4 feet. ?

130 H. A'UIDA (St. Hil. mss. ex Benth. lab. p. 116.) branches erect, twiggy, beset with spreading pili; leaves sessile, ovate-lanceolate, acute, serrated, roundedly cordate at the base, glabrous, scabrous above ; floral leaves broad-heart shaped ; heads sessile; whorls equal, interruptedly racemose ; racemes simple, or a little panicled ; bracteas ovate, bluntish, coloured, about equal in height to the calyxes; calyx tubular, with linear, unequal teeth, which are shorter than the tube. f? . S. Native of Brazil, in dried up marshes in the southern deserts of the province of Minas Geraes. Corollas pale purple.

Arid Hyptis. Shrub 2 to 3 feet.

131 H. VIOLA'CEA (Pohl, icon. ined. ex Benth. lab. p. 116.) branches erect, twiggy, villous at apex, at length glabrous; leaves nearly sessile, ovate-lanceolate, or ovate, acute, doubly serrated, rounded at the base : or the lower ones are cordate, very scabrous on both surfaces, green, coriaceous; heads nearly sessile ; whorls secund, interruptedly racemose ; racemes short, simple, or a little panicled ; bracteas ovate, acutish, membranous, coloured, exceeding the calyxes a little ; calyx tubular, nearly glabrous, with subulate teeth. *fy* • ? S. Native of Brazil, in the province of Goyaz, at Trahiras.

Violaceous-flowered Hyptis. Shrub.

132 H. GLOMERA'TA (Mart, ex Schranck, in syll. pi. bot. ratisb. 2. p. *55.)* branches clothed with fine pubescence ; leaves on short petioles, or sessile, ovate-oblong, or lanceolate, acutish, serrated, rounded at the base, pubescent on both surfaces; heads nearly sessile, ovoid-globose, few-flowered ; whorls interruptedly racemose ; raceme elongated, a little panicled ; bracteas ovate, acute, twice as long as the calyxes ; calyx tubular, nearly glabrous, with lanceolate, acute teeth, which are about 3 times shorter than the tube. J?. S. Native of Brazil, in the provinces of Minas Geraes, and Goyaz, and the South, in humid places. Stem herbaceous, ? bluntly tetragonal, usually purplish. Corolla hardly exceeding the calyx, pubescent outside.

Glomerate-flowered Hyptis. PI. ?

133 H. PAUCIFLORA (Pohl, icon. ined. ex Benth. lab. p. 117.) herbaceous, pubescent; leaves petiolate, ovate, bluntish, serrated, rounded at the base, or cordate, clothed with soft hairs above, and nearly glabrous beneath, and somewhat canescent; heads ovate-globose, few- flowered, pedunculate, racemose ; raceme elongated, loose; bracteas broad-ovate, membranous, a little coloured, longer than the calyxes ; calyx tubular, membranous, nearly glabrous, with lanceolate, acute teeth, which are shorter than the tube. *%.* S. Native of Brazil, in the province of Goyaz. Leaves like those of *//. pectinata,* and the heads like those of *H. glomerata,* but smaller, few-flowered, and pedunculate.

Few-flowered Hyptis. PI.

134 H. FOLIOSA (St. Hil. mss. ex Benth. lab. p. 117.) shrubby ; ? branches ascending, clothed with rufous villi; leaves on short petioles, broad-ovate, obtuse, crenated, rounded at the base, or cordate, green on both surfaces, and clothed with viscid pubescence, or villous ; racemes sub-secund, leafy, somewhat panicled ; bracteas ovate-lanceolate, exceeding the calyxes • calyx tubular, with lanceolate, erect, acute teeth. fc . ? g' Native of Brazil. Leaves 1-2 inches long.

Leafy Hyptis. Shrub 1 to 2 feet.

135 H. PETR^A (St. Hil. mss. ex Benth. lab. p. 117.) shrubby ; branches erect, tomentose; leaves petiolate, ovate, obtuse, crenated, cuneated at the base, wrinkled, clothed " j * *J rufous tomentum on both surfaces ; heads ovoid, few-no bracon short peduncles, crowded into a short, dense raceme alyxes ; teas ovate-lanceolate, acute, coloured, exceeding the c ^ ect calyx tubular, nearly glabrous, with lanceolate, acute, Minas teeth. P?. S. Native of Brazil, in the province ot ^ Geraes, in the western desert, among rocks near 1 aioo red jsbj slender, naked at the base. Bracteas and calyxes glandular. Racemes sub-secund.

Rock Hyptis. Shrub. R , ja b. p.

136 H. SUBROTU'NDA (Pohl, icon. ined. ex, bentn. 118.) shrubby ; branches erect, twiggy, clothed with nn ^ nate a, cence; leaves small, sessile, oval-rounded, ob * use, ve iny, broadly rounded at the base, obtuse, stiff, coriaceou J^J^ ; green on both surfaces, rather scabrous: floral on simple heads ovoid, few-flowered, racemose ; racemes nearly j bracteas coloured, lanceolate, acutish, ciliated, exceed calyxes; fructiferous calyx tubular, with a trunca the prohardly toothed mouth. F? . S. Native of Brazil, in vince of Goyaz, at Pontefeite.

Roundish-leaved Hyptis. Shrub. p 118.)

137 H. LYTHROIDES (Pohl, icon. ined. ex Benth. ^ { ^ 88S * shrubby; branches erect, twiggy, pubescent; * ea ^ s us on both sile, oval, obtuse, rounded at the base, rather scabrous surfaces, and clothed with rufous pubescence: £ bracteas few-flowered, racemose; raceme elongated, simp ^ ca lyx; lanceolate, acute, coloured, pubescent, longer thai ^ calyx tubularly campanulate, with a truncate *vaout* tube late teeth, ? which are about equal in length to the zend ^ Ag ua Native of Brazil, in the province of Goyaz, at ^ Fria. Differs from *H. subrotunda* in the calyx.

Lythrum-like Hyptis. Shrub. 1 u p, 118.)

138 H. PARVIF6LIA (Pohl, icon. ined. ex Benth. w ht • r leaves shrubby ; branches erect, twiggy, finely P ubes(* at the base, small, petiolate, oval, toothed at top, narrowec ith surfaces, quite entire, stiff, coriaceous, veiny, green on D few-fevered* rather scabrous : floral ones similar; heads ovoid, eOjate-linear» racemose; raceme nearly simple ; bracteas lan the caly* ^ ' coloured, clothed with adpressed villi, longer than ated jlarjly. fructiferous calyx tubular, with a truncate, ciu ro ' vjnCe ot toothed mouth. J? . S. Native of Brazil, in the p Goyaz. Nearly allied to *H. subrotunda.*

Small-leaved Hyptis. Shrub. ,. p. U*V

139 H. RUBICI/NDA (Pohl, icon. ined. ex Benth. i ^ g peti- branches nearly glabrous, with scabrous angles; ^^ cl sne * olate, broad-ovate, shortly acuminated, doubly * er tor n cohose ately rounded at the base, scabrous above, ar 7 ca cis circoid beneath, and more particularly on the nerves ; mo ^ , lnae few-flowered, on short peduncles, paniculately race g; ca ly* teas lanceolate, coloured, twice as long as the ca y^ teeb tubular, with a truncate mouth, and setaceous,^ jja tive ^ which are about equal in length to the tube. *?. *'JUIL^S Oe^eb, Brazil, in several places of the province ot w to % inC hes The whole plant generally purplish. Leaves lg long.

Reddish Hyptis. PI. U to 2± feet. n 9 .) *W*

140 H. MURICA'TA (Schott, mss. ex Benth. lab. p. us ; le ^es baceous ; ? stem nearly glabrous, with scabrous ang cunea teiy petiolate, broad-ovate, acuminated, doubly serrate ti- - labrous rounded at the base, rather scabrous above, and ne a y beneath ; heads depressed, nearly globose, few-flow ^^ cmen sessile ; whorls secund : upper ones approximate ' xeue jj og the remote ; bracteas broad-ovate, acute, villous, e h ^ trUt] C» te calyxes; fructiferous calyx tubular, pubescent, wit er than the mouth, and strict, setaceous teeth, which are short

with hoary tomentum beneath ; heads small, few-flowered, racemose ; peduncles equalling the heads ; racemes strict, elongated, panicled ; bracteas ovate-lanceolate, acuminated, somewhat exceeding the calyxes; calyx pubescent, with a truncate mouth, and strict, setaceous teeth, which are rather shorter than the tube. *11.* ? S. Native of Brazil, in the province of Goyaz, at Villa Boa. Allied to *H. polystdchya,* but more green, and less tomentose, and the heads much smaller.

Small-flowered Hyptis. Pl.

146 H. SPICATA (Poit. ann. mus. 7. p. 474. t. 28. f. *2.)* branches nearly glabrous, with scabrous, prickly edges; leaves petiolate, ovate, acute, unequally serrate-crenated, roundedly cuneated at the base, nearly glabrous on both surfaces, or pubescent above; heads semi-ovoid, loosely racemose; peduncles equal in length to the fructiferous heads; racemes panicled; bracteas ovate, rather membranous, one-half shorter than the fructiferous calyx ; calyx glabrous, elongated in the fructiferous state, inflated at the base, with a truncate mouth, and strict, setaceous teeth, which are shorter than the tube. *$* . S. Native of Tropical America, on the east coast, from Mexico to the provinces of Minas Geraes, and Cisplatin in Brazil; also of St. Domingo, Martinica, Mariane Island, &c. Nepeta mutabilis, Rich, in act. soc. hist. nat. par. Leaves 1-2 inches long. Corollas small, violaceous.

Afyicate-flowered Hyptis. Fl. July, Aug. Clt. 1820. Pl. 4 to 6 feet.

147 H. ROSTRATA (Salzm. pi. bras. exs. ex Benth. lab. p. 121.) branches glabrous, with rough, prickly angles; leaves petiolate, ovate, acute, unequally serrate-crenated, roundly cuneated at the base, glabrous ; heads globose at the base, loosely racemose ; peduncles rather shorter than the fructiferous heads ; bracteas ovate, membranous, glabrous, 3-4 times shorter than the fructiferous calyxes; fructiferous calyx glabrous, inflated at the base, long-beaked, with a truncate mouth, and short, setaceous, strict teeth. *$* . S. Native of Brazil, in shady places near Bahia. Stems branched. Whorls distant, secund.

Beaked-G'Ayxed Hyptis. Pl. 4 to *5* feet.

14S H. TENUIFLORA (Benth. lab. p. 121.) branches bifariously pubescent, with smooth angles; leaves petiolate, ovate, acute, unequally serrated, roundly cuneated at the base, glabrous ; heads ovoid, few-flowered, loosely racemose ; peduncles twice as long as the fructiferous heads ; racemes panicled : bracteas ovate, membranous, one-half shorter than the fructiferous calyxes; fructiferous calyx glabrous, elongated, inflated at the base, with a truncate mouth, and strict, setaceous teeth, which are much shorter than the tube. *$^* S. Native of Brazil, Leandro di Sacramento. Allied to *H. spicata.*

Thin-flowered Hyptis. Pl. *3* to 4 feet. ?

149 H. EXPANSA (Pohl, icon. ined. ex Benth. lab. p. 122.) nearly glabrous ; angles of branches roughish ; leaves petiolate, ovate, acuminated, unequally serrated, cuneated at the base, rather hispid above and on the nerves beneath ; heads ovoid, few-flowered, loosely racemose ; peduncles shorter than the fructiferous heads ; racemes divaricately panicled ; bracteas ovate, acute, membranous, ciliated ; fructiferous calyxes nearly glabrous, scarcely longer than the bracteas, with a truncate mouth, and strict, setaceous teeth, which are one-half shorter than the tube. *X.* ? S. Native of Brazil. Allied to *H. spicata,* but differs in the shorter calyxes, and longer teeth, &c.

Expanded Hyptis. PL ?

150 H. DUBIA (Pohl, icon..ined. ex Benth. lab. p. 122.) pubescent ; angles of branches smooth ; leaves *on* short petioles, ovate, acute, doubly crenated, cuneated at the base, scabrously hispid above, and pubescent on the veins beneath, wrinkled ; heads ovoid, few-flowered, racemose; peduncles very short; racemes a little branched ; bracteas lanceolate, acuminated,

longer than the fructiferous calyxes, pubescent, ciliated; calycine teeth setaceous, strict, one-half longer than the tube. %. ? S. Native of Brazil, in the province of Minas Geraes, at Rio Abaite. Allied to *H. exptinsa,* but is less branched, and more villous, and the bracteas are narrower and longer.

Doubtful Hyptis. PL ?

SECT. XIII. MESOPH^NRIA (from *fieaog, mesos,* the middle; and or^cupa, *sphaira,* a globe ; in reference to the heads of flowers being semi-globose.) Benth. lab. p. 122. Heads rather loose, few-flowered. Bracteas sometimes minute, or scarcely any, sometimes subulate, about equal in length to the calyxes. Calyxes nearly sessile in the heads, obliquely campanulate in the fructiferous state, with a truncate mouth, and subulate, strict teeth ; the throat closed inside by hairs, or more or less ciliated, with 5 fascicles of hairs, which are disposed between the teeth. Tube of corolla inclosed, or a little exserted.—Herbs, rarely shrubs, for the most part pilose. Heads pedunculate : lower ones rarely all from the axils of the leaves : cauline ones conforming, solitary, or in fascicles : the superior ones usually disposed into a loose panicle.

151 H. PLECTRANTHOÏDES (Benth. lab. p. 122.) stem herbaceous, erect, clothed with long hairs, with smooth angles ; leaves on very short petioles, broad-ovate, or roundish, obtuse, crenately serrated, rounded at the base, or subcordate, pilose; heads few-flowered, loosely racemose, pedunculate; racemes loose, panicled; bracteas lanceolate, acute, shorter than the calyxes, villous : teeth equalling the tube. 1/. ? S. Native of the South of Brazil, Sello. Stem generally purplish. Leaves an inch long. Corolla twice as long as the calyx. Stamens exserted.

***Plectranthus-like* Hyptis. PL**

152 H. PU^MILA (Pohl, icon. ined. ex Benth. lab. p. 122.) herbaceous, humble, erect; stem beset with spreading pili; leaves on very short petioles, broad-ovate, roundish, serrately crenated, rounded, or subcordate at the base, green, pilose ; heads loosely few-flowered, pedunculate, racemose; bracteas loose, subulate, shorter than the calyxes; fructiferous calyx sessile : throat villous inside. 1/. ? S. Native of Brazil, in the province of Goyaz, on Serra de Chrystais. Very nearly allied to *H. communis,* but smaller, and more pilose, and the leaves are broader.

Dwarf Hyptis. PL \ foot.

153 H. COMMUNIS (St. Hil. mss. ex Benth. lab. p. 123.) herbaceous, humble, glabrous, or more or less villous; leaves on short petioles, rounded, ovate, or^blong, crenated, cuneated, or narrowed at the base ; heads loosely few-flowered, pedunculate, racemose ; bracteas loosely subulate; calyxes sessile, villous : throat woolly inside. 1/. S. Native of Brazil, in the province of Minas Geraes, in elevated fields, and among rubbish on the mountains. H. flabellata, Pohl, icon. ined. Stems often rooting at the base. Corolla blue, nearly glabrous outside.

Common Hyptis. PL £ to 1 foot.

154 H. FRUTICOSA (Salzm. pi. bras, exsic. ex Benth. lab. p. 123.) branches divaricate, tomentose while young; leaves on short petioles, ovate, obtuse, crenated, cuneated at the base, much wrinkled, pale beneath ; peduncles solitary, axillary, longer than the leaves ; heads loosely few-flowered, nearly globose ; bracteas loose, subulate ; fructiferous calyx rather gibbous above the base, with an oblique, villous mouth, and spreading teeth. *? . S. Native of Brazil, in the provinces of Bahia, Minas Geraes, in fields and woods. Corolla blue, scarcely pubescent, equalling the calycine teeth. Genitals inclosed

Shrubby Hyptis. Shrub 4 to 6 feet.

155 H. MELISSOÏDES (H. B. et Kunth, nov. gen. amer. 2. p. 320.) suffruticose; branches clothed with rufous v.lhi; l« ^ short petioles, ovate, acute, serrately crenated, roundea tum base, villous above, and densely clothed with hoary . W "e" ^ beneath ; peduncles very short, axillary, usually twin, many-flowered, rather loose, secund; bracteas min„l r' throat ceous ; calyx pubescent, ovate, strict in the ripe sta • ^ ^ villous inside : teeth short, setaceous, villous. I? • °- on the of Tropical America, in bushy places in New Granada, ^ banks of the river Juanambu. Shrub much brancne made. Corolla white, downy.

Melissa-like Hyptis. Shrub 4 to 6 feet.

156 H. PILOSA (Benth. lab. p. 124.) branches ratherj ^ leaves petiolate, ovate, acute, serrulated, cordate tbe leaveS; rather canescent; peduncles rather longer than. seta. heads 6-10-flowered, nearly globose; bracteas "V"^^ equal, ceous ; fructiferous calyx much increased, 0^ate tu adth of the truncate, very hairy: teeth shorter than the bre on inch calyx. ^. S. Native of Peru, Pavon. Leaves long.

Pilose Hyptis. Shrub.

157 H. SUAVEWNS (Poit. ann. mus. par. /. P broad-2.) stem herbaceous, erect, pilose; leaves pet bag e: upper ovate, sinuately serrated ; lower ones cordate at tn ones rounded, or cuneated, pubescent, villous, or d d b t villous o f peduncles rather shorter than the few-flowered neau or 2-3-together in the axils, racemose ; racerTles £ vill bracteas minute, setaceous ; mouth of calyx tru ^ £10 ©. S. Native of Tropical America, from Me Janeiro, Peru ; also of several of the West ma &c. Philippines, Manilla, Moluccas, about Madras, J. Ballota suaveolens, Lin. spec. 815. Jacq. hort. vni • fl t. 42. Bystropdgon suaveolens, Lher. sert. an S ; R pr. i Plumieri, Poitt ann. mus. 7. p. 473. H. ebracteata, Ait. hort. kew. ed. 2. vol. 3. p. 391. Bystropogon Blum, bijdr. p. 824.?—Plum. icon. t. 163. f. ti^ 257. t. 18. f. 3.—Sloan, hist. 1. p. 171. *' fla' blue, annual, branched. Leaves 1-2 inches long, t^roi ^ % w

Sweet-scented Hyptis. Fl. July, Aug. Clt. lo 6 feet.

158 H. GRAVE^OLENS (Salzm. pi. bras, exsic ex p. 125.) stem herbaceous, erect, rather P llose, rrated, angles ; leaves petiolate, ovate, acute, sinuately ser at the base, wrinkled, clothed with clammy P ubeSC tjian surfaces; peduncles axillary, many times longer flowered fascicles : superior ones irregularly panicle minute. 0. S, Native of Brazil, on the- sea heavy an* Bahia. Nearly allied to *H. suaveolens.* Odour aromatic.

Heavy-scented Hyptis. PL 4 to 6 feet.

159 H. UMBROSA (Salzm. pi. bras, exsic. ex 125.) stem herbaceous, erect, villous, with scabrous nearly naked axils; leaves petiolate, broad-ova- gularly serrated, or deeply lobed, rounded at the pilose above, pale and pubescent beneath, or at than peduncles axillary, filiform, sub-fasciculate, rnuci the loose, 3-10-flowered heads; bracteas minute, calyx pubescent: mouth villous. ©. S. Native pi woods near Bahia ; also very common in the prov Janeiro, Minas Geraes, Goyaz, and St. Paul, in and of Peru, at Huanuco and Tarma, Mathews. Schranck, in syll. pi. ratisb. 2. p. *56.1* Nearly *viscida,* but the hairs are less clammy. Corollas *DI*

Shaded Hyptis. PL

160 H. POLYA'NTHA (Poit. ann. mus. 7. p. herbaceous, erect, pubescently villous; the axils very pi leaves petiolate, ovate, acutish, irregularly crenate-serratea,

or cordate at the base, scabrous from pili above, and clothed with white tomentum beneath; panicle ample; peduncles filiform, much longer than the loosely 5-20-flowered heads; bracteas minute, setaceous ; calyx pubescent, with a villous mouth. ©•?S. Native of Peru, near Quito, Loxa, and Gonzanama. tfystrop6gon sidsefolium, Lher. sert. angl. 19.? Herb sweet-scented. Leaves U to 2 inches Ions. Corollas minute, pubescent, violaceous.

Many-flowered Hyptis. Fl. July, Aug. Clt. 1819. PL 4 to 6 feet.

cloth 11H\LILACINA (Schiede, et Deppe, in Linnsea, 5. p. 101.) lifc. W*lb ^soft pubescence; leaves petiolate, ovate, or el- clothed with "Ptic, acute, doubly serrated, cuneated at the base, or narrowed, Pubescent above, canescently tomentose beneath ; heads loosely jew-nowered, axillary, opposite, pedunculate, small ; bracteas Oose, setaceous, scarcely shorter than the calyx ; calyx villous, .*ate, with spreading, subulately acuminated teeth. ©.? S. native of Mexico, about Jalapa, &c, among bushes. Nearly pllled to the preceding, but differs in the leaves and calyx, &c. Corolla lilac, puberulous.

^ac-flowered Hyptis. PL 2 to 3 feet.

32fr? URTICOIDES (H. B. et Kunth, nov. gen. amer. 2. p. u0 stem herbaceous, erect, downy, with rather rough angles; Aves Petiolate, ovate, acute, serrated, cuneated at the base, «ner hispid above, and pubescent beneath ; heads loosely few-cem on lonS peduncles, disposed in secund, panicled ra-mes 5 bracteas minute, setaceous; calyx pubescent, with a ^1]ous mouth. ©.? S. Native of Mexico, at the foot of i oun l Macultipec, near Jalapa. Branches tetragonal. Corol-£ mi nute. An intermediate species between *H. polydntha* and **• *pectincita.*

Bystropogon coarctatum, Thonn. et Schum. in act. acad. hafn. 4. p. 34. Stem rather woody at the base. Leaves variable in form and size. Corolla small, pale purple, or yellow, spotted with purple.

Pectinate Hyptis. FL year. Clt. 1776. " PL 2 to *5* feet.

SECT. XV. MENTHIDIUM (SO called from the habit of the species being that of Mentha, or Mint.) Benth. lab. p. 128. Flowers sessile, or on short pedicels, disposed usually in many-flowered whorls. Bracteas minute, or hardly any, or loose and setaceous. Calyx campanulate, equal; throat naked inside. Corolla hardly exceeding the calyx.—Herbs often panicled at apex.

166 H. PULEGIOIDES (Pohl, icon. ined. ex Benth. lab. p. 128.) herbaceous, procumbent at the base ; branches ascending, clothed with adpressed pubescence; leaves on short petioles, lanceolate, acute, serrated, narrowed at the base, wrinkled, very villous : floral ones conform, smaller ; whorls all distinct, and globose, densely many-flowered; bracteas subulate, shorter than the calyx; calyx tubular, with a villous base, and lanceolate, subulate, erect, short teeth. %. ? S. Native of Brazil, in the province of Minas Geraes, at Fazenda do Pari. This species is intermediate between the present section and sect. *Apodbtes.*

***Penny-Royal-like* Hyptis. PL ?**

167 H. A^BIDA (H. B. et Kunth, nov. gen. amer. 2. p. 319.) shrubby, clothed with floccose wool; leaves nearly sessile, ovate, obtuse, or the upper ones are subulately acuminated, crenated, roundly cuneated at the base, wrinkled; whorls loose, globose, distinct; racemes sub-panicled ; bracteas short, setaceous; fructiferous calyx nearly globose, densely woolly : teeth very soft, setaceous, about equal in length to the tube. *?• S. Native of Mexico, at Lake Cusco, in the valley of St. Jago, and near Valladolid. Corollas hardly longer than the calyx.

Whitish Hyptis. FL July, Aug. Clt. 1824. Shrub 2 to *3* feet.

168 H. PUBE'SCENS (Benth. lab. p. 129.) suffruticose, clothed with tomentose pubescence ; leaves nearly sessile, oblong, acutish, serrated, rounded at the base, a little wrinkled, pale beneath ; whorls small, globose, many-flowered, remote ; racemes panicled ; bracteas short, setaceous ; calyx villous : teeth stiff, subulate, equalling the tube, at length spreading in a stellate manner. Pj • S. Native of New Spain. Branches bluntly tetragonal. Corolla a little longer than the calycine teeth.

Pubescent Hyptis. Shrub.

169 H. MOCINIANA (Benth. lab. p. 129.) suffruticose, pubescent; leaves on short petioles, cordate-ovate, doubly serrated, whorls globose, many-flowered, distinct, racemose; racemes panicled ; bracteas short, setaceous ; calyx villous : teeth stiff, subulate, glabrous, twice as long as the tube, spreading

in a stellate manner. ^ . ? S. Native of New Spain, Moçino et Sesse. Plant clothed with rubiginose pubescence. Leaves 1 to 1| inch long. Corolla shorter than the calycine teeth.

Moçino's Hyptis. Shrub.

170 H. SPINULOSA (Benth. lab. p. 129.) suffFruticose, clothed with fine pubescence ; leaves petiolate, ovate, acuminated, serrulately crenated, cordate at the base; whorls globose, many-flowered, distinct, racemose ; racemes panicled ; bracteas short, setaceous ; calyx ovate, pubescent: teeth stiff, subulate, glabrous, shorter than the tube, spreading in a stellate manner. J? . S. Native of New Spain, Moçino et Sesse. Stem clothed with rufous pubescence.

Spinulose-calyxed Hyptis. Shrub.

171 H. STELLULA'TA (Benth. lab. p. 129.) herbaceous; branches clothed with rusty villi; leaves on short petioles, ovate, acute, serrately crenated, rounded at the base, wrinkled, villous; racemes panicled ; whorls densely globose; bracteas small, setaceous; calyx ovate, villous, with subulate, stellately spreading teeth. ©.?S. Native of Mexico, at Cuernavaca and Toluco, Berlandier. Corolla pubescent, hardly longer than the calyx.

>$7fl7T?/-calyxed Hyptis. PI. 4 to 5 feet.

172 H. SCOPA'RIA (Poit. ann. mus. 7. p. 475. t. 31. f. 2.) shrubby; branches glabrous, with prickly angles ; leaves on short petioles, linear, obtuse, quite entire, or a little denticulated, glabrous; whorls loose, remote, 2-10-flowered; calyx nearly glabrous, with ovate, erect, obtuse teeth. *? . S. Native of Porto Rico and St. Dominica. Saturèia Americana, Poir. diet. 6. p. 571. Saturèia Condae'a, Juss. ex Poir. I.e. Corolla glabrous, hardly exceeding the calyx. Leaves minutely glandular.

Broom Hyptis. Fl. June, Aug. Clt. 1825. Shrub.

173 H. VERTICILLA'TA (Jacq. icon. rar. *2.* t. 113.) suffruticose ; branches erect, pubescent or pilose; leaves on short petioles, lanceolate, acute, serrated, roundly narrowed at the base, clothed with fine pubescence; whorls rather loose, many-flowered, distinct, racemose; calyx ovate, glabrous, with erect, ovate-lanceolate teeth. ^ . S. Native of Mexico, on waysides near Papantla ; and of St. Dominica. Stachys pàtens, Swartz, nov. gen. et spec. p. *88.* Angles of stem smooth. Leaves 1-2 inches long. Corolla white, tinged with red, hardly exceeding the calyx.

Whor led-flowered Hyptis. Shrub *3* to 4 feet.

174 H. FASCICULA'TA (Benth. lab. p. 130.) herbaceous, glabrous, or clothed with fine down ; leaves petiolate, ovate, acute, serrated, a. little wrinkled, green on both surfaces ; racemes elongated, panicled ; whorls loose, many-flowered; bracteas minute, setaceous; fructiferous calyx inclosed, glabrous : teeth ovate, acute, much shorter than the tube. *1(..* ? S. Native of Brazil, near habitations, in humid places in the provinces of Minas Geraes, Rio Janeiro, &c.; and of Buenos Ayres, at Parano. Corollas minute, purplish.

Fascicled-i\owered Hyptis. PI. 1 to 3 feet.

175 H. FASTIGIA'TA (Benth. lab. p. 130.) herbaceous, ascending ; leaves petiolate, ovate, acute, doubly serrated, rounded at the base, green above and villous, but clothed with hoary pubescence beneath; racemes fastigiately panicled; whorls loose, few-flowered; bracteas minute, setaceous; fructiferous calyx increased, glabrous: teeth ovate, acute, much shorter than the tube. %. ? S. Native of Brazil, Sello. Nearly allied to the preceding.

Fastigiate-fiowered Hyptis. PI. 1 to 3 feet.?

176 H. ERIOCA'LYX (St. Hil. mss. ex Benth. lab. p. 131.) herbaceous; stem ascending, clothed with rufous tomentum ; leaves petiolate, ovate, serrately crenated, wrinkled at the base, villous above, and clothed with rufous tomentum beneath; cymes elongated, panicled; whorls loose, few-flowered; teas minute, setaceous ; fructiferous calyx wooiiy, ^ ^ teeth ovate, acute, much longer than the tube. W- of Brazil, in the province of Minas Geraes, at the r 1 Simeon Pareira. Habit of *H. fasciculate,* but the are different.

Woolly-calyxed Hyptis. PI. , , p. isl.)

177 H. VEPRETORUM (Mart. mss. ex p^nth J* shrubby ; leaves petiolate, small, ovate, obtuse, so nated, rounded at the base, rather coriaceous, above, but pale and reticulated beneath; with secund, axillary; fructiferous calyx short, ovate-lanceolate teeth. J? . S. desert fields between Minas Novas and K10 in the province of Minas Geraes. Branches downy, exceeding the calyx a little.

Bramble Hyptis. Shrub.

178 H. VESICULOSA (Benth. lab. p. 131.) stem clothed with fine rusty tomentum ; leaves on long-elliptic, acute, cuneated at the base, crenulately clothed with hoary tomentum beneath; whorls rather secund, distinct, racemose ; racemes minute; fructiferous calyx campanulate, inflated, veiny, with a contracted mouth, and short setaceous S. Native of Guayaquil, Tafalla. Leaves like *dlea salvijolia,* 4-6 inches long and \\ broad. calyx size of a pea, bladdery.

Bladdery-calyxed Hyptis. Shrub.? IQI ^shrubby*

179 H. CA'LIDA (Mart. mss. ex Benth. lab. p. branches pubescent; leaves on short petioles, blunt, a little crenated, wrinkled, canescent minute ; cymes sessile, loose, approximate into a branched raceme; calyxes pedicellate, tubular, truncate mouth, and subulate, strict teeth, than the tube. P2. S. Native of Brazil, in the Minas Geraes, at Serro Frio. Branches 10-15-flowered. This species is intermediate *Menthidium* and sect. *Pectinaria.*

Hot Hyptis. Shrub.

SECT. XVI. BUDDLEIOIDES (from *Buddlea,* Plants with the habit of species of that genus.; *132.* Cymes pedunculate, capitate, many-flowered, panicled. Bracteas minute. Calyxes almost campanulate, with short teeth and naked throat corolla exserted, tomentose outside.—Tall habit of species of *Buddlea.*

180 H. MEMBRANA'CEA (Benth. lab. p. 132.) ed with rufous tomentum ; leaves petiolate, roundly cuneated at the base, very rough above, with rufous tomentum beneath ; fascicles of flowers late, loose, numerous, many-flowered, on short pedicels, urceolate, clothed with rufous very short equal teeth. I? . S. Native 'of Brazil, in vinceof Minas Geraes; and south of Brazil, in woods. bluntly tetragonal. Achenia compressed, girded oy broad membranous wing. Leaves 4-5 inches long.

Membranous-wlnged-seeded Hyptis. Shrub 7 to

181 H. TAFA'EL* (Benth. lab. p. 132.) shrubby tose; leaves petiolate, oblong-lanceolate, cordate at wrinkled above, shining and glabrous, and clothed hoary tomentum beneath; fascicles of flowers pedun loose, many-flowered, panicled ; calyxes on short p

M.* Pudlna, Hamilt. ex Benth. in Wall. pi. rar. 1. p. 29. M. tenuis, Michx. fl. bor. amer. 2. p. 2. Stature, habit, and form of leaves that of *M. sylvestris*^ but is easily distinguished from that species by the stems and leaves being constantly quite glabrous. Spikes usually hairy, but sometimes also glabrous. Corollas purplish. There are several species of Mint cultivated in gardens for culinary purposes, but principally spearmint. The young leaves and tops of it are used in spring salads, and form an ingredient in soups. They are also employed to give flavour to certain dishes, as peas, &c, being boiled for a time, and then withdrawn, in the manner of garlic. The leaves have a warm, roughish, bitter taste, and a strong, not unpleasant smell. Their virtues are stomachic and carminitive. The culture of spearmint is the same as that for peppermint, which see. In order to have young leaves and tops all the summer, cut down some advanced stalks every month, when young shoots will be produced; and to have dried balm for winter, permit others to complete their growth, and come into blossom. Dry the crop thus gathered in the shade, and afterwards keep it in small bundles, (fig. 76.)

FIG. *76.*

Far. /3, *angustifolia* (Lag. ex Benth. lab. p. 174.) leaves narrow. %. H. M. tenuifblia, Opiz, ex Rchb. fl. germ. exc. p. 309. M. Lejeunii, Opiz, ex Rchb. 1. c. M. Michelii, Rchb. icon. bot. 10. p. 27. t. 981.

INDIAN BOTANIC GARDEN LIBRARY
BOTANICAL SURVEY OF INDIA

Shrubby Tetradenia. Shrub.
Cult. For culture and propagation see *Eriope*, p. 708.

XXII. COLEBROO'KIA (named in honour of Henry Thomas Colebrooke, F.R.S., F.L.S., &c., an accomplished botanist.) Smith, exot. bot. 2. p. 111. Benth. lab. p. 165.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, equal, 5-parted, plumose, pappous at maturity, adhering to the achenia. Corolla with the tube equalling the calyx: the limb very short, nearly equal, 4-cleft: upper lobe emarginate. Stamens 4, equal, distant; filaments very short; anthers nearly sessile, 2-celled: cells parallel. Disc of ovarium equal, glandless. Style deeply bifid: lobes subulate, stigmatiferous in the upper part.—Shrubs, densely clothed with whitish or subrufous woolly tomentum. Leaves petiolate, 4-6 inches long, oblong-elliptic, crenulated; lower floral leaves similar, but smaller: upper ones bractea-formed, imbricate before florescence. Spikelets 1-3 inches long, pedunculate, panicled. Cymes of whorls distinct, head-formed, dense, sessile, involucrated by bracteas which are connate at the base. Flowers small, white. Corolla tubular, contracted in the middle.

1 C. oppositifòlia (Smith, exot. bot. 2. p. 111. t. 115.) branches, leaves, and spikes opposite. ♄. S. Native of Nipaul and Kamaon. Elsholtzia oppositifòlia, Poir. suppl. 5. p. 663. (fig. 75.)

FIG. 75.

Opposite-leaved Colebrookia. Fl.? Clt. 1820. Shrub 3 to 4 feet.

2 C. ternifòlia (Roxb. corom. 3. p. 40. t. 245.) branches, leaves, and spikes 3 in a whorl. ♄. S. Native of the East Indies, among the Carnatic mountains, Roxb. Leaves more tomentose, and on shorter petioles than the first species, and the spikelets are more dense.

Tern-leaved Colebrookia. Clt. 1823. Shrub 3 to 4 feet.
Cult. For culture and propagation see *Eriope*, p. 708.

XXIII. PERI'LLA (meaning unknown to us.) Lin. gen. 578. Benth. lab. p. 166.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, nearly equal at the time of florescence, 5-cleft, nutant after florescence, and bilabiate: upper lip dilated, trifid: middle tooth the smallest: lower lip bifid; throat naked inside. Corolla almost equalling the calyx, nearly equal; limb shortly 5-cleft. Stamens 4, nearly equal, distant, erect, equalling the corolla; anthers 2-celled: cells parallel, at length diverging, or sub-divaricate. Style deeply bifid; stigmas terminal. Achenia dry, smooth.—An herb, with the inflorescence almost of the genus *Moschósma*, and with the flowers disposed in axillary and terminal secund spikes.

1 P. ocymoìdes (Lin. gen. 578. Sims, bot. mag. 2395.) ⊙. H. Native of Silhet, Kamaon, Nipaul, and Ava. *Ocymum* Lin. spec. p. 832. *Melissa máxima*, Arduin. spec. frutéscens, 2. p. 28. t. 13. Méntha perilloìdes, Lam. dict. 4. p. 112. but not of Lin. Stem pilose, bluntly tetragonal. Leaves petiolate, 2-4 inches long, ovate, acuminated, coarsely serrated, cuneated at the base, or narrowed into the petiole, green on both surfaces, pilose on the veins. Racemes shorter than the leaves. Corolla minute, white.

Basil-like Perilla. Fl. July, Aug. Clt. 1770. Pl. 1 to 3 feet.
Cult. Sow the seeds in the open ground, where the plant will thrive without any further care.

XXIV. ISA'NTHUS (from ισος, *isos*, equal; and ανθος, *anthos*, a flower; in allusion to the corolla being regular, not bilabiate.) Michx. fl. bor. amer. 2. p. 3. Benth. lab. p. 166.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, equal, 10-nerved, deeply 5-toothed; throat naked inside. Corolla hardly exceeding the calyx, with a short, straight tube, and a campanulate limb: lobes 5, equal, roundish, spreading. Stamens 4, nearly equal, distant, erect, about equal in length to the corolla; anthers 2-celled: cells parallel, or at length diverging. Style shortly bifid at apex: lobes subulate; stigmas terminal. Achenia dry, obovate, reticulated, lacunosely wrinkled.—A herb with the habit and inflorescence of *Saturèia hortènsis.*

1 I. caroli'nus (Michx. fl. bor. amer. 2. p. 4. t. 30.) ⊙. H. Native of North America, in Pennsylvania, Maryland, and Virginia, Nutt.; Carolina and Kentucky, Michx.; at St. Louis, Drummond. Trichostèma brachiàta, Lin. spec. 884. Plant erect, branched, rather viscid; branches pubescent, or pilose. Leaves on short petioles, oblong-elliptic, narrowed at both ends, with quite entire, or sub-sinuated edges, 3-nerved, green on both surfaces, glabrous, but usually pubescent, or pilose. Peduncles solitary, axillary, 1-flowered, shorter than the leaves, usually bibracteate under the calyx. Corollas like those of *Méntha*, pale blue.

Blue-flowered Isanthus. Fl. July, Aug. Clt. 1818. Pl. ½ to 1 foot.
Cult. The seeds should be sown in spring in a peat border, where the plants will flower and produce seed if the summer prove warm.

XXV. PRE'SLIA (named in honour of C. B. and J. S. Presl, of Prague, brothers; authors of "Flora Sicula, Diliciæ Pragenses, &c.") Opiz, in bot. zeit. 1824. 1. p. 322. Benth. lab. p. 167. but not of Mart.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate, equal, 4-toothed; teeth awned; throat rather villous inside. Corolla equal, with an inclosed tube, and a 4-parted limb; lobes equal, entire. Stamens 4, equal, distant, erect; filaments glabrous; anthers 2-celled: cells parallel. Style bifid at top; lobes nearly equal, bearing the stigmas at apex. Achenia oblong, smooth, dry.—A bog herb, with the habit of *Saturèia*, and the inflorescence of *Méntha verticillàta.*

1 P. Cervi'na (Fresen. in sylt. pl. soc. ratisb. 2. p. 288.) ♃. H. Native of Middle and South Europe, in bogs and ditches; as of the South of France, Spain, and Portugal. Méntha cervìna, Lin. spec. 807. Méntha punctàta, Mœnch. Pulègium cervìnum, Mill. dict. no. 3. Pulègium angustifòlium, Riv. mon. irr. t. 23. f. 2. Préslia glabriflòra, Opiz, in bot. zeit. 1824. 1. p. 323. Préslia villiflòra, Opiz, l. c. Herb prostrate, glabrous. Leaves sessile, linear, or linear-lanceolate, obtuse, quite entire, green on both surfaces, dotted, somewhat fascicled in the axils. Whorls many-flowered, dense, distant, rather shorter than the floral leaves. Corollas pale purplish, about twice as long as the calyxes.

Stag Preslia. Fl. June, Aug. Clt. 1684. Pl. prostrate.
Cult. This plant will grow freely in most soils, and is readily increased by division. It requires a little protection in severe frost.

XXVI. ME'NTHA (Mentha of Pliny. Μινθη, *Minthe*, of Theophrastus. From a nymph of that name, daughter of Cocytus, fabled to have been changed into mint by Proserpine in a fit of jealousy.) Lin. gen. no. 713. Schreb. gen. no. 967. Juss. gen. p. 113. ed. Usteri, p. 127. Tourn. inst. t. 89. Benth. lab. p. 168.

LIN. SYST. *Didynàmia, Gymnospérmia.* Calyx campanulate, or tubular, 5-toothed, equal, or sub-bilabiate; throat naked, or villous inside. Corolla with an inclosed tube, and a campanulate, nearly equal, 4-cleft limb: upper segment broader, and nearly entire, or emarginate. Stamens 4, equal, erect, distant; filaments glabrous, naked; anthers 2-celled: cells parallel. Style shortly bifid; segments bearing the stigmas at apex. Achenia dry, smooth.—Herbs. Whorls usually many-flowered, sometimes all remote in the axils of the leaves, sometimes approximate into terminal spikes, with the superior floral leaves bractea-formed.—The European mints, as is generally the case with plants which are very common in highly civilized and long cultivated countries, especially aquatic plants, vary much in appearance; and the repeated attempts by different authors in different countries to reduce these inconstant and ephemeral variations to so many species, have thrown so much confusion into this difficult genus that it is now almost impossible to clear up the chaos thus produced, ex Benth.

* *Throat of corolla naked inside.*

1 M. LAVANDULA'CEA (Willd. enum. p. 609.) canescent; leaves sessile, lanceolate-linear, quite entire, clothed with hoary tomentum on both surfaces; spike dense; calyxes clothed with white tomentum. ♃. H. Native of Spain; on Mount Sinai, Bové; and of the Cape of Good Hope. M. lavandulæfòlia, Pers. ench. 2. p. 119. Stem erect, branched. Leaves 1½ to 2 inches long. Spikes solitary, conical at first, but at length somewhat interrupted at the base. Bracteas subulate. Corollas purple.? Whorls many-flowered.

Lavender-like Mint. Fl. July, Aug. Clt. 1823. Pl. 1 to 2 feet.

2 M. INCA'NA (Willd. enum. p. 609.) stem humble, panicled; leaves nearly sessile, ovate-cordate, a little toothed, clothed with hoary tomentum on both surfaces; spikes numerous, short: calyxes clothed with villous tomentum. ♃. H. Native of Greece, and probably of Persia and Arabia. M. spicàta, Forsk. in herb. Vahl. M. Crética, and M. Pérsica, Hortul. Stems ascending. Spikes hardly an inch long, panicled. Whorls 8-flowered. Corolla twice as long as the calyx, downy outside, purple.?

Hoary Mint. Fl. July, Aug. Clt. 1790. Pl. ½ foot.

3 M. TOMENTÒSA (D'Urv. mem. soc. Lin. par. 1. p. 323. but not of Borkh.) canescent; stem erect, or ascending, tall; leaves sessile, lanceolate, or ovate-lanceolate, irregularly serrated, somewhat reflexed, plicate, undulately curled, clothed with white tomentum on both surfaces; spikes elongated, cylindrical, interrupted at the base, somewhat panicled; calyx clothed with tomentose pubescence. ♃. H. Native of Crete, Syria; Greece, at fountains in the Island of Scyra, D'Urville; Persia, near Teheran. Stems erect, rarely procumbent at the base, or ascending. Leaves roundish, or cordate at the base. Spikes numerous, 3-4 inches long, or more. Whorls distinct, many-flowered. Bracteas subulate. Corolla purple,? downy outside. Fertile stamens exserted.

Tomentose Mint. Pl. 2 to 3 feet.

4 M. SALI'CINA (Burch. cat. geo. pl. afr. austr. 1372. Benth. lab. p. 170.) canescent; stem erect; leaves petiolate, lanceolate-linear, almost entire, nearly glabrous above, and hoary beneath; spikes cylindrical. ♃. G. Native of the Cape of Good Hope. M. Capénsis, Thunb. prod. p. 95.? Leaves size and form of those of *M. lavandulàcea*, but are nearly glabrous above.

Willowy-leaved Mentha. Pl.

5 M. ROYLEA'NA (Benth. in Wall. pl. rar. asiat. 1. p. 20.) plant clothed with white tomentum; leaves petiolate, ovate-oblong, unequally serrated; spikes elongated, slender, interrupted at the base. ♃. H. Native of Deyra Dhoon, Royle; and at Simlah. Habit of M. sylvéstris, var. hispida. Whorls distinct, numerous, small, globose: lower ones remote. Flowers minute, nearly sessile. Corollas small, whitish. Fertile stamens about equal in length to the corolla.

Royle's Mint. Pl. 1 to 2 feet.

6 M. SYLVE'STRIS (Lin. spec. 804.) stem erect; leaves nearly sessile, ovate-lanceolate, or oblong, pubescent above, or tomentose, but clothed with white tomentum beneath; spikes dense, or interrupted at the base, conically cylindrical; calyx clothed with villous tomentum. ♃. H. Native throughout Europe, North of Asia, and Canary Islands, in ditches and boggy places common. Spikes usually dense, obtuse, but in some of the varieties interrupted at the base. Corolla purplish, pubescent outside. Fertile stamens exserted.

Var. α, mollíssima (Benth. lab. p. 171.) leaves clothed with soft white tomentum on both surfaces. ♄. H. Native of Greece, Dalmatia, Spain, Canary Island, Cashmere; also of England, and Germany, but rare. M. mollíssima, Borkh. M. incàna, Sole herb. Sm. M. sylvéstris, Smith, in Rees' cycl. vol. 23. M. canéscens, Roth, catalect. 2. p. 46. M. Chalepénsis, Mill. dict. no. 10.

Var. β, cándicans (Benth. lab. p. 171.) leaves clothed with short, hoary tomentum on both surfaces. ♃. H. Native in the same countries and places with var. α. M. cándicans, Crantz. austr. p. 330. M. pállida, Nees. M. sylvestris cándicans, Rchb. icon. bot. 10. p. 28. t. 982. M. sylvéstris álbida, Rchb. icon. bot. 10. p. 28. t. 983.

Var. γ, glabràta (Benth. lab. p. 171.) leaves almost glabrous above, pubescent and rather hoary beneath. ♃. H. Native of Britain, South of Sweden, Denmark, throughout Germany, France, Portugal, Italy, Spain, Sicily, Greece, European Russia, Tauria, Caucasus, Siberia, Cape of Good Hope, Teneriffe, &c. M. Rosàni, Tenore, fl. nap. append. 5. p. 18. syll. p. 281. M. Eisenstadtiàna, Nees.

Var. δ, vulgàris (Benth. l. c.) leaves pubescent above, rather wrinkled, clothed with soft white tomentum beneath. ♃. H. Native in the same countries and places with var. γ. M. cándicans, Mill. dict. M. villòsa, Sole, menth. brit. t. 1. & 2. M. sylvéstris, α, Smith, in Lin. trans. 5. p. 179. engl. bot. t. 686. bad. M. gratíssima, Willd. spec. 3. p. 75. M. Niliaca, Willd. spec. 3. p. 76. but not of Vahl. M. longifòlia, Huds. angl. p. 221. M. tomentòsa, Borkh. M. hybrida, Schleich. pl. exsic. cent. 1. no. 55.? M. reflexifòlia, Opiz, in bot. zeit. 1824. 2. p. 525. M. suàvis, Hoffm.? ex Smith, in Rees' cycl. vol. 23. but not of Juss. M. Wierzbeckiàna, Opiz, l. c.? M. oblónga, Opiz, l. c. M. Ratisbonénsis, Opiz, l. c.

Var. ε, nemoròsa (Benth. lab. p. 171.) leaves ovate-oblong, green and pubescent above, and clothed with loose, white tomentum beneath. ♃. H. Native of Catalonia, Italy, and probably of Germany; Ceylon, Macrae; Brazil, St. Hilaire. M. nemoròsa, Willd. spec. 3. p. 75. M. sylvéstris, Sole, menth. brit. t. 3. Oed. fl. dan. 484. M. sylvéstris, δ, Smith, engl. fl. 3. p. 73. M. rotundifòlia, Sole, menth. brit. t. 4.? but not of Lin. M. Niliaca, Jacq. hort. vind. 3. p. 46. t. 87. but not of Vahl. M. serótina, Tenore, fl. nep. t. 156. syll. p. 281. M. hirta, Beck. fl. fr. 220. ex Fresen. syll. pl. ratisb. 229. and probably of Willd. M. dumetòrum, Schultes,? ex Rchb. fl. germ.

exc. p. 310. M. gratíssima, Wigg. prim. fl. hols. 43. ex Roth, tent. fl. germ. 2. pt. 2. p. 6. M. sápida, Tausch. ? ex Rchb. fl. germ. exc. p. 310. M. Hallèri, Gmel. fl. bad. 2. p. 594. ? ex Rchb. fl. germ. exc. p. 310. M. sylvéstris, nemorósa, Rchb. icon. bot. 10. p. 28. t. 984.

Var. ζ, *urticæfólia*; stem divaricately branched; spikes slender, interrupted; whorls few-flowered, distinct. ♃. H. Native of Naples. M. urticæfólia, Tenor. fl. nap. t. 157. syll. p. 283. ? M. origanoides, Tenor. fl. nap. prod. app. 5. p. 19. syll. p. 284.

Var. η, *crispa* (Benth. lab. p. 172.) leaves undulately curled, profoundly toothed, rather rugose, clothed with white tomentum beneath. ♃. H. Native of many parts of Europe, and in gardens. M. undulàta, Willd. enum. p. 608. Nees. pl. med. with a figure. M. velutina, Lejeune. M. dulcíssima, Dumort floral. belg. p. 48. ? M. crispa, Tenore, fl. nap. 2. p. 29. Rivin. mon. t. 50. M. serótina, Tenore, syll. p. 281. ? M. foliósa, Opiz, ex Fresen. syll. pl. soc. ratisb. 2. p. 226. M. tomentósa, Hoppe, et Hornsch. ex Rchb. fl. germ. exc. p. 310. M. Lamárkii, Tenore, fl. nap. prod. append. 5. p. 19. syll. fl. nap. p. 282. exclusive of the syn. of Schrad. M. emarginàta, Rchb. icon. bot. 10. p. 27. t. 979. M. undulàta, Rchb. icon. bot. 10. p. 27. t. 980.

Wild, or Horse Mint. Fl. July, Aug. Britain. Pl. 1 to 2 feet.

7 M. rotundifólia (Lin. spec. 825.) stem erect; leaves sessile, ovate-roundish, crenated, wrinkled, pubescently hairy above, and clothed with loose white wool beneath; spikes dense, conically cylindrical; calyxes hairy. ♃. H. Native throughout Europe, Africa in the region of the Mediterranean, and of Siberia, among rubbish by way sides, and in ditches; also of Madeira and North America, in like situations, but probably escaped from gardens; plentiful in some parts of Britain. Smith, engl. bot. 7. t. 446. M. macrostáchya, Tenore, fl. nap. 2. p. 30. t. 56. syll. p. 282. M. neglécta, Tenore, fl. nap. 2. p. 379. t. 157. f. 1. ex syll. 281. M. frágrans, Presl. del. prag. 78. ex Guss. prod. fl. sic. 2. p. 88. M. rugósa, Lam. fl. fr. 2. p. 420. Roth. catal. 2. p. 65. ex Fresen. syll. pl. soc. ratisb. 2. p. 230. M. suavèolens, Ehrh. beitr. 7. p. 149. ex Fresen. l. c. Stem panicled by a few branches at top. Leaves usually obtuse, roundish cordate at the base. Corollas whitish. Sterile stamens exserted.

Round-leaved Mint. Fl. July, Sept. Britain. Pl. 1 to 2 feet.

8 M. prate'nsis (Sole, menth. brit. t. 17.) leaves nearly sessile, ovate-lanceolate, or oblong, serrated, glabrous, or finely pubescent, as well as the erect stem: floral leaves similar, but smaller: superior ones broad-lanceolate, about twice as long as the whorls; whorls all remote, globose; pedicels glabrous; calyx campanulate, with hairy teeth. ♃. H. Native of the North of Europe?; in England in ditches and watery places, but hardly spontaneous, Sole; Sweden, in cultivated places, apparently wild. M. rúbra, Huds. angl. ex Fries, nov. fl. suec. ed. 2d. p. 179. but not of Smith. M. gentílis, Sole, menth. brit. t. 15. Smith, engl. bot. 7. t. 449. M. grácilis, γ, Smith, in Lin. trans. 5. p. 210. Stem purplish red, with short, erect branches, glabrous, or furnished with a few spreading hairs. Cauline leaves deep green, or reddish, glabrous above, but paler beneath, with a few hairs on the veins. Whorls dense. Corolla purplish, glabrous, or pubescent outside. Stamens all inclosed. Style exserted.

Meadow Mint. Fl. July, Aug. Britain. Pl. 1 to 2 feet.

9 M. sua'vis (Guss. pl. rar. p. 387. t. 66.) clothed with soft pubescence, or villi; leaves petiolate, ovate, acute, serrated, rounded at the base, pale beneath, or hoary: floral leaves small, lanceolate, or conforming to the lower cauline ones; whorls distinct: lower ones remote: upper ones disposed in a cylindrical spike. ♃. H. Native of the South of France, Italy, and Sicily. M. pubéscens, Willd. enum. p. 608. ? M. divaricàta, Lag. ? M. balsámea, Willd. enum. p. 608. ? M. hírta, Willd. enum. l. c. Link, enum. 2. p. 105. M. pubéscens, Rchb. icon. bot. 10. p. 27. t. 978. M. glomerulàta, Jan. M. Lángii, Geiger, pharm. bot. 1332. and Nees, pl. med. with a figure. Leaves more or less canescent beneath. Stem usually decumbent at the base, branched; branches ascending, rarely erectish. Leaves like those of *M. Piperita*, but soft: upper ones exceeding the whorls. Corolla red, hardly exceeding the calyx. Stamens inclosed. Style exserted.

Sweet Mint. Fl. July, Aug. Clt. 1804. Pl. 1 to 2 feet.

10 M. víridis (Lin. spec. 804.) stem erect; leaves nearly sessile, ovate-lanceolate, unequally serrated, and are, as well as the stems, glabrous: floral ones all bractea-formed, rather longer than the whorls, and are, as well as the calyxes, hairy, or glabrous; spikes cylindrical, loose; whorls approximate, or the lower ones or all are distant. ♃. H. Native of the temperate parts of Europe, among rubbish; in England and Scotland, France, &c.; also at the Cape of Good Hope, and North and South America, but probably has been carried thither from Europe. Sole, menth. brit. t. 5. Nees, pl. med. with a figure. Smith, engl. bot. t. 2434. Fl. dan. 1876. M. verticillàta, Feuill. chil. p. 42. t. 28. M. spicàta, Crantz, austr. 328. M. ocimiodòra, Opiz. M. brevispicàta, Lehm. sem. hort. hamb. 1828. M. balsámea, Rchb. fl. germ. exc. p. 309. ? but not of Willd. M. lævigàta, Willd. enum. p. 609. N. Niliaca, Vahl, symb. 3. p. 75. M. Pudína, Hamilt. ex Benth. in Wall. pl. rar. 1. p. 29. M. ténuis, Michx. fl. bor. amer. 2. p. 2. Stature, habit, and form of leaves that of *M. sylvéstris*, but is easily distinguished from that species by the stems and leaves being constantly quite glabrous. Spikes usually hairy, but sometimes also glabrous. Corollas purplish. There are several species of Mint cultivated in gardens for culinary purposes, but principally spearmint. The young leaves and tops of it are used in spring salads, and form an ingredient in soups. They are also employed to give flavour to certain dishes, as peas, &c., being boiled for a time, and then withdrawn, in the manner of garlic. The leaves have a warm, roughish, bitter taste, and a strong, not unpleasant smell. Their virtues are stomachic and carminitive. The culture of spearmint is the same as that for peppermint, which see. In order to have young leaves and tops all the summer, cut down some advanced stalks every month, when young shoots will be produced; and to have dried balm for winter, permit others to complete their growth, and come into blossom. Dry the crop thus gathered in the shade, and afterwards keep it in small bundles. (fig. 76.)

FIG. 76.

Var. β, *angustifólia* (Lag. ex Benth. lab. p. 174.) leaves narrow. ♃. H. M. tenuifólia, Opiz, ex Rchb. fl. germ. exc. p. 309. M. Lejeúnii, Opiz, ex Rchb. l. c. M. Michèlii, Rchb. icon. bot. 10. p. 27. t. 981.

Var. γ, *crispa* (Benth. lab. p. 174.) leaves curled. ♃. H. M. crispàta, Schrad. ex Willd. enum. 608. Nees, pl. off. with a figure. M. Haregnica, Röhl, deutsch. fl. M. crispa, Roth. tent. fl. germ. 1. p. 248. but not of Lin. M. cordifólia, Opiz,

Green Mint, or Spearmint. Fl. July, Aug. Britain. Pl. 2 feet.

11 M. PIPERI'TA (Lin. spec. 805.) leaves petiolate, ovate-oblong, acute, serrated, roundly crenated at the base, and are, as well as the stems, glabrous; spikes loose, obtuse, short, interrupted at the base; pedicels and calyxes glabrous at the base, with hispid teeth. ♃. H. Native of the North of Europe, spontaneous; and cultivated throughout Europe, Egypt, Asia, North and South America. Smith, engl. bot. t. 687. Nees. pl. off with a figure. Woodv. med. bot. 169.—Zorn. icon. t. 56.—Petiv. brit. t. 81. f. 10.—Ray. syn. t. 10. f. 1. *M. piperita officinàlis*, Sole, menth. brit. t. 7. *M. piperita vulgàris*, Sole, herb. but hardly of menth. brit. t. 8. *M. glabràta*, Vahl. symb. 3. p. 75. *M. Kahirina*, Forsk. fl. ægypt. *M. balsâmea*, Willd. enum. p. 608.? Stem branched, reddish, quite glabrous, or with a few spreading hairs. Petioles usually ciliated. Spikes reddish. Calyxes purplish. Corolla purple, or red. This species, the peppermint, is almost entirely for distillation, for which it is extensively cultivated in low, rich, soft, marshy lands, especially such as can be irrigated or flooded. It is sometimes also cultivated in gardens for its young green tops and leaves, for the purposes of spearmint. The leaves have a strong, rather agreeable smell, and a pungent, aromatic taste, somewhat resembling that of pepper, and accompanied with a peculiar sensation of coldness. Its predominant constituents are essential oil and camphor, both of which rise in distillation, and are combined in what is called oil of peppermint. Peppermint is principally used as a carminitive and antispasmodic. The distilled water is a domestic remedy for flatulent colic, and the essential oil is often given with advantage in doses of a few drops in cramps of the stomach.

Culture. All the species of *Méntha*, as well as the present, are raised by the same methods, viz. by parting the roots, by offset young plants, and by cuttings of the stalks. By the roots—This is performed in spring and autumn. Having some full roots from any established beds, divide them as expedient, and drawing drills, with a hoe about 2 inches deep and 6 inches asunder, place the roots in the drills moderately close, and earth them over to an equal depth. By offsets—In the spring procure these from established plants, and dibble them in rows 6 inches asunder. By cuttings of the young stalks—In May, June, or advanced summer, taking the opportunities of showery weather, cut these into lengths of 5 or 6 inches, and plant the cuttings by dibble, 6 inches apart, inserted half way into the earth.

Subsequent Culture. Propagated in any of the above methods the plants set in spring or summer will come into use the same year. Water new plants till they take root. Keep them clean from weeds. At the end of autumn cut away any remaining stems, at which season, or in the spring, spread a little loose earth thinly over the beds.

Taking the crop. "For culinary use or salads, gather both when the young green tops are from one inch to 6 inches in length, and in their advanced growth throughout the summer. When nearly full grown in June, July, or August, or beginning to flower, gather a store for winter, spread the heads thinly in some dry place, shaded from the sun, to be well dried, then, tied in bunches, house the store. When desired for distillation let them attain full growth coming into flower, then cut and use the heads immediately. Peppermint being principally used for distillation, should stand in the ground until they begin to flower, being then in the highest perfection. Cut in dry weather, and tie the bundles, and carry under cover ready for immediate use. Cut full grown stalks close to the bottom. It is best to cut as soon as the dew is off in the morning, for in the afternoon, and especially during bright sunshine, the odour of the plant is found to be much diminished."

New Plantation. All the species continue by the roots many years, but when the plants grow weakly make a fresh plantation in time.

Forcing spearmint. Mint in a young green state may be obtained all winter, and early in spring, by planting some roots in a gentle hot-bed, or in pits, or shallow pans, to be plunged therein. Plant the roots pretty thickly, and earth over an inch and a half deep; or some roots thus planted in pots or boxes may be placed in a stove. Plant for succession every 3 weeks, as forced roots soon decay.

Var. β, ? subhirsùta (Benth. lab. p. 176.) leaves hairy on the nerves beneath, and on the petioles. ♃. H. Native of England, in Norfolk, at a lake called Saha, Smith; and near Bath, Sole. *M. hirsùta*, β, Smith, herb. *M. piperita sylvéstris*, Sole, menth. brit. t. 24. *M. hirta*, Willd. enum. 608.? *M. pinétum*, Nees, ex Rchb. fl. germ. exc. p. 309.

Pepper Mint. Fl. Aug. Sept. Britain. Pl. 1 to 2 feet.

12 M. ETTICA'TA (Ehrh. beitr. 7. p. 150.) leaves petiolate, ovate, broadly rounded at the base, or subcordate, and are, as well as the stem, glabrous, or the petioles are ciliated; whorls few, approximate into an oblong head, or the lower one is loose and remote; pedicels and calyxes glabrous. ♃. H. Native of England, in watery places in Cheshire, North Wales, and near Bedford, Smith, probably spontaneous. *M. nigricans*, Mill. dict. no. 12. *M. odoràta*, Sole, menth. brit. t. 9. Smith, in Lin. trans. 5. p. 192. engl. bot. t. 1025. *M. adspérsa*, Mœnch. menth. 379. ex Willd. spec. 3. p. 79. This is intermediate between *M. piperita* and *M. aquàtica*. Corollas reddish purple.

Bergamot Mint. Fl. July. Aug. Britain. Pl. 1 foot.

13 M. AQUA'TICA (Lin. spec. p. 805.) stem beset with reflexed hairs; leaves petiolate, ovate-serrated, rounded at the base, or sub-cordate, rather hispid on both surfaces, or villous; lower floral leaves like the others: upper ones bractea-formed; whorls few, all, or only 2 or 3 of the upper ones, disposed into globose or oblong heads: upper terminal one often remote from the lower ones; calyxes tubular, and are, as well as the pedicels, villous. ♃. H. Native of Europe, and Asiatic Russia, very common in watery places and ditches; and now occurs almost in every part of the globe, but has probably migrated from Europe. Sole, menth. brit. t. 10, 11. *M. palústris*, Mill. dict. no. 11. *M. hirsùta*, Smith, in Lin. trans. 5. p. 193. engl. bot. 7. p. 447. *M. pedunculàta*, Pers. ench. 2. p. 119. Poir. dict. suppl. 3. p. 663. *M. pyramidàlis*, Tenore, fl. nap. p. 33. t. 35. *M. acùti-serràta*, Opiz, ex Fresen. in syll. pl. soc. ratisb. 2. p. 226. *M. nigréscens*, Weihe, ex Fresen. l. c. *M. bugulæfòlia*, Weihe, l. c. *M. brachiàta*, Weihe, l. c. *M. aurita*, Weihe, l. c. *M. origanoides*, Lejeune, fl. spa. *M. pubéscens*, Willd. enum. 608.?—Riv. mon. t. 49. Corollas purplish red. The upper head of flowers is always terminal, while the stem of *M. arvénsis* is always indeterminate.

Var. α, nemorósa (Fries, nov. fl. succ. ed. 2d. p. 183.) stem and peduncles beset with short, reflexed hairs; hairs of the leaves few and scattered, of the calyx short and spreading; whorls few, all globosely capitate, or the lower one remote. ♃. H. Native of Britain, Sweden, France, Portugal, Spain, Germany, Italy, Sicily, Greece, Caucasus, Siberia, Azores, Madeira, Cape of Good Hope, Brazil, and North America. *M. capitàta*, Opiz. *M. intermèdia*, Host, fl. austr. 2. p. 141. *M. purpùrea*, Host, fl. austr. 2. p. 141. *M. citràta*, Rchb. icon. bot. 10. p. 26. t. 977. but hardly of Ehrh.

Var. β, hirsùta (Willd. enum. p. 610.) more villous: whorls as in var. α, but usually larger. ♃. H. Native of the same

countries as var. α. M. hirsùta, Lin. mant. p. 81. Hook. fl. lond. 5. t. 166. M. dùbia, Vill. dauph. 2. p. 358. M. ripària, Schreb. M. Weiheàna, Opiz. M. nepetoìdes, Lejeune, fl. spa.? M. dumetòrum, Schult.? Origanum vulgàre, Fl. dan. t. 638.

Var. γ, *crispa* (Benth. lab. p. 177.) leaves plicately curled, lacerately toothed, on short petioles; inflorescence of the preceding. ♃. H. In gardens. M. crispa, Lin. spec. 805. Nees, pl. off. with a figure.

Var. δ, *subspicàta* (Benth. lab. p. 177.) villous; whorls numerous: upper ones subspicate; lower ones remote: floral leaves almost all conforming to the cauline leaves. ♃. H. Native of Britain, &c. M. hirsùta, var. ε, Smith, engl. fl. 3. p. 79. M. piperìta, γ, Smith, engl. fl. 3. p. 77. M. paludòsa, Sole, menth. brit. t. 22. M. palùstris, Sole, menth. brit. t. 6. bad. M. rivàlis, Sole, in herb. Water Mint. Fl. July, Aug. Britain. Pl. 1 to 2 feet.

14 M. ARVE'NSIS (Lin. spec. 806.) stem beset with retrograde pili or villi, or nearly glabrous; leaves petiolate, ovate or oblong, rounded at the base, cuneated or narrowed: floral ones all conforming to the cauline ones, exceeding the flowers: uppermost ones almost sterile; whorls all globose, many-flowered, remote; bracteas lanceolate-subulate, about equal in length to the tubular or campanulate calyxes. ♃. H. Native of Europe, and North and Middle Asia, very common; but very rare in the region of the Mediterranean; in shady places by the sides of ditches, in bogs and all moist soils; plentiful in Britain. M. gentilis, Lin. spec. p. 805. This is a very polymorphous plant. Corollas red or purplish. Stamens sometimes exserted, but usually inclosed.

Var. α, *sativa* (Benth. lab. p. 178.) calyxes subcylindrical, and are, as well as the pedicels, hairy; leaves more or less villous. ♃. H. M. rivàlis, Sole, menth. brit. t. 20. Var. ι, *crispa* (Benth. lab. p. 180.) leaves undulately curled, and lacerately toothed; calyxes and leaves glabrous. ♃. H. M. sativa, Nees, pl. med. with a figure. M. crispa of many authors.

Corn-field, or Wild Mint. Fl. July, Sept. Britain. Pl. ½ to 2-3 feet.

15 M. CANADE'NSIS (Lin. spec. 806.) prostrate or ascending, nearly glabrous, or densely clothed with spreading hairs; leaves petiolate, oblong-elliptic, narrowed a long way at both ends: floral ones similar to the rest: upper ones lanceolate-linear, almost sterile; whorls all globose, many-flowered, remote; bracteas lanceolate-subulate, about equal in length to the calyxes,

which is tubularly campanulate. ♃. H. Native of North America, on the mountains, and on the banks of rivulets; North-west coast, Canada, near New York, Pennsylvania; also of China, Sir G. Staunton.

Var. α, villòsa (Benth. lab. p. 181.) plant densely hairy. ♃. H. M. Canadénsis of authors.

Var. β, glabràta (Benth lab. p. 181.) plant nearly glabrous. ♃. H. M. borcàlis, Michx. fl. bor. amer. 2. p. 2.

Canadian Mint. Fl. July, Aug. Clt. 1800. Pl. 1 foot.

16 M. Lapponica (Wahl. fl. lapp. p. 161. t. 10.) stem beset with retrograde asperities; leaves petiolate, oblong, serrated, narrowed at the base, glabrous: floral ones similar to the others; whorls all remote, few-flowered; pedicels glabrous; calyxes rough, with obtuse teeth. ♃. H. Native of Lapland, in humid sandy places at the river Kemen; also of Kamtschatka. Very nearly allied to *M. Canadénsis, β, glabràta*. Corollas rose-coloured. Stamens exserted.

Lapland Mint. Pl. 1 to 1½ foot.

17 M. lanceola'ta (Benth. lab. p. 181.) stem clothed with adpressed, reflexed hairs; leaves lanceolate, acute, serrated, narrowed at the base into the petioles, roughish above and glabrous beneath: floral ones similar to the rest: upper ones twice as long as the whorls; whorls all remote, many-flowered; calyx tubular, clothed with adpressed villi, with acute teeth. ♃. S. Native of Ceylon, Macrae. Stem a little branched, tetragonal. Nearly allied to *M. Canadénsis*.

Lanceolate-leaved Mint. Pl. 1 to 2 feet.

18 M. Dahu'rica (Fisch. mss. ex Benth. lab. p. 181.) stem erect, nearly simple; leaves on short petioles, ovate-lanceolate, quite glabrous: floral ones similar to the others; whorls few, remote, loosely globose; calyx tubular, nearly glabrous, with obtuse teeth. ♃. H. Native of Dahuria. Lepechínia clinopodiòlia, Willd. hort. berol. under no. 21. Horminum clinopodiòlia, Pers. ench. 2. p. 132. Stem tetragonal. Leaves quite entire, or remotely serrated. Calyx villous inside. This differs from all the European tubular-calyxed species, in the calycine teeth being obtuse.

Dahurian Mint. Fl. July. Aug. Clt. 1818. Pl. ½ to 1 foot.?

* * *Throat of calyx villous inside.*

19 M. mollis (Benth. lab. p. 182.) stem much branched, twining? pilosely woolly; leaves petiolate, ovate-roundish, acute, somewhat serrated, pubescent above, and clothed with white tomentum beneath: floral ones similar; whorls all remote, globose, many-flowered; calyx clothed with white hairs; throat villous inside. ♃. S. Native of tropical America; frequent on elevated plains near Quito, Riobamba, Nuevo, and Cuenca; Peru, and near Santa Fe de Bogota. Bysteropògon mòlle, H. B. et Kunth, nov. gen. amer. 2. p. 317. Leaves about an inch long. Corolla scarcely longer than the calyx. Stamens inclosed. Style exserted.

Soft Mint. Pl. twining.?

20 M. Pule'gium (Lin. spec. p. 807.) stem much branched, prostrate; leaves petiolate, ovate; whorls all remote, globose, many-flowered; calyx hispid, bilabiate: throat villous inside. ♃. H. Native throughout Europe, in ditches and bogs, and other humid places; as in England, Sweden, France, Germany, Spain, Portugal, Italy, Greece; also of Caucasus, near Lenkoran, and about Valparaiso; also of North America. Sole, mentb. brit. t. 28. Smith, engl. bot. t. 1026. Nees, pl. med. with a figure. Woodv. med. bot. t. 171. M. exigua, Lin. spec. 806. Smith, icon. ined. t. 38. Pulègium latifòlium, Bauh. pin. 222. Pulègium erèctum, Mill. dict. no. 2. Pulègium vulgàre, Mill. dict. no. 1.—Sabb. hort. rom. 3. t. 49.—Riv. mon. t. 23. f. 1. Stems and leaves glabrous, or finely pubescent. Corollas pale purple. The name is derived from *pulex*, a flea, because the plant is supposed to drive away fleas by its smell.

Var. β, tomentòsa; stem and leaves densely villous. ♃. H. Native of Portugal, Spain, about Montpelier, Sicily, Naples, Algiers, South of Tauria, Teneriffe. M. tomentòsa, Smith. in Rees' cycl. M. tomentélla, Hoffm. et Link, fl. port. 1. p. 73. M. Gibraltárica, Willd. enum. 611. M. pulegioides, Rchb. Pulègium tomentéllum, Presl. fl. sic. 36. Pennyroyal is indigenous to places subject to inundations. It is used in different branches of cookery, also for distilling Pennyroyal-water. In its sensible qualities it is warm, pungent, and aromatic, somewhat similar to *Spearmint*, but less agreeable, and is seldom used. The plant is said to thrive best in a strong clayey moist soil.

Flea Mint, or Pennyroyal. Fl. Aug. Sept. Britain. Pl. prostrate.

21 M. Requie'ni (Benth. lab. p. 182.) small, creeping, quite glabrous; branches filiform, ascending; leaves petiolate, orbiculate, quite glabrous, somewhat bilabiate: throat villous inside. ♃. H. Native of Corsica, Requien. Thymus parviflòrus, Req. in ann. sc. nat. Audibértia, Benth. Stem diffuse at the base, much branched. Leaves almost quite entire. Flowers 2-6 in each whorl; pedicels longer than the calyx. Corolla and odour that of *M. Pulègium*.

Requien's Pennyroyal. Pl. creeping.

† *Species hardly known.*

22 M. grave'olens (Presl, fl. sic. p. 36.) spikes panicled, cylindrical; flowers sessile; calyx pubescent; bracteas linear-setaceous, twice as long as the calyxes; stem erect, branched, tomentose; leaves cordate-oblong, mucronate, remotely serrated, pubescent, clothed with greyish tomentum beneath. ♃. H. Native of Sicily. Perhaps referrible to *M. pyramidàlis*.

Strong-scented Mint. Pl. 2 to 3 feet.?

23 M. angustifòlia (Host, fl. austr. 2. p. 148.) whorls of flowers approximate; leaves linear-lanceolate, flat, hairy; pedicels hispid; stamens shorter than the corolla. ♃. H. Native of Austria, about Vienna, in humid parts of woods. Stem humble, purplish, roughish from bristles, simple or branched. Leaves denticulated above the middle. Bracteas ciliated. Pedicels hispid. Calyx campanulate, hairy. Corolla purplish, hairy outside.

Narrow-leaved Mint. Pl. humble.

24 M. Numi'dica (Poir. suppl. 3. p. 662.) leaves lanceolate, somewhat serrated, glabrous, nerved, dotted beneath; stem erect, much branched; whorls pedunculate, subcorymbose. ♃. H. Native of the north of Africa, near the ruins of the town of Tabrarca. Plant glabrous. Leaves petiolate. Corolla rather hairy. Stamens exserted. Perhaps a species of *Micromèria*.

Numidian Mint. Pl.

25 M. Java'nica (Blum. bijdr. p. 826.) flowers capitate; leaves lanceolate, distantly serrated from the middle to the apex, puberulous on both surfaces; stem obversely hairy; stamens exserted. ♃. S. Native of Java, in humid places, as at Buitenzorg, and in bogs near Tugu. Said by Blume to be nearly allied to *M. acutifòlia*. Perhaps the same as *M. lanàta*, or a var. of *M. arvénsis*.

Java Mint. Pl.

Cult. Most of the species delight in a moist soil; but they will also grow in a dry soil. Being all creeping rooted plants, they are readily increased by slips of the roots.

XXVII. LYCO'PUS (from λυκος, *lukos*, a wolf; and πους, *pous*, a foot; so called probably from the form of the leaves.)

Tourn. inst. t. 89. Lin. gen. no. 36. Schreb. gen. no. 44. Juss. gen. p. 111. ed. Usteri, p. 124. Benth. lab. p. 185.

Lin. syst. *Diándria, Monogýnia.* Calyx campanulate, equal, 4-5-toothed; throat naked inside. Corolla hardly exceeding the calyx, campanulate, equal, 4-cleft. Superior stamens wanting, or sterile, filiform, capitellate, shorter than the corolla: lower 2 a little exserted, fertile, distant; anthers 2-celled: cells parallel, rather distinct. Style somewhat equally bifid at top; stigmas minute, terminal. Achenia dry, smooth, with thickened callous edges, trigonal, truncate at apex, attenuated at the base. —Coarse marsh or bog herbs. Leaves acutely toothed or pinnatifid: floral ones similar to the rest, much exceeding the flowers. Whorls dense, usually many-flowered, axillary. Interior bracteas minute: outer ones sometimes exceeding the calyxes in the inferior whorls. Flowers small, sessile. This genus is nearly allied to *Méntha*, but differs from it in the superior stamens being sterile or wanting, and in the achenia being callously thickened on the margin.

1 L. Virgi'nicus (Lin. spec. p. 30.) nearly glabrous; stem stoloniferous at the base; leaves oblong-elliptic, narrowed at both ends, remotely toothed; calyx 4-toothed: teeth ovate, obtuse; rudiments of sterile stamens wanting. ♃. H. Native of North America, in humid places from New England to Carolina, Michx.; near St. Louis, and at the river Saskatchawan, near Cumberland House Fort, Drummond. Root often tuberous, creeping. Leaves 1-2 inches long, on short petioles, usually purplish beneath. Whorls small. Corolla a little longer than the calyx, white.

Var. β, pauciflòrus (Benth. lab. p. 185.) ♃. H. Native at Lake Mistassins, &c., Michx. L. uniflòrus, Michx. fl. bor. amer. 1. p. 14. L. pùmilus, Vahl, enum. 1. p. 211.

Virginian Water-Horehound. Fl. Aug. Sept. Clt. 1760. Pl. 3 feet.

2 L. macrophy'llus (Benth. lab. p. 185.) stem erect, firm, bluntly tetragonal; leaves large, petiolate, ovate, long-acuminated, coarsely and sinuately toothed, narrowed at the base, glabrous; whorls many-flowered; calyx irregularly 4-5-toothed: teeth ovate, obtuse; rudiments of sterile stamens wanting? achenia equalling the calyx. ♃. H. Native of North-west America, at the straits of Juan de Fuca, Scouler. L. Virgínicus, β, quercifòlius, Pursh, fl. amer. sept. 1. p. 16.? Stem pubescent. Leaves glabrous, 3-4 inches long. Corollas white.

Long-leaved Water-Horehound. Fl. Aug. Sept. Clt. 1700.? Pl. 1 to 3 feet.

3 L. obtusifòlius (Michx. ex Vahl, enum. 1. p. 212.? Benth. lab. p. 185.) stem erect, firm, almost simple; leaves sessile, oblong-elliptic, deeply serrated, roundly narrowed at the base; whorls many-flowered; calyx irregularly 5-toothed; achenia hardly shorter than the calyx; rudiments of sterile stamens almost wanting. ♃. H. Native of North-west America, in flats along the Red River, Douglas; at the river Saskatchawan, near Carlton House Fort, Drummond, Hudson's Bay, Michx. Habit of *L. Virgínicus*. Teeth of leaves acute or bluntish. Corolla rather longer than the calyx, white.?

Blunt-leaved Water-Horehound. Pl. 1 to 2 feet.

4 L. Europæ'us (Lin. spec. p. 30.) stolons none; stem erect, branched; leaves petiolate, ovate-oblong, sinuately toothed or pinnatifid; whorls many-flowered; calyx acutely 5-toothed; rudiments of sterile stamens wanting; achenia rather shorter (rarely) the tube of the calyx. ♃. H. Native throughout Europe and the north of Asia, in humid watery places by the sides of ditches and rivers; plentiful in Britain. Smith, engl. bot. t. 756. Fl. dan. 1081. Svensk, bot. t. 262. Curt. lond. vol. 1. with a figure. L. vulgàris, Pers. ench. 1. p. 24. L. palústris, Lam. fl. fr. 2. p. 430. ill. t. 18. L. aquáticus, Mœnch. —Petiv. brit. t. 32. f. 5. Root creeping. Stem acutely tetragonal, glabrous, as well as the leaves. Corolla white, equalling the calycine teeth, with a tinge of red. Cattle appear not to touch this herb. It dyes black, and gives a permanent colour to linen, wool, and silk. Gypsies are said to stain their skin with it.

Var. β, pubéscens (Benth. lab. p. 186.) stem bluntly tetragonal; and are, as well as the more nerved leaves, pubescent, and the calycine teeth are a little longer. ♃. H. Native of England.

European Water-Horehound. Fl. July, Aug. Britain. Pl. 1 to 4 feet.

5 L. rube'llus (Mœnch. suppl. p. 446. ex Wenderoth, in syll. pl. soc. ratisb. 1. p. 88.) stolons creeping; stem erectish, humble, pubescent; leaves petiolate, ovate, narrowed at the base, deeply toothed, pubescent; calyx 5-toothed: teeth lanceolate, acute; rudiments of sterile stamens wanting. ♃. H. Native of Virginia, Wenderoth. This species differs from *L. Europæ'us* in the stolons being long and leafy, and in the stem being hardly half a foot high.

Reddish Water-Horehound. Pl. ½ to 1 foot.

6 L. sinua'tus (Elliott, car. 1. p. 187.) stem erect, acutely tetragonal, nearly glabrous; leaves petiolate, oblong-lanceolate, narrowed at both ends: lower ones pinnatifid: middle ones sinuately toothed: upper ones linear, almost quite entire; whorls many-flowered; calyx 5-toothed, acute; rudiments of sterile stamens capitate; achenia shorter than the tube. ♃. H. Native of North America, in watery places common, from the river Saskatchawan to Canada, Virginia, &c. L. Europæ'us, Pursh, fl. amer. sept. 1. p. 16. Michx. fl. bor. amer. 1. p. 14. but not of Lin. L. bracteàtus, Muhl. ex Link, jahrb. 1-3. p. 55. L. Americánus, Muhl. ex Bart. fl. phil. 1. p. 12. Stolons not seen. Stem glabrous, acutely tetragonal. Leaves very variable, glabrous. Corollas white.

Var. α, dissèctus (Benth. lab. p. 187.) leaves usually pinnatifid. ♃. H. Native principally of the northern region of North America. L. exaltàtus, Elliott, bot. car. 1. p. 187. but not of Lin. L. heterophýllus, Rafin, med. fl. 2. p. 28.

Var. β, vulgàris (Benth. lab. p. 187.) leaves generally sinuated. ♃. H. Native of the middle region of North America, L. sinuàtus, Elliott, bot. car. 1. p. 187. L. vulgàris, Nutt. gen. amer. 1. p. 15.

Var. γ, angustifòlius (Benth. lab. p. 187.) leaves for the most part linear, and almost quite entire. ♃. H. Native of the southern region of North America. L. angustifòlius, Nutt. gen. amer. 1. p. 15. L. longifòlius, Rafin. med. fl. 2. p. 28. L. Pennsylvánicus, Muhl. ex Rafin. l. c. L. pauciflòrus, Rafin. l. c.?

Sinuated-leaved Water-Horehound. Pl. 1 to 2 feet.

7 L. Austra'lis (R. Br. prod. p. 500. Benth. lab. p. 716.) stem erect, quite glabrous, or hispid from a few pili; leaves almost sessile, oblong-lanceolate, narrowed at both ends, sharply toothed, quite glabrous above or on both surfaces, shining or pubescent beneath; whorls many-flowered; calyx 5-toothed: teeth, as well as the bracteas, very acute; rudiments of sterile stamens capitate; achenia shorter than the tube of the calyx. ♃. H. Native of Eastern Siberia; China; New South Wales, at Port Jackson; and on the south coast of New Holland; also of Van Diemen's Land. L. Europæ'us, γ, argùtus, Benth. lab. p. 186. L. lùcidus, Turcz. mss. This species differs from *L. Europæ'us* besides habit, in the rudiments of sterile stamens being present; and it is also very nearly allied to *L. sinuàtus*; but differs in habit, almost sessile leaves, and in the calyxes and bracteas being very acute.

Southern Water-Horehound. Fl. July, Aug. Clt. 1823. Pl. 1 to 3 feet.

8 L. exalta'tus (Lin. fil. suppl. p. 87.) stem erect, branched, tall; leaves petiolate, ovate-oblong, pinnatifid; whorls many-flowered; calyx acutely 5-toothed; rudiments of sterile stamens capitate; achenia about equal in length to the calycine teeth. 4. H. Native of the east of Europe, and Middle Asia; as of Hungary, Siberia, Himalaya, Bithynia, Italy, France, &c., in humid or watery places. Sibth. et Smith. fl. græc. t. 12.—Sabb. hort. rom. 3. t. 64. but not of the more recent authors. L. pinnatífidus, Pall. fl. ross. 2. t. 1. Stem acutely tetragonal, glabrous or pubescent. Leaves glabrous or pubescent. Corollas white, smaller than those of *L. Europæ'us*.

Exalted Water-Horehound. Fl. July, Aug. Clt. 1739. Pl. 4 to 6 feet.

N.B.—What is *L. intermèdius*, Schrad.?

Cult. Coarse marsh plants of easy culture, but of no beauty. They will grow in any kind of soil, but prefer one moist; and are readily propagated by dividing at the root.

XXVIII. MERIA'NDRA (from *μερος, meris*, a part; and *ανηρ ανδρος, aner andros*, a male; in allusion to the superior stamens being abortive, rarely one of them fertile.) Benth. in bot. reg. vol. 15. lab. p. 188. Sálvia species, Roth. and Roxb.

Lin. syst. *Diándria, Monogýnia.* Calyx ovate, bilabiate: upper lip concave, entire, or with 3 very short teeth: lower lip bifid; throat naked inside. Corolla having the tube equal in length to the calyx; and the limb equally 4-cleft; lobes flat: upper lobe entire or emarginate. The 2 lower stamens fertile, erect, distant: the two superior ones usually abortive, rarely with one or the other fertile, conforming to the lower ones; anthers 2-celled: cells separate, stipitate, equal, pendulous; with a short linear connective, which is articulated with the filament at the middle, and erect on both sides. Style nearly equally bifid at top.—Shrubs with racemose or spicately panicled flowers. Habit of *Sálvia*, but the form of the corolla and direction of the stamens are that of *Menthoideæ*; and *M. strobilífera* is not unlike *Elshóltzia* in habit.

1 M. strobili'fera (Benth. in Wall. pl. asiat. rar. 1. p. 29. lab. p. 188.) branches densely clothed with floccose tomentum; whorls spicate: lower ones rather remote; floral leaves bracteaformed, ovate-lanceolate, disposed in 4 rows. ♄. F. Native of the East Indies, among the mountains, in the province of Sirmore, Wall.; Himalaya, at Syen, and below Simlah, Royle. Leaves on short petioles, oblong-lanceolate, 2-4 inches long, obtuse, crenulated, rather villous above, and woolly beneath: floral ones entire. Flowers about the size of those of *Elshóltzia*. Odour ungrateful.

Strobile-bearing Meriandra. Shrub 2 to 3 feet.

2 M. Bengale'nsis (Benth. l. c.) stem nearly glabrous; branches canescent; whorls remote, racemosely panicled. ♄. S. Native of Bengal and Coromandel. It is cultivated in the gardens of India, and used for the purposes of sage. It has also been found in Abyssinia, where it is also probably a native. Sálvia Bengalénsis, Roxb. fl. ind. 1. p. 146. Sálvia dianthèra, Roth. nov. spec. p. 18. Sálvia Abyssínica, R. Br. append. to Salt. abyss. Leaves very like those of *Sálvia officinàlis*, 2-3 inches long, petiolate, oblong-lanceolate, obtuse, crenulated, rounded or truncate at the base, green above and canescent beneath: floral ones small. Flowers about the size of those of *Thymus serpyllum*. Taste and odour of leaves stronger than that of sage, Roxb. The whole plant exhales an odour like that of camphor when rubbed, Wall.

Bengal Meriandra. Shrub 4 to 6 feet.

Cult. For culture and propagation see shrubby species of *Sálvia*, p. 729.

Tribe III.

MONA'RDEÆ (the plants contained in this tribe agree with the genus *Monárda* in the characters given below.) Benth. lab. p. 190. Corolla bilabiate. The 2 superior stamens abortive, or if fertile, bearing linear connate anthers. The 2 lower stamens fertile, ascending; anthers linear, sometimes with opposite, confluent, contiguous cells, therefore apparently 1-celled, sometimes dimidiate, free or connate behind; connective linear, articulated in the filament, bearing a fertile cell at top, truncate behind, or usually drawn out, filiform and clavate, or bearing another cell, which is sometimes difformed and empty, and sometimes fertile.

XXIX. SA'LVIA (from *salvo*, to save; so called on account of the healing qualities of sage.) Lin. gen. no. 39. Schreb. gen. no. 50. Gærtn. fruct. t. 66. Tourn. inst. t. 88. Juss. gen. p. 111. ed. Usteri, p. 125. Benth. lab. p. 190. Hormínum, Schárea, and Æthiopis, Tourn. inst. and other authors. Schradèria and Júngia, Mœnch.—Stenarrhèna, D. Don, prod. fl. nep.—Leùnia, Llave and Lexarza, pl. mex.

Lin. syst. *Diándria, Monogýnia.* Calyx ovate, tubular, or campanulate, bilabiate: upper lip entire or tridentate: lower one bifid: throat naked inside. Corolla with an inclosed or exserted tube, which is equal, ventricose, or widened, sometimes furnished with a ring of hairs inside, sometimes naked, or sometimes furnished with 2 teeth or processes on the lower side at the base: limb bilabiate: upper lip erect, rarely spreading, straight or falcate, entire or emarginate: lower lip spreading, shorter or longer, with the lateral lobes oblong or roundish, spreading, reflexed, or twisted erectly, the middle lobe usually the broadest, entire or emarginate. Rudiments of superior stamens wanting, or small and club-shaped: lower 2 always fertile, inserted near the throat of the tube; filaments short, horizontal, rarely erect, articulated with the anther at top, and usually drawn out beneath the articulation, rarely almost continuous. Anthers dimidiate; connective elongated, linear, articulated transversely with the filament, ascending under the upper lip of the corolla, and bearing at the top a linear, adnate, or versatile fertile cell, and deflexed or erect behind, and sometimes bearing another smaller cell, which is either fertile or difformed, and empty; free, but usually combined together, or connate in various ways. Disk of ovarium glanduliferous in front. Style ascending, bifid at top: lobes sometimes subulate, equal, or the superior one is longest, and sometimes the lower one or both are rounded, dilated, and flattened. Stigmas for the most part minute, terminal, or in the larger part running along the lobes of the style. Achenia ovoid-triquetrous, dry, glabrous, usually very smooth.—This very extensive genus is very variable in habit.

Sect. I. Eu'sphace (from *ευ, eu*, well; and *σφακος, sphakos*, sage; this section is supposed to contain the true species of the genus.) Benth. in Hook. bot. misc. 3. p. 372. lab. p. 207. Calyx campanulate: upper lip tridentate: lower one bifid: teeth all acute, and hardly increasing at maturity. Tube of corolla wide, a little exserted, furnished with a ring of hairs inside: upper lip erect; lateral lobes of lower lip reflexedly spreading: middle lobe broad, emarginately bifid, with the segments a little reflexed. Connective stretched out behind, bearing a difformed, empty, rarely somewhat polliniferous cell, almost connected at the extremities.—Herbs, rarely shrubs, natives of the region of the Mediterranean. Leaves entire or pinnate.

1 S. Cre'tica (Lin. spec. p. 33.) shrubby; stem clothed with white wool; floriferous branches clothed with white pubescence; leaves petiolate, entire, oblong-linear, narrowed at the base, wrinkled: lower ones clothed with white wool beneath: floral leaves sessile: uppermost ones deciduous; racemes a little branched; whorls many-flowered; calyx membranaceous, coloured, striated, pubescent, with subulately acuminate teeth; tube of corolla exserted; connective very short behind, and bearing an empty cell. ♄. H. Native of Candia. Schreb. nov. act. nat. cur. 479. t. 3. D. C. pl. rar. hort. gen. not. 4. 9. t. 3. S. tenuifòlia, Riv. mon. irr. 59. t. 128. S. officinàlis, var. angustifòlia, Link. Corollas violet. Very nearly allied to *S. officinàlis*; and differs principally in the very narrow leaves and long petioles.

Cretan Sage. Fl. June, Aug. Clt. 1760. Shrub 1 foot.

2 S. lavandulæfòlia (Vahl, enum. 1. p. 222.) shrubby, clothed with white tomentum; leaves petiolate, entire, oblong-lanceolate, narrowed at the base, wrinkled, clothed with white tomentum on both surfaces; floral leaves sessile: uppermost ones deciduous; calyx tubularly campanulate, membranaceously coloured at apex, striated, pubescent: teeth all nearly equal, subulately acuminated; tube of corolla exserted; connective stretched out behind, bearing anthers at both ends, the hind cells empty and connate. ♄. S. Native of Spain, on arid hills. S. rosmarinifòlia, Hortul. ex Roem. et Schultes, syst. 1. p. 200. S. tenuior, Desf. ex Roem. et Schultes, mant. 1. p. 200. S. Hispanòrum, Lag. gen. et spec. nov. diagn. 3. Very nearly allied to *S. officinàlis*; and differs principally in being canescent; in the leaves being narrower; in the racemes being slender; in the whorls being loose and fewer-flowered; and in the calyxes being smaller, and hardly bilabiate. Corollas violet.

Lavender-leaved Sage. Shrub.

3 S. officina'lis (Lin. spec. p. 34.) stem shrubby, clothed with white tomentum; floriferous branches clothed with tomentose pubescence; leaves petiolate, entire, oblong, narrowed or roundish at the base, wrinkled: lower ones clothed with white wool beneath: floral leaves sessile, ovate, acuminated, membranous at the base, striated; racemes almost simple; whorls many-flowered, distinct; calyx membranaceously coloured, striated, pubescent: teeth all subulately acuminated; tube of corolla exserted; connective stretched out behind, bearing anthers at both ends: hind cells empty, connate. ♄. H. Native of the south of Europe, in dry places; as of Spain, south of France, Piedmont, Naples, Dalmatia. Woodv. med. bot. t. 38.? S. grandiflòra, Tenore, fl. nap. prod. append. 5. p. 3. syll. p. 16. but not of Ettling. S. chromática, Hoffm. nasehtr.? S. papillòsa, Hoffm. nasehtr. 1. p. 58.? S. Hispánica, &c., Besl. cyst. ord. 8. fol. 1. f. 19. 2. Leaves 1 to 1½ inch long: upper floral ones coloured. Corolla downy outside, larger or smaller, purple, blue, or white. There are several varieties of this species; one with variegated leaves, another with narrow leaves, and a third with small leaves, &c. The leaves of this and some other species are used in stuffing and sauces for many kinds of luscious and strong meats, as well as to improve the flavour of various articles of cookery. The decoction called sage-tea is usually made from one variety, the *Small-leaved green*, or *Sage of virtue*; but any of the other varieties are equally fit for this purpose. Sage has a peculiar aromatic smell, and a warm aromatic taste, with some degree of bitterness and astringency. In its effects, sage agrees with other aromatics. It is stimulant, carminative, and tonic. The best preparation for these purposes is an infusion of the dried leaves, drunk as tea. With the addition of a little lemon-juice, it proves a useful diluting drink in febrile disorders, being sufficiently agreeable to the palate.

Varieties are as follow: 1. The common or red. 2. The green. 3. The small-leaved green, or Sage of Virtue. 4. The broad-leaved, or balsamic. The red is the principal sort in culinary use, having the most agreeable and fullest flavour: the green is the next in estimation with the cook; but the small-leaved is generally preferred to those to eat as a raw herb, and for decoctions; while the broad-leaved or balsamic kind is most efficacious in a medical way, and is also a tea herb. However, any of the sorts may be occasionally used for those alternate purposes.

Cult. All the varieties may be propagated by slips or cuttings of the young shoots taken from March to June; but most successfully in May and June, by detaching the young shoots of the same year. The outward shoots are to be preferred: slip or cut them off 5 or 6 inches long, slipping off the under leaves, and preserving the top leaves, and water them. They will soon take root freely, especially the young shoots planted in May and June. In the advancing growth, if they spindle up into flower-stalks, pinch or cut that part down; that the plants may shoot out full and stocky from the bottom in close bushy growth for use the same year. In gathering sage for use, cut or slip off the young side and top shoots neatly; and be careful not to strip too close, especially towards winter, and during that season. In July, and the rest of the summer, it is usual to gather some of the young top growth to dry for winter. Keep the plants in regular bushy heads, by cutting away disorderly growths, and the decayed flower-stalks in autumn. Keep them clear from weeds; and sometimes loosen the earth about the plants with a hoe, garden trowel, or small spade, in spring and autumn. Make a fresh plantation once in two, or three, or four years, or as may be necessary by the plants becoming naked, stubby, and dwindling.—*Abercrombie.*

Officinal or Common Sage. Fl. June, July. Clt. 1597. Shrub 1 to 2 feet.

4 S. crassifòlia (Desf. arb. 1. p. 134. but not of Smith.) stem shrubby, clothed with white wool; floriferous branches clothed with tomentose pubescence; leaves petiolate, ovate, obtuse, somewhat cordate at the base, erosely crenated, wrinkled, pubescent: those of the sterile branches undulately curled, and clothed with white wool on both surfaces: lower floral leaves green: upper ones membranous, deciduous; racemes simple; whorls many-flowered, distant; calyx membranous, coloured, striated, pubescent: teeth all lanceolate, acute; tube of corolla a little exserted; connective stretched out behind, antheriferous at both ends: hind cells empty, connate. ♄. H. Native of the South of Europe. This is probably only a variety of *S. officinàlis*, differing in the shape and larger size of the leaves, &c.

Thick-leaved Sage. Fl. June, July. Clt. 1804. Shrub 1 to 2 feet.

5 S. grandifòlia (Ettling, salv. no. 2.) stem shrubby, clothed with white wool; floriferous branches clothed with tomentose pubescence; leaves entire, petiolate, ovate, acute, broadly rounded at the base, or cordate, wrinkled, pubescent: lower ones woolly beneath: floral leaves herbaceous, or the upper ones are membranaceous at the base, ovate, acute; racemes nearly simple; whorls 6-10-flowered, distinct; calyx membranaceous, coloured, striated, hispid: teeth all acute; tube of corolla exserted; connective stretched out behind, antheriferous at both ends: hind cells empty, connate. ♄. H. Native of Tauria, in stony, exposed places on the mountains, and of the Levant. Jacq. fil. ecl. fasc. 4. p. 55. t. 36. S. tomentòsa, Mill. dict. no. 2. S. officinàlis, Pall. ind. taur. p. 134. but not of Lin. S. màjor, &c. Besl. cyst. ord. 8. fol. 1. f. 11. Leaves 3-4 inches long, and 1½ to 2 broad, green above, and canescent beneath, pubescent on both surfaces, but not woolly. Corollas large, blue.

Var. β, minor (Benth. lab. p. 210.) plant more humble; leaves smaller, and more hoary, and always broadly rounded, or cordate at the base.

Great-flowered Sage. Fl. June, Sept. Clt. 1816. Shrub 2 to 3 feet.

6 S. conyzoides (Benth. lab. p. 210.) stem shrubby, rather woolly at the base; floriferous branches clothed with tomentose pubescence; leaves petiolate, usually interruptedly pinnate, wrinkled, clothed with white wool beneath: terminal segment large, oblong-lanceolate, narrowed at the base, with 1-2 lateral segments on each side, which are oblong-lanceolate, and rounded at the base; floral leaves bractea-formed, deciduous; racemes elongated; whorls many-flowered, remote; calyx rather membranous, coloured, striated, pubescent: teeth all subulately acuminated; tube of corolla exserted; connective stretched out behind, antheriferous at both ends: hind cells empty, connate. ♄. H. Native of the South of Europe; ? and occurs in French gardens under the names of *S. triloba*, *S. interrúpta*, and *S. officinàlis foliis pinnatis*. S. aurita, Schultes, obs. bot. p. 10. ? but not of Thunb. Corollas blue, or purple.

Confused Sage. Fl. June, July. Clt. ? Shrub 1 to 2 feet.

7 S. triloba (Lin. fil. suppl. 88.) stem shrubby, and is, as well as the branches, clothed with white wool; leaves petiolate, ovate, obtuse, wrinkled, thick, clothed with white wool beneath, cordate at the base, auriculated, or with 1 or 2 additional, roundish-ovate, small, distinct segments; floral leaves membranous, deciduous; racemes short, somewhat panicled, clammy; whorls 6-10-flowered, distinct; calyx tubularly campanulate, striated, villous, clammy: teeth all ovate, acutish; tube of corolla exserted; connective stretched out behind, antheriferous at both ends, the hind cells empty, approximate, free. ♄. H. Native of the region of the Mediterranean, on dry, exposed hills; as of Sicily, Calabria, Grecian Archipelago, Syria, &c. Sibth. et Smith, fl. græc. 1. p. 13. t. 17. S. subtriloba, Schranck, in syll. pl. soc. ratisb. 2. p. 58.? S. Clûsii, Jacq. hort. schœnbr. 2. p. 37. t. 195.? S. marrubioides, Vahl, enum. 1. p. 223. a garden monstrosity, having the whorls axillary. S. baccifera, Ettling. salv. p. 4. S. Sipylea, Lam. ill. gen. 1. p. 68. S. fruticòsa, Mill. dict. no. 5. S. auriculàta, Mill. dict. no. 9. S. quinquéloba, Riv. mon. irr. t. 131. Leaves 1 to 1½ inches long, seldom entire, but usually furnished with 1-2 segments at the base. Calyx purplish. Corolla reddish violet, glabrous outside.

Three-lobed-leaved Sage. Fl. June, Aug. Clt. 1596. Shrub 2 to 3 feet.

8 S. interrúpta (Schousb. beob. mar. 7. t. 1.) stem shrubby; branches clothed with clammy villi; leaves petiolate, irregularly pinnate, wrinkled, clothed with white tomentum beneath: terminal segment large: the lateral ones 1-2 pairs, ovate-oblong, rounded at the base, with other small, rounded segments between these; floral leaves membranous, deciduous; racemes simple; whorls about 6-flowered, remote; calyx tubularly campanulate, striated, clothed with clammy villi: teeth all acute; tube of corolla exserted; connectives stretched out behind, antheriferous at both ends, the hind cells empty, and rather connate. ♄. H. Native of the North of Africa, in the southern provinces of Morocco. Jacq. fragm. 61. t. 90.? Sweet, fl. gard. 2. t. 169. Hairs on the plant glanduliferous. Leaves 4-6 inches long, with the petioles; segments crenulated. Raceme 1-2 feet long. Corolla showy, white, with a tinge of blue: upper lip downy outside. This species occurs in gardens under the names of *S. rosæfólia* and *S. pinnàta*.

Interrupted-leaved Sage. Fl. April, Sept. Clt. 1798. Shrub 3 to 4 feet.

9 S. sinuata (Sibth. et Smith, fl. græc. 1. p. 14. t. 18.) branches clothed with clammy villi; leaves petiolate, irregularly pinnate; segments unequal, ovate-oblong, rounded at the base, villous on both surfaces, hardly canescent beneath: floral leaves membranous, deciduous; racemes simple; whorls about 6-flowered, remote; calyxes drooping, tubularly campanulate, striated, clothed with clammy villi; teeth all acutish; tube of corolla exserted, recurvedly ascending, connective stretched out behind, antheriferous at both ends, the hind cells empty, and rather connate. ♄. H. Native of Greece, on the declivities of mountains frequent. Petioles ciliated. Leaves almost like those of *S. interrúpta*. Corollas blue.

Ringent-flowered Sage. Shrub 1 to 2 feet.

10 S. pinnata (Lin. spec. p. 39.) stem herbaceous, erect, pilose; leaves pinnate, with 3-4 pairs of petiolate, ovate, or deeply crenated, wrinkled, villous leaflets; racemes simple; whorls about 6-flowered, remote; floral leaves and bracteas membranous, ovate, acuminated, shorter than the calyxes, deciduous; calyx urceolate, truncate, pilosely woolly: teeth all short, acute; tube of corolla much exserted; connective stretched out behind, antheriferous at both ends, the hind cells empty, approximate, free. ♂. H. Native of the South and East of Europe; as of Spain, and the Levant; also of Arabia. The whole plant is clothed with long, white hairs, and short, clammy villi. Leaves smaller than those of *S. interrúpta*, and the segments more numerous. Corolla above an inch long, purple, showy.

Pinnate-leaved Sage. Fl. July. Clt. 1731. Shrub 1 to 2 feet.

11 S. incarnata (Vahl, enum. 1. p. 226. but not of Cav., but probably of Ettling, salv. no. 15.) stem herbaceous, erect, pilose; leaves pinnate, with 2-3 pairs of almost sessile, ovate, crenated, wrinkled, villous leaflets; racemes simple; whorls 2-6-flowered, remote; floral leaves membranaceous, ovate, acuminated, shorter than the calyx, deciduous; calyx campanulate, pilosely woolly: teeth all ovate, acute; tube of corolla deflexed, equalling the calyx; connective stretched out behind, antheriferous at both ends, the hind cells empty, free. ♃. H. Native of the Levant. Habit of *S. pinnàta*, but the flowers are different. It differs from *S. rosæfólia* in the erect stem and bracteas. Corollas large, flesh-coloured.

Flesh-coloured-flowered Sage. Pl. 1 to 2 feet. ?

12 S. rosæfólia (Smith, icon. ined. 1. p. 5. t. 5.) stem procumbent at the base; branches ascending, pubescent; leaves pinnate, with 2-3 pairs of petiolate, oblong leaflets, which are narrowed at both ends, villous above, and pubescent beneath; floral leaves ovate-lanceolate, coloured, about equal in length to the calyxes; racemes short; whorls 2-3-flowered, distinct; calyx coloured: teeth all acute. ♃. ? ♄. ? H. Native of Armenia, Levant, Persia. S. orientàlis, Mill. dict. no. 8.? Petioles ciliated. Leaves 3 inches long. Calyx almost like that of *S. officinàlis*. Corollas, calyxes, and bracteas purple. There is a variety of this having lanceolate leaflets, the ultimate ones confluent, ex Vahl.

Rose-leaved Sage. Shrub procumbent.

13 S. bracteata (Russ. nat. hist. Alep. 2.) stem herbaceous, erect, pubescent; leaves pinnate, with 2-3 pairs of sessile, oblong, acute, crenately serrated leaflets, which are narrowed at the base, and tomentosely villous on both surfaces: floral leaves very broad, ovate, acuminated, quite entire, permanent, clasping the flowers, longer than the calyxes; racemes simple; whorls usually 10-flowered, remote; calyx sessile, with villous lips: teeth all lanceolate; tube of corolla inclosed. ♃. H. Native of Syria, near Aleppo, Russel.—Plukn. alm. p. 185. t. 194. f. 6. Leaves 2-4 inches long. Floral leaves membranaceous, whitish, like those of *S. Sclárea*. Whorls dense. Corolla purplish.

Bracteate-flowered Sage. Pl. 1 to 1½ foot.

14 S. scabiosæfòlia (Lam. journ. hist. nat. no. 14. p. 44. t. 27.) stem shrubby; branches diffuse, pilosely woolly; leaves pinnate: leaflets usually twin, entire, bifid, or pinnate, oblong, or linear, acute, quite entire; racemes simple; whorls 6-10-flowered, distinct: floral leaves permanent, lanceolate, ovate, or ovate-roundish, acuminated; calyx ample, striated, villous: teeth all ovate, acute; tube of corolla a little exserted; connective stretched out behind, dilated, antheriferous at both ends, the hind cells empty, and connate. ♄. H. Native of Tauria, Caucasus, and Armenia. Mirb. ann. mus. 15. t. 15. f. 2. S. vulnerariæfòlia, Willd. spec. 1. p. 149. S. Hablizièna, Willd. in Schrad. journ. bot. 1. p. 289. t. 2. Jacq. fil. eclog. 1. p. 9. t. 1. Sims, bot. mag. t. 1429. S. scabiòsa, Pers. euch. 1. p. 29. S. Taúrica, Habl. phys. beschr. taur. p. 207. S. pinifòlia, Pall. ind. taur. Stem pilose, or woolly, almost glabrous above, and often purplish. Leaves numerous, sometimes almost glabrous, but usually canescent and pilose, with 3-4 pairs of segments, which are usually twin, or by threes, but opposite, and therefore apparently somewhat verticillate. Corolla beautiful, large, white. There is a variety of this with usually very narrow, almost glabrous leaves, and with the whorls all 6-flowered, and sometimes 10-flowered and more. There are also varieties differing in the size and form of the floral leaves. The *S. Hablizièna* is a more hairy plant, with broader leaflets than that called *S. scabiosæfòlia* in the gardens, whose leaflets are narrower and nearly glabrous.

Scabious-leaved Sage. Fl. Aug. Clt. 1795. Shrub diffuse.

Sect. II. Hymenósphace (from ὑμην, *hymen*, a membrane; and σφακος, *sphakos*, sage; in reference to the dilated, membranaceous lobes of the lower lip of calyx.) Benth. in Hook. bot. misc. 3. p. 373. lab. p. 214. Calyx campanulate: upper lip 2-3-cleft: lower one bifid; lobes all nearly equal, and becoming dilated, membranaceous, and veiny after florescence. Tube of corolla ample, furnished with a *ring* of hairs inside; upper lip rather falcate, compressed, and the lateral lobes of the lower lip spreading. Connective drawn out behind, and bearing a difformed, empty cell, somewhat connected at the extremities.—Shrubs, rarely herbs, usually hoary. Habit of the last section, especially those species natives of the region of the Mediterranean and the Canary Islands. The Cape species are more woody.

15 S. Linkia'na (Roem. et Schultes, syst. mant. 1. p. 182.) herbaceous; ? branches ascending, tomentose; leaves pinnate, with 2-3 pairs of *sessile*, oblong-lanceolate, bluntish, crenated leaflets, which are narrowed at the base, wrinkled, pubescent above, and clothed with soft villi beneath; floral leaves broad-ovate, obtuse, entire, equal in length to the calyxes; racemes simple; whorls many-flowered; calyxes on short pedicels, villous, with coloured lips; lobes all ovate, roundish; tube of corolla a little exserted; hind cells of anthers connate. ♃. ? H. Native of the Levant. S. pilántha, Link, enum. 1. p. 10. Corolla blue: upper lip pilose.

Link's Sage. Fl. July, Aug. Clt. 1823. Pl. 2 to 3 feet.

16 S. acetabulòsa (Vahl, enum. 1. p. 227.) stem suffruticose, ascending, pilose; lower leaves pinnate, with 1-2 pairs of leaflets; upper leaves entire, oblong, obtuse, very much wrinkled, villous on both surfaces, canescent beneath: lower floral ones like the rest, but the upper ones are membranous, and about equal in length to the calyxes; racemes simple; whorls about 10-flowered; calyx ample, hispid, with coloured lips: upper lip entire. ♄. H. Native of the Levant. Very nearly allied to *S. Moluccèllæ*, but differs in the leaves being pinnate, and the calyxes hispid. Corolla glabrous.

Acetabulose Sage. Shrub ascending.

17 S. Hydra'ngea (D. C. herb. ex Benth. lab. p. 717.) canescent; leaves pinnate, with 3-4 pairs of oblong, obtuse, quite entire, pubescent leaflets; floral leaves small, deciduous; whorls 6-10-flowered; calyx large, glabrous, coloured: upper lip sinuated: lobes of lower lip ovate-roundish; corollas hardly exserted. ♄. ? H. Native of Persia, Olivier. Flowers similar to those of the last. Leaves not wrinkled.

Hydrangea Sage. Shrub. ?

18 S. pomi'fera (Lin. spec. p. 34.) shrubby: branches clothed with hoary tomentum; leaves petiolate, ovate-oblong, obtuse, rounded at the base, or somewhat cordate, with crenulated, undulately curled margins, wrinkled, hoary; floral leaves shorter than the calyxes: upper ones and bracteas membranous, deciduous; racemes a little branched; whorls about 6-flowered, distinct; calyx ample, pubescent at the base, a little striated, with coloured lips: upper lip very broad, almost entire, or sinuated: lobes of the lower lip obovate-roundish, obtuse, mucronulate; tube of corolla ample, a little exserted; hind cells of anthers difformed, rather connate. ♄. H. Native of the Levant, Grecian Islands, Palestine, and Syria. Sibth. et Smith, fl. græc. 1. p. 12. t. 15.—Tourn. itin. t. 92. S. frugifera, Etding, salv. no. 5. S. crispa, Riv. mon. irr. t. 125. Calyxes nearly sessile. Corollas bluish-violet, 1½ inch long, glabrous, or downy outside, with sometimes a white spot on the lower lip. Sterile stamens clavate at top.

Apple-bearing Sage. Fl. July, Aug. Clt. 1699. Shrub 2 to 3 feet.

19 S. calycina (Sibth. et Smith, fl. græc. 1. p. 13. t. 16.) shrubby; branches erect, clothed with hoary tomentum; leaves petiolate, ovate, obtuse, cuneated, rounded, or subcordate at the base, crenulated, flattish, wrinkled, hoary; floral leaves shorter than the calyxes: upper ones and bracteas membranous, deciduous; racemes short, branched a little; whorls 2-6-flowered, remote; calyx ample, striated at the base, pubescent: upper lip entire, sinuated, or ending in 3 small points: lobes of the lower lip obovate, cuneated; tube of corolla ample, hardly exserted; hind cells of anthers difformed, sub-connate. ♄. H. Native of Greece, in several parts. S. peregrina, Rauw. gesn. ed. Schmidel, 1. t. 12. f. 103. Very nearly allied to *S. pomifera*, but differs in the shorter, broader leaves, and larger flowers, &c. Corollas reddish violet.

Large-calyxed Sage. Fl. July, Aug. Clt. 1823. Shrub.

20 S. multicau'lis (Vahl, enum. 1. p. 225.) tomentose; leaves subcordate-oblong, very blunt, crenated; calyx hairy; bracteas lanceolate; stem herbaceous. ♃. H. Native of the Levant. Stems many, leafy at the base, and, like the whole plant, clothed with hoary tomentum, but pilose above among the whorls. Leaves petiolate, wrinkled. Whorls distant, 6-flowered. Bracteas shorter than the calyxes. Calyx large, campanulate, veiny, membranaceous, with rounded segments. It appears to differ from *S. calycina* in the stems being humble and herbaceous, in the cauline leaves being smaller, and the floral ones lanceolate.

Many-stemmed Sage. Pl. ½ foot.

21 S. Moluccoi'des (Benth. lab. p. 216.) stem herbaceous, erect, pubescent; leaves on long petioles, ovate, obtuse, crenated, cordate at the base, much wrinkled, pubescent on both surfaces, canescent while young: floral ones shorter than the calyxes: upper ones and bracteas membranous, deciduous; racemes elongated, simple; whorls remote, 6-10-flowered; calyxes almost sessile, striated at the base, pubescent, ample; upper lip minute, tridentate; lobes of the lower lip very blunt. ♃. H. Native of Syria, near Aleppo. This species differs from *S. calycina* in the leaves being more wrinkled, hardly

tomentose, in the racemes being nearly a foot long, and in the fructiferous calyxes being as large as those of *S. Moluccélla læ'vis*. Stems creeping at the base.

Molucella-like Sage. Pl.?

22 S. au'rea (Lin. spec. p. 38.) stem shrubby; branches clothed with hoary tomentum; leaves petiolate, ovate-roundish, obtuse, quite entire, or sinuated, coriaceous, hoary; floral leaves sessile, villous, permanent; racemes short, a little branched; whorls 2-flowered, approximate; calyx ample, villous, with coloured lobes: upper lip almost quite entire, broad-rounded: lobes of the lower lip ovate-roundish; tube of corolla hardly exceeding the calyx; connective short, somewhat deflexed and dilated behind, bearing a small, empty cell. ♄. G. Native of the Cape of Good Hope, and Algoa Bay. Curt. bot. mag. t. 186. Mirb. ann. mus. 15. t. 15. f. 7. Walth. hort. t. 15. S. colorâta, Lin. syst. p. 71.? but not of Vahl. S. Africàna, &c. Commel. hort. 2. p. 183. t. 92. The whole plant clothed with white tomentum. Corolla beautiful, golden yellow. Leaves ½ an inch long, or hardly an inch.

Golden-flowered Sage. Fl. April, Nov. Clt. 1731. Shrub 3 to 4 feet.

23 S. Africa'na (Lin. spec. p. 38.) stem shrubby, panicled at top; branches canescent; leaves nearly sessile, ovate-oblong, obovate, or cuneated, acute, quite entire, or sinuately toothed, narrowed at the base, nearly glabrous above, and white beneath, coriaceous, stiff: floral leaves and bracteas broad-ovate, almost permanent; racemes a little branched; whorls 2-6-flowered, distant; calyx hispid: upper lip nearly entire, broad-roundish: lobes of the lower lip ovate, acute; tube of corolla hardly exceeding the calyx; connective short, and dilated behind, bearing an empty cell. ♄. G. Native of the Cape of Good Hope. Commel. hort. 2. p. 181. t. 91. Mill. fig. t. 225. f. 1. S. colorâta, Vahl, enum. 1. p. 230. S. integérrima, Mill. fig. t. 225. f. 2. dict. no. 12. S. barbâta, Lam. ill. 1. p. 72. Branches purplish. Leaves variable, often green above, but constantly white beneath. Corolla violaceous. There are several slight varieties of the species.

African Sage. Fl. April, July. Clt. 1731. Shrub 2 to 3 feet.

24 S. paniculâ'ta (Lin. mant. p. 25. and p. 511.) stem shrubby; branches scabrous, nearly glabrous; leaves petiolate, obovate, acute, a little toothed, coriaceous, green on both surfaces, scabrous beneath; floral leaves ovate, membranous, deciduous; racemes paniculately branched; whorls 2-flowered, distant; calyx scabrous: upper lip entire, rounded: lobes of the lower lip ovate, acuminated; tube of corolla hardly equalling the calyx in length; connective short, and dilated behind, bearing an empty cell. ♄. G. Native of the Cape of Good Hope. S. chamæelæágnea, Berg. cap. 1. p. 3. S. minor, &c. Breyn. cent. 1. p. 169. t. 85. Shrub purplish. Leaves ½ an inch long. Corolla purplish violet, a little larger than those of *S. Africàna*.

Panicled-flowered Sage. Fl. June, Aug. Clt. 1758. Shrub 2 to 4 feet.

25 S. denta'ta (Ait. hort. kew. 1. p. 37.) stem shrubby, glabrous; leaves linear, fascicled, remotely-toothed, nearly glabrous; floral leaves and bracteas ovate, much shorter than the calyxes, permanent; racemes short, simple; whorls 2-6-flowered; calyx ample, pubescent: upper lip sinuate, somewhat 3-toothed; lobes of the lower lip ovate, bluntish; tube of corolla equalling the calyx; connective short, and dilated behind, bearing an empty cell. ♄. G. Native of the Cape of Good Hope. S. rigida, Thunb. prod. fl. cap. 1. p. 96. Corollas purplish violet, smaller than those of *S. Africàna*.

Toothed-leaved Sage. Fl. Dec. Jan. Clt. 1774. Shrub ½ to 1 foot.

26 S. ni'vea (Thunb. prod. p. 96.) leaves lanceolate, quite entire, clothed with white tomentum; branches divaricate. ♄.? G. Native of the Cape of Good Hope. S. lanceolàta, Lam. ill. 1. p. 72. Branches and branchlets decussate, tetragonal, tomentose at top. Leaves petiolate, acute, a little wrinkled, an inch long, bearing other leaves in the axils. Flowers opposite, or somewhat panicled at the top of the branchlets. Calyxes hairy. Corolla purple. Distinguished from *S. áurea* by the lanceolate, white leaves.

Snowy Sage. Shrub 2 to 3 feet.

27 S. Canarie'nsis (Lin. spec. p. 38.) stem shrubby, clothed with white tomentum; leaves petiolate, lanceolate, hastately-triangular, wrinkled, almost glabrous: floral leaves ovate-lanceolate, exceeding the calyxes, membranous, coloured; calyx incurvedly campanulate: upper lip sinuated, somewhat 3-lobed: lobes of lower lip obtuse, mucronate; tube of corolla wide, inclosed; connective somewhat dilated behind, bearing an empty cell. ♄. G. Native of the Canary Islands; also of Sicily. Sclárea tomentòsa, Mill. dict. no. 13. Schradèria hastàta, Mœnch. meth.—Trew. pl. rar. 2. p. 17. t. 19. Corollas purple.

Canary Island Sage. Fl. June, Sept. Clt. 1697. Shrub 3 to 6 feet.

Sect. III. Drymo'sphace (from δρυμος, *drymos*, a forest; and σφακος, *sphakos*, sage; probably in reference to the species inhabiting woods.) Benth. in Hook. misc. 3. p. 373. lab. p. 218. Calyx tubular, or campanulate; upper lip almost entire, truncate, or with 3 very short teeth. Tube of corolla exserted, furnished with a ring of hairs inside; upper lip falcately compressed; lateral lobes of the lower lip spreading. Connective drawn out behind, bearing an empty, difformed cell, somewhat connected at the extremities.—European, or Asiatic green, rather clammy herbs. Leaves usually large, hastately cordate. Corollas yellow, rarely blue.

28 S. glutinòsa (Lin. spec. p. 37.) stems herbaceous, erect, clammy, pilose; leaves petiolate, ovate-oblong, acuminated, cordately sagittate at the base: floral ones ovate, acuminated, shorter than the calyxes; racemes simple; whorls distant, loose, 6-flowered; calyx tubular: upper lip truncate, entire, somewhat recurved; corollas gaping, 3 times as long as the calyx. 4. H. Native of Europe, and middle Asia, in woods and other shady places; as of Spain, South of France, Switzerland, Italy, South of Germany, South of Russia, Tauria, Caucasus, &c.—Sabb. hort. rom. t. 3. Mirb. ann. mus. 15. t. 15. f. 11. Riv. mon. irr. t. 35. Sclárea glutinòsa, Mill. dict. no. 11. Lobus jàvis, Besl. syst. ord. 8. fol. 4. f. 1. Plant clammy. Lower leaves large, glabrous, or clothed with clammy pubescence. Corollas pale yellow.

Clammy Sage. Fl. June, Sept. Clt. 1769. Pl. 2 to 3 feet.

29 S. nubi'cola (Wall. ex Benth. in Wall. pl. rar. asiat. 1. p. 68. lab. p. 219.) stem herbaceous, erect, villous; leaves petiolate, ovate-lanceolate, crenated, pubescent on both surfaces: lower ones hastately cordate at the base: upper ones rounded, or narrowed at the base: uppermost and floral ones sessile, ovate, acute, quite entire; racemes a little branched; whorls loose, few-flowered, remote; calyx campanulate, villous: upper lip entire, and toothed: the lower lip acute; corolla 3 times as long as the calyx: hind cells of anthers empty, connected. 4. H. Native of Kamaon and Sirinaghur, Wall.; in the valley of Cashmere, and at Kidarkonta, Royle; Simlah, Jacquemont. Sweet, fl. gard. 2. t. 140. Corollas yellow, smaller than those of *S. glutinòsa*.

Cloud Sage. Fl. Oct. Clt. 1823. Pl. 3 feet.

30 S. hi'ans (Royle, ex Benth. in Hook. bot. misc. 3. p. 373. lab. p. 219.) stem herbaceous, erect, villous; leaves on long petioles, broad ovate, broadly and cordately sagittate at the base: floral leaves ovate, acuminated, shorter than the calyxes; racemes branched a little; whorls 6-flowered; calyx campanulate, striated, coloured, clammy: upper lip entire, truncate; lower lip longer, with ovate, acute teeth; corolla gaping, 3 times as long as the calyx; bind cells of anthers somewhat connected, empty. ♃. H. Native of the valley of Cashmere, Royle. Allied to *S. glutinosa*. Corolla showy, blue. Connective short behind.

Gaping-flowered Sage. Pl. 2 to 3 feet.?

31 S. campanula'ta (Wall. ex Benth. in Wall. pl. rar. asiat. 1. p. 67. lab. p. 220.) stem herbaceous, ascending, hairy; leaves large, on long petioles, ovate, acute, deeply crenated, cordate at the base, rather hispid on both surfaces: floral leaves ovate, acute, shorter than the calyxes; racemes a little branched; whorls about 6-flowered, remote; calyxes on short pedicels, amply campanulate, truncate, villous: upper lip very short, nearly entire, and toothed: lobes of the lower lip broad ovate, acute; corolla one-half longer than the calyx; tube of corolla inclosed; connective free behind, and bearing an empty cell. ♃. H. Native of Nipaul, on Gosainsthan. Leaves 4 to 6 inches long, and about the same in breadth. Racemes short. Corollas, according to Wallich, similar to those of *S. nubicola*.

Campanulate-calyxed Sage. Pl. 1 to 2 feet.

Sect. IV. Hormi'num (from *ὁρμαω, hormao*, to excite; in reference to the stimulating qualities of the plant.) Benth. in Hook. bot. misc. 3. p. 378. lab. p. 220. Calyx tubular: upper lip truncate, somewhat 3-toothed. Tube of corolla widened under the throat, or ventricose, without any ring of hairs inside: upper lip straight, concave, or falcate, compressed: lateral lobes of the lower lip oblong, erect, a little twisted; middle lobe spreading, roundish. Connective deflexed behind, abruptly dilated, connected, and callous at the extremity.—Herbs natives of the region of the Mediterranean.

32 S. vi'ridis (Lin. spec. p. 34.) stem herbaceous, erect, villous; leaves petiolate, ovate-oblong, rounded at the base, obtuse, crenated, villous: superior ones ovate-cordate: floral leaves very broad, acute, permanent, rather longer than the calyxes, becoming gradually smaller as they ascend; racemes simple; whorls distant, usually 6-flowered; calyx villous, reflexed in the fructiferous state, and plicately striated: teeth of the lower lip lanceolate, acute; corolla hardly a third part longer than the calyx, with an almost inclosed tube. ☉. H. Native of Europe, Africa, and Asia, in the region of the Mediterranean, in dry, stony, or gravelly places; Barbary, Spain, Italy, Dalmatia, Greece, Tauria, Caucasus, &c. Jacq. icon. rar. 1. p. 2. t. 4. Desf. fl. atl. 1. p. 20. t. 1. Sibth. et Smith, fl. græc. 1. p. 15. t. 19. Rchb. icon. bot. c. 6. p. 23. t. 581. S. Spielmánni, Scop. del. ins. 3. p. 31. t. 15. Jacq. fil. ecl. 1. p. 25. t. 15. Rchb. icon. bot. c. 6. p. 23. t. 552. but not of Willd. S. truncàta, Willd. enum. 1. p. 34. Horminum viride, Mœnch. meth. p. 377. Horminum comâ viridi, Tourn. inst. 178. Stem sparingly branched. Leaves 1-2 inches long. Corollas small, blue. Bracteas green.

Var. β, *violàcea*; flowers violaceous, or bluish. ☉. H. Plant more robust than the species.

Green-topped Clary. Fl. July, Aug. Clt. 1759. Pl. ¼ to 1 foot.

33 S. Horminum (Lin. spec. p. 34.) stem herbaceous, erect, villous; leaves petiolate, oval-oblong, rounded at the base, or cuneated, obtuse, crenated, villous: superior ones ovate-cordate: floral leaves very broad, acute, permanent, rather longer than the calyxes: uppermost ones membranaceously dilated, coloured, comose; racemes simple; whorls distant, about 6-flowered; calyx pubescent, reflexed in the mature state, and plicately striated: teeth of the lower lip lanceolate, acute; corolla one-half longer than the calyx, with an inclosed tube. ☉. H. Native of Europe, Africa, and Asia, in the region of the Mediterranean, at the edges of fields, and in bushy places; as of Barbary, Greece, Italy, Dalmatia, Syria, Tauria. Sibth. et Smith, fl. græc. 1. p. 15. t. 20. S. colorâta, Thore, chl. land. p. 17. Horminum sativum, Mill. dict. no. 5. Horminum colorâtum, Mœnch. meth. p. 376.—Plenck. icon. 20.—Lob. icon. t. 555. —Gesn. fasc. 17. t. 11. f. 21.—Buxb. cent. t. 39. f. 2. There are two varieties of this, the *Purple-topped Clary*, and the *Red-topped Clary*, the bracteas in the one being purple, and in the other red, for which they are cultivated in gardens.

Clary, Purple, and Red-topped. Fl. June, July. Clt. 1596. Pl. 1 to 1½ foot.

34 S. Forsköhlei (Lin. mant. p. 26.) stem herbaceous, clothed with rather clammy villi; lower leaves petiolate, large, ovate, repandly crenated, auricled at the base, or lobed, villous; cauline leaves few, nearly sessile: floral leaves broadly ovate, acuminated, permanent, much shorter than the calyxes; racemes elongated, nearly simple; whorls 2-6-flowered, distant; teeth of lower lip of calyx lanceolate, acute; corolla twice as long as the calyx, with an exserted tube: upper lip emarginately bifid. ♃.? H. Native of the Levant, Forsk.; in woods on Mount Olympus in Bithynia; and about Belgrad, near Constantinople, Sibthorp. Sims, bot. mag. t. 988. Willd. hort. berol. t. 20. Sibth. et Smith, fl. græc. 1. p. 16. t. 21. S. bifida, Forsk, fl. arab. p. 202. Stem leafy at base, and nearly naked at top. Lower leaves 3-4 inches long, subcordate at the base. Calyx usually coloured at top, clothed with clammy pubescence. Corollas violaceous, similar to Sect. I. *Eusphace*: lower lip variegated; middle lobe deflexed, emarginately bifid.

Forskæl's Sage. Fl. June, Aug. Clt. 1800. Pl. 1½ foot.

35 S. miltiorhi'za (Bunge. enum. pl. chin. p. 50.) stem herbaceous, erect, pilose; leaves petiolate, pinnate, with 3-7 petiolate, ovate, crenated leaflets: the ultimate leaflet larger or bifid; floral leaves bractea-formed; racemes simple; whorls many-flowered, loose; calyx campanulate: upper lip acute, entire: lower one shortly bidentate; corolla about 3 times as long as the calyx: tube a little exserted, obliquely annulate inside: upper lip falcate, compressed: middle lobe of lower lip fringed; connective rather dilated behind. ☉.? ♃.? G. Native of the north of China, in shady mountains at Zui-wey-schin and Ssi-jui-ssy, Bunge. Habit of *S. Forskæ'lei*. Root vermilion-coloured. Leaves large, hispid, green above and paler beneath. Calyxes coloured, rather clammy. Corollas blue, clothed with clammy pubescence outside. This species differs from the present section in the upper lip of corolla being *entire*; and in the inside of the tube of the corolla being annulate from both the present section and sect. *Æthiopis*.

Red-rooted Sage. Pl. 2 to 3 feet.

Sect. V. Æthi'opis (so called from *S. Æthiopis* being a native of Ethiopia.) Benth. in Hook. bot. misc. 3. p. 373. lab. p. 222. Calyx campanulate or tubular; upper lip tridentate: teeth erect: middle tooth very small. Tube of corolla widened under the throat or ventricose, without any ring of hairs inside: upper lip falcate, compressed; lateral lobes of lower lip oblong, erectish, and a little twisted: middle lobe spreading, roundish, usually concave, emarginate, crenulated. Connective deflexed behind, abruptly dilated, callous and connected at the extremity.—Herbs, natives of the region of the Mediterranean, and the mountains of Middle Asia. Leaves and lower parts of stem usually clothed with white wool. Floral leaves permanent, erect, clasping the whorls, rarely rather

longer than the peduncles. Panicle divaricately branched, rarely almost simple.

36 S. Índica (Lin. spec. p. 37.) stem erect, rather hairy; leaves petiolate, ovate or oblong, acute, a little toothed, broadly cordate at the base, glabrous; floral leaves ovate-cordate, reflexed; racemes simple; whorls 6-flowered, remote; calyxes sessile, campanulate, inflated after florescence; corolla 3 times as long as the calyx. ♃. H. Native of India, Lin., but probably of the mountains of Persia or Arabia. Jacq. hort. vind. 1. p. 33. t. 78. Curt. bot. mag. t. 395. Sclárea Índica, Mill. dict. no. 9.—Mor. hist. 3. sect. 11. t. 13. f. 16. Stem angular, glabrous, or beset with clammy hairs. Lower leaves 3-5 inches long: floral ones shorter than the calyxes. Corollas variegated: lower lip yellow and blue; the upper lip purple, size of those of *S. argéntea*. Calyx clothed with clammy pubescence.

Indian Clary. Fl. May, July. Clt. 1731. Pl. 3 to 4 feet.

37 S. commuta'ta (Benth. lab. p. 222.) stem erect, hispidly pilose; leaves petiolate, ovate, obtuse, erosely crenated, cordate at the base, thick, tubercularly wrinkled, hispid and green on both surfaces; floral leaves hardly longer than the peduncles; raceme dense, spike-formed; calyx campanulate, hispid; corolla about twice as long as the calyx. ♃.? H. Native of Syria or Italy. S. Dominica, Lin. spec. p. 35. but not of Swartz. and other authors. S. Syríaca, Gouan. herb. but not of Lin. Cauline leaves very numerous, and smaller than in other species of the present section, hardly 1½ inch long.

Changed Clary. Pl.?

38 S. Syría'ca (Lin. spec. p. 36.) stem nearly glabrous, panicled at top, and clothed with tomentose pubescence; leaves petiolate, ovate, obtuse, erosely crenated or deeply toothed, cordate at the base, green on both surfaces, much wrinkled, pubescent; floral leaves broad-ovate, concave, permanent, one half shorter than the calyxes; racemes panicled; whorls distant, 2-6-flowered; calyx campanulate, tomentose; corolla one half longer than the calyx, with an inclosed tube. ♃. H. Native of the Levant, Persia, and Palestine; Syria, near Aleppo. Sclárea Syríaca, Mill. dict. no. 5. Horminum Syríacum, Bauh. pin. p. 238. Allied to *S. oderàta*; but differs in the leaves being green on both surfaces, and the form of the leaves is that of *S. praténsis*. Corollas white.

Syrian Clary. Fl. July. Clt. 1759. Pl. 2 to 3 feet.

39 S. odora'ta (Willd. enum. p. 43.) stem suffruticose, clothed with white wool at the base, but panicled and glabrous at top; leaves petiolate, ovate-lanceolate, acuminated, irregularly crenate-toothed, cordate at the base, wrinkled, clothed with white tomentum on both surfaces; upper ones sessile; floral leaves shorter than the pedicels, permanent; racemes panicled, loose; whorls remote, 2-flowered; calyx campanulate, striated, pubescently hairy; corolla about 3 times as long as the calyx. ½. F. Native near Bagdad. Jacq. fil. ecl. fasc. 2. p. 26. t. 16. S. álbida, Jacq. obs. 10. no. 73. S. argéntea, Hortul. but not of Lin. Branches tetragonal. Leaves 3 inches long, and 1 to 1½ broad. Flowers on short pedicels, about the size of those of *S. sclárea*. Corollas white: lower lip yellowish in the middle.

Sweet-scented Clary. Fl. July. Clt. 1804. Shrub 2 to 3 feet.

40 S. candidí'ssima (Vahl, enum. 1. p. 278.) stem erect, clothed with white tomentum; leaves petiolate, ovate, obtuse, sinuately toothed, cordate at the base, thick, wrinkled, densely clothed with white tomentum on both surfaces; floral leaves broad, acuminated, concave, permanent, rather shorter than the calyxes; racemes branched; whorls 6-10-flowered: upper whorls abortive; calyx campanulate, villous; tube of corolla equal in length to the calyx. ♃. S. Native of Armenia, and the Island of Cyprus. S. crassifólia, Sibth. et Smith, fl. græc. 1. p. 19. t. 26. Corollas white, with a yellow lip, size of those of *S. sclárea*. Leaves smaller than those of *S. argéntea*. Root creeping.?

Very-white Clary. Fl. June, Aug. Clt. 1820. Pl. 1 to 2 feet. ?

41 S. scla'rea (Lin. spec. p. 38.) stem erect, villous; leaves petiolate, ample, ovate, erosely crenated, cordate at the base, wrinkled, hoary: upper ones stem-clasping: floral leaves very broad, acuminated, concave, membranous, coloured, exceeding the flowers, permanent; racemes panicled; whorls distant, about 10-flowered; calyx campanulate, striated, pubescently hispid: teeth somewhat spinosely acuminated; corolla twice as long as the calyx: tube inclosed. ♂. H. Native of the south of Europe, in the region of the Mediterranean; as of the south of France, north of Italy, Naples, Sicily, Dalmatia, Grecian Islands, Tauria, Caucasus, &c. Sibth. et Smith, fl. græc. 1. p. 18. t. 25. St. Hil. pl. fr. t. 2. 47. Mirb. ann. mus. 15. p. 210. f. 2. S. Simsiána, Roem. et Schultes, syst. mant. 1. p. 2520. Lindl. bot. reg. 1003. S. bracteàta, Sims, bot. mag. t. 2320. Sclárea vulgáris, Mill. dict. no. 1.—Ludw. ect. t. 171.—Plenck, icon. 21.—Blackw. t. 122. Lob. icon. 556.—Mor. hist. 3. sect. 11. t. 16. f. 1. Stem clammy. Leaves 8-9 inches long, and 4-5 broad: floral leaves membranous, white at the base, and red at top, comose. Corolla white, tinged with purple. In the cultivated specimens the leaves are more glabrous than in the wild specimens.

This plant is called *Orvale* by the French; *Scharlach-kraut* by the Germans; *Schlarea* by the Italians; and *Clary* by the English. The leaves are sometimes used in soups, though many dislike its scent. Its flowers are used for a fermented wine; and the whole plant is, like sage, esteemed medicinal. *Clary* is reared from seed, and sometimes from cuttings and slips. A small bed will supply most families; and if raised from seed, a quarter of an ounce will suffice for a seed-bed to be transplanted from 2 feet by 2. Sow in the last fortnight of March or the course of April, in any bed or border thinly, and rake in the seed. In summer, when the plants are advanced 2 or 3 inches, transplant a portion of the strongest from 12 to 18 inches apart, to allow competent room for the leaves to spread, when they will be fit for use the same year, and in continuation through winter until the following spring and summer. In the spring allot some old plants to run up into stalks, these will yield ripe seed in autumn.

Common *Clary*. Fl. July, Sept. Clt. 1562. Pl. 3 to 4 feet.

42 S. serótina (Lin. mant. p. 511.) stem beset with glandular villi; leaves petiolate, ample, ovate, deeply crenated, rounded at the base, wrinkled, pubescent: superior ones sessile, cordately stem-clasping: floral ones very broad, acuminated, concave, permanent, exceeding the calyxes; racemes panicled; whorls distant, 6-10-flowered; calyx tubular, cylindrical, striated: teeth all erect and spiny; corolla hardly one half longer than the calyx: tube inclosed. ♂. H. Native of Egypt, Persia; and of Syria, near Aleppo. Jacq. icon. rar. 1. p. 2. t. 7. S. Ægyptíaca, Lin. mant. p. 26. S. Abyssínica, Lin. fil. suppl. p. 88. ex Steud. Márum Ægyptíacum, Vesling, fl. aegypt. p. 75. t. 76. Horminum suavèolens, Mœnch, meth.—Mor. hist. 3. sect. 11. t. 16. f. 2. Plant hispid from spreading glandular hairs in all parts, rarely glabrous. Lower leaves 4-5 inches long. Floral leaves green or white at the base, ciliated. Calyx glabrous, or ciliated with long glandular hairs. Corollas white, glabrous outside.

Spiny-calyxed Clary. Fl. June, July. Clt. 1789. Pl. 1 to 2 feet.

43 S. Palæsti'na (Benth. lab. p. 718.) stem clothed with glandular hairs; leaves petiolate, oblong, somewhat pinnate or

pinnatifid, wrinkled, villous: lobes erosely toothed, very blunt; floral leaves bractea-formed, very broad, acuminated, concave, permanent, shorter than the calyxes; racemes panicled; whorls distant, about 6-flowered; calyx tubular, striated: teeth all erect and spiny; corolla about twice as long as the calyx. ♂. H. Native of Palestine, in corn-fields, Bove. S. Sinàica, Delile, mss. Habit, inflorescence, and flowers, like that of *S. spinòsa*; but differs from that species in the form of the leaves.

Palestine Clary. Pl. 1 to 2 feet.

44 S. Tingita'na (Ettling, salv. p. 30.) stem herbaceous, beset with glandular hairs; leaves petiolate, ample, ovate, deeply crenated, somewhat cordate at the base, much wrinkled, villous: superior ones stem-clasping; floral leaves very broad, acuminated, concave, permanent, rather shorter than the calyxes; racemes panicled; whorls distant, 6-10-flowered; calyx campanulate, plicately striated, hispidly ciliated: teeth all somewhat spiny: the middle tooth of the lower lip obsolete; corolla twice as long as the calyx. ♂. H. Native of the north of Africa, about Tunis; and of Spain, near Cadiz. S. coarctàta, Vahl, enum. 1. p. 277. S. fœ'tida, Lam. ill. 1. p. 69. Horminum Tingitànum, Riv. mon. irr. 1. t. 62. Allied to *S. spinòsa*; but differs in the broader leaves, cordate at the base, and more wrinkled, &c. The whole plant is beset with long spreading, and short glandular hairs. Corolla dirty white: lower lip yellowish, crumulated: upper lip tinged with blue.

Tangier Clary. Fl. July. Clt. 1796. Pl. 1 to 3 feet.

45 S. pras'cox (Vahl, enum. 1. p. 274.) leaves ovate-oblong, rather repand, smooth, rather pilose; bracteas cordate, veiny, acuminated, length of calyx. ♃.? H. Native of the north of Africa. Nearly allied to *S. Tingitàna*. Stem erect, pilose. Lower leaves 3 inches long, petiolate: superior ones sessile, ovate, acute. Teeth of calyx cuspidate, but not spiny. Corolla size of that of *S. Sclàrea*: upper lip villous: lower lip concave.

Early Clary. Pl. 2 to 3 feet.

46 S. Æthiopis (Lin. spec. p. 39.) stem erect, clothed with white wool; lower leaves petiolate, narrowed at the base: cauline leaves cordate, stem-clasping, all deeply toothed, and much wrinkled, densely clothed with white wool on both surfaces: floral leaves very broad, acuminated, permanent, concave, equalling the calyxes, woolly; racemes panicled; whorls 6-10-flowered, distinct; calyx campanulate, woolly: teeth all subulately spinose, spreading; corolla twice as long as the calyx, with an inclosed tube. ♂. H. Native of Europe, Africa, and Asia, in the region of the Mediterranean, in arid fields and dry sterile places; south of France, Piedmont, Naples, Sicily, Austria, Hungary, Podolia, Greece and Syria, Tauria and Caucasus.—Herb panicled at top. Corollas white: upper lip pubescent, often reddish. This plant in a wild state is from ½ to 1 foot in height, but in the cultivated state it grows from 3-5 feet in height. Jacq. fl. austr. 3. p. 7. t. 211. Sclàrea lanàta, Moench. meth. p. 374. Sclàrea Æthiopis, Mill. dict. no. 2. Æthiopis, Besl. syst. 2. ord. 8. fol. 3. f. 1.

Var. β. laciniàta; leaves jagged.—Barrel. icon. p. 24. t. 188.

Var. γ. papillòsa; leaves woolly beneath, and papillosely wrinkled above.—Sabb. hort. rom. p. 5. t. 3.

Ethiopian Clary. Fl. May, June. Clt. 1570. Pl. 1 to 4 feet.

47 S. compre'ssa (Vahl, enum. 1. p. 275.) stem erect, villous; lower leaves petiolate, rounded at the base: superior ones cordately stem-clasping, all ovate, and erosely toothed, wrinkled, rather woolly on both surfaces; floral leaves very broad, obtuse, permanent, concave, coloured, ciliated, equalling the calyxes; racemes panicled; whorls 6-10-flowered: the upper whorls abortive; calyx campanulate, membranous coloured, pubescent: teeth of lower lip of calyx obtuse; corolla one half longer than the calyx. ♂.? H. Native of the Levant. Vent. cels. t. 59. Very nearly allied to the preceding; but differs principally in the floral leaves and blunt mutic calycine teeth, and in the upper whorls being abortive. Bracteas and floral leaves purplish at top. Corollas white.

Compressed Clary. Fl. May, June. Clt. 1822. Pl. 2 feet.?

48 S. argen'tea (Lin. spec. 38.) stem erect, villous; radical leaves petiolate, and the lower cauline leaves sessile, ample, ovate, cuneated at the base, sinuately lobed, erose, woolly, wrinkled: floral leaves very broad, acuminated, concave, permanent, pilose, equalling the calyxes; racemes panicled; whorls 6-10-flowered, remote: the upper ones abortive; calyx campanulate, striated, villous; calycine teeth all rather spiny; corolla about 3 times as long as the calyx, with an inclosed tube. ♂. H. Native of Europe and Africa, in the region of the Mediterranean, in corn-fields; as of Barbary, Portugal, Algarves, Sicily, Naples, Greece, &c. Jacq. hort. schœnbr. 1. p. 4. t. 6. Sibth. et Smith, fl. græc. 1. p. 20. t. 27. S. pyramidàlis, Petagna, inst. bot. 2. p. 54. S. candidissima, Guss. prod. fl. sic. 1. p. 16. and of other Sicilian authors. Hoffm. et Link. fl. port. 1. p. 151. t. 20. but not of Vahl. S. Atlántica, Pers. ench. 1. p. 29. S. pátula, Desf. fl. atl. 1. p. 25. S. Æthiopis, Brot. fl. lus. 1. p. 18. but not of Lin. Sclàrea argéntea, Mill. dict. no. 15.—Mirb. ann. mus. 15. t. 15. f. 4. Allied to *S. spinòsa* and *S. Tingitàna*. Radical and lower cauline leaves 6-8 inches long, and 4-6 broad, clothed with loose white wool on both surfaces. Panicle ample. Corollas showy, bluish-white: lower lip yellowish.

Silvery Clary. Fl. May, July. Clt. 1759. Pl. 2 to 3 feet.

49 S. verbascifòlia (Bieb. fl. cauc. 3. p. 24.) stem erect, clothed with clammy villi; lower leaves petiolate, ample, ovate, cordate at the base, sinuately lobed, erose, thick, much wrinkled, hardly woolly above, but clothed with white tomentose wool beneath; floral leaves very broad, acuminated, concave, permanent, villous, about equalling the calyxes; racemes subpanicled; whorls 2-6-flowered, approximate, distinct: the upper ones abortive; calyx campanulate, striated, clothed with clammy villi; calycine teeth all acute, but scarcely spiny; corolla twice as long as the calyx. ♃. H. Native of Caucasus and Iberia, on sterile parts of mountains; Persia, in the province of Azarbaudgan. S. candidissimum, Bieb. fl. cauc. 1. p. 21. but not of Vahl. Very nearly allied to *S. argéntea*, but differs in the more humble stature, in the leaves being cordate at the base, not narrowed, &c. Corollas white.

Mullein-leaved Clary. Fl. May, July. Clt. 1823. Pl. 1 to 2 feet.?

50 S. Broussone'tii (Benth. lab. p. 227.) stem erect, clothed with rather clammy villi; leaves petiolate, ample, ovate, obtuse, sinuately crenated, cordate at the base, thick, much wrinkled, green, and nearly glabrous above, clothed with white tomentum beneath, and the veins with clammy pubescence; floral leaves ovate-lanceolate, acuminated, concave, green, hispid, permanent, rather longer than the calyxes; racemes panicled; whorls usually 6-flowered, distinct; calyx campanulate, hispid; teeth of upper lip ovate, acute; corolla scarcely twice the length of the calyx. ♃.? H. Native of Teneriffe, or the north of Africa, Broussonet. This is a very distinct species from *S. verbascifòlia*; the leaves are larger, and destitute of wool on the upper surface; the panicle is more dense and more branched, and very villous; the floral leaves narrower, and the flowers smaller.

Broussonet's Clary. Pl.?

51 S. Moorcroftia'na (Wall. ex Benth. in Wall. pl. rar. asiat. 1. p. 67. Benth. lab. p. 228.) stem erect, woolly at the base, but clothed with clammy villi at top; lower leaves on long petioles, ample, ovate, erosely crenated, narrowed at the base,

wrinkled, villous above, and clothed with white wool beneath; floral leaves very broad, acuminated, concave, permanent, equalling the calyxes; racemes panicled; whorls remote, about 6-flowered; calyx campanulate, striated, clothed with rough villi; calycine teeth all subulately mucronate; corollas 3 times as long as the calyx, with an exserted tube. ♂. ? H. Native of the Himalaya; in Luddak, Moorcroft; in the valley of Cashmere; and in Kinaour and Kidarkonta, Royle. Allied to *S. argéntea*; but differs in the leaves being on long petioles, less cut, hardly woolly above, but densely clothed with subfloccose wool beneath, &c. Corolla violaceous. ?

Moorcroft's Clary. Pl.

52 S. lana'ta (Roxb. fl. ind. 1. p. 147.) stems tufted, woolly at the base; leaves oblong-lanceolate, obtuse, entire, minutely crenulated, narrowed a long way at the base, much wrinkled, loosely clothed above, but densely beneath with white wool; floral leaves very broad, acuminated, concave, permanent, equalling the calyxes; racemes almost simple, clothed with clammy villi; whorls remote, about 10-flowered; calyx campanulate, with acute teeth; corolla twice as long as the calyx, with the tube rather exserted. ♃. ? S. Native of Himalaya; on the tops of the alps of Kamaon and Sirmore, and Mussooree; and common throughout the whole of the range. Wall. pl. rar. asiat. 2. p. 11. t. 116. S. càna, Wall. cat. no. 2145. S. integrifòlia, Hardw. in asiat. res. 6. p. 349. Stenarhèna lanàta, D. Don, prod. fl. nep. p. 111. Stems woody at the base, numerous. Leaves 3-4 inches long. Flowers size of those of *S. Æthiopis*. Corolla downy outside, purple.

Woolly Clary. Pl. 1 to 2 feet.

53 S. phlomoi'des (Asso, arrag. p. 158. t. 4.) stems tufted, clothed with white wool at the base; leaves oblong-linear or lanceolate, acute, entire, or the lower ones are sinuately lobed, narrowed a long way at the base, much wrinkled, clothed with white wool on both surfaces; floral leaves very broad, acuminated, concave, permanent, longer than the calyx; racemes nearly simple, clothed with clammy villi; whorls remote; calyx campanulate: teeth of lower lip lanceolate, acuminated; corolla about 3 times as long as the calyx: the tube a little exserted. ♂. H. Native of Spain, plentiful among the mountains of Arragon, about Siguenza. Ruem. script. pl. hisp. et lus. 10. t. 1. f. 1. Stems clothed with clammy hairs at top. Corollas almost glabrous outside, size of those of *S. Sclárea*.

Phlomis-like Clary. Fl. May, June. Clt. 1805. Pl. 1 to 2 feet.

54 S. cane'scens (Meyer, verz. pflanz. p. 86.) stems woolly at the base; leaves lanceolate-oblong, entire or sinuately-lobed, narrowed a long way at the base, wrinkled, loosely clothed above, but densely beneath with white wool; floral leaves very broad, acuminated, concave, permanent, rather shorter than the calyxes; racemes branched, clothed with clammy villi; whorls remote; calyx tubularly campanulate; teeth of lower lip lanceolate, acuminated; corolla about 3 times longer than the calyx, the tube a little exserted. ♂. ? H. Native of Caucasus, among rocks towards the river Anticeta; and near Natzana, Meyer. This is very nearly allied to *S. phlomoides*; but differs in being taller and more slender; in the racemes being branched; in the flowers being fewer and smaller, &c.

Canescent Clary. Pl. 2 to 3 feet. ?

55 S. ceratophyl'lea (*Lin. spec.* p. 39.) stem clothed with white wool at the base; lower leaves deeply pinnatifid, with linear, obtuse, sinuately subpinnatifid lobes, much wrinkled, clothed with loose wool on both surfaces; superior leaves nearly entire: floral leaves very broad, acuminated, concave, permanent, longer than the calyxes; racemes panicled; whorls about 6-flowered, distant, the upper ones abortive; calyx campanulate, with lanceolate-setaceous, rather spiny teeth; corolla twice as long as the calyx, the tube inclosed. ♂. H. Native of the Levant; Syria, near Aleppo, Persia, &c. *S. exasperata*, Cav. ann. hist. nat. 3. p. 113. t. 17. icon. 6. p. 38. t. 558. Sclárea ceratophýlla, Mill. dict. no. 8.—Kniph. cent. 4. t. 78.—Mor. hist. 3. p. 393. sect. 11. t. 13. f. 6. The lower part of the stem and leaves are clothed with loose wool. Lower leaves 7-8 inches long: floral leaves green, clammy. Corolla yellowish-white or cream-coloured.

Buckhorn-leaved Clary. Fl. July, Aug. Clt. 1690. Pl. 2 to 3 feet.

† *Doubtful species, probably belonging to the present section.*

56 S. grave'olens (Vahl, enum. 1 p. 273.) stem shrubby; branches tetragonal, very villous; leaves petiolate, cordate, wrinkled, crenated, villous, hoary beneath: lower ones somewhat sinuated: floral leaves cordate; spikes branchy; whorls approximate, 6-flowered; calyx campanulate. ♄. F. Native of Egypt. Bracteas attenuated, shorter than the calyxes, glabrous above. Galea of corolla linear-falcate, pilose.

Strong-scented Clary. Shrub.

57 S. va'ria (Vahl, enum. 1. p. 273.) herbaceous; leaves petiolate, cordate, unequally crenated, obtuse, wrinkled, clothed with hoary tomentum beneath, as well as the stems, but rather villous above; whorls 6-flowered; bracteas cordate, acuminated, length of calyxes; calyx, bracteas, and peduncles hoary; calycine teeth subulate. ♃. H. Native of Armenia. Leaves 3-4 inches long. Corolla small, a little longer than the calyx.

Various Clary. Pl.

Sect. VI. Plethióspace (from πληθος, *plethos*, multitude; and σφακος, *sphakos*, sage; so called from the section containing the *S. sylvéstris*, or common wild sage.) Benth. lab. p. 280. in Hook. bot. misc. 3. p. 378. Calyx ovate: upper lip concave above, bisulcate, with 3 very short conniving teeth: lower lip bifid, with acute teeth. Tube of corolla widened or ventricose under the throat, without any ring of hairs inside: upper lip concave, or falcately compressed; lateral lobes of lower lip obusually concave, emarginate, and crenulated. Connective deflexed behind, abruptly dilated, callous and connate at the extremity.—European, African, and North Asiatic herbs. Leaves usually erosely toothed or cut. Racemes elongated, simple, or virgately panicled.

58 S. bi'color (Desf. in Fourer. journ. de decouv. 1792.) stem erect, a little branched, clothed with clammy pubescence: lower leaves petiolate, ample, ovate, deeply toothed, pinnatifid or palmately lobed; middle leaves petiolate, ovate-lanceolate, acuminated, deeply toothed: superior leaves sessile, lanceolate, all cordate at the base, and clothed with clammy pubescence: floral leaves ovate-lanceolate, acuminated, reflexed; racemes a little branched, elongated; whorls distant, 6-flowered; calyxes pedicellate, campanulate, striated, clothed with clammy hispid hairs: teeth all subulate; corolla 3 times longer than the calyx; the tube equalling the calyx; stamens exserted. ♃. H. Native of the north of Africa; and of Spain, in Andalusia. Sims. bot mag. t. 1774. Desf. fl. atl. 1. p. 22. t. 2. Jacq. hort. schœnbr. 1. p. 4. t. 7. S. crassifòlia, Cav. hort. matr. descr. p. 10. Jacq. fragm. p. 47. t. 60. This is a very beautiful and distinct species, allied to *S. Austriaca*. Stems tetragonal. Radical leaves usually palmately pinnatifid. Racemes 1 to 2 feet long, many-flowered. Corollas larger than those of *S. Austriaca*: upper lip bluish-violet, spotted with white: lower lip yellow.

Two-coloured-flowered Sage. Fl. June, July. Clt. 1793. Pl. 2 to 3 feet.

59 S. Algeriè'nsis (Desf. fl. atl. 1. p. 23. t. 8.) stem branched, hairy; lower leaves ovate-oblong, crenated, running into the petioles: middle and upper leaves few, sessile, usually quite entire; whorls 2-6-flowered, distinct; calycine teeth setaceous, spiny; bracteas reflexed. ♃. H. Native of Algiers, near Maiane. Calyxes nutant. Corollas blue, size of those of *S. pratènsis*. This species is said to differ from *S. bicolor*, in the stem being hairy; in the leaves being ovate-oblong, crenated, not erose, and sinuately toothed, ex Desf.

Algiers Sage. Pl. 2 to 3 feet.?

60 S. latifòlia (Vahl, enum. 1. p. 271.) stem rather pilose, branched at top; lower leaves petiolate, oblong, attenuated at the base: upper ones sessile, cordate; racemes clothed with clammy villi; whorls remote, 4-flowered; calyx campanulate, striated, villous, with setaceous teeth; bracteas cordate, acuminated, glabrous inside, one half shorter than the calyxes. ♃. H. Native of Tangiers. Stems purplish. Upper leaves sessile, 2-3 inches long, very blunt, attenuated at the base, veiny, villous. Pedicels very short. Corolla much larger than the calyx. Very nearly allied to *S. Algeriènsis*; but differs in the leaves being remotely toothed, and the seeds larger, &c.

Broad-leaved Sage. Pl.

61 S. ibanè'nsis (Vahl, enum. 1. p. 269.) stem erect, branched, clammy and hispid; leaves petiolate, ample, ovate, deeply toothed, cordate at the base, hispid: upper leaves lanceolate-linear: floral leaves ovate, acuminated, reflexed; racemes elongated, a little branched; whorls 6-flowered, distant; calyxes shorter than the pedicels, amply campanulate, striated, hispid: teeth all short and stiff; genitals hardly exserted. ♃. H. Native of Spain, Schousboe. Leaves a hand long. Corollas size of those of *S. Sclàrea*, pubescent outside. Pedicels clothed with clammy villi.

Unpleasant Sage. Pl. 2 to 3 feet.?

62 S. Austrì'aca (Lin. syst. veg. p. 69.) stem erect, nearly naked, pubescent; radical leaves petiolate, broad-ovate, erosely toothed, cordate, rounded or cuneated at the base, wrinkled, glabrous above and pubescent beneath: cauline leaves few; floral leaves ovate, acuminated, ciliated, about equal in length to the calyxes; racemes a little branched; whorls about 6-fluwered: lower ones distant: upper ones approximate; calyxes nearly sessile, campanulate, very pilose; corolla 3 times as long as the calyx, the tube a little exserted. ♃. H. Native of Lower Austria, Hungary, Transylvania, Moldavia; frequent in Tauria, and Caucasus. Jacq. fl. austr. 2. p. 8. t. 112. Lindl. bot. reg. t. 1019. S. Sclàrea, Crantz, austr. p. 236. but not of Lin. Sàlvia distans, Pohl, ex Steud. nom. 725. Sclàrea distans, Mœnch. meth. Stems bluntly tetragonal. Radical leaves 3-4 inches long; cauline ones 2 inches long, pinnatifid. Corolla cream-coloured, beset with clammy pili outside, size of that of *S. pratènsis*.

Austrian Sage. Fl. June, Jul. Clt. 1776. Pl. 2 to 3 feet.

63 S. limba'ta (Meyer, verz. pflanz. p. 86.) stems erect, almost naked, pubescent; radical leaves petiolate, broad-ovate, entire, erosely toothed, cordate at the base, very much wrinkled, green, and rather hairy on both surfaces; cauline leaves few, sessile; floral leaves ovate, acuminated, shorter than the calyx; racemes branched; whorls 2-6-flowered, distant; calyxes nearly sessile, broadly campanulate, rather hispid; corolla about thrice as long as the calyx, the tube a little exserted; genitals exserted. ♃. H. Native of Caucasus, in dry stony places on the Talusch mountains. Very nearly allied to *S. Austriaca*; but differs in the leaves being shorter, more wrinkled; in the racemes being fewer-flowered; in the calyx being more broadly campanulate, and hardly hairy.

Limbate Sage. Pl. 2 to 3 feet.?

64 S. ceratophylloi'des (Lin. mant. p. 26.) stem ascending? villous; leaves oblong, deeply pinnatifid, with oblong-lanceolate, deeply toothed lobes, much wrinkled, glabrous: superior leaves nearly sessile; floral leaves ovate, acute, one half shorter than the calyxes; racemes elongated, branched a little; whorls remote, 2-6-flowered; calyxes pedicellate, campanulate, hispid; teeth of lower lip lanceolate, acute; corolla twice as long as the calyx: the tube exserted a little. ♃.? H. Native of the region of the Mediterranean; on arid hills of Calabria; and south of Sicily. Corollas of *S. pratènsis*, but smaller, larger than those of *S. nerbenàca*, violaceous or blue.

Stag-horn-like-leaved Sage. Fl. June, May. Clt. 1771. Pl. 1 to 2 feet.

65 S. prate'nsis (Lin. spec. p. 35.) stems erect, almost simple, pubescent; radical leaves petiolate, oblong-ovate, obtuse, crenated, or cut, cordate at the base, bullately wrinkled, glabrous above, with the petioles and nerves pubescent beneath; cauline leaves few, sessile: uppermost ones lanceolate, acuminated: floral leaves cordate-ovate, shorter than the calyxes, rather reflexed; racemes clammy, nearly simple; whorls 6-flowered, distant; calyxes nearly sessile, campanulate, clothed with clammy villi; corolla 3 times longer than the calyx, the tube equal in length to the calyx; genitals exserted. ♃. H. Native of Middle and South Europe, in dry, grassy fields, and by waysides; as of Britain, France, Spain, Portugal, Germany, Italy, Greece, Caucasus, Sweden, Russia. Smith, engl. bot. t. 159. S. agréstis, Lin. amœn. acad. 3. p. 399.? S. hæmatòdes, Lin. spec. p. 35. S. Barrelièri, Tenor. fl. nap. 1. p. 9. t. 2. Schranck, hort. mon. 1. t. 5. S. Tenòrii, Spreng. syst. 2. p. 65. Sweet. brit. fl. gard. 1. t. 26. S. rubicùnda, Wenderoth. S. virgàta, Sav. bot. etrusc. 2. p. 4. ex Tenore, syll. p. 17. but not of Jacq. S. variegàta, Waldst. et Kit. ex Willd. enum. 1. p. 36. S. tricolor, Hortul.—Berg. phyt. 2. t. 95.—Blackw. t. 258.—Plenck, icon. t. 22. This species is variable in height and pubescence, but the flowers are always large, usually blue, rarely reddish, or white. Racemes simple, or furnished with a few small branches. Root thick. Leaves in the more southern varieties more or less spotted with red.

Meadow Sage. Fl. May, June. Britain. Pl. 2 to 4 feet.

66 S. nemorò'sum (Andrz. in Bess. enum. fl. volh. 3. & 40.) stem erect, almost simple, pubescent; radical and lower cauline leaves petiolate, ovate, doubly crenated, deeply crenated at the base, wrinkled, glabrous on both surfaces, or pubescent on the nerves and petioles beneath; cauline leaves few, sessile, broadly ovate-cordate, acute; floral leaves roundish-cordate, shorter than the calyxes, at length reflexed; racemes almost simple, clammy; whorls 6-flowered, remote; calyxes almost sessile, campanulate, striated, clothed with clammy villi; corolla about 3 times longer than the calyx: tube equal in length to the calyx; genitals almost inclosed. ♃. H. Native of Altaia, in fields at the river Tscharysch; and in the Kirghisean Steppe at the river Nura Ledeb; and in the valley of Cashmere, Royle. Corollas blue. This species differs from *S. pratènsis* in the leaves being smaller, less wrinkled, and more entire, the lower ones on longer petioles, the whorls more remote, and the flowers about half the size.

Bush Sage. Pl. 1 to 3 feet.

67 S. Lusita'nica (Jacq. fl. eclog. 1. p. 57. t. 38. exclusive of the syn. of Vahl and Poir.) stem erect, pilose, clammy; radical leaves petiolate; cauline leaves few, stem-clasping, all triangularly ovate, truncate at the base, somewhat cordate, acute, deeply toothed, much wrinkled, glabrous above, and villous beneath; floral leaves ovate, acuminated, equalling the calyxes; racemes branched; whorls 6-flowered, distant; calyxes nearly sessile, campanulate, striated, hispid, rather veiny; corolla about twice as long as the calyx, with an inclosed tube. ♃. H. Native of Spain and Portugal. Sclàrea Lusitànica, Mill. dict. no.

3.? This species is very nearly allied to *S. praténsis*, *S. dumetòrum*, and *S. virgàta*. It has the small flowers of the two latter species, and the branching panicle of *S. virgàta*. Corollas blue.

Portugal Sage. Fl. June, July. Clt. 1819. Pl. 1 to 2 feet.

68 S. virga'ta (Ait. hort. kew. ed. 1st. vol. 1. p. 39.) stem erect, branched, pubescently villous; radical leaves petiolate, amply ovate, cordate at the base: lower cauline leaves on short petioles, ample, ovate-oblong, rounded or cordate at the base: upper cauline ones more sessile, and smaller: uppermost ones cordately stem-clasping, acuminated, all erosely crenated, wrinkled, almost glabrous above, and pubescent on the nerves beneath, or hispid; floral leaves ovate, acuminated, somewhat reflexed, shorter than the calyxes; racemes branched, elongated; whorls 6-flowered, distant; calyxes pedicellate, campanulate, striated, clothed with clammy villi; corolla twice as long as the calyx, with an inclosed tube. ♃. H. Native of Italy, about Rome, and in fields on Mount St. Angelo. Jacq. hort. vind. 1. p. 14. t. 37. S. Tiberìna, Mauri, ex Requien. S. Gargánica, Tenore, ind. sem. hort. neap. 1829. syll. p. 18. S. cadùca, Horn. hort. hafn. 1. p. 30. S. gigantèa, Desf. cat. hort. par. 2. p. 68. S. Pyrenàica, Lin. spec. p. 36. S. grandidentàta, Lehm. ind. sem. hort. hamb. 1. p. 29.? S. amplexicaùlis, Lam. ill. 1. p. 68.? S. rùbra, Spreng. cur. post. 17. S. Caucásica, Schranck, in syll. pl. soc. ratisb. 2. p. 58. S. affìnis, Spreng. ex Steud. nom. S. Bauhìni, S. Barrelièri, S. quercifòlia, S. Taúrica, and S. Taurìna, Hortul.—Riv. mon. irr. t. 68. Corollas white, pale red, or pale blue. This species differs from *S. praténsis* in the large panicle, in the elongated, few-flowered racemes, in the larger leaves, and smaller flowers. The calyxes and floral leaves are clammy, and hardly coloured.

Twiggy Sage. Fl. June, Nov. Clt. 1756. Pl. 2 to 4 feet.

69 S. rugòsa (Thunb. prod. fl. cap. p. 97.) stem ascending, very villous; leaves petiolate, ovate, or oblong-lanceolate, obtuse, erosely toothed, cordate at the base, bullately wrinkled, pubescent on both surfaces; floral leaves ovate-cordate, acute, rather shorter than the calyxes; racemes a little branched; whorls 6-10-flowered, remote; calyx campanulate, striated, clothed with clammy villi; corolla twice as long as the calyx, the tube equalling the calyx. ♃. G. Native of the Cape of Good Hope. Corollas white, tinged with red. This species differs from *S. dísermas* in the form of the leaves, large and widely campanulate calyxes, and in the corollas being white.

Wrinkled-leaved Sage. Fl. July, Aug. Clt. 1775. Pl. 1 o 2 feet.

70 S. viscòsa (Jacq. misc. 2. p. 328. icon. rar. 1. p. 2. t. 5.) stem erect, clothed with clammy pubescence; leaves petiolate, broad-ovate, crenulated, sub-sinuated, cordate at the base, wrinkled, rather villous on both surfaces, clammy: superior leaves sessile: floral leaves rounded, half the length of the calyxes; racemes elongated, branched; whorls remote, usually 3-flowered; calyx campanulate, clothed with clammy villi; corolla 3 times as long as the calyx, the tube exserted. ♃. H. Native of Spain, Italy, &c. All parts of the plant are clothed with clammy pubescence. Stems with few leaves at top. Radical leaves 8 inches long, and 4-5 broad: cauline ones becoming gradually smaller as they ascend. Corolla 8-9 lines long, violaceous, glabrous outside. Allied to *S. virgàta*.

Clammy Sage. Fl. June, July. Clt. 1778. Pl. 2 to 4 feet.

71 S. dise'rmas (Lin. spec. p. 36.) stems procumbent at the base; branches ascending, and clothed with clammy villi; lower leaves petiolate: superior ones nearly sessile, all oblong-lanceolate, erose, rounded at the base, or cordate, clothed with clammy villi on both surfaces: floral leaves broad-ovate, acute, about equal in length to the calyxes; racemes a little branched; whorls 6-10-flowered, remote; calyx ovate-tubular, clothed with clammy villi, striated; lower calycine teeth lanceolate, acute; corolla exceeding the calyx but little, the tube equalling the calyx. ♃. H. Native of the Cape of Good Hope. Horminum dísermas, Mœnch. meth. Allied to *S. verbenàca* and *S. clandestìna*. Corollas white.

Two-glumed Sage. Fl. July. Clt. 1778. Pl. 1 foot.?

72 S. Sibthórpii (Smith, fl. græc. 1. p. 17. t. 22.) stem erect, rather panicled at top, villous; radical leaves petiolate, ample: superior leaves sessile, all ovate, coarsely and doubly crenated, a little cut, glabrous above, wrinkled, villous beneath: floral leaves roundish, acuminated, rather coloured, shorter than the calyxes; racemes elongated, brachiate, branched, rather canescent; whorls numerous, distinct, 6-10-flowered; calyx tubularly campanulate, villous; lower calycine teeth lanceolate, very acute; corolla hardly twice as long as the calyx, the tube exserted. ♃. H. Native of Europe, in the region of the Mediterranean, in grassy places, and by way-sides; as of Greece, South of Podolia, Bulgaria, about Smyrna, Tauria, &c.; also in the valley of Cashmere, Royle. S. campéstris, Bieb. fl. cauc. 1. p. 20. and 3. p. 22. Rchb. icon. bot. 6. p. 21. t. 529. S. Hyspánica, Andrz. in Bess. enum. pl. pod. 3. S. móllis, Jacq. fil. ecl. 1. p. 56. t. 37.? exclusive of the syn. of Host. S. amplexicaúlis, S. Barrelièri, S. Caucásica, S. Taurica, and S. virgàta, &c. Hortul. Very nearly allied to *S. sylvéstris* and *S. virgàta*; it differs from the first in the less leafy, more villous stem, and more ample leaves, which are 6-9 inches long, and 3-4 broad; and from the latter in the whorls being more numerous and more approximate, in the calyx being larger, and in the floral leaves being membranous and coloured.

Sibthorp's Sage. Pl. 1 to 3 feet.

73 S. sylve'stris (Lin. spec. p. 34.) stem erect, panicled at top; lower leaves petiolate: superior ones sessile, all oblong-lanceolate, crenated, rounded, or usually cordate at the base, wrinkled, glabrous above, and paler and pubescent beneath, or canescent; floral leaves orbicular, acuminated, coloured, about equal in length to the calyxes, imbricated before florescence, but afterwards a little reflexed; racemes elongated, a little branched; whorls 6-10-flowered, distinct; calyx ovate-tubular; corolla twice as long as the calyx, the tube equalling the calyx. ♃. H. Native of East and middle Europe, and middle Asia, in grassy fields; Spain, South of France, Sicily, Naples, Germany, Austria, Hungary, Bohemia, Greece, Persia, Tauria, and Caucasus, Siberia, &c. Jacq. fl. austr. 3. p. 7. t. 212. Rchb. icon. bot. 6. p. 20. t. 527. S. nemorósa, Lin. spec. p. 35. Poit. et Turp. fl. par. t. 35.? Rchb. icon. bot. 6. p. 19. t. 526. S. desérta, Schangin, in Led. cat. hort. dorp. 1824. p. 6. Rchb. icon. bot. 6. p. 21. t. 528. S. Valentìna, Vahl, enum. 1. p. 268. S. clàta, Host, fl. austr. 1. p. 34, and probably of Tenore, syll. p. 18. S. amplexicaúlis, Lam. ill. 1. p. 68.? S. alpéstris, S. aspérula, and S. Taurìna, Hortul. Sclàrea punctàta, Mœnch. meth. Sclàrea sylvéstris, Mill. dict. no. 7. Sclàrea nemorósa, Mill. dict. no. 6. Sclàrea Syriaca, Mill. dict. no. 5. This species is very variable in height and villosity, but with a very distinct habit. Leaves 2-4 inches long. Corollas purplish violet.

Wild Sage. Fl. June, Oct. Clt. 1759. Pl. 1 to 3 feet.

74 S. re'nouia (Vahl, enum. 1. p. 281.) stem erect, villous; lower leaves petiolate: upper ones sessile, all oblong-lanceolate, obtuse, doubly crenated, rather cordate at the base, wrinkled, pubescent; floral leaves orbicular, acuminated, about half as long as the calyxes, permanent, reflexed; racemes a little branched, rather nutant at apex; whorls 6-10-flowered, distinct; calyx tubular, pubescent; corolla twice as long as the calyx, the tube a little exserted. ♃. H. Native of Transylvania, and

Podolia. * S. betonicæfòlia, Ettling, salv. 49. S. Cremenecénsis, Bess. enum. pl. volh. p. 40. This species differs from *S. nùtans* in the stem being leafy, in the leaves being narrower, and on shorter petioles, the racemes few, elongated, and loose, and the flowers larger, &c. Corollas violaceous, larger than those of *S. sylvéstris*.

Pendulous-racemed Sage. Pl. 1 to 2 feet.?

75 S. pu'tans (Lin. spec. p. 30.) stem pubescent, nearly naked; leaves all radical, or nearly so, on long petioles, ovate-oblong, doubly crenated, sub-cordate at the base, wrinkled; floral leaves orbicular; racemes short, on long peduncles, paniced, drooping at the time of flowering; whorls about 6-flowered, approximate; calyxes reflexed, pubescent; corolla twice as long as the calyx, the tube equalling the calyx. ♃. H. Native of the East of Europe, Podolia, and Galicia, Hungary, and Transylvania, Siberia, Tauria, and Caucasus, &c. Waldst. et Kit. pl. hung. 1. p. 63. t. 62. Sims, bot. mag. 2496. S. acutifòlia, Lam. ill. 1. p. 68?. S. péndula, Besser. fl. galic. but not of Vahl. S. hastàta, Ettling, salv. 46. Vahl, enum. 1. p. 280. S. betonicæfòlia, Ettling, salv. p. 49. Bieb. fl. cauc. 1. p. 23.—Kniph. cent. 7. t. 79.—Nov. act. petrop. 1. p. 378. t. 14. Stems nearly simple. Lower leaves 3-4 inches long, glabrous above, and pubescent beneath. Racemes spike-formed, 1-2 inches long. Corolla violaceous, 4-5 lines long. Stamens inclosed.

Drooping-racemed Sage. Fl. June, Aug. Clt. 1780. Pl. 1 to 3 feet.

76 S. sclarεoi'des (Brot. fl. lus. 1. p. 17. phyt. 3. t. 2.) stems erect, almost simple, pilose; radical leaves petiolate, oblong-ovate, obtuse, crenated, or a little cut, cordate at the base, bullately wrinkled, glabrous above, but the petioles and nerves are pilose beneath; cauline leaves few, sessile: upper ones lanceolate, acuminated: floral leaves cordate-ovate, shorter than the calyxes, a little reflexed; racemes clammy, nearly simple; calyxes nearly sessile, campanulate, clothed with clammy villi; corolla hardly twice as long as the calyx, the tube equalling the calyx. ♃. H. Native of the South of Europe, as of Portugal, and Italy. S. Lusitánica, Poir. dict. 6. p. 606. but not of Jacq. S. elongàta, Spreng. pug. pl. min. cogn. 1. p. 43. S. bullàta, Schousb. ex Vahl. enum. 1. p. 265. This species differs from *S. praténsis* in the flowers being smaller. Habit of *S. clandestina*, but the leaves are very distinct. Corollas violaceous.

Clary-like Sage. Fl. July, Aug. Clt. 1804. Pl. 1 to 2 feet.

77 S. nubicau'lis (Vahl, enum. 1. p. 266.) stems erect, nearly naked, clothed with hoary villi; leaves all radical, or nearly so, petiolate, oblong-linear, or lanceolate, acute, erosely toothed, somewhat cordate at the base, bullately wrinkled, glabrous above, canescent and sub-villous beneath; floral leaves ovate-roundish, shorter than the calyxes, a little reflexed, permanent; racemes simple, or branched; whorls 6-flowered, distant; calyxes nearly sessile, campanulate, striated, clothed with clammy villi; corolla about twice as long as the calyx. ♃. H. Native of Arabia. S. Abyssinica, Lin. fil. suppl. p. 88.? but not of other authors. S. Merjàmie, Forsk. fl. arab. p. 10. Nearly allied to *S. bullàta*, but differs in the narrower, more wrinkled, erosely toothed leaves.

Naked-stemmed Sage. Pl. 1 to 2 feet.?

78 S. verbena'ca (Lin. spec. p. 35.) stem erect, pubescent, or villous; leaves broad-ovate, or oblong, crenated, wrinkled, glabrous: lower ones on long petioles, narrowed at the base: superior ones broader, sessile, cordate at the base; floral leaves ovate-roundish, acuminated, villous, permanent, rather shorter than the calyxes, reflexed after florescence; racemes elongated, simple, or a little branched; whorls remote, about 6-flowered; calyx ovate, hairy; corolla one-half longer than the calyx, the tube equalling the calyx. ♃. H. Native of North and middle Europe; as of Britain, North of France, Sweden, Denmark, Germany, Italy, European Russia, about Constantinople, Tauria, and Caucasus, &c. Smith, engl. bot. t. 154. Curt. lond. 6. t. 1. S. Spielmánni, Willd. enum. p. 38. but not of Scop. S. Spielmanniàna, Bieb. fl. cauc. 1. p. 21. S. Illyrica, Schultes, obs. bot. 8. S. micrántha, Desf. cat. hort. par. but not of Vahl. S. horminoides, Pourr. act. toul. 3. p. 327. S. Byzantìna, and S. heterophylla, Hortul. Horminum verbenàceum, Mill. dict. no. 1. Mor. hist. sect. 11. t. 14. f. 33. Leaves 3-4 inches long, 1-2 broad. Corollas blue, rarely white, size of those of *S. Horminum*. The herb and flowers prove very aromatic when rubbed. The seeds produce a great quantity of mucilage when moistened, whence they become serviceable for removing extraneous matter from the eyes. If put under the eye-lashes for a few moments the tears dissolve their mucilage, which envelopes any sand or dust, and brings it out. Hence some old authors has called the plant *Oculus christi*, and others of our own country have derived our English name *Clary* from the same circumstance.

Var. β, oblongifòlia (Benth. lab. p. 240.) leaves oblong, crenated, hardly cut. ♃. H. Cultivated in gardens. S. oblongàta, Vahl, enum. 1. p. 256. S. betonicæfòlia, Lam. ill. 1. p. 70. but not of Ettling.

Var. γ, ? incìsa (Benth. l. c.) leaves broad-ovate, cut: lobes ovate, acute, approximate. ♃. H. Native of France, about Toulouse. This is probably a variety of *S. clandestina*.

Vervain Sage, or Clary. Fl. June, Oct. Britain. Pl. 1 to 2 feet.

79 S. clandesti'na (Lin. spec. p. 36. but not of his herb.) stem herbaceous, erect, pubescent, or villous; leaves ovate-oblong, deeply toothed, or pinnatifid, wrinkled, glabrous: lower ones petiolate, narrowed at the base, truncate, or sub-cordate; floral leaves ovate-roundish, acuminated, villous, permanent; racemes simple, or a little branched; lower whorls remote: upper ones approximate, about 6-flowered; calyx ovate, hairy; corolla twice as long as the calyx. ♃. H. Native of the South of Europe, and North of Africa; and Madeira, in dry places, and by way sides; Spain, Portugal, South of France, Sardinia, Dalmatia, Syria, Caucasus, &c. S. verbenàca, Vahl, enum. 1. p. 255. Rchb. icon. bot. 6. p. 17. t. 523. S. verbenacioìdes, Brot. fl. lus. 1. p. 17. S. polymórpha, Hoffm. et Link, fl. port. 1. p. 149. t. 19. Rchb. icon. bot. 6. p. 18. t. 524. f. 719. S. acutàta, Link, et Brot. phyt. lus. p. 116. S. obtusàta, Link, et Brot. l. c. S. parviflòra, Link, et Brot. l. c. but not of Vahl. S. clandestinoìdes, Link, jahrb. 3. p. 169. S. præcox, Savi, fl. pis. 1. p. 22. Lois. not. 6. but not of Vahl. S. pallidiflòra, St. Amans. fl. agen. 10. S. collìna, Lowe, prim. fl. mad. p. 19. S. variàbilis, var. Lois. fl. gall. ed. 2d. vol. 1. p. 16. S. oblongàta, Rchb. icon. bot. 6. p. 16. t. 521. but not of Vahl. S. micrántha, Desf. cat. hort. par. ex Rchb. l. c. but not of Vahl. S. Viviàni, Spreng. in Sieb. pl. apul. et calab. ex Rchb. l. c. Corollas pale blue or pale purple. This is a very variable plant, very nearly allied to *S. verbenàca*, but is always much smaller, with the leaves crowded at the bottom of the stem, narrower, and more deeply cut.

Var. β, multìfida (Benth. lab. p. 241.) leaves deeply pinnatifid, with ovate-oblong lobes. ♃. H. S. multìfida, Sibth. et Smith, fl. græc. 1. p. 17. t. 23. Rchb. icon. bot. 6. p. 18. t. 524. f. 720. S. clandestìna, Vahl, enum. 1. p. 256. Rchb. icon. bot. 6. p. 18. t. 525. S. laciniàta, Willd. enum. suppl. p. 2. , S. crìsa, Desf. cat. hort. par. p. 68. Poir. suppl. 5. p. 49. S. ceratophylloìdes, Willd. enum. 1. p. 297. ex Rchb. l. c. but not of Lin.—Horminum, &c. Barrel. icon. 24. t. 200.

Clandestine Sage. Fl. May, Aug. Clt. 1739. Pl. ½ to 1 foot.

80 S. contravérsa (Tenore, syll. fl. nap. p. 18.) stem pubescent, or villous; leaves oblong, deeply pinnatifid, with *oblong-linear, very blunt, deeply crenated lobes*, bullately wrinkled, rather pilose on both surfaces, with revolute margins; lower leaves petiolate: superior ones sessile: floral leaves roundish, acuminated, villous, *scarcely shorter than the calyxes*; racemes branched; whorls 6-10-flowered: lower ones remote; *superior ones approximate*; *calyx ovate, clothed with long* hairs; corolla shorter than the calyx, or a half longer. ♃. H. Native of the region of the Mediterranean; as of Spain, Calabria, *Cyprus, Syria; Egypt, in the Great* Syrtus; also of the Cape of Good Hope. S. clandestìna, Lin herb. but not of his spec. p. 36. Sibth. et Smith, fl. græc. 1. p. 18. t. 24. S. lanìgera, Poir. suppl. 5. p. 48. Habit of *S. clandestìna*, but more humble and more branched: the leaves more deeply cut, lobed almost to the midrib. Corolla pale purple.

Var. β, grandiflòra (Benth. lab. p. 719.) corolla more than twice as long as the calyx. ♃. H. Native near Jaffa, in the sand by the sea-side, *Bové*.

Twisted Sage. Pl. ½ to ¾ foot.

81 S.? desérti (Decaisne, in ann. sc. nat. par. 1834. 2. p. 248.) plant suffruticose, hoary; branches divaricate, pubescent; leaves small, few, oblong, petiolate, crenated, bullately wrinkled, with reflexed margins, clothed with hoary pubescence; floral leaves small: uppermost ones very small; whorls 2-6-flowered, distant; calyx ovate-campanulate, beset with very long hairs: teeth all nearly equal, or the upper one is smaller. ♄. G. Native of the desert of Sinai, Bové. Habit of *S. contravérsa* and *S. Ægyptiaca*.

Desert Sage. Shrub.

82 S. Núbia (Ait. hort. kew. ed. 1st. vol. 1. p. 42. but not of other authors.) stem erect, villous, canescent; lower leaves on long petioles: superior ones sessile, or cordately stem-clasping, all oblong-ovate, or lanceolate, obtuse, or acuminated, irregularly crenated, or erose, cordate at the base, much wrinkled, clothed with fine pubescence above, and hoary tomentum beneath, or rather woolly; racemes very villous, dense, branched; whorls 6-flowered, approximate; calyx ovate, clothed with soft, hair-like wool; corolla about twice as long as the calyx. ♃. H. Native of Abyssinia. Habit of *S. verbenàca*. Leaves almost like those of *S. sylvéstris*. Racemes like those of *S. contravérsa*, but more branched, and more dense, and the stem is taller.

Nubian Sage. Fl. June, July. Clt. 1784. Pl. 2 to 3 feet.?

† *Doubtful species, probably belonging to the present section.*

83 S. Barrelie'ri (Ettling, salv. p. 46. ex Vahl, enum. 1. p. 269.) stem erect, leafy; leaves petiolate, hairy, lustately 7-lobed: middle lobe lanceolate, acute, all unequally serrated; bracteas small, ovate, ciliated, acute; whorls 6-flowered; calyx villous, 5-toothed. ♃. H. Native of Spain.

Barrelier's Sage. Pl. 1 to 2 feet.

84 S. parviflòra (Vahl, enum. 1. p. 268. Labill. pl. syr. var. dec. 4. p. 13. t. 7.) stems erect, hoary; leaves cordate, oblong, veiny, wrinkled, greenish grey, crenated, villous beneath: upper ones sessile; flowers pedicellate; whorls 2-6-flowered; bracteas cordate, ovate, acute, hardly the length of the calyxes; calyx tomentose, rather hoary, one-half shorter than the corolla; stamens inclosed. ♃. H. Native of Syria, near Damascus, and on the mount called Dgebel-cher. Corollas rather tomentose, yellowish. Nearly allied to *S. Núbia*.

Small-flowered Sage. Pl. 1½ foot.

Sect. VII. Micro'sphace (from μικρος, *mikros*, small; and σφακος, *sphakos*, *sage*; *in allusion to the small corollas.*) Benth. lab. p. 244. Calyx ovate: upper lip entire. Corolla small; tube inclosed, without any ring of hairs inside; lips very short; upper lip erect: lateral lobes of lower lip spreading. Connective deflexed behind, linear, combined longitudinally. Lower lobe of style flattened, dilated, rounded.—Procumbent, American herbs.

85 S. occidenta'lis (Swartz, fl. ind. occ. 1. p. 28.) diffuse, procumbent, glabrous, or pubescent; leaves petiolate, broad-ovate, acute, serrated, rounded at the base, or cuneated, glabrous or hispid; floral leaves sessile, hardly longer than the pedicels, ovate-lanceolate, acute, permanent; racemes elongated, branched a little at the base; whorls 2-6-flowered, remote; flowers minute; calyx tubular, clothed with glandular villi; teeth of lower lip obtuse; corolla a half longer than the calyx. ♃. S. Native of Tropical America, in waste fields; Mexico, Jamaica, St. Domingo, Cuba, Martinico, Trinidad, Antigua, Peru, in the valley of Lima, and elsewhere on the same coast. S. procumbens, Ruiz. et Pav. fl. per. 1. p. 27. t. 30. f. a. S. radicans, Poir. suppl. 6. p. 621. Hyptis glandulòsa, Sieb. fl. mart. exsic. no. 151. Verbena minima chamædryos folio, Sloane, jam. 1. p. 172. t. 107. Stems numerous, tetragonal. Leaves 1 to 1½ inches long. Racemes like those of *Verbèna officinàlis*. Corolla blue, glabrous.

Western Sage. Pl. procumbent.

86 S. mise'lla (H. B. et Kunth, nov. gen. amer. 2. p. 290.) herbaceous; stems pilose; leaves roundish rhomboid, acute, rather cuneated at the base, crenated, glabrous; whorls generally 6-flowered, remote; calyx beset with glandular hairs. ♃. S. Native of New Spain, in most places between Acapulco and La Venta del Exido. Stem branched, diffuse; branches ascending. Leaves on short petioles, 2-4 lines long. Racemes filiform. Bracteas roundish-ovate, hairy, acuminated, deciduous, shorter than the calyxes. Corolla violet.? This species hardly differs from *S. occidentàlis*.

Pitiful Sage. Pl. ½ to 1 foot.

Sect. VIII. Calo'sphace (from καλος, *kalos*, beautiful; and σφακος, *spakos*, sage; many of the species contained in this section are showy.) Benth. in Hook. bot. misc. 3. p. 374. lab. p. 245. Calyx ovate, tubular, or campanulate: upper lip entire, or shortly tridentate. Tube of corolla exserted, or inclosed, without any ring of hairs inside, but sometimes furnished near the base with two teeth: upper lip of corolla straight, concave, entire, or usually a little emarginate; lobes of lower lip spreading. Connective deflexed behind, linear, longitudinally connate. Lower lobe of style subulate.—Herbs, undershrubs, or shrubs, variable in habit, but readily distinguished from the other sections. Leaves entire, serrated, crenated, rarely quite entire.

§ 1. Micra'nthæ (μικρος, *mikros*, small; and ανθος, *anthos*, a flower; flowers small.) Benth. lab. p. 245. *Corolla hardly 3 lines long, half as long again, rarely almost twice as long as the calyx, with an inclosed tube; lower lip almost twice as long as the upper, which is erect.—Herbs, with blue inconspicuous corollas.*

87 S. obscu'ra (Benth. lab. p. 245.) herbaceous, diffuse; leaves petiolate, ovate, acute, serrated, narrowly cuneated at the base, glabrous or hispid above, green on both surfaces; floral leaves permanent, sessile, ovate, acuminated, shorter than the calyxes; racemes elongated, simple; whorls 2-6-flowered, remote; flowers minute; calyx tubular, clothed with rather glandular villi, increasing in the fructiferous state: upper lip entire, and the teeth of the lower lip shortly and subulately acuminated; corolla a half longer than the calyx; lobes of style subulate. ♃.? S. Native of Jamaica. *Very nearly allied to S.*

occidentalis; but differs in the lobes of the calyx being subulately-acuminated; in the lobes of the style being acute and subulate, not roundish and flattened.

Obscure Sage. Pl ½ to 1 foot.?

88 S. RIPA'RIA (H. B. et Kunth, nov. gen. amer. 2. p. 306.) stem herbaceous, *erect, branched, pubescent*; leaves *ovate-oblong*, acute, cordate, serrated, pilosely pubescent on both surfaces; whorls many-flowered, rather remote; calyx subcampanulate, *striated, beset with glandular hairs, having the upper lip* cricuspidate, and the lower one bifid, the segments acuminately subulate; corolla a little longer than the calyx. ♃.? S. Native of Peru, between Guancabamba and Paramo de Guamani, Humb. et Bonpl.; on the banks of the river Chulucana. Herb canescent, sweet-scented. Leaves on short petioles, an inch long. Racemes 3-4 inches long. Bracteas roundish-ovate, acute, hardly longer than the pedicels, which are pilose. Corollas bluish.

River-side Sage. Pl.?

89 S. TENUI'LLA (Swartz, *fl.* ind. 1. p. 45. t. 2.) stems herbaceous, small, procumbent; branches ascending, pubescent, leaves petiolate, broad-ovate, roundish, obtuse, crenated, cordate at the base, clothed with adpressed pubescence above, but glabrous beneath; floral leaves lanceolate, minute, permanent; racemes short; whorls about 6-flowered; flowers minute; calyx tubular, clothed with glandular villi, having the upper lip entire, and the teeth of the lower lip very short and bluntish; corolla exceeding the calyx a very little: upper lip short, truncate; lobes of style subulate. ♃.? S. Native of Jamaica. Habit of *Verónica agréstis*. Corollas blue.

Slender Sage. Pl. procumbent.

90 S. MICRA'NTHA (Vahl, enum. 1. p. 235.) stems herbaceous, erect, glabrous or pubescent; leaves petiolate, broad-ovate, obtuse, irregularly crenated, a little curled, truncate at the base or cordate, nearly glabrous; floral leaves lanceolate, shorter than the pedicels; racemes simple; whorls 6-10-flowered; flowers minute; calyx tubular, clothed with glandular villi, having the upper lip quite entire, and the teeth of the lower lip obtuse; corolla a half longer than the calyx: upper lip short, truncate; lobes of style subulate. ☉. S. Native of Mexico, and near the Havana, in Cuba. S. bullàta, Ort. dec. 9. p. 109. Jacq. hort. schœnbr. 4. p. 41. t. 481. S. serótina, Vahl, enum. 1. p. 232. but not of Lin. S. foliis cordato-ovatis, &c. Ard. spec. 1. p. 10. t. 2. Leaves small. Corollas blue.

Small-flowered Sage. Fl. May, June. Clt. 1823. Pl. ½ foot.

91 S. SERÓTINA (Lin. mant. p. 25.) stems herbaceous, pubescent or villous; leaves petiolate, ovate, obtuse, crenated, truncate at the base, somewhat cordate, wrinkled, villous above, and clothed with soft woolly pubescence beneath; floral leaves lanceolate, shorter than the pedicels; racemes simple; whorls about 6-flowered; flowers minute; calyx tubular, clothed with glandular villi, having the upper lip almost entire, and the teeth of lower lip acutish; corolla exceeding the calyx a little: upper lip short, truncate; lobes of style subulate. ♃.? S. Native of the Bahama Islands, Trinidad, Santa Cruz, Jamaica, &c. Jacq. icon. rar. 1. p. 1. t. 3. S. Dominica, Vahl, enum. 1. p. 233. Swartz, obs. p. 18. t. 1. f. 1. but not of Lin. Allied to *S. micrántha*, but smaller. Racemes loose, more branched and more villous. Leaves villous. Corollas smaller, dirty white or bluish.

Late Sage. Fl. Aug. Clt. 1808. Pl. 1½ foot.

92 S. HU'MILIS (Benth. lab. p. 246.) stem herbaceous, erect, branched, beset with spreading hairs; leaves petiolate, broad-ovate, acutish, crenated, rounded at the base or cordate, green on both sides, and finely pubescent; upper floral leaves membranous, lanceolate, deciduous; racemes simple; whorls 2-4-flowered, loose, remote; lower flowers in the axils of the cauline leaves; calyx tubularly campanulate, villous, with the upper lip entire, and the teeth of the lower one acute, increased very much in the fructiferous state. ♃.? S. Native of Mexico, Karwinski. Habit and leaves of *S. serótina*; but differs in the whorls being *usually 2-flowered*, and in the lower whorls being axillary, but particularly in the increased fructiferous calyx.

Humble Sage. Pl. ½ foot.?

93 S. INCONSPI'CUA (*Benth. lab. p. 247.*) *stems procumbent?* villous; leaves on short petioles, ovate-lanceolate, obtuse, crenated, cordate at the base, wrinkled, clothed with rufous tomentum beneath; floral leaves deciduous; racemes a little branched; whorls 4-6-flowered, loose; flowers small; calyx tubular, striated, clothed with rather glandular villi, with the upper lip entire, and the teeth of the lower lip obtuse. ♃.? S. Native of Mexico, Hænke. This species differs from *S. micrántha*, in the leaves being wrinkled and tomentose beneath. Stems elongated, branched. Leaves 1 to 1½ inch long: superior ones sessile. Calyx of *S. serótina*, but stiffer, and the teeth more obtuse.

Inconspicuous Sage. Pl. procumbent.?

94 S. TILLEFÒLIA (Vahl, symb. 3. p. 7.) stem herbaceous, erect, almost glabrous or finely pubescent; leaves broad-ovate, crenated, truncate or nearly cordate at the base, softly wrinkled and pubescent from a few hairs on both surfaces: floral leaves membranous, lanceolate, deciduous; racemes simple; whorls loose, approximate, 6-10-flowered; calyx tubular, with ciliated nerves, having the upper lip entire, and the teeth of the lower lip ovate-lanceolate, acute; corolla hardly exceeding the calyx, with short erectish lips: lobes of style nearly equal, subulate. ♃. S. Native of Caracccas, and the Andes of New Spain, near the town of Pazcuara; Mexico, at Jalapa, &c. Jacq. hort. schœnbr. 3. p. 2. t. 254. S. fimbriàta, H. B. et Kunth, nov. gen. amer. 2. p. 299. t. 149.? Leaves with the petioles 1 to 1½ inch long. Corollas blue, variegated with white.

Lime-tree-leaved Sage. Fl. June, Aug. Clt. 1793. Pl. 3 to 4 feet.

95 S. PALÆFÒLIA (H. B. et Kunth, l. c. p. 303. t. 157.) stem suffruticose, erect, and is, as well as the branches, pilose; leaves cordate-sagittate, rounded at top, crenated, hairy on both surfaces, canescent beneath; spikes paniculed; whorls 2-flowered, crowded; calyx clothed with glandular hairs, campanulate, striated, having the upper lip bluntish, and the teeth of the lower lip acuminated; tube of corolla exceeding the calyx a little: upper lip pubescent: middle segment of the lower lip emarginately 2-lobed; genitals exserted. ♄. S. Native of New Granada, between Popayan and Palace. Leaves petiolate, 2 inches long. Pedicels clothed with glandular pili. Flowers size of those of *Thymus serpyllum*. Corollas blue.

Chaff-leaved Sage. Shrub.

96 S. FLEXUÒSA (Presl, mss. ex Benth. lab. p. 248.) stem diffuse, twisted, glabrous; leaves petiolate, ovate, acute, serrately crenated, roundly cuneated at the base, glabrous; floral leaves membranous, lanceolate, deciduous; racemes simple; whorls 6-10-flowered; flowers minute; calyx tubular, glabrous or ciliated on the nerves, with an entire upper lip, and the teeth of the lower lip acutish; corolla hardly exceeding the calyx. ♃. S. Native of Mexico, Hænke. Allied to *S. tiliæfólia*, but differs in the diffuse, twisted, glabrous stem. Leaves glabrous or minutely ciliated on the nerves and margins, not truncate nor cordate at the base. Racemes 2-6 inches long.

Twisted-stemmed Sage. Pl. diffuse.

97 S. LANCEOLA'TA (Willd. enum. 1. p. 37.) stem herbaceous, ascending, branched, glabrous; leaves petiolate, lanceolate-linear, bluntish or acuminated, narrowed at the base, pubescent, hoary *while young*; *floral leaves lanceolate-subulate, shorter than the*

calyxes; racemes simple; whorls generally 2-flowered, all remote; calyx tubular, striated, glabrous, having the upper lip entire, and the teeth of the lower lip lanceolate, acute; corolla exceeding the calyx a little: upper lip straight. ⊙. *H.* Native of Mexico, Moçino et Sesse; in the valley of Guanaxuato, Humb. et Bonpl.; at the river Missouri, Clarke and Lewis. Jacq. fil. eclog. 1. p. 13. t. 13. S. lanceæfòlia, Poir. suppl. 5. p. 49. S. reflèxa, Horn. hort. hafn. 1. p. 34. S. aspidophýlla, Roem. et Schultes, syst. mant. 1. p. 206. S. trichostemmoides, Pursh, fl. amer. sept. 1. p. 19. Stem glabrous, or clothed with hoary pubescence at top. Leaves 1½ to 2 inches long, obscurely and bluntly serrated. Whorls 2-4-flowered. Corollas blue.

Lanceolate-leaved Sage. Fl. June, Sept. Clt. 1818. Pl. 1 foot.

98 S. leptophýlla (Benth. lab. p. 249.) stem herbaceous, ascending, branched, glabrous; leaves nearly sessile, narrow-linear, acute, quite entire, glabrous: floral leaves deciduous; racemes simple; whorls remote, generally 2-flowered; calyx tubular, striated, glabrous, with the upper lip entire, and the teeth of the lower lip acute; corolla about twice as long as the calyx: tube inclosed; style bifariously bearded. ⊙.? *H.* Native of Mexico. Nearly allied to *S. lanceolàta*; but differs in the leaves being narrower, quite glabrous, and in the flowers being larger; and from *S. angustifòlia*, in the stem being glabrous, and in the flowers being much smaller.

Slender-leaved Sage. Pl. 1 foot.

§ 2. Brachya'ntha (from βραχυς, *brachys*, short; and ανθος, *anthos*, a flower; in allusion to the shortness of the flowers.) Benth. lab. p. 249. *Floral leaves bractea-formed, deciduous. Calyx glabrous, villous, or clothed with hoary tomentum. Corolla 4 lines long, or longer: tube inclosed, or hardly a half again as long as the calyx: lower lip generally longer than the upper one, flat, with rounded lobes: the middle lobe very large. Flowers blue, rarely white or pale red, never scarlet nor yellow.*

* Angustifòliæ. *Leaves linear or lanceolate, very narrow at the base, or cuneated, usually petiolate.*

99 S. angustifòlia (Cav. icon. 4. p. 9. t. 317.) stems herbaceous, erect, glabrous, or beset with spreading hairs; leaves nearly sessile, oblong-linear, narrowed at both ends, quite entire or serrated, glabrous; floral leaves bractea-formed, linear-lanceolate, deciduous; racemes elongated, simple; whorls all distant, 2-6-flowered; calyx tubular, striated, hispid, with the upper lip entire, and the teeth of the lower lip ovate, acute; corolla twice as long as the calyx: tube equalling the calyx: middle lobe of lower lip emarginately bifid; style bifariously bearded. ¥. S. Native of Mexico, in bushy places near Totonilco el Grande and Tlalpuxahua. Lindl. bot. reg. t. 1554. S. réptans, Jacq. hort. schœnbr. 3. p. 38. t. 319. S. virgàta, Ort. dec. 3. Stems numerous, twiggy, a little branched, leafy at the base, bluntly tetragonal. Leaves 1½ inch long. Calyx usually bluish. Corolla azure blue. Upper lobe of style very long, subulate.

Narrow-leaved Sage. Fl. June, July. Clt. 1806. Pl. 1 to 1½ foot.

100 S. pa'tula (Benth. lab. p. 250.) stem herbaceous, procumbent, glabrous; branches ascending, canescent; leaves petiolate, ovate-lanceolate or linear, acuminated, narrowed at the base, clothed with hoary tomentum while young, but at length glabrous: floral leaves ovate at the base, but with a long linear acumen at apex, deciduous; racemes simple, elongated; whorls remote, about 6-flowered; calyx nearly sessile, tubular, striated, clothed with hoary tomentum, with the upper lip entire, and the teeth of the lower lip ovate, acute: corolla about twice as long as the calyx, downy outside; tube ventricose, equalling the calyx; style pubescent beneath. ¥.? S. Native of the south of Brazil, Sello; at Buenos Ayres, Parker. S. canéscens, Benth. mss. but not of Meyer. Habit of *S. lanceolàta*; but the stems are more procumbent and elongated; the branches canescent; the leaves more acute. Flowers size of those of *Stachys lanata*.

Pale Sage. Pl. procumbent.

101 S. azu'rea (Lam. diar. hist. nat. 1. p. 409.) stem herbaceous, erect, glabrous; leaves petiolate, oblong-lanceolate or linear, bluntish, narrowed a long way at the base, subserrated, green on both surfaces, and glabrous; floral leaves lanceolate-linear, deciduous; racemes simple, elongated; whorls distant, generally 6-flowered; calyxes nearly sessile, tubular, striated, nearly glabrous, with the upper lip entire, and the teeth of the lower lip broad, acutish; corolla more than twice as long as the calyx, pubescent outside: tube ventricose, a half again as long as the calyx; style bifariously bearded. ¥.? *H.* Native of the southern states of North America, as of Carolina, Upper Georgia, Eastern Florida, Jacksonville, Alabama, Arkansas, &c. Sims, bot. mag. t. 1728. S. Mexicàna, Walt. fl. car. p. 65. but not of Lin. S. elàta, Poir. dict. 6. p. 625. S. angustifòlia, Michx. fl. bor. amer. 1. p. 13. but not of Cav. S. acuminàta, Vent. hort. cels. 50. t. 50. S. acuminàta, Pers. ench. 1. p. 24. S. longifòlia, Nutt. in amer. phil. trans. n. s. 5. p. 185. Herb tall, green or bluish. Leaves 2-3 inches long, stiffish, entire or few-toothed. Whorls subsecund. Calyx pubescent, green or bluish. Corolla blue, downy outside.

Azure-blue-flowered Sage. Fl. Aug. Clt. 1806. Pl. 4 to 6 feet.

102 S. Pitche'ri (Torrey, mss. ex Benth. lab. p. 251.) stem herbaceous, erect, tomentose, pubescent; leaves petiolate, oblong-lanceolate, or linear, acute, somewhat serrated, narrowed a long way at the base, clothed with soft tomentum on both surfaces; floral leaves lanceolate-linear, deciduous; racemes simple, elongated; whorls distant, 6-15-flowered; calyxes nearly sessile, tubular, striated, villous, with the upper lip entire, and the teeth of the lower lip broad, obtuse; corolla more than twice as long as the calyx, pubescent outside; tube ventricose, a half again as long as the calyx; style bearded. ¥. *H.* Native of North America, at the Red River, Pitcher. Habit of *S. azùrea*, but the whole plant is pubescent and canescent, the flowers more numerous, and the calyx larger, and the teeth blunter.

Pitcher's Sage. Pl. 3 to 4 feet.?

103 S. læ'vis (Benth. lab. p. 251.) stem herbaceous, erect, glabrous; leaves petiolate, oblong-lanceolate, narrowed a long way at the base, remotely serrated, glabrous; floral leaves membranous, broad roundish, ciliated, obtuse, deciduous; racemes simple, on long peduncles; whorls 6-10-flowered: lower ones remote: upper ones approximate; calyxes pedicellate, campanulate, ciliated, with the upper lip almost entire, and the teeth of the lower lip lanceolate, cuspidate; corolla thrice as long as the calyx: tube exserted, ventricose; upper lip glabrous. ¥.? G. Native of Mexico. Stem nearly terete, striated, with yellow and green lines. Corollas pale blue. Genitals inclosed. Allied to *S. aliginòsa*. Style furnished with a long beard at top.

Smooth Sage. Pl.?

104 S. villòsa (Benth. lab. p. 251.) stem herbaceous, erect, glabrous, or villous; leaves petiolate, oblong-lanceolate, acute, serrated, narrowed at the base, glabrous, or pubescent; floral leaves membranous, broad-ovate, acuminated, deciduous; racemes dense, on long peduncles, a little branched; whorls many-flowered; calyx campanulate, with the upper lip almost

entire, and the teeth of the lower one acuminated; corolla twice as long as the calyx: tube almost inclosed, ventricose: upper lip pubescent; style shortly bearded at top. ♃. S. Native of Brazil, in the province of Rio Grande; and in bogs in the missions of the Uruguay, Buenos Ayres, &c. Stems glandular. Leaves 2-4 inches long. Whorls 10-20-flowered. Corollas blue, or white.

Var. β, *rufescens* (Benth. lab. p. 252.) stem and lower surfaces of the leaves clothed with rufous pubescence. ♃. S. Native by way-sides from Rio Janeiro to the Mines.

Bog Sage. Pl. 2 to 4 feet.

105 S. lavandulóides (H. B. et Kunth, nov. gen. 2. p. 287.) stem herbaceous; branches erect, clothed with hoary pubescence; leaves on short petioles, oblong-lanceolate, acute, cuneated at the base, crenated, clothed with hoary pubescence, white beneath: floral leaves ovate, long, and subulately acuminated, deciduous; spikes simple; whorls approximate, equal, about 10-flowered; calyx tubularly-campanulate, clothed with hoary pubescence, having the upper lip entire, and the teeth of the lower lip ovate, and shortly mucronate; corolla half as long again as the calyx: tube inclosed, nearly equal; style inclosed, shortly bearded. ♃. S. Native of New Spain, Moçino et Sesse; near Pazcuaro, on the shores of lakes, Humb. et Bonpl. S. lavandulæfólia, Spreng. syst. 1. p. 58. but not of Vahl. S. Humboldtiàna, Roem. et Schultes, syst. mant. 1. p. 188. Stems many, branched at the base. Leaves 1½ to 2 inches long. Calyx usually tipped with blue. Corollas small, pale blue.

Lavender-like Sage. Pl. 2 to 3 feet. ?

106 S. stachyoides (H. B. et Kunth, l. c. p. 287. t. 138.) stem herbaceous, almost simple, pubescent, as well as the leaves; leaves lanceolate, acute, crenately serrated; spikes oblong, on long peduncles; whorls approximate; calyx clothed with hoary villi, tubular, striated, having the upper lip entire and acute, and the teeth of the lower lip acuminated. ♃. H. Native of Mexico, in frigid places on the mountains near Los Joares and Santa Rosa de La Sierra. Leaves on short petioles, 2-3 inches long. Bracteas oblong, acuminately subulate, pubescent. Corolla probably blue. This hardly differs from *S. elongàta*.

Stachys-like Sage. Pl. 3 feet.

107 S. elongàta (H. B. et Kunth, l. c. p. 287. t. 139.) stem herbaceous, erect, almost simple, clothed with hoary pubescence; leaves on short petioles, oblong, acutish, narrowed at the base, crenately serrated, almost glabrous, or pubescent beneath: floral leaves ovate-lanceolate, hairy, equalling the calyxes; spikes oblong, on long peduncles; whorls many-flowered, closely approximate; calyx tubular, striated, pilose, having the upper lip entire, and the teeth of the lower lip acute; corolla twice as long as the calyx: tube hardly exserted, ventricose; style bearded. ♃. S. Native of New Spain, Moçino et Sesse; on the western declivities of the mountains between Ario and Agnasarco. S. simplex, Spreng. syst. 1. p. 58. S. betónica, Roem. et Schultes, mant. 1. p. 188. Stems many, leafy at the base, and almost naked at top. Leaves 1½ inch long, rather scabrous above, and glabrous beneath, or pubescent on the nerves. Spikes villous. Calyx coloured a little. Corolla violaceus, pubescent outside.

Elongated-peduncled Sage. Pl. 2 feet.

108 S. corunga'ta (Vahl, enum. 1. p. 252.) stem shrubby; branches clothed with rufous tomentum; leaves petiolate, oblong-lanceolate, obtuse, crenated, rounded at the base, much wrinkled, almost glabrous above, and clothed with rufous wool beneath: floral leaves deciduous; whorls usually 6-flowered, distant; calyx campanulate, almost glabrous, coloured, having the upper lip entire, and the teeth of the lower lip obtuse; corolla a little longer than the calyx: tube almost inclosed. ♄. S. Native of Peru. Leaves 2 inches long, approximate. Calyxes bluish. Corolla blue, hairy.

Wrinkled-leaved Sage. Shrub.

* * Ovatifólia. *Leaves petiolate, ovate-roundish, ovate, or ovate-lanceolate, rounded, truncate, or cuneated at the base, rarely almost sessile, and cuneated at the base.*

109 S. assu'rgens (H. B. et Kunth, nov. gen. amer. 2. p. 293.) stem herbaceous, a little branched, ascending, pubescent; leaves ovate-elliptic, acute at both ends, crenately serrated, nearly glabrous; whorls many-flowered: lower ones distant; calyx clothed with silky hairs, campanulate, having the upper lip ovate, obtuse, and mucronate, and the lower lip bifid, with obtuse, mucronate segments; tube of corolla ventricose, equalling the calyx. ♃. S. Native of Mexico, near Pazcuaro. Leaves almost glabrous on both surfaces, or pubescent on the veins beneath, 2 inches long. Calyx very pilose. Corolla pale violet. Stamens inclosed. Said to be nearly allied to *S. prunelloides*.

Assurgent Sage. Pl. 1 foot.

110 S. helianthemifólia (Benth. lab. p. 254.) stem herbaceous, erect; branches twiggy, pubescent; leaves on short petioles, oblong, acute, somewhat serrated, narrowed at the base, wrinkled, glabrous, or pubescent on both surfaces: floral leaves very minute; racemes simple; whorls 6-20-flowered, secund, remote, or the upper ones are approximate; calyx tubular, with pubescent nerves, having the upper lip entire, and the teeth of the lower lip acute; corolla about twice as long as the calyx: tube equal, inclosed: upper lip pubescent outside; style bearded. ♃. S. Native of Mexico, near Thalpuxahua. Leaves ½ to 1½ inches long. Corollas blue.

Var. β; flowers white, smaller. ♃. S. Native of Mexico, near San Martin, Graham.

Sun-Rose-leaved Sage. Pl. 1 to 1½ foot.

111 S. sideritoides (Presl, mss. ex Benth. lab. p. 255.) shrubby; branches erect, clothed with white tomentum; leaves on short petioles, oval, bluntish, serrately crenated, cuneated at the base, wrinkled, green above, and clothed with white tomentum beneath; racemes short; whorls about 6-flowered; calyx tubular, villous, having the upper lip entire, and the teeth of the lower lip acute. ♄. S. Native of Peru, at Huanuco, Hænke. This species differs from *S. spicàta* in the upper lip of calyx being entire, not tridentate.

Sideritis-like Sage. Shrub.

112 S. chamædryoides (Cav. icon. 2. p. 77. t. 197.) stem suffruticose, procumbent; branches clothed with hoary tomentum; leaves petiolate, ovate-oblong, obtuse, crenulated, narrowed or rounded at the base, wrinkled, clothed with hoary tomentum beneath: floral leaves broad-ovate, acuminated, longer than the calyxes, deciduous; racemes simple; whorls about 6-flowered; calyx tubular, striated, tomentose, the upper lip entire, and the teeth of the lower lip shortly cuspidate; corolla twice as long as the calyx, glabrous outside; tube hardly exserted, ventricose: middle lobe of lower lip large, bifid; style bearded at apex. ♄. S. Native of Mexico. Sims, bot. mag. t. 808. S. chamæ'drys, Willd. hort. berol. 1. p. 29. t. 29. S. chamædrifólia, Andr. bot. rep. 6. p. 416. An humble branched, canescent shrub. Leaves wrinkled similar to those of *S. officinàlis*, but smaller. Corollas blue. Genitals equalling the corolla.

Germander-like Sage. Fl. June, Sept. Clt. 1795. Shrub 1½ foot.

113 S. thymoides (Benth. lab. p. 255.) stem suffruticose, much-branched, canescent; leaves small, nearly sessile, oval, obtuse, quite entire, canescent, with sub-revolute edges; floral

leaves ovate, acuminated, deciduous; racemes short, few-flowered; whorls distinct, loosely 2-4-flowered; calyx ovate-tubular, striated, clothed with glandular pubescence, having the upper lip entire, and the teeth of the lower one bluntish; corolla twice as long as the calyx: tube ventricose, equal in length to the calyx: middle lobe of lower lip emarginate; style shortly bearded at apex. ♄. S. Native of New Spain, Moçino et Sesse. A much branched, humble, canescent shrub, with the habit of *Thýmus*, or *Gardòquia*. Corollas bluish.

Thyme-like Sage. Shrub dwarf.

114 S. GLECHOMÆFÒLIA (H. B. et Kunth, nov. gen. amer. 2. p. 290. t. 141.) stems herbaceous, nearly simple, rather pilose at top; leaves ovate-triangular, obtuse, somewhat cordately truncate at the base, crenated, almost glabrous, rather pilose while young; whorls about 5-flowered, remote; calyx hairy, campanulate, striated, having the upper lip tricuspidate, and the segments of the lower lip cuspidate; tube of corolla ventricose, a little shorter than the calyx: middle lobe of lower lip emarginately 2-lobed. ♃. S. Native of New Spain, between the city of Guanaxuato and Santa Rosa. Stems many, procumbent. Leaves petiolate, 6-9 lines long. Floral leaves ovate, acuminated, ciliated, length of flowers deciduous. Corollas blue.

Ground-Ivy-leaved Sage. Pl. procumbent.

115 S. NA'NA (H. B. et Kunth, l. c. p. 289.) plant herbaceous, stemless; leaves ovate, obtuse, narrowed at the base, crenated, hispid above, and clothed with hairy tomentum beneath; spikes ovate, pedunculate; whorls usually 4-flowered; calyx clothed with glandular hairs, the upper lip tridentate, and the lower lip bifid: teeth all subulate. ♃. S. Native of New Spain, in dry places near the mine of Valentiana, in the valley of Guanaxuato. Leaves radical, nearly sessile, an inch long. Corolla blue, ex Bonpl. Spikes radical. Leaves more wrinkled than in *S. prunelloides*.

Dwarf Sage. Pl. small.

116 S. PRUNELLOIDES (H. B. et Kunth, l. c. p. 289.? Benth. lab. p. 256.) stems herbaceous, nearly simple, erect, pilosely pubescent; leaves petiolate, ovate-oblong, obtuse, crenated, narrowed at the base, green on both surfaces, and nearly glabrous; floral leaves ovate, acuminated, deciduous; racemes simple, on long pedunculs; whorls remote, sub-secund: upper whorls approximate, 6-10-flowered; calyx campanulate, striated, clothed with silky hairs, having the upper lip shortly tridentate, and the teeth of the lower lip lanceolate, acute; corolla about 2 times longer than the calyx, pubescent outside: tube ventricose, equalling the calyx: middle lobe of lower lip emarginate; style bearded. ♃. S. Native of Mexico, among rocks on the burning mount Jorullo. Stems many, ascending. Calyxes bluish. Corolla blue.

Prunella-like Sage. Pl. 1 to 1½ foot.

117 S. ARENA'RIA (St. Hil. mss. ex Benth. lab. p. 257.) shrubby; branches glabrous; leaves petiolate, oblong, or lanceolate, acuminated, serrately crenated, cuneated, or narrowed at the base, green, and glabrous on both surfaces: floral leaves ovate, acuminated, deciduous; racemes short, simple; whorls 4-6-flowered, secund; calyx tubularly campanulate, striated, glabrous, smooth, with the upper lip entire, and the teeth of the lower lip ovate, acuminated; corolla about twice as long as the calyx, nearly glabrous outside: tube ventricose, a little exserted. ♄. S. Native of Brazil, in sandy places at the limits of the provinces of Minas Geraes and Rio Janeiro. Shrub much branched. Leaves 2-3 inches long. Style bifariously bearded.

Sand Sage. Shrub.

118 S. SERRA'TA (Benth. lab. p. 257.) stem herbaceous, erect, almost simple, and nearly glabrous; leaves petiolate, ovate, oblong, or lanceolate, acute, coarsely and irregularly serrated, cuneate at the base, or rounded, glabrous: floral leaves lanceolate-linear, shorter than the calyxes, reflexed, or deciduous; racemes elongated, simple; whorls all remote, 6-10-flowered; calyxes pedicellate, tubular, striated, pubescent, the upper lip entire, and the teeth of the lower lip acutish; corolla about 3 times as long as the calyx, pubescent outside: tube rather exserted, ventricose: middle lobe of lower lip large, emarginate; style bearded. ♃. S. Native of the South of Brazil. Habit of *S. uliginòsa*, but the inflorescence and flowers are very different. Corollas blue, almost an inch long.

Serrated-leaved Sage. Pl.?

119 S. URUGUAYE'NSIS (St. Hil. mss. ex Benth. lab. p. 257.) stem herbaceous, erect, nearly glabrous; leaves petiolate, ovate-lanceolate, or oblong, acute, serrately crenated, roundly cuneated at the base, nearly glabrous, green on both surfaces, or pale beneath; floral leaves ovate, acuminated, deciduous; racemes simple, elongated; whorls remote, 6-10-flowered; calyxes nearly sessile, tubular, striated, clothed with hoary villi, the upper lip entire, and the teeth of the lower lip ovate, acute; corolla about twice as long as the calyx, pubescent outside: tube ventricose, exceeding the calyx; style bearded below. ♃. S. Native of Brazil, on the banks of the Uruguay, in fields, at San Jozè; in the province of Rio Grande do Sul. Nearly allied to *S. pállida*, but the stems are erect, the leaves broader and less acuminated, and the flowers more numerous. It is probably only a variety of *S. pállida*.

Uruguay Sage. Pl. erect.

120 S. URTICÆFÒLIA (Lin. spec. p. 34.) plant herbaceous, erect, beset with rather glandular villi; leaves on short petioles, ovate-rhomboid, acutish, crenated, roundly subcordate at the base, cuneated at the petioles, nearly glabrous; floral leaves broad-ovate, deciduous; whorls many-flowered, remote; calyxes on short pedicels, campanulate, clothed with clammy villi, the upper lip entire, and the teeth of the lower lip ovate, acutish; corolla about twice as long as the calyx, pubescent outside: middle lobe of lower lip emarginately bifid; style bearded. ♃. H. Native of Carolina, Virginia, and Georgia. Pursh, fl. amer. sept. 1. p. 20.—Mor. hist. 3. p. 395. sect. 11. t. 13. f. 31.? Corollas blue, small.

Nettle-leaved Sage. Fl. June, July. Clt. 1799. Pl. 3 feet.

121 S. GRA'CILIS (Benth. lab. p. 258.) stem herbaceous? erect, almost glabrous; leaves on long petioles, ovate, acuminated, rounded at the base, serrated, pilosely pubescent on both surfaces; floral leaves ovate, acuminated, coloured, deciduous: racemes simple; whorls loose, 6-10-flowered: lower ones remote: upper ones approximate; calyxes on short pedicels, campanulate, striated, coloured, glabrous, having the upper lip entire, and the teeth of the lower lip setaceously acuminated; corolla twice as long as the calyx: tube ventricose, equalling the calyx: middle lobe of lower lip broad, emarginate; style bearded. ♃. S. Native of New Spain, Moçino and Sesse. Stems or branches simple, purplish. Leaves flaccid, 1½ inch long. Flowers small, flesh-coloured, size of those of *S. cárnea*. Allied to *S. cárnea*; but differs from it in the calyx being glabrous, and in the leaves not being cordate at the base.

Slender Sage. Pl.

122 S. LEPTÓSTACHYS (Benth. lab. p. 258.) stem herbaceous, erect, branched, clothed with hoary pubescence; leaves on long petioles, ovate-roundish, acute, truncate at the base, green, and finely pubescent on both surfaces; floral leaves ovate, subulately acuminated, deciduous; racemes simple, elongated; whorls at length all remote, about 6-flowered; calyx ovate-tubular, striated, hoary, having the upper lip entire, and the teeth of the lower lip acuminated; corolla twice as long as the calyx: tube rather ventricose, equalling the calyx; middle lobe of lower lip broad, emarginate; style glabrous. ♃. S. Na-

tive of New Spain, Moçino et Sesse. Leaves similar to those of *S. tiliæfòlia*, 1½ to 2 inches long: upper ones more sessile. Corollas blue.

Slender-spiked Sage. Pl. ?

123 S. membrana'cea (Benth. lab. p. 259.) stem herbaceous? erect, glabrous; leaves on long petioles, ample, broad-ovate, acute, crenated, rounded at the base or truncate, glabrous; floral leaves deciduous; racemes elongated, simple; whorls all remote, loose, about 10-flowered; calyxes pedicellate, nutant, campanulate, glabrous, the upper lip entire, and the teeth of the lower lip setaceously acuminated; corolla twice as long as the calyx: tube ventricose, equalling the calyx: middle lobe of lower lip large, emarginate; style bearded. ♃. S. Native of Mexico, Moçino et Sesse. Herb glabrous. Leaves 3-6 inches long, membranous, often purplish beneath. Calyxes often purplish. Corollas blue, size of those of *S. angustifòlia*.

Var. β, acuminàta (Benth. l. c.) leaves long-acuminated at both ends; corollas shorter. ♃. ? S. Native of Guayaquil, Tafalla.

Var. γ, villòsula (Benth. lab. p. 720.) leaves smaller, and are, as well as the younger calyxes, villous. ♃. G. Native of Mexico, about Oaxaca.

Membranaceous-leaved Sage. Pl. 2 to 3 feet.

124 S. rhombifòlia (Ruiz, et Pav. fl. per. 1. p. 26. t. 36. f. b.) stem herbaceous, erect, branched, pubescent; leaves petiolate, broad-ovate or rhomboid, subcordate at the base, pubescent; floral leaves ovate-lanceolate, deciduous; racemes simple, few-flowered; whorls about 6-flowered, remote; calyx ovate, pubescent, the upper lip entire, and the teeth of the lower lip ovate, acute; corolla a half again as long as the calyx: tube inclosed, ventricose: middle lobe of lower lip emarginate; style glabrous. ☉. S. Native of Peru, in the province of Canana, on the sandy hills of Lomas de Atiquipa and Pongo; plentiful about Chancay and near Lima; and also of Mexico. *S. foliòsa*, Benth. in bot. reg. t. 1429. *S. pilòsa*, Vahl, enum. 1. p. 240. Leaves 1½ to 2 inches long, coarsely crenated. Genitals exserted. Corollas blue.

Var. β, glàbrior (Benth. l. c.) calyxes more slender and glabrous. ☉. H. Native near Lima.

Rhomb-leaved Sage. Fl. Year. Clt. 1827. Pl. 1½ foot.

125 S. herba'cea (Benth. lab. p. 720.) stem herbaceous, erect, a little branched, villous; leaves on long petioles, broad-ovate or rhomboid, rather cordate at the base, pubescent; floral leaves ovate, deciduous; racemes simple; whorls about 6-flowered, distinct; calyx ovate-tubular, hairy, green, the upper lip and the teeth of the lower one ovate-dilated; corolla half as long again as the calyx: tube inclosed. ☉. H. Native of Mexico, at Tehuantepec, in Oaxaca. Nearly allied to the preceding, from which it differs in the stem and calyxes being more hairy, &c.

Herbaceous Sage. Pl. 1½ foot. ?

126 S. Tafa'llæ (Benth. lab. p. 260.) stem herbaceous, erect, branched, villous; leaves petiolate, ovate, crenated, rounded at the base or cuneated, rather hispid; floral leaves ovate, acute, at length deciduous; racemes simple; whorls 6-10-flowered, remote; calyx ovate, nerved, villous, the upper lip entire, and the teeth of the lower lip ovate, acute; corolla a half as long again as the calyx: tube inclosed, ventricose: middle lobe of lower lip emarginate; style glabrous. ☉. H. Native of Peru, at Tarma, Tafalla. Leaves hardly an inch long. Corollas small, blue.

Tafalla's Sage. Pl. 1½ foot. ?

127 S. viola'cea (Ruiz, et Pav. fl. per. 1. p. 26. t. 43.) stem herbaceous, hairy; leaves ovate, acute, crenated, wrinkled; spikes short, terminal; whorls 6-flowered; upper lip of corolla dependent. ☉. H. Native of Peru, in the province of Tarma. Flowers on short pedicels, propped by ovate, concave, opposite bracteas. Corolla bluish-violet, about 3 times as long as the calyx.

Violaceous-flowered Sage. Pl. 1 to 2 feet.

128 S. glandulife'ra (Cav. ann. hist. nat. 2. p. 8.) stem branched, beset with glandulíferous pili, as well as the branches, bracteas, and calyxes: leaves petiolate, serrated, villous; whorls 6-flowered; corolla hardly twice as long as the calyx. ☉. ? H. Native on Mount Chimboraco, Cav. Floral leaves short, acute. Calycine segments bluntish. Corolla purplish-violet. Stamens exserted.

Gland-bearing Sage. Pl. 1 to 3 feet.

129 S. Cruikshanksii (Benth. lab. p. 261.) stem herbaceous? erect, glabrous or pubescent; leaves on short petioles, ovate, obtuse, crenated, rounded at the base or subcordate, glabrous or pubescent beneath; floral leaves deciduous: racemes simple; whorls about 6-flowered, remote, somewhat secund; calyx tubularly campanulate, striated, pubescent, the upper lip entire, and the teeth of the lower lip ovate, acute; corolla thrice as long as the calyx: tube ventricose, inclosed: middle lobe of lower lip large, emarginate; style glabrous. ♃. ?. S. Native of Peru, in the valley of Canta, near Obrajillo, Cruikshanks; and at Huamantanga, Mathews. *S. rhombifòlia, β*, Hook. bot. misc. Stem naked at the base, and leafy in the middle. Leaves 1 to 1½ inch long. Calyxes sessile. Corollas blue, nearly glabrous.

Cruikshanks's Sage. Pl. 1 to 1½ foot.

130 S. gale'ta (Ruiz, et Pav. fl. per. 1. p. 27. t. 42. f. a.) stem shrubby, much branched, naked at bottom; leaves nearly sessile, oval or ovate, serrated, wrinkled, pubescent; spikes terminal, by threes; whorls 6-10-flowered, propped by ovate deciduous bracteas; calyx ventricose at top, the upper lip concave; corolla twice as long as the calyx. ♄. S. Native of Peru, around Muna, in arid places. Flowers on short pedicels. Corollas pale violet. Genitals inclosed.

Galeate-calyxed Sage. Shrub 3 feet.

131 S. mi'tis (Ruiz, et Pav. fl. per. 1. p. 27.) stem shrubby, branched; branches pubescent; leaves petiolate, ovate, acute, serrated, tomentose, hoary beneath; spikes terminal: middle one longer, and leafless; whorls many-flowered, secund; calyx pubescent, subcampanulate: the upper lip bifid and acute. ♄. S. Native of Peru, in the valley of Canta, at Obrajillo. Flowers pedicellate. Whorls 6-12-flowered. Floral leaves oval, acuminated, pubescent, deciduous. Corolla whitish blue, a little longer than the calyx, pubescent outside. Stamens length of corolla. Stigma exserted.

Mild Sage. Shrub 2 feet.

132 S. incurva'ta (Ruiz, et Pav. fl. per. 1. p. 24. t. 42. f. b.) stem herbaceous, erect, clothed with fine hoary tomentum; leaves petiolate, ovate, acute, serrated, rounded at the base or cordate, clothed with soft white tomentum beneath; floral leaves deciduous; racemes simple; whorls 4-6-flowered, remote; calyx tubularly campanulate, pubescent, the upper lip entire, and the teeth of the lower lip ovate, acuminated; corolla twice as long as the calyx: tube inclosed, ventricose; style glabrous. ♃. ? S. Native of Peru, around Muna. Leaves 2 inches long, approximate at the middle of the stem. Lips of fructiferous calyx incurved. Corolla purplish blue.

Incurved-calyxed Sage. Pl. 2 feet.

133 S. Hispa'nica (Lin. spec. 37.) stem herbaceous, erect, pubescent; leaves petiolate, ovate, acute, crenately serrated, narrowed or cuneated at the base, glabrous; floral leaves ovate, acuminated, ciliated, almost permanent; racemes dense, branched; whorls many-flowered, approximate; calyx inflately tubu-

lar, clothed with soft pubescence, the upper lip entire, and the teeth of the lower lip acute; corolla hardly exceeding the calyx: tube ventricose; style bearded. ☉. H. Native of tropical America; Quito, near Chillo; Jamaica, among the mountains; Mexico; State of New York; and now apparently naturalized in the south of Europe, as in Spain, Portugal, Piedmont, Liguria, &c. Ker. bot. reg. t. 359. S. tetragòna, Mœnch, meth. p. 373. S. prismática, Cav. descr. 14.—Arduin. spec. 1. p. 10. t. 2.—Lam. ill. t. 20. f. 2. Leaves 2-3 inches long. Whorls usually 10-flowered. Corolla glabrous outside, pale blue. Genitals equalling the corolla.

Spanish Sage. Fl. June, Aug. Clt. 1739. Pl. 1 to 2 feet.

134 S. angula'ta (Benth. lab. p. 721.) stem herbaceous, erect, hardly pubescent; leaves petiolate, broad, ovate, acuminated, serrated, roundly cuneated at the base, clothed with fine pubescence, scarcely canescent beneath; floral leaves ovate, acuminated, deciduous; racemes many-flowered, elongated, branched; whorls loose, secund; calyx tubularly campanulate, scarcely pubescent, the upper lip entire, and the teeth of the lower lip acute; corolla exceeding the calyx a little, upper lip pubescent; style bearded. ☉.? H. Native of Caracas, Vargas. Habit of *S. polystàchya*. Calyx often coloured, angular. Corolla small, blue.?

Angular-calyxed Sage. Pl. 1 to 2 feet.

135 S. densiflòra (Benth. lab. p. 721.) stem herbaceous, erect, hardly pubescent; leaves petiolate, ovate, obtuse, crenated, roundly truncate at the base, or subcordate, much wrinkled, pubescent on both surfaces, green, or hardly canescent beneath; floral leaves deciduous; racemes almost simple, spike-formed; whorls many-flowered, approximate; calyx tubular, nearly glabrous, having the upper lip entire, and the teeth of the lower lip ovate, obtuse; corolla half as long again as the calyx; genitals exserted; style glabrous. ☉. H. Native of the Island of Dominica. Allied to *S. polystàchya* and *S. Keèrlii*, but differs from both in the form of the calyx, small corolla, and exserted genitals.

Dense-flowered Sage. Pl. 1 to 2 feet.

136 S. polysta'chya (Ortega, dec. p. 55.) stem herbaceous, erect, clothed with hoary down; leaves petiolate, ovate, acuminated, serrated, rounded at the base or cordate, rather wrinkled above, and pubescent, nerved, and clothed with hoary pubescence beneath; floral leaves ovate, acuminated, deciduous; racemes dense, branched; whorls many-flowered, approximate, almost secund; calyx tubularly campanulate, pubescent or tomentosely villous, having the upper lip entire, and the teeth of the lower lip acute; corolla twice as long as the calyx: tube inclosed, ventricose; style bearded. ♃.? G. Native of Mexico, in many places; as among the mountains of Guanaxuato; shores of Lake Pazcuaro; near Tlalpuxahua, &c. Cav. icon. 1. p. 17. t. 27. bad. H. B. et Kunth, nov. gen. amer. 2. p. 296. S. cæ'sia, H. B. et Kunth. l. c. p. 295. S. lineatifòlia, Lag. gen. et spec. nov. 2. Stem nearly glabrous, but usually pubescent. Leaves 2-3 inches long. Whorls 15-20-flowered. Corolla blue. This species occurs in gardens, under the names of *S. spicàta*, *S. Breyniàna*, *S. eremitica*, and *S. tetragòna*.

Many-spiked Sage. Fl. Oct. Dec. Clt. 1822. Pl. 1 to 2 feet.

137 S. Kee'rlii (Benth. lab. p. 263.) stem shrubby? erect, pubescent; leaves petiolate, ovate, obtuse, crenated, roundly truncate or cordate at the base, much wrinkled, clothed with hoary tomentum on both surfaces; floral leaves ovate, deciduous; racemes dense, paniculately branched; whorls many-flowered, approximate; calyx tubularly campanulate, pilosely hairy, having the upper lip entire, and the teeth of the lower lip acute; corolla twice as long as the calyx: tube inclosed, ventricose: upper lip pubescent; style glabrous or bearded above. ♄.? S. Native of Mexico, near Tlalpuxahua, Keerl. Nearly allied to *S. polystàchya*; but the leaves are smaller, obtuse, and much wrinkled, and more cordate at the base; the racemes shorter and more dense; the calyxes hairy, not clothed with hoary tomentum.

Keerl's Sage. Shrub 1 to 3 feet.?

* * * *Leaves petiolate, more or less cordate at the base.*

138 S. semiatra'ta (Zucc. acad. wiss. 1. p. 298.) stem shrubby; branches tomentosely pubescent; leaves petiolate, ovate, obtuse, crenated, cordate at the base, much wrinkled, clothed with white tomentum beneath; floral leaves ovate, small, deciduous; racemes simple; whorls 4-8-flowered, distant; calyxes pedicellate, tubular, striated, clothed with glandular villi, the upper lip entire, and the teeth of the lower lip obtuse; corolla twice as long as the calyx, pubescent outside: tube ventricose, a little exserted; style bearded beneath. ♄. S. Native of Mexico, Karwinski. Said to be nearly allied to *S. scorodònia*; but differs in the calyxes being twice the size; in the pedicels being elongated; and in the lower lip of the corolla being shorter and of a more intense colour.

Half-dark-flowered Sage. Shrub.

139 S. fruticulòsa (Benth. lab. p. 721.) stem shrubby, humble, much branched; branches clothed with white tomentum; leaves petiolate, ovate, obtuse, crenated, roundly truncate or subcordate at the base, much wrinkled, hardly pubescent above, and clothed with white tomentum beneath; floral leaves ovate, acuminated, deciduous; racemes simple; whorls about 6-flowered, distant; calyxes nearly sessile, tubularly campanulate, clothed with white tomentum, having the upper lip entire, and the teeth of the lower lip obtuse and truncate; corolla about 3 times as long as the calyx: tube a little exserted; style shortly bearded. ♄. S. Native of Mexico, about Oaxaca, Andrieux. Allied to *S. scorodònia* and *S. brevifòra*, but differs from both in habit. Leaves ½ inch long.

Fruticulose Sage. Shrub ½ foot.

140 S. scorodònia (Poir. suppl. 5. p. 46.) stem shrubby; branches clothed with hoary tomentum; leaves petiolate, ovate or oblong, obtuse, crenulated, roundly cordate at the base, much wrinkled, pubescent above, pale, or clothed with white tomentum beneath; floral leaves ovate, acuminated, deciduous; racemes simple; whorls 6-20-flowered, distant; calyxes nearly sessile, tubularly campanulate, striated, clothed with glandular villi, having the upper lip entire, and the teeth of the lower one bluntish; corolla twice as long as the calyx, pubescent outside: tube a little exserted, ventricose; style glabrous. ♄. S. Native of Mexico. S. melissodòra, Lag. nov. gen. et spec. 3. S. hirta, Schranck, in syll. pl. soc. ratisb. 2. p. 60.? Leaves 1-2 inches long. Corollas blue, white at the base; middle lobe of lower lip large, emarginate.

Garlick Sage. Shrub.

141 S. amarissima (Ortega, dec. p. 4.) stem herbaceous, erect, branched, hispidly pilose; leaves petiolate, ovate-cordate, crenated, wrinkled, almost glabrous, canescent beneath; floral leaves ovate, acuminated, deciduous; racemes simple, dense-flowered; whorls distinct, rather remote, generally 10-flowered; calyx tubularly campanulate, striated, villous, having the upper lip entire, and the teeth of the lower lip acutish; corolla about 3 times as long as the calyx: tube ventricose, equalling the calyx: upper lip almost glabrous; style bearded above. ♃. G. Native of Mexico, in several places. Ker. bot. reg. t. 347. S. nepetoïdes, H. B. et Kunth, nov. gen. 2. p. 299. t. 150. S amàra, Jacq. hort. schœnbr. 3. t. 255. S.

circinàta. Cav. icon. 4. p. 9. t. 318. Stem beset with long hairs, often glandularly hispid. Leaves 1½ inch long. Corollas blue: middle lobe of lower lip broad, emarginate. Upper lobe of style twice as long as the lower one.

Very-bitter Sage. Fl. July, Aug. Clt. 1803. Pl. 3 to 6 feet.

142 S. cuspida'ta (Ruiz, et Pav. fl. per. 1. p. 23. t. 40. f. b.) suffruticose; branches pubescent; leaves petiolate, ovate, bluntish, crenated, cordate at the base, wrinkled, pale and pubescent beneath; floral leaves ovate, acuminated, deciduous; racemes elongated, almost simple; whorls usually 6-flowered, distant; calyx tubularly campanulate, villous, having the upper lip tricuspidate, and the teeth of the lower lip ovate, cuspidate; corolla about 3 times as long as the calyx; tube exserted a little, ventricose; style glabrous, or shortly pubescent. ♄. S. Native of Peru, on hills about Purrochuca and Cheuchin. Leaves an inch long, somewhat doubly crenated. Flowers almost like those of *S. scorodònia* and *S. amarissima*. Corollas blue.

Cuspidate-calyxed Sage. Shrub 4 to 6 feet.

143 S. cardiophy'lla (Benth. lab. p. 721.) herbaceous or suffruticose; branches pubescent; leaves petiolate, ovate, crenated, deeply cordate at the base, wrinkled, clothed with soft villi on both surfaces: floral ones deciduous; racemes elongated, simple; whorls about 6-flowered, distant; calyx tubularly campanulate, finely pubescent, having the upper lip entire, and the teeth of the lower lip ovate, acutish; corolla twice as long as the calyx; tube almost inclosed, ventricose; style glabrous. ♄.? G. Native of South America, without the tropic, in Banda Oriental. Habit of *S. cuspidàta*, from which it differs in the soft villous leaves, and larger, somewhat coloured calyxes, mutic teeth, and entire upper lip.

Heart-leaved Sage. Pl. 2 feet.?

144 S. Gillie'sii (Benth. lab. p. 264.) stem shrubby; branches clothed with hoary tomentum; leaves petiolate, ovate or ovate-lanceolate, bluntish, crenately toothed, truncately cordate at the base, wrinkled, nearly glabrous above, and clothed with hoary tomentum beneath; floral leaves ovate, acute, deciduous; racemes simple; whorls remote, 2-6-flowered; flowers nearly sessile; calyx campanulate, clothed with hoary pubescence, having the upper lip entire, and the teeth of the lower lip ovate, obtuse, mucronate, recurved; corolla about twice as long as the calyx, downy outside; style pubescent. ♄. G. Native of Chili; plentiful on the Andes near Mendoza, at Uspaleta; and on Mount Cerro de las Achiras. Branches tomentose, and furnished with red scattered glands. Leaves 1 to 1½ inch long. Calyxes usually coloured. Corollas blue, like those of *S. urticæfòlia*, but smaller.

Gillies's Sage. Shrub humble.

145 S. racemòsa (Ruiz, et Pav. fl. per. 1. p. 25.) plant shrubby, hairy, erect, branched; leaves cordate, acute, sublanceolate, serrated; racemes terminal, numerous, compound; floral leaves ovate, acuminated, concave, deciduous. ♄. S. Native of Peru, among rubbish, and in waste places of Huanuco. Leaves on long petioles, usually spotted with livid purple. Flowers verticillate, on short pedicels. Corolla pale blue.

Racemose-flowered Sage. Shrub.

146 S. ca'rnea (H. B. et Kunth, nov. gen. 2. p. 300. t. 151.) stem shrubby, erect, branched, glabrous; leaves roundish-ovate, cordate, crenately serrated, hairy; floral leaves oblong, acuminated, shorter than the calyxes, deciduous; spikes terminal; whorls many-flowered: lower ones remote; calyx tubular, striated, hairy: upper lip ovate, acuminated, and the teeth of the lower lip acuminated; tube of corolla exceeding the calyx a little, rather ventricose: upper lip pubescent: middle segment of the lower lip emarginately 2-lobed. ♄. S. Native of New Granada, on the Andes of Quindiu. Leaves on long petioles, 2 to 2½ inches long. Corolla pale red. Genitals a little exserted. Stigma glabrous.

Flesh-coloured Sage. Shrub.

147 S. procu'rrens (Benth. lab. p. 266.) stems creeping, and rooting at the base; floriferous branches ascending, glabrous, or villous; leaves petiolate, roundish, or broad-ovate, cordate at the base, crenated, glabrous, or villous: floral leaves broad-ovate, acutish, deciduous; racemes simple, on long peduncles; whorls 6-10-flowered, remote; flowers on short pedicels; calyx campanulate, hispid, having the upper lip entire, or shortly tridentate, and the teeth of the lower lip acute; corolla glabrous, about twice as long as the calyx: tube ventricose, equalling the calyx; style almost glabrous. ♃. G. Native of South America, in humid pastures and woods; in the province of Rio Grande do Sul, and the more southern parts of Brazil, St. Hil. and Sello; in moist woods at Porana, Tweedie; in ditches near Buenos Ayres, Gillies. Stem glabrous, or hispid from hairs, which are often glandular, clammy, pubescent while young. Leaves similar to those of Ground Ivy. Corolla blue.

Running Sage. Pl. creeping.

148 S. procu'mbens (Benth. lab. p. 267.) stems creeping at the base?; branches ascending, elongated, villous; leaves petiolate, ovate, obtuse, crenated, cordate at the base, villous on both surfaces; floral leaves deciduous; racemes simple; whorls about 6-flowered, remote; calyxes equal in length to the pedicels, tubular, striated, clothed with rufous villi, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla twice as long as the calyx: tube ventricose, equalling the calyx: lobes of lower lip roundish, emarginate; style glabrous. ♃. G. Native of the south of Brazil, Sello. Allied to *S. procàrrens*; but differs in the stem being firmer; in the leaves being more villous, on short petioles, and particularly in the flowers being larger; in the calyxes being on long pedicels, and tubular, not campanulate, clothed with rufous villi, not hispid.

Allied Sage. Pl. creeping.?

* * * * Sessilifòliæ. *Leaves sessile, or nearly so, rounded or truncate at the base. Species all natives of Brazil.*

149 S. ovalifòlia (St. Hil. mss. ex Benth. lab. p. 267.) stems creeping at the base; branches ascending, glabrous or villous; leaves on short petioles, oval, obtuse, crenated, rounded at the base, glabrous, rather coriaceous; floral leaves ovate-lanceolate, shorter than the calyxes, deciduous; racemes simple; whorls 6-10-flowered, remote; calyx tubular, striated, pubescent, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla twice as long as the calyx: tube ventricose, equalling the calyx: middle lobe of lower lip very broad, emarginate; style shortly bearded. ♃.? G. Native of Brazil, common in pastures in the missions of the Uruguay; and to the south of that, as well as in the province of Minas Geraes. *S. rèpens*, Benth. in herb. berol. Stems rather woody. Branches naked under the racemes. Leaves an inch and more long. Racemes on long peduncles.

Var. β, villòsa (Benth. lab. p. 267.) leaves deeply serrate-crenated, broadest at the base. ♃. G. Native near Salto Grande, on the banks of the Uruguay, in the province of Rio Grande do Sul.

Oval-leaved Sage. Pl. 1 to 1½ foot.

150 S. lachnostachys (Benth. lab. p. 267.) stem rooting at the base; branches ascending, simple, villous or spreadingly pilose; leaves nearly sessile, oval-oblong, obtuse, regularly crenulated, rounded or subcordate at the base, wrinkled, clothed with rufous tomentum above; floral leaves cordate-ovate, bluntish, rather shorter than the calyxes, almost permanent; racemes dense; whorls remotish, usually 10 flowered; calyx campanu-

late, pilosely hispid, having the upper lip entire, and the teeth of the lower lip acutish; corolla about twice as long as the calyx: tube about equal in length to the calyx, ventricose; style bifariously bearded. ♃. G. Native of Brazil, in the province of St. Paul, in fields near Registra de Curitiba, and the pastures near Fazenda da Fortaleza, St. Hil.; and in the south of Brazil, Sello. Stems clothed with rufous tomentum, or villous. Leaves 1 inch long, pubescent above. Corolla blue, a little smaller than those of *S. ovalifolia*.

Woolly-spiked Sage. Pl. 1 to 2 feet.

151 S. vi'scida (St. Hil. mss. ex Benth. lab. p. 268.) suffruticose, clammy; branches clothed with glandular hairs; leaves nearly sessile, or the lower ones are ovate-lanceolate, acutish, serrately crenated or cordate at the base, green on both surfaces, soft, hispid; racemes elongated, almost simple; whorls generally 6-flowered, subcecnd; calyx tubularly campanulate, villous, clammy, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla twice as long as the calyx: tube a little exserted, ventricose; style bearded above. ♄. G. Native of Brazil, in the woods called Carrascos, in Serra Negro, at the limits of the provinces of Minas Geraes and Rio Janeiro, St. Hil. Shrub decumbent at the base. Racemes numerous, ½ foot. Corollas blue.

Viscid Sage. Shrub 3 to 4 feet.

152 S. corda'ta (Benth. lab. p. 268.) stem herbaceous, erect, tall, villous; leaves on short petioles, ovate-oblong, acute, crenated, cordate, wrinkled, pubescent above, clothed with soft white tomentum beneath; floral leaves ovate, acute? deciduous; racemes simple; whorls distant, many-flowered; calyx tubularly campanulate, striated, pubescent, having the upper lip entire, and the teeth of the lower lip acute; corolla thrice as long as the calyx: tube a little exserted, ventricose; upper lip pubescent: middle lobe of lower lip very broad, emarginate; style glabrous. ♃. G. Native of the south of Brazil, Sello. Stems almost simple. Leaves 3-4 inches long. Whorls often 20-flowered. Corolla blue, above an inch long. Upper lobe of style very long, subulate.

Cordate-leaved Sage. Pl. 3 to 4 feet.

153 S. nervo'sa (Benth. lab. p. 268.) stem herbaceous? erect, almost simple, clothed with rufous tomentum, and long spreading hairs; leaves sessile, ovate-lanceolate, acute, crenately serrated, rounded or subcordate at the base, coriaceous, wrinkled above, and glabrous, nerved, and clothed with fine rufous tomentum beneath; floral leaves ovate, acuminated, deciduous; racemes elongated; whorls numerous, 6-10-flowered; calyx ovate-tubular, striated, pubescent, having the upper lip entire, and the teeth of the lower lip broad-ovate, obtuse, or shortly acuminated; corolla twice as long as the calyx, tomentose outside: tube exserted, widened at top; style bearded. ♃.? G. Native of the south of Brazil, Sello. Stems naked at the base. Leaves 1-2 inches long. Whorls distant. Corolla bluish. Stamens inclosed. Upper lobe of style longest.

Nerved-leaved Sage. Pl. 2 to 3 feet.

154 S. si'cula (Benth. lab. p. 269.) stems herbaceous, erect, villous or nearly glabrous; leaves sessile, lanceolate or linear, cordate at the base, with crenulated margins, glabrous, rather coriaceous, stiff; floral leaves minute, linear, deciduous; racemes simple; whorls 6-10-flowered, remote; calyx tubular, striated, villous, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla about twice as long as the calyx: tube ventricose, equalling the calyx; style shortly bearded beneath. ♃.? G. Native of Brazil, in the provinces of Minas Geraes, Rio Grande do Sul, and the south of Brazil, St. Hil. and Sello. Stems branched at the base. Branches almost simple. Leaves 1-2 inches long. Flowers almost sessile. Corolla blue, hardly half an inch long with the calyx.

Stiff Sage. Pl. 1 to 2 feet.

155 S. rosmarinoi'des (St. Hil. mss. ex Benth. lab. p. 269.) stem suffruticose; branches erect, twiggy, tomentosely villous; leaves sessile, linear or linear-lanceolate, acuminated, crenated, subcordate at the base, stiff, almost glabrous above, but clothed with hoary tomentum beneath; floral leaves ovate, acuminated, deciduous; racemes elongated, simple; whorls about 6-flowered, distant; calyx tubular, clothed with clammy villi, having the upper lip entire, and the teeth of the lower lip acute; corolla about thrice as long as the calyx: tube a little exserted; style bifariously pubescent. ♄. G. Native of Brazil, in fields in the Missions of the Uruguay, near El Salto Grande. Plant scentless. Racemes nearly a foot long. Corollas blue, marked with white lines.

Rosmary-like Sage. Shrub 2 feet.

§ 3. Axillariflo'ræ. *Floral leaves conforming to the cauline ones. Flowers axillary. Tube of corolla equal in height to the calyx, or hardly half as long again.—Humble undershrubs, with bluish flowers.*

156 S. axilla'ris (Moc. et Sesse, mss. ex Benth. lab. p. 270.) leaves oblong-linear, acute, quite entire, narrowed at the base, scabrous from hairs; whorls axillary, 2-6-flowered; calyxes almost sessile, tubular, striated, pubescent, having the upper lip tridentate, and the lower lip bifid: teeth all acute, and subulately acuminated. ♄. S. Native of New Spain, Moçino et Sesse. Habit of *Thymus* or *Satureia*. Leaves 3-4 lines long. Corollas not seen.

Axillary-flowered Sage. Shrub humble.

157 S. cunrifo'lia (Benth. lab. p. 270.) branches decumbent, villous; leaves sessile, ovate-cuneated, a little toothed, narrowed at the base, green on both surfaces; whorls axillary, few-flowered; calyx tubular, villous, having the upper lip shortly tricuspidate, and the lower lip bifid: lobes acuminated; corolla more than twice as long as the calyx: tube exserted, equal; style glabrous. ♄. G. Native of Mexico, near Chapultepec? Karwinski. Stems many, rising from a thick woody base. Leaves 3-4 lines long, furnished with one or two teeth on both sides: the upper ones quite entire. Flowers size of those of *Calamintha Nepeta*.

Wedge-leaved Sage. Shrub ½ foot.

158 S. calamintheifo'lia (Vahl, enum. 1. p. 233.) stem shrubby; branches canescent; leaves petiolate, broad-ovate, obtuse, crenated, cordate at the base, clothed with fine tomentum on both surfaces; whorls axillary, remote, generally 6-flowered; calyxes pedicellate, tubularly campanulate, nearly glabrous, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla about twice as long as the calyx, pubescent outside; style bearded above. ♄. S. Native of St. Domingo. Branches slender, purplish. Leaves hardly a nail in length. Corollas blue. Genitals a little exserted.

Calamint-leaved Sage. Shrub humble.

159 S. ballotæfo'lia (Benth. lab. 270.) leaves petiolate, ovate, roundish, obtuse, truncate or cordate at the base, nearly glabrous above, and clothed with white tomentum beneath; upper floral leaves bractea-formed; whorls few, axillary, 2-6-flowered, distant, or the 2 or 3 upper ones approximating into a short raceme; calyx pedicellate, tubularly campanulate, attenuated at the base, having the upper lip entire, and the teeth of the lower lip ovate, dilated after florescence; corolla about twice as long as the calyx: tube inclosed; style bifariously bearded. ♄. G. Native of Mexico, near Toliman, Karwinski. Shrub much branched. Leaves hardly ½ an inch long, when young clothed with mealy tomentum beneath, as well as the calyxes.

Ballota-flowered Sage. Shrub humble.

§ 4. Membranace'æ. *Floral leaves bractea-formed, dilately spreading, membranous. Tube of corolla inclosed, or hardly longer than the calyx.—Herbs or subshrubs, with bluish flowers.*

160 S. bupleuroi'des (Presl, mss. ex Benth. lab. p. 271.) herbaceous, nearly glabrous; leaves petiolate, ovate, acute, crenately-serrated, narrowed or cuneated at the base, green on both surfaces; axillary branches short; peduncles long, fascicled, with a solitary, terminal, many-flowered whorl on each peduncle; floral leaves exceeding the calyxes, permanent, broad, rounded, subcordate at the base, shortly acuminated at the apex, membranaceous, veiny, glabrous; calyxes sessile, membranous, having the upper lip entire, and the teeth of the lower lip acutish; corolla hardly longer than the calyx. ♃. G. Native of Mexico, Hænke. Flowers small. Very distinct from all other species in the inflorescence.

Bupleurum-like Sage. Pl.?

161 S. Moci'ni (Benth. lab. p. 271.) stem herbaceous, procumbent; branches ascending, clothed with short pubescence; leaves petiolate, ovate, acuminated, serrately-crenated, cuneated or truncate at the base, nearly glabrous; floral leaves large, orbicular, acuminated, membranous, veiny, spreading; racemes simple; whorls remote, 6-10-flowered; calyx almost sessile, ovate, tubular, canescent, having the upper lip entire, and the teeth of the lower lip acute, ciliated; corolla twice as long as the calyx: tube inclosed, ventricose: middle lobe of lower lip emarginate; style glabrous. ♃.? G. Native of New Spain, Moçino et Sesse. Leaves green on both surfaces, glabrous or downy; floral ones almost an inch broad. Corollas blue.

Moçino's Sage. Pl. procumbent.

§ 5. Bracteate'æ. *Floral leaves bractea-formed, permanent, green, broad-roundish, clasping the flowers. Tube of corolla inclosed, or hardly half as long again as the calyx.—Herbs and undershrubs, with bluish flowers.*

162 S. hirsu'ta (Jacq. schœnbr. 3. p. 1. t. 252.) stem herbaceous, ascending, branched, pubescent; leaves petiolate, oblong, acute, remotely serrated, narrowed at the base, villous; floral leaves sessile, broad-roundish, acuminated, ciliated, permanent, exceeding the whorls; racemes simple: whorls about 6-flowered, at length distant; calyxes sessile, tubularly campanulate, somewhat inflated, striated, pubescent or hispid, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla exceeding the calyx a little: tube inclosed, ventricose; style bearded beneath. ☉. G. Native of Mexico. S. nepetifolia, Poir. suppl. 5. p. 48. S. cryptánthos, Schultes, obs. p. 12. S. sideritidis, Vahl, enum. 1. p. 250. S. bracteàta, Poir. dict. 6. p. 662.? S. ciliàta, Poir. dict. 6. p. 588. S. phlomoides, Cav. icon. 4. p. 10. t. 320. but not of Asso. Corollas blue.

Hairy Sage. Fl. May, July. Clt. 1801. Pl. 1 to 2 feet.

163 S. clinopodioi'des (H. B. et Kunth, nov. gen. amer. 2. p. 294. t. 145.) stem herbaceous, erect, clothed with white wool above; leaves ovate, bluntish, rounded at the base, crenated, pubescent beneath; floral leaves roundish-ovate, obtuse, pilose, permanent, exceeding the calyxes; whorls many-flowered, distant; calyx clothed with white hairs, tubularly campanulate, with an ovate-acuminated upper lip, and a reflexed lower bifid lip, with acuminated segments. ♃. S. Native of New Spain, between Pazcuaro and Aguasarco. Leaves petiolate, 2 inches long. Corollas pale blue: upper lip pubescent: tube a little longer than the calyx. Stamens equalling the upper lip of the corolla.

Clinopodium-like Sage. Pl.?

164 S. speciòsa (Presl, mss. ex Benth. l. c. p. 272.) shrubby; branches clothed with white villi; leaves petiolate, ovate, acute, serrated, rounded at the base or truncate, wrinkled, pubescent above, and clothed with white villi or tomentum beneath; floral leaves bractea-formed, broad-ovate, acuminated, longer than the calyxes, permanent, herbaceous, a little coloured; raceme dense, imbricate; whorls approximate, 6-10-flowered; calyx large, tubular, having the upper lip erect, and the teeth of the lower lip ovate, acute; corolla about twice as long as the calyx: tube equalling the calyx; genitals much exserted. ♄. S. Native of Peru, about the town of Huanuco, and on the mountains in the vicinity, Hænke. Corolla dark purple.?

Showy Sage. Shrub.

165 S. Parquere'nsis (Moc. et Sesse, mss. ex Benth. lab. p. 273.) stem herbaceous, erect, clothed with white wool above; leaves on long petioles, ample, ovate, acute, pubescent on both surfaces, rounded or cuneated at the base, running into the winged petioles; floral leaves sessile, rounded, obtuse, permanent, clasping the flowers; racemes simple; whorls densely globose, many-flowered, approximate, distinct; calyx tubularly campanulate, clothed with white hairs, having the upper lip ovate, acuminated, entire, and the segments of the lower lip acuminated, reflexed; corolla about thrice as long as the calyx: tube exserted, widened at top: middle lobe of lower lip large, emarginate; style pubescent. ♃.? S. Native of New Spain. Corollas blue, an inch long.

Parquero Sage. Pl.?

166 S. Mathe'wsii (Benth. lab. p. 722.) herbaceous?; branches very villous at top; leaves ample, petiolate, ovate, deeply cordate at the base, flaccid, green on both surfaces, glabrous or hardly hairy on the nerves; floral leaves bractea-formed, broad-ovate, membranous, coloured, almost permanent, equalling the calyxes; racemes elongated, loose; whorls 6-10-flowered; calyxes pedicellate, large, tubular, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla hardly twice as long as the calyx: tube equalling the calyx; genitals much exserted. ♃.? S. Native of Peru, at Purrochuca and Obrajillo, Mathews. Leaves 6-8 inches long. Calyxes hispid at the base, glabrous at apex, and coloured. Flowers like those of *S. speciòsa*.

Mathews's Sage. Pl.?

167 S. macrosta'chya (H. B. et Kunth, nov. gen. 2. p. 298.) stem shrubby, erect, hairy; leaves petiolate, roundish-ovate, acute, deeply cordate at the base, with rounded imbricate auricles, pubescently villous on both surfaces; floral leaves broad-ovate, villous, permanent, equalling the calyxes; spikes dense, thick; whorls many-flowered, closely approximate; flowers sessile; calyx tubular, villous, having the upper lip entire, and the teeth of the lower lip acute; corolla hardly exceeding the calyx. ♄. S. Native of Peru, near Guayaquil; and near Quito, Llactacunga, and Cuença. Leaves 2-3 inches long. Corolla blue: upper lip arched, emarginate, as well as the middle segment of the lower lip.

Long-spiked Sage. Shrub 4 to 6 feet.

§ 6. Eria'nthæ. *Floral leaves bractea-formed, deciduous. Calyxes densely clothed with tomentose wool. Tube of corolla hardly a half as long again as the calyx.—Herbs or shrubs. Flowers whitish or yellowish, rarely reddish.*

168 S. leucoce'phala (H. B. et Kunth, nov. gen. 2. p. 301. t. 156.) stem shrubby, erect, and is, as well as the branches, clothed with hoary tomentum; leaves ovate, bluntish, cordate, crenately serrated, clothed with hoary tomentum beneath; spikes

ovate: whorls many-flowered, closely crowded; calyx tubular, having the upper lip ovate, acute, and the segments of the lower lip acute; tube of corolla equalling the calyx. ♄. S. Native of Peru, in the province of Quito, near Alausi. Floral leaves ovate, acute. Corolla violaceous. Stamens hardly exserted. This is a very showy species.

White-headed Sage. Shrub 3 to 4 feet.

169 S. BREVIFLÒRA (Moc. et Sesse, mss. ex Benth. lab. p. 274.) stem shrubby; branches clothed with hoary tomentum; leaves on short petioles, ovate, acute, crenulated, rounded at the base or subcordate, clothed with soft hoary pubescence above, and white tomentum beneath; floral leaves ovate, acuminated, equalling the calyxes; racemes spike-formed, dense, a little branched; whorls about 6-flowered, approximate, secund; flowers almost sessile; calyx tubularly campanulate, having the upper lip entire, and the teeth of the lower lip short, obtuse; corolla about twice as long as the calyx, tomentose outside, with equal lips; genitals exserted a little; style glabrous. ♄. S. Native of New Spain. Leaves almost like those of a species of *Lantàna*, scarcely an inch long. Upper lip of corolla shortly emarginate, and the middle segment of the lower lip large, bifid.

Short-flowered Sage. Shrub.

170 S. COLLI'NA (H. B. et Kunth, l. c. p. 288.) shrubby; branches and under sides of leaves clothed with white tomentum, but pubescent above; leaves oblong-lanceolate, bluntish, acute at the base, crenated; floral leaves lanceolate, tomentose, deciduous; spikes on long peduncles; whorls many-flowered, approximate; calyx clothed with white tomentum, campanulate, striated, having the upper lip entire, acute, and the lower one bipartite, with acuminated segments. ♄. S. Native of Quito, on dry hills about Riobamba Nuevo. Shrub sweet-scented. Leaves an inch long, green above. Lower whorls distant. Corollas blue: lower lip spotted with white, ex Bonpl. This species differs from *S. breviflòra*, in the leaves being green above, and in their form.

Hill Sage. Shrub.

171 S. SPICA'TA (Roem. et Schultes, syst. mant. 1. p. 202.) shrubby; branches glabrous, clothed with hoary pubescence while young; leaves lanceolate-oblong, obsoletely crenated towards the apex, pubescent above, but clothed with white tomentum beneath; floral leaves ovate, acuminated, clothed with white tomentum, tipped with blue, deciduous; spikes terminal, solitary, pedunculate; whorls many-flowered, approximate; calyx clothed with white tomentum, campanulate, striated, having the upper lip obtuse and tridentate, and the lower one bidentate: teeth all acute. ♄. S. Native of New Spain. S. salignà, Willd. herb. ex Link, Schwæg. et Dietr. spec. pl. 1. p. 308. S. Humbóldtii, Spreng. syst. 1. p. 64. S. Humboldtiàna, Dietr. gart. lex. 7. p. 418. S. pulchélla, H. B. et Kunth, nov. gen. 2. p. 288. t. 140. Leaves about an inch long. Corolla blue: tube equalling the calyx: upper lip galeate, concave, emarginate, pubescent. Calyx reddish, more villous than that of *S. breviflòra*.

Spicate-flowered Sage. Shrub 3 feet.

172 S. FARINA'CEA (Benth. lab. p. 274.) stem herbaceous, erect, nearly glabrous; leaves petiolate, ovate-oblong, or lanceolate, bluntish, irregularly serrate-crenated, narrowed a long way at the base, nearly glabrous, green on both surfaces or canescent beneath; floral leaves small, deciduous; raceme elongated, simple; whorls many-flowered, almost secund, remote, or the upper ones are approximate; flowers almost sessile; calyx tubular, having the upper lip entire, and the teeth of the lower lip short and obtuse; corolla twice as long as the calyx: tube hardly exserted, ventricose; style bearded. ♃. ? S. Native of Texas, between Rio Guadaloupe and Rio Colorado. Leaves like those of *S. uliginòsa* or *S. serràta*.

Mealy Sage. Pl. ?

173 S. REVOLU'TA (Ruiz, et Pav. fl. per. 1. p. 28. t. 41. f. b.) stem shrubby, erect, clothed with white tomentum; leaves on short petioles, linear-lanceolate, obtuse, crenated, with revolute edges, wrinkled, clothed with white tomentum on both surfaces; lower floral leaves similar to the cauline ones: upper ones ovate, acuminated, deciduous; racemes simple; whorls about 6-flowered, remote, secund; calyx tubular, having the upper lip entire, and the teeth of the lower lip acute; corolla twice as long as the calyx: tube exserted, ventricose: lips equal in length; style hairy. ♄. S. Native of Peru, in the province of Canta. Shrub much branched. Leaves on short petioles, 1¼ inch long. Corolla whitish-violet.

Revolute-leaved Sage. Shrub 2 to 3 feet.

174 S. LEUCA'NTHA (Cav. icon. 1. p. 16. t. 24.) stem shrubby; branches nearly terete, clothed with white wool; leaves on short petioles, lanceolate-linear, acute, minutely crenated, rounded at the base, wrinkled above, and pubescent, but clothed with white wool beneath; floral leaves ovate, acuminated, deciduous; raceme elongated; whorls many-flowered: lower ones remote; flowers almost sessile; calyx ovate, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla twice as long as the calyx, clothed with white tomentum outside: tube exserted, rather ventricose: lips short; style bearded. ♄. S. Native of Mexico. Leaves 2-6 inches long. Racemes usually purplish. Corolla white, rather contracted under the throat.

White-flowered Sage. Shrub 4 to 5 feet.

175 S. VELUTI'NA (Benth. lab. p. 275.) stem shrubby?; branches densely leafy, clothed with velvety wool; leaves almost sessile, oblong-lanceolate, obtuse, crenated, narrowed at the base, wrinkled, clothed with velvety wool beneath; floral leaves lanceolate, deciduous; racemes rather loose; whorls about 6-flowered; calyxes striated, tubular, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla half again as long as the calyx, clothed with white wool outside: tube wide: lips nearly equal; style glabrous. ♄. ? S. Native of the South of Brazil, Sello. Nearly allied to *S. confertiflòra*. Corollas white.

Velvety Sage. Shrub.

176 S. ERIOCA'LYX (Bertero, ex Roem. et Schultes, syst. addit. to mant. 1. p. 246.) stem shrubby; branches divaricate, clothed with hoary pubescence; leaves oblong-lanceolate, acuminated, serrated, cuneated at the base, pubescent above, and densely clothed with hoary tomentum beneath; floral leaves ovate, acuminated, deciduous; racemes short, simple; whorls 6-10-flowered, approximate; calyx campanulate, having the upper lip entire, and the teeth of the lower lip ovate, obtuse; corolla exceeding the calyx a little, woolly outside: tube inclosed: lips short; style bearded. ♄. S. Native of Jamaica. Branches divaricate or procumbent. Leaves 3-4 inches long. Flowers nearly sessile. Wool of calyx generally reddish. Corollas like those of *S. confertiflòra*.

Woolly-calyxed Sage. Shrub.

177 S. LONTENTIFLÒRA (Pohl, pl. bras. 2. p. 134. t. 190.) stem shrubby?; branches clothed with rufous tomentum; leaves petiolate, ovate-oblong, acutish, crenated, cuneated at the base, and running into the petioles, a little wrinkled above, and clothed with adpressed tomentum, and densely clothed with rufous tomentum beneath; floral leaves ovate, long-acuminated, reflexed or deciduous; racemes elongated; whorls numerous, many-flowered; calyx ovate-tubular, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla one half longer than the calyx, clothed with yellow wool outside: tube

exserted, ventricose: lips short; style glabrous. ♄. S. Native of Brazil, near Rio Janeiro, and on Serra d'Estrella, and Padre Correa. Leaves 3-4 inches long, and 1½ broad. Bracteas long-acuminated, comose at apex. Whorls 10-20-flowered. Calyx reddish. Corolla reddish, small.

Crowded-flowered Sage. Shrub. ?

178 S. lasiántha (Benth. lab. p. 276.) shrubby; branches densely woolly; leaves almost sessile, oval-oblong, obtuse, crenated, rounded at the base or cordate, much wrinkled above, hispid, clothed with soft white wool beneath: floral ones ovate, acuminated, shorter than the calyxes, deciduous; racemes elongated, simple; whorls distant, many-flowered; calyxes tubular, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla one half longer than the calyx: tube hardly exserted, ventricose, pubescent outside: lips nearly equal; style glabrous. ♄. S. Native of Mexico. Shape of leaves and habit of *S. scorodònia*. Racemes reddish or yellowish. Inflorescence of *S. eriocàlyx*.

Woolly-flowered Sage. Shrub.

§ 7. Longiflòræ. *Tube of corolla 2-3 times longer than the calyx: lower lip generally shorter, rarely longer than the upper one.—Herbs, undershrubs, or shrubs. Corollas white, yellowish, orange-coloured, bluish, scarlet, or purple.*

* Aléidæ. *Corollas white or whitish.*

179 S. tomentélla (Pohl, pl. bras. 2. p. 138. t. 194.) herbaceous? erect, clothed with rufous tomentum; leaves sessile, ovate-oblong, obtuse, crenated, narrowed at the base, wrinkled, and rather hispid above, and clothed with tomentose pubescence beneath; floral leaves deciduous; racemes elongated; whorls 6-10-flowered, remote; calyxes tubular, striated, tomentosely pubescent, having the upper lip entire, and the teeth of the lower one acute; corolla twice as long as the calyx, clothed with white wool outside: tube exserted: lips short; lateral lobes of lower lip reflexed: middle one concave; style shortly bearded. ♃.? S. Native of Brazil, in the provinces of Goyaz and Minas Geraes. Leaves 2-3 inches long, few. Corolla 15 lines long, white.

Woolly Sage. Pl. 2 to 3 feet.

** Aurantiàcæ. *Corollas yellowish or orange-coloured.*

180 S. ícxea (H. B. et Kunth, nov. gen. 2. p. 297. t. 148.) stems shrubby, and are, as well as the branches, pilose; leaves oblong, acutish, cordate, crenated, glabrous above, and clothed with white tomentum beneath; whorls many-flowered: lower ones distant; floral leaves ovate, acute, shorter than the calyxes, deciduous; calyx subcampanulate, clothed with glandular hairs, the upper lip tridentate, the teeth acuminately mucronate, and the segments of the lower lip acuminately subulate. ♄. S. Native of Peru, between Loxa and Mount Saraguru, in the province of Quito. Leaves 1½ inch long. Corolla yellow, glandularly pilose on the back: tube ventricose, thrice as long as the calyx.

Yellow-flowered Sage. Shrub.

181 S. funcia'na (Ruiz, et Pav. fl. per. 1. p. 27. t. 39.) stem suffruticose, erect, clothed with glandular pubescence; leaves petiolate, ovate, acute, serrated, rounded at the base, quite entire, coriaceous, veiny, clammy above, of the same colour beneath, pubescent or glabrous; floral leaves ovate, acuminated, deciduous; racemes simple; whorls 1-10-flowered, remote; calyx campanulate, hairy, having the upper lip entire, obtuse, or shortly tridentate, and the teeth of the lower lip ovate, acute; corolla pubescent, thrice as long as the calyx: tube exserted, rather ventricose: lips nearly equal; style bearded. ♄. S. Native of Peru, on hills of Huannco.—A fetid ferruginous plant. Branches purplish. Leaves hardly an inch long. Corollas white, but usually yellowish or whitish-violet, size of those of *S. lamiifòlia*.

Dotted Sage. Shrub 2 to 3 feet.

182 S. Pavònii (Benth. lab. p. 278.) stem shrubby, bifariously pubescent; branches beset with glandular villi at top; leaves petiolate, ovate, obtuse, quite entire, cuneated at the base, glabrous; floral leaves ovate, acuminated, deciduous; racemes simple; whorls many-flowered, distant; calyx campanulate, clothed with glandular villi, having the upper lip entire, and the teeth of the lower lip broad-ovate, acute; corolla pubescent outside, about 4 times longer than the calyx: tube much exserted, inflated in the middle: lips short, erect; style bearded above. ♄. S. Native of Peru. Allied to *S. punctàta*; but differs in the quite entire obtuse leaves, and longer corollas. Corollas yellowish.

Pavon's Sage. Shrub.

183 S. integrifòlia (Ruiz, et Pav. fl. per. 1. p. 26. t. 36. f. b.) stem shrubby, glabrous; leaves petiolate, ovate, quite entire, rounded at the base, glabrous, clammy, rather fleshy; floral leaves lanceolate, acute, deciduous; racemes short, simple; whorls about 6-flowered, distant; calyx tubular, glabrous, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla thrice as long as the calyx, pubescent: tube exserted, nearly equal; style glabrous. ♄. S. Native of Peru, at Caxatamba, near the hot baths of Cheuchin, and among rocks, where it is called *Succoncha* by the natives. Stem much branched. Branches clammy, purplish. Leaves scarcely half an inch long, obtuse or acute. Corolla more than an inch long, of a coppery-yellow colour. Genitals exserted.

Entire-leaved Sage. Shrub 2 to 3 feet.

184 S. oppositifòlia (Ruiz, et Pav. fl. per. 1. p. 26. t. 43. f. a.) stem suffruticose, procumbent at the base; branches erect, finely pubescent; leaves petiolate, ovate, obtuse, rounded at the base or cordate, wrinkled, pubescent; floral leaves deciduous; racemes simple; whorls 2-flowered, secund; calyx tubular, striated, the upper lip entire, and the teeth of the lower lip ovate, acute; corollas 4 times as long as the calyx, pubescent outside: tube much exserted: lips nearly equal; style glabrous.? ♄. S. Native of Peru, in elevated, exposed, arid places of Tarma. S. grata, Vahl, enum. 1. p. 244. Plant with a grateful scent. Leaves 1 to 1½ inch long. Corollas a little smaller than those of *S. tubiflòra*, scarlet. The vernacular name of the plant is *Chenchelcoma*.

Opposite-flowered Sage. Shrub.

185 S. glechæ'oea (H. B. et Kunth, nov. gen. 2. p. 298.) stem suffruticose, erect, and is, as well as the branches, pubescent; leaves ovate, obtuse, cordate, almost quite entire, coriaceous, nearly glabrous; whorls 2-flowered, distant; floral leaves oblong, acute, ciliated, glumaceous, about equal in length to the calyxes; calyx nearly glabrous, tubular: lips ciliately pilose: upper lip and segments of the lower lip acuminated. ♄. S. Native of New Spain, in temperate places. Corolla scarlet.?

Glumaceous-bractead Sage. Shrub.

186 S. strictiflòra (Hook. bot. misc. 2. p. 234.) stem shrubby; branches clothed with tomentose pubescence; leaves petiolate, ovate, acute, crenately serrated, cordate at the base, thickish, rather fleshy, nearly glabrous; floral leaves ovate, acute, membranous, deciduous; racemes elongated; whorls 2-flowered, secund; calyx tubular, striated, pubescent, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla more than twice as long as the calyx: tube elongated, incurved, tomentose outside: lips nearly equal, hardly spreading: lateral lobes of lower lip very short; genitals exserted;

style glabrous. ♄. S. Native of Peru, between Yazo and Obrajillo, in the valley of Canta. Leaves 1½ to 2 inches long. Corolla of a yellowish scarlet colour.

Strict-flowered Sage. Shrub 4 to 6 feet.

187 S. TURBIFLÒRA (Smith, icon. ined. t. 26.) stem suffruticose, erect, villous; leaves petiolate, ovate, obtuse, crenately-serrated, cordate at the base, pubescent above, or villous, and clothed with white wool beneath, or the lower ones are nearly glabrous; floral leaves ovate, acute, membranous, deciduous; racemes simple; whorls 2-flowered, secund; calyx tubular, striated, woolly or villous, having the upper lip entire, and the teeth of the lower lip lanceolate, acute; corolla 3 times as long as the calyx: tube elongated, incurved, tomentose outside: lateral lobes of lower lip small: middle one concave; genitals exserted a little; style glabrous. ♄. S. Native of Peru, on the mountains. S. biflòra, Ruiz, et Pav. fl. per. et chil. 1. p. 24. t. 38. f. a. Stem and branches densely villous. Floral leaves and calyxes glumaceous, usually clothed with soft, silky, white tomentum. Corolla of a golden scarlet colour, 1½ inch long.

Var. β, *glabràta* (Benth. lab. p. 279.) lower leaves of the same colour on both surfaces, and nearly glabrous. ♄. S. Native of Peru, common in sandy places in the town of Atiquipa, in the province of Camana. S. excisa, Ruiz, et Pav. fl. per. 1. p. 25. t. 36. f. a. Stem and racemes less villous; the younger leaves constantly tomentose beneath.

Tube-flowered Sage. Fl. June, July. Clt. 1820. Shrub 2 to 3 feet.

* * * Coccíneæ. *Corollas scarlet or purple.*

188 S. LEONUROÍDES (Glox. obs. bot. 15. t. 2.) stem suffruticose, nearly glabrous; leaves petiolate, ovate, or rhomboid, obtuse, crenated a little, truncate or subcordate at the base, nearly glabrous above, veiny and canescent beneath; floral leaves similar to the others; whorls about 6-flowered; flowers about equal in length to the leaves; pedicels shorter than the petioles; calyx tubularly campanulate, glabrous: the upper lip entire, and the lobes of the lower lip broad-ovate, acute; corolla about twice as long as the calyx: tube ventricose: lips nearly equal: upper lip pubescent outside; stamens inclosed; style exserted, bearded, with subulate lobes. ♄. S. Native of Quito, in temperate places near Chillo, Ichubamba, and Huanuco. Lam. ill. t. 20. f. 3. S. comòsa, Lher. stirp. 1. p. 41. t. 21. Mirb. ann. mus. 15. t. 15. f. 6. S. nodòsa, Ruiz, et Pav. fl. per. 1. p. 25. t. 41. f. a. S. pyrifòlia, Donbey, ex Cav. Jùngia formòsa, Mœnch. Branches furrowed, nodose, glabrous, or clothed with fine hoary tomentum. Leaves rarely quite entire, but usually sinuated or crenated. Corolla scarlet.

Lion's-tail-like Sage. Shrub 4 to 6 feet.

189 S. PHLOMÒSA (Ruiz, et Pav. fl. per. 1. p. 26. t. 37. f. a.) shrubby, clothed with rusty tomentum; branches woolly; leaves petiolate, subcordate, acute, crenated, veiny, wrinkled, very woolly beneath; peduncles 4-5, axillary, 6-flowered, propped by subulate bracteoles; calyx tubular, scabrous inside; corolla hairy outside, twice as long as the calyx: lips equal: upper one emarginate: lower one trifid; style plumose, purplish. ♄. S. Native of Peru, in the province of Tarma, among broken rocks at Huassahuassi. Corollas purple: tube not ventricose. Very nearly allied to the preceding.

Plumose-styled Sage. Shrub.

190 S. BALAUSTÍNA (Pohl, pl. bras. 2. p. 133. t. 189.) suffruticose, erect, pilose; leaves petiolate, oblong, acute, serrated, narrowed at the base, green on both surfaces, pilose; floral leaves conforming to the others; whorls axillary, remote, 6-flowered; calyx tubular, pilose, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla thrice as long as the calyx: tube much exserted; style bearded. ♄. S. Native of Brazil, among bushes, by way sides near Eugenho da Varge, in the province of Rio Janeiro. Branches reddish-brown. Leaves 2 to 2½ inches long. Bracteas lanceolate, hardly longer than the pedicels. Corolla 2 inches long, scarlet. Stamens inclosed.

Pomegranate-flowered Sage. Shrub 3 feet.

191 S. ASPERIFÒLIA (Benth. lab. 281.) stem suffruticose, erect, clothed with short pubescence; leaves sessile, oblong, crenated, narrowed at the base, tubercled and very rough above, but nearly glabrous beneath; floral leaves ovate, acuminated, membranous, ciliated, deciduous; racemes elongated; whorls about 6-flowered, somewhat secund: lower ones remote; calyx tubular, pubescent, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla 3 times as long as the calyx, pubescent: tube elongated, widened above: lateral lobes of lower lip deflexed; style exserted, plumose. ♄. S. Native of Brazil, in the provinces of Goyaz and Minas Geraes. Stem nearly naked above. Leaves 3-4 inches long. Corolla 1½ inch long, scarlet.

Rough-leaved Sage. Shrub.

192 S. SCABRIDA (Pohl, pl. bras. 2. p. 140. t. 195.) stem suffruticose, erect, clothed with short pubescence; leaves almost sessile, oblong-lanceolate, obtuse, crenated, narrowly rounded at the base, rough from tubercles above, and nearly glabrous beneath; floral leaves ovate, acuminated, deciduous; racemes simple, elongated; whorls few-flowered; calyx tubular, pubescent, having the upper lip entire, and the segments of the lower lip ovate, acute; corolla thrice as long as the calyx, pubescent: tube elongated, hardly widened; style plumose. ♄. S. Native of Brazil, in grassy pastures at St. Lucia, in the province of Goyaz; and about Barbacena and Registo Velho, in the province of Minas Geraes. This differs from *S. asperifolia*, in the narrower leaves; in the whorls being usually 2-4-flowered, and in the tube of the corolla being less widened. Corolla of a beautiful red colour.

Scabrous Sage. Shrub.

193 S. PERSICÆFÒLIA (St. Hil. mss. ex Benth. lab. p. 281.) shrubby; branches villous above; leaves nearly sessile, oblong-lanceolate, acuminated, a little serrated, narrowed at the base, rather scabrous above, and of the same colour on both surfaces, nearly glabrous beneath; floral leaves bractea-formed, ovate, acuminated, deciduous; racemes simple; whorls about 6-flowered, distant; calyx campanulate, clothed with long purple wool outside, having the upper lip entire, and the teeth of the lower lip ovate, acutish; corolla more than twice as long as the calyx, villous: tube widened above; style plumose. ♄. S. Native of Brazil, in woods near Rio Vermelho, in the eastern part of the province of Minas Geraes. Leaves 2-3 inches long, villous on the veins beneath, the rest glabrous. Racemes and calyxes densely clothed with purple articulated hairs. Corolla scarlet, more than 2 inches long. Style exserted.

Peach-leaved Sage. Shrub 5 to 7 feet.

194 S. MARIÁNA (Mart. mss. ex Benth. lab. p. 282.) shrubby; branches clothed with tomentose villi; leaves on short petioles, oblong-lanceolate, narrowed a long way at both ends, pubescent on both surfaces, pale beneath; floral leaves bractea-formed, ovate, acuminated, deciduous; racemes simple; whorls about 6-flowered, distant; calyx tubularly campanulate, densely clothed with brownish-white, rather silky adpressed wool, having the upper lip entire, and with the teeth of the lower lip very short, ovate-acute; corolla twice as long as the calyx, villous: tube much exserted; style bearded. ♄. S. Native of Brazil, in the province of Minas Geraes, in humid parts of woods at Mariana, and elsewhere in the same province. This differs from *S. persicæfòlia*, in the leaves being narrower, and rather

tomentose beneath; in the woolly calyx and shorter corolla. Corolla 1½ inch long, scarlet.

Mariana Sage. Shrub.

195 S. Uiga'ati (Benth. lab. p. 282.) shrubby; branches glabrous; leaves petiolate, oblong or ovate-lanceolate, acuminated, subserrated, narrowly cuneated at the base, green on both surfaces, smoothish, glabrous; floral leaves linear, almost deciduous; racemes simple, short; whorls few, 2-4-flowered, approximate; calyx tubularly campanulate, corrugated from short wool outside, having the upper lip entire, and the teeth of the lower lip very short, ovate, bluntish; corolla twice as long as the calyx, woolly: tube much exserted; style bearded. ♄. S. Native of Brazil, St. Hil. Leaves almost like those of *S. persicæfòlia*, but broader, and on longer petioles. Flowers size of those of *S. persicæfòlia*, or a little smaller, but differs in the wool of the corolla and calyx.

St. Hilaire's Sage. Shrub.

196 S. salicifòlia (Pohl, pl. bras. 2. p. 140. t. 196.) shrubby; branches glabrous, pubescent, or clothed with rufous villi; leaves on short petioles, oblong-lanceolate, somewhat crenately serrated, narrowed at both ends, glabrous or hispid above, and clothed with fine rufous tomentum beneath; floral leaves ovate, acute, deciduous; racemes elongated; whorls about 6-flowered; calyx tubularly campanulate, glabrous or pubescent, having the upper lip entire, and the teeth of the lower lip very short and acute; corolla more than twice as long as the calyx: tube much exserted; style bearded. ♄. S. Native of Brazil, among bushes about Queluz, in the province of Minas Geraes, and elsewhere in the same province. This species differs from *S. persicæfòlia*, in the glabrous or pubescent calyxes, &c.

Willow-leaved Sage. Shrub.

197 S. Hæ'nkei (Benth. lab. p. 283.) shrubby; branches clothed with hoary tomentum and clammy villi at top; leaves on short petioles, ovate-oblong or oblong-lanceolate, acute, serrated, rounded at the base, wrinkled, clothed with white tomentum beneath; floral leaves bractes-formed, lanceolate, deciduous; racemes elongated, simple, or the lower whorls are irregularly cymose, and a little branched; calyx tubularly campanulate, clothed with clammy villi, having the upper lip entire, and the teeth of the lower lip bluntish; corolla about 3 times as long as the calyx, clothed with clammy villi: tube much exserted; genitals exserted; style glabrous. ♄. S. Native of Peru, Hænke. Upper whorls 6-flowered, but sometimes 8-10-flowered: lower ones elongated, or the racemes are branched at the base. Corolla 15-16 lines long, scarlet: tube slender, hardly widened at top. This species is very distinct in the form of the leaves and inflorescence.

Hænke's Sage. Shrub.

198 S. hirta (H. B. et Kunth, nov. gen. amer. 2. p. 296.) stem shrubby, erect, bifariously pilose; leaves ovate-oblong, acuminated, crenately-serrated, clothed with hoary pubescence beneath; spikes panicled; whorls remote, few-flowered; floral leaves ovate, acuminated, hairy, shorter than the calyxes, deciduous; calyx clothed with rather glandular hairs, tubularly campanulate; upper lip acuminated, entire: segments of the lower lip acuminately mucronate; corolla thrice as long as the calyx. ♄. S. Native of the Andes of Peru, near Ayavaca, and elsewhere. Leaves petiolate, 2 inches long. Corolla purple.

Hairy Sage. Shrub.

199 S. tortuòsa (H. B. et Kunth, nov. gen. amer. 2. p. 292. t. 142.) stems shrubby, erect, clothed with fuscescent tomentum; leaves petiolate, ovate-oblong, acuminated, narrowed at the base, serrated, clothed with fuscescent tomentum beneath, and pubescence above; spikes secund; whorls about 6-flowered, approximate; calyx tubularly campanulate, clothed with villous tomentum, having the upper lip entire, ovate, acuminated, subulate, and the segments of the lower lip acuminately subulate; corollas 2-3 times longer than the calyx, pubescently villous; genitals a little exserted. ♄. S. Native of New Granada, on the Andes of Quindiu. Branches twisted, clothed with fuscescent tomentum. Flowers on long pedicels. Corolla an inch long: upper lip emarginate, villous outside, and middle segment of the lower lip obcordate: tube widened above.

Twisted-branched Sage. Shrub.

200 S. curvifòra (Benth. lab. p. 284.) shrubby; branches clothed with tomentose pubescence; leaves petiolate, ovate-oblong, acute, crenately serrated, rounded or narrowed at the base, pubescent above, but clothed with soft hoary tomentum beneath; floral leaves acuminated, deciduous; flowers secund, incurvedly reflexed, nearly sessile; whorls 6-10-flowered; calyx tubular, pubescent, having the upper lip as well as the teeth of the lower lip acuminated; corolla about 4 times longer than the calyx, pubescent outside: tube rather widened above; stamens inclosed; style exserted, quite glabrous. ♄. G. Native of Mexico, near Tlalpuxahua. Shrub divaricately branched. Leaves 1 to 1½ inch long. Corolla reddish scarlet, nearly 1½ inch long: tube bidentate inside at bottom.

Curved-flowered Sage. Shrub.

201 S. Neovingensis (Benth. lab. p. 284.) shrubby?; branches finely pubescent; leaves petiolate, ovate, acuminated, serrately crenated, rounded at the base, soft, pubescent above, and pale and clothed with hoary tomentum beneath; upper leaves sessile: floral leaves lanceolate-subulate, longer than the calyxes, at length deciduous; racemes elongated, simple; whorls loose, remote, secund, 2-6-flowered; calyxes tubularly-campanulate, pubescent, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla 4-5 times longer than the calyx, nearly glabrous: tube slender at the base, and much widened at top: lower lip very short; genitals exserted; style glabrous. ♄. S. Native of Brazil, near Rio Janeiro, Prince Maximilian Neuwied. Nearly allied to *S. curvifòra*. Corolla 14-15 lines long, scarlet.

Neuwied Sage. Shrub.

202 S. frutictòrum (Benth. lab. p. 284.) herbaceous, erect, tall, nearly glabrous; leaves petiolate, ovate, acuminated, serrated, cuneated at the base, green on both surfaces, glabrous, or clothed with fine pubescence; floral leaves deciduous; racemes elongated, simple; whorls about 6-flowered, distant; calyx tubular, striated, pubescent, having the upper lip entire, and the teeth of the lower lip ovate, obtuse; corolla about 3 times as long as the calyx, villous outside: lower lip very short; stamens shorter than the corolla; style pubescent. ♃. S. Native of Brazil, among bushes at Arrayal, Prince Maximilian Neuwied. Leaves 3 inches long. Calyx green. Corollas deep red, form of those of *S. Neocidénsis*.

Bush Sage. Pl. 4 feet.

203 S. altíssimum (Pohl, pl. bras. 2. p. 136. t. 192.) suffruticose; branches erect, tall, nearly glabrous; leaves petiolate, ovate-oblong, acute, serrated, narrowly cuneated at the base, glabrous above, and clothed with fine pubescence beneath; floral leaves ovate, acuminated, deciduous; racemes elongated, simple; whorls distant, many-flowered; calyx tubular, villous, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla more than twice as long as the calyx, glabrous: tube much exserted: lips equal; style pilose. ♄. S. Native of Brazil, among bushes at Arrayal Santa Rita, in the province of Goyaz. Branches, as well as the nerves of the leaves and calyxes, clothed with glandular villi. Corolla pure red, 14 lines long: tube scarcely widened at top. Leaves 4-5 inches long.

Tallest Sage. Shrub 6 to 7 feet.

204 S. moschāta (H. B. et Kunth, nov. 2. p. 293, t. 143.) shrubby, erect, glabrous; leaves petiolate, ovate, acute, cuneated at the base, serrated, glabrous or pilose; whorls 5-6 flowered, distant; calyx tubular, striated, glabrous or pilose, having the upper lip ovate, acuminated, entire, and the segments of the lower lip acuminated; corolla thrice as long as the calyx; tube widened at top; upper lip emarginate; middle segment of the lower lip short, retuse; style villous on the upper side. ♄. S. Native of New Granada, near Almaguer, among bushes. Plant exhaling a scent of musk. Leaves 2 inches long; pilose on the veins beneath. Spikes terminal, pedunculate. Corolla purple. Calyxes clothed with fuscescent hairs while young. Allied to *S. Neovidénsis* and *S. altíssima*.

Musky-scented Sage. Shrub, 4-6 feet.

205 S. sequālens (H. B. et Kunth, nov. gen. amer. 2. p. 297.) stem shrubby, erect, and are, as well as the branches, pilose and clammy; leaves petiolate, ovate-oblong, obtuse, cordate, crenated, coriaceous, wrinkled above, and pilose but clothed with hoary tomentum beneath; whorls 2-flowered, distant; floral leaves ovate-oblong, shorter than the calyxes, deciduous; calyx tubular, hairy, striated, the upper lip, and segments of the lower lip, acuminated; corolla twice as long as the calyx, pubescent; stamens exserted. ♄. S. Native of Peru, on the Andes. Branches purple. Leaves 1½ to 2 inches long. Spikes terminal. Corolla purple.

Filthy Sage. Shrub.

206 S. rubescens (H. B. et Kunth, nov. gen. amer. 2. p. 301. t. 154.) stem shrubby, erect, canescent, glabrous; leaves on long petioles, ovate, narrowly-acute, cordate, crenated, clothed with fine hoary tomentum beneath; spikes panicled; whorls 4-6 flowered, distant; calyx densely clothed with clammy hairs, tubular, purple, having the upper lip ovate, acute, entire, and the teeth of the lower lip acuminated; corolla glabrous, twice as long as the calyx. ♄. S. Native of Quito, in temperate places. Leaves 4 inches long. Leaves pubescent above. Corolla beautiful purple.

Reddish-flowered Sage. Shrub.

207 S. hirtella (Vahl. enum. 1. p. 249.) stem herbaceous? ascending, clothed with clammy villi; leaves petiolate, ovate-oblong, acute, crenated, roundly-cuneated at the base, green on both surfaces, and nearly glabrous; floral leaves ovate, acute, deciduous; racemes elongated, simple; whorls about 6-flowered, remote; calyx tubular, very hairy, having the upper lip entire, and the teeth of the lower lip ovate, obtuse; corolla more than twice as long as the calyx, villous outside: tube much exserted: lips nearly equal; genitals much exserted. ♄.? S. Native of Peru, Dombey. Corolla scarlet, an inch long; tube dilated a little at top.

Hairy Sage. Shrub.

208 S. secunda (Benth. lab. p. 285.) stem herbaceous, erect, glabrous; branches pubescent; leaves petiolate, oblong, narrowed at the base, acute, serrated, rather hispid above, and glabrous beneath: floral leaves ovate, acuminated, deciduous; whorls about 6-flowered, secund; calyx tubular, striated, pubescent, having the upper lip entire, and the teeth of the lower lip acute; corolla one half longer than the calyx, pubescent outside: tube a little exserted, nearly equal, or hardly contracted at the throat: lips short, nearly equal; genitals inclosed; style glabrous. ♃.? G. Native of the South of Brazil, Sello. Leaves 2-3 inches long. Corolla scarcely half an inch long. Hairs of branches reflexed.

Var. β; leaves clothed with hoary tomentum beneath. ♄. G. Native of Brazil, in the province of Minas Geraes.

Second-flowered Sage. Pl.?

209 S. ciliāta (Benth. lab. p. 286.) stem herbaceous?; branches elongated, glabrous, or the angles and petioles are ciliated; leaves petiolate, ovate, acute, crenately serrated, roundish or subcordate at the base, nearly glabrous: floral leaves ovate, acuminated, ciliated at length, deciduous; whorls about 10-flowered; calyx tubular, striated, pubescent, having the upper lip entire, and the teeth of the lower lip acute; corolla pubescent outside, 2-3 times longer than the calyx: tube widened at top: lips nearly equal; style glabrous, exserted. ♃.? S. Native of Mexico, among bushes, at Papantla. Leaves downy on the nerves. Corolla scarlet. Allied to *S. lamiifólia*, like the preceding.

Ciliated Sage. Shrub. ?

210 S. élegans (Vahl. enum. 1. p. 238.) stem herbaceous, erect, glabrous, or furnished with scattered hairs; leaves petiolate, ovate, acuminated, serrated, rounded or narrow at the base, rather hispid above, and glabrous beneath; floral leaves sessile, ovate, acuminated, deciduous; whorls remote, about 6-flowered; flowers on short pedicels; calyx campanulate, clothed with glandular villi, having the upper lip almost entire, or with 1-3 short awns, lower lip shortly bidentate, 2-awned; corolla pubescent outside, six times as long as the calyx: tube slender, incurved: lips equal, oblong; stamens a little exserted, bearded. ♃ ? S. Native of Mexico, near Tlalpuxahua and Guanaxuato. *S. incarnàta*, Cav. ann. sc. 2. p. 112. H. B. and Kunth, nov. gen. amer. 2. p. 298. t. 144. *S. microcalúlis*, Poir. dict. 6. p. 614. Branches purplish at the base. Leaves 1 to 1½ inch long. Corolla blood-red, more than an inch long. Tube toothless inside.

Elegant Sage. Pl. 4 feet.

211 S. mentiens (Pohl, pl. bras. 2. p. 137. t. 193.) herbaceous, erect; stem glabrous at the base, but furnished with spreading hairs at apex; leaves petiolate, ovate, acuminated, serrated, rounded at the base, green and glabrous on both surfaces; floral leaves small, deciduous; racemes simple, elongated; whorls remote, few-flowered; calyx tubularly campanulate, green at the base, villous, membranous, and coloured at top, having the upper lip entire, and the teeth of the lower lip ovate, subulately acuminated; corolla 4-5 times longer than the calyx: tube much exserted: lips short, nearly equal, broad; genitals inclosed; style glabrous. ♃ ? S. Native of Brazil, at Serra d'Estrella, and about Fazenda de Padre Correa, in the province of Rio Janeiro, and about the town of Rio Janeiro. Herb nearly simple. Calyx scarlet at top. Corolla scarlet, nearly glabrous, 18-22 lines long. Tube widened a little at top.

Disguising Sage. Pl. 1½ foot.

212 S. selloidens (Sello ex Roem. et Schultes, syst. mant. 2. p. 185. Benth. lab. p. 287.) shrubby; branched; branches glabrous; leaves petiolate, ovate, acuminated, crenately serrated, cuneate, rounded or subcordate at the base, glabrous on both surfaces; floral leaves ovate, acuminated, coloured, deciduous; whorls 2-flowered; calyx campanulate, membranous, coloured, glabrous, or the nerves and pedicels are villous, having the upper lip entire, and the teeth of the lower lip broad, ovate, acute; corolla glabrous outside, about three times as long as the calyx: tube exserted, widened a little; lower lip short; stamens exserted; style glabrous. ♄. G. Native of Brazil, in woods at Guaxindiba, near Rio Janeiro. Ker. bot. reg. t. 687. Rehb. hort. bot. 1. t. 51. Colla in acad. taur. 31. p. 331. t. 17. S. colórans, Hortul. S. Brasiliénsis, Spreng. syst. 2. p. 56.—An elegant species, very common in gardens, having the floral leaves, calyxes, and corollas scarlet. Corolla 2 to 2½ inches long. This species is a very great ornament in the autumn, if planted out in the open ground against a south wall.

Shining Sage. Fl. Sept. Nov. Clt. 1822. Shrub 3 to 4 feet.

213 S. involucrāta (Cav. icon. 2. p. 114. t. 195.) stem

shrubby; branches elongated, glabrous; leaves petiolate, ovate, acuminated, crenately serrated in the middle, roundly serrated at the base, glabrous; floral leaves bractea-formed, sessile, broad-ovate, acuminated, coloured, imbricated before florescence, deciduous; whorls about 6-flowered, approximate; calyx tubularly campanulate, striated, having the upper lip entire, and the teeth of the lower lip short, ovate, setaceously acuminated; corolla 2-3 times as long as the calyx; tube ventricose, glabrous: lips short, nearly equal; style bearded. ♄. G. Native near to the city of Mexico and Tlalpuxahua. Bot. reg. 1205. Hook. bot. mag. t. 2872. S. lævigàta, H. B. et Kunth, nov. gen. amer. 2. p. 295. t. 147. Corolla rose-coloured.

Involucrated-flowered Sage. Fl. July, Aug. Clt. 1825. Shrub 2-4 feet.

214 S. Sessèi (Benth. lab. p. 288.) stem shrubby; branches nearly glabrous: leaves petiolate, ovate-oblong, acuminated, rounded, cuneated, or narrowed at the base, glabrous on both surfaces, or pubescent beneath; floral leaves smaller: uppermost ones minute, deciduous; whorls few-flowered, panicled; calyx inflately-campanulate, membranous, coloured, glabrous, having the upper lip entire, and the teeth of the lower lip ovate, rounded; corolla about three times as long as the calyx, pubescent outside; tube much exserted, nearly equal; style glabrous. ♄. G. Native of New Spain, on the western declivity of Cordillera de Guchillaque. Leaves 2-3 inches long, rather coriaceous. Panicles short, loose. Fructiferous calyx large, scarlet. Corolla nearly 2 inches long, scarlet. Upper lobe of style very long.

Sessé Sage. Shrub.

215 S. Agglutina'ta (Lag. gen. et spec. nov. p. 2. no. 120.) leaves cordate-ovate-lanceolate, acute, serrated, white beneath; corolla pubescent, four times longer than the calyx, which is inflated; stem hairy, clammy. ♄. S. Native of New Spain. S. frutícosa, Cervantes. Leaves clothed with clammy villi, particularly while young. Whorls about 6-flowered, bracteate. Bracteas ovate, acuminated, concave, deciduous, shorter than the calyxes. Corolla scarlet. Style bearded. This species agrees with *S. Sessèi* in the calyx; but the leaves are very distinct.

Clammy Sage. Shrub.

216 S. pube'scens (Benth. lab. p. 723.) stem shrubby; branches tomentosely pubescent; leaves petiolate, ovate, bluntish, rounded at the base, wrinkled, pubescent above, and clothed with hoary villi beneath; floral leaves smaller: upper ones minute, deciduous; whorls few-flowered, rather panicled; flowers nearly sessile; calyx inflately tubular, rather incurved, coloured at top, having the upper lip entire, and the teeth of the lower lip broad-ovate, obtuse; corolla twice as long as the calyx, pubescent outside: tube much exserted, nearly equal: lips nearly equal; style shortly bearded. ♄. S. Native of Mexico at San Dionicio, in Oaxaca. Allied to *S. Sessèi* and *S. Règla*.

Pubescent Sage. Shrub.

217 S. Re'gla (Cav. icon. 5. p. 33. t. 455.) stem shrubby; branches glabrous or pubescent under the axils; leaves petiolate, rounded, obtuse, sinuately crenated, broadly subcordate at the base, coriaceous, wrinkled, rather hispid above, nerved and pubescent beneath; floral leaves conforming to the others; whorls terminal, few-flowered; flowers nearly sessile; calyx tubular, coloured, having the upper lip entire, and the teeth of the lower lip broad-ovate, acutish; corolla twice as long as the calyx, pubescent outside; tube ventricose; style glabrous, exserted. ♄. S. Native of Mexico at Vilalpando and Regla. Branches purplish. Leaves 1½ inch long, fuscescent beneath. Flowers crowded in the number of 3 to 6, at the tops of the branches. Calyx pubescent. Corolla scarlet.

Regla Sage. Shrub 5 to 6 feet.

218 S. Grama'mi (Benth. in bot. reg. t. 1370.) stem shrubby; branches glabrous or bifariously pubescent; leaves petiolate, oval, obtuse, rounded or cuneated at the base, irregularly crenated in the middle, nearly glabrous; floral leaves ovate, acuminated, ciliated, deciduous; racemes elongated; whorls 2-flowered; calyx tubular, striated, pubescent on the nerves, having the upper lip entire, and the teeth of the lower lip acute; corolla twice as long as the calyx, glabrous outside: tube much exserted, ventricose: middle lobe of lower lip very broad, emarginate; style shortly bearded. ♄. S. Native of Mexico, in several places. Calyxes usually coloured. Flowers smaller than those of *S. microphýlla*; but the leaves are larger.

Graham's Sage. Shrub.

219 S. microphy'lla (H. B. et Kunth, nov. gen. amer. 2. p. 294.) stem shrubby; branches finely pubescent: leaves petiolate, ovate, obtuse, minute, regularly crenated, rounded at the base, wrinkled, pubescent; floral leaves ovate, acuminated, deciduous; racemes short; whorls 2-flowered; calyx tubular, striated, with pubescent nerves, having the upper lip entire, and the teeth of the lower lip acuminated; corolla twice as long as the calyx, glabrous outside: tube ventricose, exceeding the calyx: throat contracted: middle lobe of lower lip broad; style shortly bearded. ♄. G. Native of New Spain, near Santa Rosa, Moran, and Pachucan. Leaves 3-4 lines long. Corolla reddish, purple, or scarlet.

Small-leaved Sage. Shrub 1 foot.

220 S. subrotu'nda (St. Hil. mss. ex. Benth. lab. p. 290.) herbaceous, erect; branches glabrous; leaves petiolate, broad-ovate, roundish, bluntish, crenately serrated, rounded or truncate at the base, green and glabrous on both surfaces; racemes elongated, simple; whorls loose, 2-6-flowered; flowers pedicellate; calyx tubularly campanulate, pubescent, coloured at top; corolla more than twice as long as the calyx: tube exserted, widened: middle segment of lower lip very broad; genitals exserted; style glabrous. ♃. ? S. Native of Brazil. Nearly allied to *S. coccínea*.

Roundish-leaved Sage. Pl. 1 to 2 feet?

221 S. coccínea (Lin. mant. p. 88.) stem herbaceous, erect, clothed with hoary pubescence; leaves petiolate, ovate, acute, crenated, cordate at the base, pubescent above, and clothed with hoary tomentum beneath; floral leaves ovate, acuminated, deciduous; racemes simple; whorls 6-10-flowered, remote; calyx tubularly campanulate, striated, pubescent, having the upper lip entire, and the teeth of the lower lip acute; corolla glabrous, twice as long as the calyx: tube exserted, widened at top: upper lip short: middle segment of the lower lip broad, emarginate. ♃. S. Native of Florida, Georgia, Mexico, Cuba, Jamaica, Brazil, in the province of Goyaz; East Indies, on the banks of the Ganges, and about Madras, but probably escaped from gardens. Murr. comm. gœtt. 1778. p. 86. t. 1. S. rósea, Vahl. enum. 1. p. 244. S. glaucéscens, Pohl. pl. bras. 2. p. 136. t. 192. Horminum coccíneum, Mœnch. Stem branched, hoary, sometimes hispid at the base from pili. Leaves 1-2 inches long, very soft beneath: floral ones shorter than the calyxes. Calyx often purplish. Corolla scarlet.

Scarlet-flowered Sage. Fl. April, Oct. Clt. 1772. Pl. 1 to 3 feet.

222 S. pseudo-coccí'nea (Jacq. coll. 2. p. 302. icon. rar. p. 22. t. 209.) stem herbaceous, erect, hispid from long spreading hairs; leaves petiolate, ovate, acute, crenated, rounded or subcuneated at the base, pubescent above, and clothed with hoary tomentose pubescence beneath; floral leaves ovate, acuminated, deciduous; racemes simple; whorls 6-10-flowered, remote; calyx tubular, striated, pubescent, having the upper lip entire, and the teeth of the lower lip acute; corolla pubescent outside, twice as long as the calyx: tube exserted, equal: middle lobe of lower lip very broad, emarginate; style exserted, glabrous. ♃. S. Native of tropical America in New Andalusia, on the

declivity of Mount Tumiriquiri; also of Caraccas, and Trinidad. Bot. mag. 2864. This species differs from *S. coccinea*, in being taller, beset with long hairs, not with hoary tomentum; and in the leaves being rounded at the base, not cordate, &c. Corollas scarlet.

False-scarlet Sage. Fl. June, Aug. Clt. 1797. Pl. 2 to 3 feet.

223 S. PHŒNÍCEA (H. B. et Kunth, nov. gen. amer. 291.) stems shrubby, erect, and are, as well as the branches, muricately hispid; leaves ovate, acute, subcordate, serrated, glabrous; racemes terminal; whorls many-flowered, distant; calyx tubular, hispidly glandular, having the upper lip entire and acute, and the segments of the lower lip acuminated; corolla downy outside, twice as long as the calyx: middle segment of lower lip large, emarginately 2-lobed; stamens much exserted. ♄. S. Native of Quito, at the roots of the mountains of Colopaxi and El Corazon, between Mulalo and Tambillo. Leaves pilose on the middle nerve, above 1½ inch long, strong-scented. Peduncles purplish, glandularly pilose, as well as the floral leaves. Corolla blood-coloured. A plant intermediate between *S. pseudo-coccinea* and *S. pulchélla*. Leaves quite glabrous. Allied to *S. glumácea*, yet the flowers are very different.

Crimson-flowered Sage. Shrub 3 to 4 feet.

224 S. LINEA'TA (Benth. lab. p. 724.) branches bifariously pubescent; leaves petiolate, ovate, obtuse, crenated, truncate at the base, green on both surfaces, and clothed with fine pubescence; floral leaves broad-ovate, deciduous; racemes simple; whorls 4-6-flowered; calyx tubularly-campanulate, green, pubescent, having the upper lip entire, and the teeth of the lower lip ovate, scarcely acuminated; corolla twice as long as the calyx: tube exserted, ventricose: throat contracted; upper lip villous; stamens enclosed; style plumose. ♄. ? S. Native of Mexico, Karwinski. Leaves almost like those of *S. Grahàmi*. Corollas form of those of *S. fúlgens*, but smaller. Floral leaves imbricate before florescence, pubescent, ciliated. Leaves crenated.

Lined-leaved Sage. Shrub.

225 S. PULCHE'LLA (D. C. cat. hort. monsp. p. 142. Benth. lab. p. 291.) stem shrubby; branches pubescent; leaves petiolate, ovate, narrowed at apex, bluntish, crenated, broad and cordate at the base, membranous, wrinkled a little, nearly glabrous; floral leaves membranaceous, acuminated, deciduous; racemes simple; whorls about 10-flowered; calyx tubular, striated, finely-pubescent, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla twice or thrice as long as the calyx, glabrous outside: tube much exserted, bidentate inside at the base: middle segment of the lower lip broad-roundish, shortly-emarginate; style shortly-bearded above. ♄. G. Native of Mexico. S. dolióstachys *Lag.* Colla, hort. vip. p. 125. t. 16. Allied to *S. fúlgens*, but differs in the thinner nearly glabrous leaves, and more glabrous stem, and shorter glabrous corollas, &c. Corollas scarlet.

Pretty Sage. Fl. Oct. Feb. Clt. 1821. Shrub 2 feet.

226 S. VE'RNANS (Cav. icon. 1. p. 15. t. 23.) stem shrubby; branches pilosely-hairy; leaves petiolate, ovate, acute, crenately-serrated, cordate at the base, pubescent above, clothed with white tomentum or wool beneath; floral leaves sessile, ovate, acuminated, deciduous; whorls 6-flowered; calyxes longer than their pedicels, tubularly-campanulate, pubescent, having the upper lip entire, and the teeth of the lower lip ovate, shortly and bluntly-acuminated; corolla twice as long as the calyx: tube exserted, ventricose, bidentate inside at the base: throat contracted: upper lip villous outside; stamens enclosed; style plumose, hardly exserted. ♄. G. Native of Mexico, on the mountains. Sweet, fl. gard. n. s. 1. t. 59. Bot. reg. t. 1356. S. cardinàlis. H. B. et Kunth, nov. gen. amer. 2. p. 301. t. 151. S. splèndens Nova, Lond. gard. mag. 5. p. 577. f. 116. Leaves variable in hairiness, and size from 1 to 3 inches long: floral leaves usually coloured, deciduous. Corollas showy, scarlet, 2 inches long: upper lip a little longer than the lower one.

Fulgent Sage. Fl. May, Oct. Clt. 1829. Shrub 2 to 5 feet.

227 S. AYAVACE'NSIS (H. B. et Kunth, nov. gen. amer. 2. p. 298.) stem shrubby, erect, and is, as well as the branches, beset with yellow hairs; leaves petiolate, ovate, acute, cordate, crenated, pilose beneath; spikes terminal, sessile; whorls 6-8 flowered, distant; calyx tubular, striated, glandularly pilose, having the upper lip, and the teeth of the lower lip, subulately acuminated. ♄. S. Native of Peru, in temperate places between Ayavaca and the river Cutaco. Leaves 2 to 2½ inches long. Rachis and pedicels hairy. Corolla purple, ex Bonpl. Allied to *S. rubéscens* and *S. squàlens*, but differs in the corolla being blue.

Ayavaca Sage. Shrub 4 to 6 feet.

228 S. ACUMINA'TA (Ruiz, et Pav. fl. per. 1. p. 24. t. 37. f. b.) stem suffruticose, erect, villous; leaves petiolate, ovate, acuminated, crenately-serrated, cordate at the base, wrinkled, rather hispid above, and of the same colour beneath, pubescent on the nerves: floral leaves about equal in length to the calyxes, ovate-oblong, obtuse, membranous, ciliated, deciduous; racemes almost simple; whorls about 6-flowered, remote; flowers pedicellate; calyx tubular, striated, pubescent, having the upper lip entire, and the teeth of the lower one lanceolate and a little incurved; corolla twice as long as the calyx: tube exserted, a little incurved: lips nearly equal. ♄. S. Native of Peru, in Pillao and Canta. Floral leaves glumaceous, flesh coloured. Calyx almost an inch long. Corolla flesh coloured.

Acuminated-leaved Sage. Shrub 5 to 6 feet.

229. S. LONGIFLO'RA (Ruiz, et Pav. fl. per. 1. p. 23. t. 10. f. a.) stem shrubby, erect, villous, clammy; leaves petiolate, ovate, acuminated, serrated, cordate at the base, pubescently-hairy, clothed with white tomentum beneath; floral leaves ovate, acute, coloured, deciduous; raceme simple; whorls few-flowered, distant; calyx ovate, inflated, coloured, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla very long, five times longer than the calyx, hairy outside: tube ample, much exserted: lips nearly equal; style glabrous. ♄. S. Native of Peru in Tarma at Huichay. Shrub much branched. Leaves ample. Racemes elongated, nutant. Corolla 5 inches long, showy, colour of wool.

Long-flowered Sage. Shrub 10 to 15 feet.

* * * * CÆRU'LEÆ. *Corollas blue, or bluish-violet.*

230 S. RUBICUNDÒLIA (H. B. et Kunth, nov. gen. amer. 2. p. 305.) stem shrubby, erect, and is, as well as the branches, pubescently-hairy; leaves petiolate, oblong, hastate, bluntish, crenated, clothed with hoary tomentose wool beneath; panicles terminal; whorls 2-flowered, remote; calyx clothed with glandular hairs, campanulate, striated, having the upper lip entire and acute, and the teeth of the lower lip acutish. ♄. S. Native near the city of Quito, at the foot of Mount Javirac. Leaves wrinkled and pilose above, 4 inches long and 2½ broad. Peduncles, and branches of panicle beset with glandular hairs. Corolla unknown. A beautiful species, intermediate between sections *Brachyánthæ* and *Longiflòræ*.

Dock-leaved Sage. Shrub 4 to 5 feet.

231 S. PETIOLA'RIS (H. B. et Kunth, nov. gen. amer. 2. p. 304.) stems herbaceous, erect, branched, pubescent; leaves on very long petioles, deltoid, cordately-hastate, bluntish, irregularly crenate-serrated, hairy; spikes terminal, on long peduncles, usually by threes; whorls 2-flowered, distant; calyx clothed with glandular hairs, campanulate, having the upper lip tridentate, and the lower one bifid, with acuminated segments.

4. S. Native of tropical America, on the banks of the river Magdalena. Leaves 3 inches long. Corolla blue, pubescent.

Petiolate-leaved Sage. Pl. 1½ foot.

232 S. sagitta'ta (Ruiz, et Pav. fl. per. 1. p. 23. t. 35. f. a.) stem herbaceous, erect, villous; leaves petiolate, triangularly sagittate, acute, crenately serrated, much wrinkled, clothed with soft villi; floral leaves ovate, acuminated, deciduous; racemes elongated, branched; whorls remote, 2-6-flowered; flowers pedicellate; calyx ovate, villous, having the upper lip broad-ovate, obtuse, or tridentate, and the teeth of the lower lip acutish; corolla 4 times longer than the calyx: tube exserted, rather inflated beneath: middle lobe of lower lip emarginate; style glabrous. 4. S. Native of Peru, plentiful in gardens, and in waste places of Tarma and Huanuco, and at Olrajillo; and of New Granada, on Mount Quindiu. Stem much branched at bottom. Branches villous, and glandularly pubescent. Leaves 2-3 inches long. Calyx purplish-violet. Corolla pale blue, downy outside. The vernacular name of this species in Peru is *Salvia Real*, where the plant is used as a substitute for common sage.

Sagittate-leaved Sage. Pl. 4 to 6 feet.

233 S. vitifo'lia (Benth. lab. p. 724.) stem herbaceous, erect, villous; leaves petiolate, broadly deltoid, angularly lobed, truncate at the base, or broadly and sagittately cordate, thick, villously hairy, and green on both surfaces, or rufescent beneath; floral leaves ovate-lanceolate, acuminated, deciduous; racemes elongated, branched; whorls remote, 2-6-flowered; flowers pedicellate; calyx ovate-campanulate, villous, having the upper lip somewhat tridentate, and the teeth of the lower lip acuminated; corolla 3-4 times longer than the calyx: tube a little exserted, ventricose: limb gaping: upper lip falcate; style glabrous. 4. S. Native of Mexico, on Mount San Felipe, near Oaxaca. Habit of *S. petiolaris*, *S. sagittata*, and *S. macrophylla*, but differs in the form of the leaves. Corollas blue, almost like those of *S. petiolaris*.

Vine-leaved Sage. Pl. ?

234 S. macrophy'lla (Benth. lab. p. 725.) stem herbaceous, erect, pilosely hispid; leaves on long petioles, ample, ovate, cordate: upper ones hastate, a little wrinkled, green on both surfaces, hispid; floral leaves ovate, deciduous; racemes elongated, branched, clammy; whorls remote, 2-6-flowered; flowers pedicellate; calyx campanulate, at length elongated, villous, having the upper lip very shortly tridentate, and the lower one bifid: the teeth all ovate, acute; corolla about 4 times as long as the calyx: tube exserted, widened: lips nearly equal; style glabrous. 4. S. Native of Peru, in the valley of Huanuco. Allied to *S. sagittata*; but differs in the taller stature, in the larger broader leaves, with the auricles rounded at the base.

Long-leaved Sage. Pl. 5 to 6 feet.

235 S. scutellarioi'des (H. B. et Kunth, nov. gen. amer. 2. p. 303. t. 158.) plant herbaceous; branches pilosely pubescent, or nearly glabrous; leaves petiolate, ovate, deltoid, acutish, crenately-serrated, cordately hastate at the base, hairy on both surfaces; floral leaves ovate, deciduous; racemes nearly simple, elongated; whorls distant, generally 2-flowered; calyx campanulate, clothed with clammy villi, having the upper lip shortly trilentate, and the lower lip bifid: teeth all acute; corolla 3 times longer than the calyx: tube much exserted, ventricose: middle segment of the lower lip emarginate; genitals much exserted. 4. S. Native of tropical America, as of the province of Quito, near Chillo; and in humid sandy places near Santa Fe de Bogota. Stems procumbent at the base. Branches a foot long, nearly naked in the upper part. Leaves 1½ inch long, and nearly the same in breadth. Corolla an inch long, blue, pubescent outside. Form of calyx and lower lip of corolla almost as in section *Brachyánthæ*.

Skullcap-like Sage. Pl. 1 foot.

236 S. pa'tens (Cav. icon. 5. p. 33. t. 454.) stem herbaceous, erect, pilose; leaves petiolate, ovate-deltoid, crenated, hastate at the base, or the upper ones are rounded, hispid on both surfaces; floral leaves lanceolate-linear; whorls few, remote; flowers large; calyx campanulate, villous, having the upper lip very shortly tricuspidate, and the lower lip bifid: teeth acuminated; corolla about 3 times as long as the calyx: throat widened; stamens much exserted; style very long, glabrous. 4.? G. Native of Mexico, near Tlalpuxahua, Guanaxuato, and Santa Rosa, and near Real del Monte. S. grandiflòra, Nee, ex Cav. S. spectàbilis, H. B. et Kunth, nov. gen. amer. 2. p. 304. Stems nearly simple. Lower leaves petiolate: upper ones nearly sessile, paler beneath: floral leaves quite entire, clothed with glandular villi. Corolla blue, more than 2 inches long, pubescent outside; middle lobe of lower lip very broad, emarginate.

Spreading Sage. Pl. 1 to 2 feet.

237 S. longi'styla (Benth. lab. p. 295.) stem herbaceous? erect, clothed with tomentose villi; leaves petiolate, broad, ovate, acuminated, crenated, amply cordate at the base, wrinkled, clothed with soft pubescent villi on both surfaces: superior ones sessile; floral leaves ovate, long-acuminated, ciliated, deciduous: uppermost ones rather connate; whorls 6-10-flowered; calyx elongated, tubular, striated at the base, clothed with soft pubescence, having the upper lip entire, and the teeth of the lower lip very short, and setaceously acuminated; corolla hardly twice as long as the calyx: tube equal: middle lobe of lower lip bifid; genitals exserted; style glabrous, the upper lobe very long and subulate. 4.? G. Native of Mexico, near Zinapecuaro, Graham. Corolla blue, a little incurved.

Long-styled Sage. Pl. ?

238 S. amethy'stina (Smith, icon. ined. 2. p. 27. t. 27.) shrubby; branches clothed with white villi; leaves petiolate, ovate, acute, deeply cordate at the base, with rounded auricles, wrinkled, pubescent above, but clothed with hoary or white tomentum beneath; floral leaves lanceolate, deciduous; racemes elongated, simple; whorls loose, 6-flowered, remote; calyx tubularly campanulate, villous outside, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla about twice as long as the calyx: tube exserted, ventricose: lips nearly equal: middle lobe of lower lip almost entire; genitals inclosed; style bearded. h. S. Native of tropical America, on the Andes of Quindiu, &c. Leaves 2 to 3½ inches long, serrated. Corollas form of those of *S. fúlgens*, or *S. Mexicàna*, but blue, and 1 inch long. Leaves similar to those of *S. fúlgens*.

Amethyst-flowered Sage. Fl. Aug. Sept. Clt. 1817. Shrub 2 to 4 feet.

239 S. Karwi'nski (Benth. lab. p. 725.) stem shrubby?; branches clothed with rufous wool; leaves petiolate, ovate, acuminated, crenated, rounded at the base, rather wrinkled above, and roughish, and clothed with rufous wool beneath; floral leaves deciduous; whorls many-flowered; calyx ample, tubular, clothed with glandular villi, having the upper lip entire, and the teeth of the lower lip very short, long-acuminated; corolla twice as long as the calyx; genitals equalling the corolla; style glabrous. h.? G. Native of Mexico, Karwinski. Allied to *S. longistyla* and *S. amethystina*. Habit of *S. Hæ'nkei*, but the corolla is blue.

Karwinski's Sage. Shrub.

240 S. cya'nea (Benth. lab. p. 296. but not of Fisch.) stem shrubby; branches clothed with hoary pubescence; leaves petiolate, ovate, acuminated, serrately crenated, cordate at the base, pubescent on both surfaces; floral leaves ovate, acuminated, membranous, deciduous; racemes simple; whorls loosely

6-10-flowered, rather secund; calyx tubular, clothed with rufous villi: upper lip very short, tricuspidate, and the teeth of the lower lip lanceolate-acute; corolla about 3 times as long as the calyx: tube exserted, ventricose above: lips nearly equal: style bearded. ♄. G. Native of New Spain, Moçino et Sessé. Allied to *S. amethystina*; but differs in the more acuminated leaves, and particularly in the slenderer calyxes being clothed with rufous villi, and in the tricuspidate upper lip.

Azure-flowered Sage. Shrub.

241 S. Mexica'na (Lin. spec. p. 37.) stem shrubby, erect, tomentose; leaves petiolate, ovate or oblong, narrowed at both ends, crenately serrated, pubescently tomentose; floral leaves ovate, acute, deciduous, scarcely longer than the pedicels; whorls 6-20-flowered; calyx tubular, with ciliated nerves, having the upper lip entire, and the teeth of the lower lip ovate, acute, and mutic; corolla twice as long as the calyx: tube inflated at the middle, contracted under the throat: lips nearly equal; upper lip pubescent: middle lobe of lower lip smaller than the lateral ones, roundish, emarginate; style bearded, with subulate unequal lobes. ♄. S. Native of Mexico, near Pazcuaro, and near the city of Mexico. Cav. icon. 1. p. 16. t. 26. S. melissæfòlia, Desf. cat. hort. par. Sclàrea Mexicàna, Dill. hort. elth. 339. t. 254. f. 330. Mill. dict. no. 14. Júngia altíssima, Mœnch. meth. Leaves 2-3 inches long. Corolla blue; tube oblong, bidentate inside.

Var. β, màjor (Benth. lab. p. 297.) younger leaves more densely and velvety tomentose. ♄. S. S. papilionàcea, Cav. icon. 4. p. 9. t. 319. S. nitidifòlia, Ortega, dec. p. 9. This is a large handsome plant. The wings of the corolla figured by Cavanilles, must be the side lobes of the lower lip split up by accident, ex Benth.

Mexican Sage. Fl. May, July. Clt. 1724. Shrub 4 to 6 feet.

242 S. glabra'ta (H. B. et Kunth, nov. gen. amer. 2. p. 299.) shrubby? glabrous; leaves petiolate, ovate, acuminated, serrately crenated, cordate at the base, green on both surfaces, glabrous; floral leaves small, deciduous; racemes elongated, simple; whorls loose, 6-10-flowered; flowers on long pedicels; calyx tubularly campanulate, nearly glabrous, having the upper lip entire, and the teeth of the lower lip subulately acuminated; corolla more than twice as long as the calyx: tube much exserted, ventricose: lips rather short: upper lip villous: middle lobe of lower lip very broad; style bearded. ♄. S. Native of Mexico, Karwinski; and of New Spain, at the monastery of Caripe, and the village of Coccollar. Larger leaves 2-4 inches long. Corolla violaceous, an inch long. Stamens inclosed. Style a little exserted.

Glabrous Sage. Shrub.

243 S. cóncolor (Lamb. herb. ex Benth. lab. p. 297.) stem shrubby?; branches glabrous; leaves petiolate, ovate, acuminated, serrated, truncate at the base, glabrous; floral leaves deciduous; racemes elongated, simple; whorls remote, many-flowered; flowers on long pedicels; calyx tubular, striated, villous, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla twice as long as the calyx, pubescent outside: tube slender, exserted, ventricose at top: lips nearly equal; style glabrous. ♄. S. Native of Mexico. This differs from *S. amethystina*, in the leaves being glabrous, truncate at the base, not cordate; in the long pedicels. Calyx bluish, villous; hairs usually glanduliferous. Corolla blue. Leaves same colour on both surfaces, sometimes pubescent in the young state.

Self-coloured-leaved Sage. Shrub. ?

244 S. caru'lea (Benth. lab. p. 298.) stem herbaceous? erect; branches glabrous, or spreadingly pilose; leaves petiolate, ovate, long-acuminated, truncate, rounded or subcordate at the base, glabrous; floral leaves deciduous; whorls 2-6-flowered, somewhat secund; calyx tubular, having the upper lip entire, and the teeth of the lower lip very short and bluntish; corolla about 3 times as long as the calyx: tube exserted, widened at top: lips nearly equal: upper lip pubescent outside; connective minutely toothed behind; style glabrous. ♃.? G. Native of the south of Brazil, Sello. Upper part of branches generally hispid from glanduliferous hairs. Leaves usually hispid from a few scattered hairs above, 4 inches long. Flowers on short pedicels. Calyxes green & bluish, pubescent. Corolla blue, 1½ to 4 inches long. Stamens equalling the lower lip.

Blue-flowered Sage. Pl. ?

245 S. tubiflòra (Cav. icon. 1. p. 16. t. 25.) stem herbaceous, nearly glabrous; leaves petiolate, broad-ovate, serrately crenated, roundedly truncate or subcuneated at the base, nearly glabrous above, or clothed with hoary pubescence beneath; floral leaves deciduous; racemes simple; whorls about 6-flowered, secund; flowers nearly sessile; calyx tubular, striated, nearly glabrous, having the upper lip entire, and the teeth of the lower lip ovate, acuminated; corolla 3-4 times as long as the calyx, glabrous outside, or pubescent: tube exserted, equal, a little incurved: lips short; style bearded. ♃.? S. Native of Mexico, Moçino et Sessé. S. longiflòra, Willd. spec. 1. p. 141. Stems purplish, glabrous or pubescent on the angles. Corolla violaceous, 12-15 lines long. Stamens a little exserted.

Tube-flowered Sage. Fl. June, July. Clt. 1820. Pl. 2 to 3 feet.

246 S. Guaraní'tica (St. Hil. mss. ex Benth. lab. p. 298.) shrubby; branches beset with spreading hairs; leaves petiolate, ovate, acute, serrated, truncately cordate at the base, much wrinkled, hispid, clothed with rather hoary tomentum beneath; racemes numerous, simple, secund; whorls few-flowered, loose, approximate; calyx tubular, nearly glabrous, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla about 3 times as long as the calyx: tube much exserted; lips elongated, equal; stamens shorter than the corolla; style bearded beneath. ♄. S. Native of Brazil, among bushes near Santa Anjo, in the Missions of the Uruguay, St. Hilaire. This is a showy species. Leaves 1 to 1½ inch long. Corolla 15-16 lines long, deep blue. Calyx usually glabrous, sometimes hispid from glanduliferous hairs.

Guaranitic Sage. Shrub.

247 S. lamiifòlia (Jacq. achœnbr. 3. p. 37. t. 318.) stem shrubby, erect, nearly glabrous; leaves petiolate, ovate, acuminated, serrately crenated, rounded or cuneated at the base, glabrous; floral leaves membranous, ovate-lanceolate, deciduous; racemes elongated; whorls 6-10-flowered; flowers almost sessile; calyx tubular, having the upper lip entire, and the teeth of the lower lip acute; corolla scarcely twice as long as the calyx: tube nearly equal: upper lip villous outside; stamens equalling the corolla in length; style bearded. ♄. S. Native of the Islands of St. Vincent and Trinidad. S. Boosiàna, Jacq. fil. ecl. 1. p. 69. t. 47. S. Boòsii, Tratt. obs. bot. fasc. 3. p. 59. t. 92. S. byemàlis, Boose, ex Jacq. fil. l. c. S. cyánea, Fisch. cat. hort. gorenki. p. 21. S. thymiflòra, Willd. enum. suppl. p. 2. S. amœ'na, Sims, bot. mag. t. 1294. Andr. bot. rep. 6. t. 446. S. violàcea, Donn, hort. cantabr. ed. 4. S. latifòlia, Anders. in trans. soc. arts et man. vol. 25. p. 210. S. azùrea, and S. cærùlea, Hortul. Branches often pubescent while young. Leaves 3-4 inches long. Corolla blue.

Dead-nettle-leaved Sage. Fl. March, April. Clt. 1821. Shrub 2 to 4 feet.

248 S. apf'nis (Cham. et Schlecht, in Linnæa, 5. p. 99.) stem shrubby; branches glabrous; leaves petiolate, ovate, acuminated, serrately crenated, rounded at the base, glabrous or

finely pubescent; floral leaves ovate, membranaceous, deciduous; racemes elongated, nearly simple, many-flowered; whorls somewhat approximate, 6-10-flowered, secund; flowers pedicellate; calyx tubular, pubescent, having the upper lip entire, and the teeth of the lower lip subulately acuminated; corolla about 3 times as long as the calyx: tube exserted, equal, slender: lips nearly equal; genitals exserted; style glabrous. ½. S. Native of Mexico, near Jalapa, Schiede et Deppe; and of the Cordillera de Guchilapa, Berlandier. Corollas pale violet.

Allied Sage. Shrub.

249 S. purpu'rea (Cav. icon. 2. p. 52. t. 166.) stem herbaceous, erect, nearly glabrous; leaves petiolate, ovate, acuminated, serrated, rounded or cordate at the base, glabrous or clothed with fine hoary pubescence; floral leaves small, ovate, acuminated, deciduous; racemes dense, branched; whorls many-flowered, approximate, secund; calyx tubular, clothed with white or purple wool, having the upper lip entire, and the teeth of the lower lip subulately mucronate; corolla about 3 times as long as the calyx: tube exserted, incurved: upper lip pubescent; style bearded on all sides. ♃. S. Native of Mexico. Jacq. schœnbr. 3. p. 2. t. 253. Habit of *S. polystachya*; but differs in the stem being more glabrous; in the flowers being secund, densely woolly; and in the corolla being twice as long, tubular, and of a reddish purple colour.

Purple-flowered Sage. Fl. May, July. Clt. 1825. Pl. 2 to 3 feet.

† *Species doubtful whether belonging to the present section.*

250 S. cupheæfo'lia (H. B. et Kunth. nov. gen. amer. 2. p. 288.) stem herbaceous, bifariously pilose; leaves petiolate, ovate-elliptic, bluntish, acute at the base, crenated, glabrous, with hairy margins; whorls 2-flowered, very remote; calyxes glabrous, ciliated, tubular, striated, having the upper lip ovate, entire, acute, and the teeth of the lower lip acute. ♃. S. Native of Peru, in woods. Stem branched. Leaves 6-9 lines long. Pedicels hairy. Bracteas ovate-lanceolate, acuminated, glabrous, with ciliated margins, deciduous. This species ought probably to be placed in section *Longiflòræ Aurantiacæ*.

Cuphea-leaved Sage. Pl. 1½ foot.

251 S. ru'fula (H. B. et Kunth, l. c. p. 291.) stem suffruticose, erect, clothed with rufous tomentum; leaves ovate, acuminated, narrowed at the base, petiolate, serrated, clothed with rufous pubescence beneath; whorls about 6-flowered, distant; calyx rather pilose, having the upper lip entire and acute, and the lower one bifid; genitals inclosed. ½. S. Native of New Granada, on the Andes of Quindiu, near Los Gallegos. Leaves rather hairy above, 2-3 inches long. Bracteas ovate, acuminately subulate, pubescent, ciliated. Corolla purple: upper lip pubescent.

Rufous Sage. Shrub 2 to 3 feet.

252 S. Tolime'nsis (H. B. et Kunth, l. c. p. 292.) stem shrubby, erect, clothed with rufous pubescence; leaves ovate-lanceolate, acute at both ends, petiolate, densely pubescent beneath; whorls about 6-flowered, distant; calyx hairy, having the upper lip ovate, entire, acute, and the lower lip bifid; stamens inclosed. ½. S. Native on Mount Quindiu, between Ibague and Tolima. Leaves nearly glabrous above, but beset with short scattered hairs beneath, 2-3 inches long. Bracteas ovate, acute, serrulated, pubescent beneath. Upper lip of corolla pubescent outside.

Tolima Sage. Shrub 3 to 4 feet.

253 S. bi'color (H. B. et Kunth, l. c. p. 146.) stem shrubby, erect, clothed with hoary tomentum; young branches clammy; leaves petiolate, ovate-lanceolate, acutish, rounded at the base, quite entire, glabrous above, and clothed with white tomentum beneath; whorls about 8-flowered, distant; bracteas caducous; calyx clothed with white tomentum, campanulate, striated, having the upper lip ovate, acute, and the teeth of the lower lip short, acute; corolla twice as long as the calyx: middle segment of the lower lip 2-lobed; stamens inclosed. ½. S. Native of the Andes of Peru, in shady places along the valley of the river Guamcabamba. Leaves 2 inches long. Corolla violaceous. This is a very distinct species, and ought probably to be placed in section *Longiflòræ Cærùleæ*.

Two-coloured-leaved Sage. Shrub 2 to 3 feet.

254 S. acutifo'lia (Ruiz, et Pav. fl. per. 1. p. 24. t. 38. f. b.) shrubby, branched; branches tomentose; leaves petiolate, cordate, acute, bluntly and unequally serrated, wrinkled above, and tomentose, and very veiny beneath; whorls 6-12-flowered, approximate; flowers on short pedicels, secund; bracteas ovate-lanceolate, acute, keeled, deciduous, tomentose; calyx tomentose, having the upper lip entire, and the lower one bifid; corolla twice as long as the calyx; stamens length of corolla; stigma villous, exserted. ½. S. Native of Peru, plentiful in meadows and humid places in Cheuchin, where it is called *Succhonca* by the natives.

Acute-leaved Sage. Shrub 4 to 5 feet.

255 S. paucifl'ora (H. B. et Kunth, nov. gen. amer. 2. p. 303.) stems shrubby, erect, and are, as well as the branches, hairy; leaves petiolate, ovate, obtuse, cordate, crenated, clothed with fine white tomentum beneath; whorls 2-flowered, distant; calyx pubescent, tubular, striated, having the upper lip acute, and the segments of the lower lip acuminated; genitals exserted. ½. S. Native of New Spain, in hot places. Branches purplish. Leaves pubescent above, 1 inch long. Bracteas oblong, shorter than the calyxes, deciduous. Corolla purple, with a hairy upper lip.

Few-flowered Sage. Shrub 1 to 2 feet.

Sect. IX. Echino'sphace (from εχινος, *echinos*, a hedge-hog; and σφακος, *sphakos*, sage; so called in reference to the spiny floral leaves and bracteas.) Benth. lab. p. 302. Floral leaves and bracteas imbricate, spinose. Calyx ovate: upper lip tridentate: lower lip shorter, bifid: teeth all spinose. Tube of corolla furnished with a ring of hairs inside; upper lip straight, emarginately bifid: lateral lobes of lower lip small, and the middle lobe large, and lacerately fringed. Connective fixed by the middle, remote, stretched out behind, and bearing a polliniferous cell, nearly similar to the other.—A Californian herb. Flowers heaped in many-flowered dense whorls, propped by bracteas.

256 S. cardua'cea (Benth. lab. p. 302.) stem herbaceous, erect, almost simple, clothed with white wool; leaves petiolate, oblong, pinnatifid, clothed with loose wool beneath: lobes ovate, sinuately toothed: teeth spinosely acuminated; whorls remote, densely many-flowered; calyx inflated, woolly; tube of corolla almost inclosed; connective free behind, and bearing an almost empty cell. ♃.? H. Native of California, Douglas. Habit of *Morìna Pérsica*, or a species of *Cárduus*.

Thistle-like Sage. Pl. 1 to 2 feet.

Sect. X. Pychno'sphace (so called from πυκνος, *pychnos*, dense; and σφακος, *sphakos*, sage; in reference to the dense whorls of flowers.) Benth. lab. p. 302. Floral leaves and bracteas imbricate, mutic. Calyx ovate; upper lip tridentate; lower lip bifid: teeth all subulate. Tube of corolla furnished with a ring of hairs inside; upper lip straight: middle lobe of the lower lip entire or emarginate. Connective fixed by the middle, remote, and extended behind, bearing a

polliniferous, almost conform cell.—A Californian herb. Whorls densely many-flowered.

257 S. columba'ria (Benth. lab. p. 302.) herbaceous, erect, a little branched; leaves deeply pinnatifid, wrinkled, almost glabrous: lobes oblong-linear, obtuse, erosely toothed or cut: terminal lobe hardly broader than the rest; floral leaves bracteaformed; whorls solitary or twin, hemispherical, densely many-flowered; bracteas broad, ovate, acuminated, membranous; calyx pubescent: upper lip elongated, concave; tube of corolla inclosed: middle lobe of lower lip crenulated; connective bearing an empty cell behind. ♃.? H. Native of California, Douglas. Habit of *Scabiòsa columbària*. Stems pubescent. Corollas a little longer than the calyxes, bluish, size of those of *S. Nilótica*.

Pigeon Sage. Pl. ½ to 1 foot.

† *A species doubtful whether belonging to sect.* X.

258 S. Leònia (Benth. lab. p. 303.) herbaceous, pubescent, branched; leaves cordate, crenated, wrinkled, petiolate; whorls 5-6-flowered, propped by sessile, ovate, acuminated bracteas; flowers pedicellate; calyx with a truncate tridentate upper lip, and a bidentate lower lip; upper lip of corolla keeled, erect, shorter than the lower lip: middle lobe of lower lip larger, emarginate; stigma trifid? the lower segments the longest; stamens 2-forked at top, with an anther on each division. ♃. G. Native of Mexico, at Chignagua, in Santa Rosa. Leònia salvifòlia, Llave ex Lexarza, nov. pl. mex. fasc. 2. p. 6.

Leon Sage. Pl. 1 foot.

Sect. XI. Heterosphace (from ἕτερος, *heteros*, variable; and σφακος, *sphakos*, sage.) Benth. in Hook. bot. misc. vol. 3. lab. p. 303. Floral leaves deciduous. Calyx tubular: upper lip truncate, tridentate. Tube of corolla furnished with a pilose ring inside: upper lip short, straight; lateral lobes of the lower lip small, spreading a little. Connective fixed by the middle, reniform, and extended behind, bearing a polliniferous, almost conform cell.—Herbs, natives of the Mediterranean, Africa, Asia, and North America. Flowers racemose; whorls loose, few-flowered. Calyxes often coloured.

259 S. Nilótica (Vahl, enum. 1. p. 238.) stem herbaceous, erect, villous; lower leaves petiolate, ovate, crenated, crose or lyrate, rather narrowed at the base: upper ones broad, heart-shaped, nearly sessile, all green on both surfaces, and villous; floral leaves ovate-lanceolate, very acute, rather shorter than the calyxes; racemes short, branched; whorls 6-10-flowered, distinct; calyx ovate-campanulate, pubescent: teeth of lower lip lanceolate, very acute; corolla half as long again as the calyx: tube nearly equal, naked inside: middle lobe of lower lip emarginate; connective bearing an empty cell behind. ♃. H. Native of Egypt. Murr. comm. gœtt. 1778. p. 98. t. 2. Jacq. hort. vind. 3. p. 48. t. 92. S. intermèdia, Schultes, obs. bot. 9. S. napœfòlia, of many authors, but not of Jacq. S. Abyssínica, Jacq. icon. rar. 1. p. 2. t. 6, but not of Lin., but probably of Lin. fil. suppl. p. 81.? S. Núbia, Murr. comm. gœtt. 1770. p. 90. t. 3. Vahl, enum. 1. p. 259, and probably of Ait. S. applanàta, Willd. enum. suppl. 3. Horminum Nilóticum, Mœnch. meth. Horminum napifòlium, Mill. dict. no. 4.? Hairs of stem rather clammy. Floral leaves and calyxes bluish. Corollas pale blue.

Nile Sage. Fl. June, Aug. Clt. 1775. Pl. 2 to 3 feet.

260 S. sylvi'cola (Burch. cat. geogr. no. 6052.) stem herbaceous, ascending, villous; leaves on short petioles, broad-ovate, acute, toothed, cordate at the base, a little lobed, villous on both surfaces; floral leaves ovate, acuminated, shorter than the calyxes; racemes simple; whorls secund, loose, 6-flowered, distant; calyx tubularly campanulate, villous: teeth of lower lip lanceolate, all setaceously acuminated; corolla twice as long as the calyx: tube slender, exserted: upper lip, and middle lobe of lower lip emarginate. ♃.? S. Native of the Cape of Good Hope. Stems almost simple. Leaves furnished with one or two lobes on each side, canescent beneath. Corollas almost like those of *S. aurìta*, but one half smaller.

Wood Sage. Pl. 2 feet.

261 S. tenuifòlia (Burch. cat. geogr. no. 298.) stems herbaceous, erect, branched at the base, villous; leaves on long petioles, ovate-roundish, obtuse, toothed, or a little cut, subcordate, truncate or subhastate, or lobed at the base, villous on both surfaces; floral leaves rather shorter than the pedicels, ovate-lanceolate, acute; racemes simple; whorls subsecund, 2-6-flowered, remote; flowers pedicellate; calyx tubular, coloured, striated, pubescent; corolla about twice as long as the calyx: tube exserted, equal: upper lip very short: middle lobe of lower lip emarginate; connective bearing an empty cell behind. ♃.? G. Native of the Cape of Good Hope. Corolla blue. Genitals exserted. Herb small, leafy and branched at the base.

Thin-leaved Sage. Pl. ½ to 1 foot.

262 S. auri'ta (Thunb. prod. p. 96.) stem herbaceous, erect, villous; leaves petiolate, lyrately pinnatifid or pinnate, with erosely toothed segments, veiny beneath, and clothed with hoary pubescence; floral leaves minute, ovate, acute; racemes simple; whorls 6-10-flowered, distant, secund; calyx sessile, tubular, elongated, coloured, striated, pubescent: teeth of upper lip setaceous, of the lower lip lanceolate, very acute; corolla more than twice as long as the calyx: tube slender, much exserted, equal: upper lip very short: middle lobe of lower lip emarginate; connective bearing an empty cell behind. ♃. G. Native of the Cape of Good Hope. Stem nearly simple, erect or ascending. Calyxes bluish-purple at top. Corollas size and form of those of *S. lyràta*, but more slender.

Eared-leaved Sage. Fl. May, June. Clt. 1795. Pl. 1 to 2 feet.

263 S. sca'bra (Thunb. prod. p. 97.) stem herbaceous, erect, panicled, branched; leaves lyrately pinnatifid, wrinkled, scabrous, with erosely curled margins, veiny and canescent beneath; floral leaves minute, ovate-lanceolate; racemes elongated, a little branched; whorls 6-flowered, distant; calyx campanulate, pubescent: teeth of upper lip setaceous, of the lower lip lanceolate, acute; corolla twice as long as the calyx: tube nearly equal: middle lobe of lower lip emarginate; connective bearing an empty cell behind. ♃.? G. Native of the Cape of Good Hope. Stem stiff, scabrous, pubescent. Corolla blue, similar to those of *S. runcinàta*, but a little larger.

Scabrous Sage. Fl. April, Aug. Clt. 1774. Pl. 2 feet.

264 S. runcina'ta (Lin. mant. 80.) stem herbaceous, erect, panicled, branched; leaves runcinately pinnatifid, wrinkled, rather hispid above: lobes deeply crenated: terminal lobe the largest; floral leaves minute, ovate-lanceolate, acute; racemes a little branched, few-flowered; whorls 2-6-flowered, remote; calyx ovate, pubescent: teeth of upper lip minute, setaceous, and of the lower one lanceolate-acute; corolla twice as long as the calyx: tube nearly equal: middle lobe of lower lip emarginate; connective bearing an empty cell behind. ♃.? G. Native of the Cape of Good Hope. Jacq. hort. schœnbr. 1. p. 5. t. 8. S. eròsa, Desf. cat. hort. par. p. 68. Poir. suppl. 5. p. 49. Herb usually clothed with hoary pubescence. Corollas blue. Genitals a little exserted.

Runcinate-leaved Sage. Fl. April, Sept. Clt. 1774. Pl. 1 to 2 feet.

265 S. stenophy'lla (Burch. cat. geogr. no. 1881.) plant herbaceous, erect, nearly glabrous; leaves petiolate, oblong-lanceolate or linear, runcinately-sub-pinnatifid, wrinkled: floral leaves minute, ovate-lanceolate, acute; racemes a little branched; whorls about 6-flowered, remote; calyx ovate, glabrous: teeth of lower lip lanceolate, acutish, all mutic; corolla twice as long as the calyx: tube nearly equal, hardly exserted: lips short, nearly equal; connective bearing an empty cell behind. ♃. ? G. Native of the Cape of Good Hope. Allied to *S. runcinàta*, but is nearly glabrous, the stem taller and less branched, &c.

Narrow-leaved Sage. Pl. ?

266 S. re'pens (Burch. cat. geogr. no. 2830.) herbaceous, quite glabrous; stems creeping at the base, leafy; floriferous branches ascending, nearly naked; leaves nearly all radical, petiolate, elongated, runcinately pinnatifid, hardly wrinkled: floral leaves ovate-lanceolate, acute, shorter than the calyxes; racemes nearly simple; whorls somewhat secund, about 6-flowered, remote; calyx ovate, with the teeth of the lower lip lanceolate, all setaceously-acuminated. ♃. ? G. Native of the Cape of Good Hope. Leaves like those of *S. stenophylla*, but the flowers are a little larger.

Creeping Sage. Shrub. ?

267 S. lyra'ta (Lin. spec. p. 33.) stem herbaceous, erect, nearly simple, pilose; radical leaves lyrate, crosely-toothed, rather hispid on both surfaces; cauline leaves few, oblong-lanceolate, narrowed a long way at the base: floral leaves oblong-linear, rather shorter than the calyxes; racemes nearly simple; whorls 6-flowered, loose, distant: calyx tubularly-campanulate, nutant, pilose, with the teeth of the lower lip lanceolate, acute, of the upper one short and distant; corolla about three times as long as the calyx: tube much exserted, widened at top: middle lobe of lower lip very broad, emarginate: connective bearing an empty cell behind. ♃. H. Native of North America, in Philadelphia, Virginia, Carolina, and Georgia. Cunila lyràta, Schranck, in sylL pl. soc. ratisb. 2. p. 57. Horminum lyràtum, Mill. dict. no. 2. Horminum Virginicum, Lin. spec. p. 832.—Dill. elth. 219. t. 175. f. 216.—Mor. hist. 3. sect. 13. t. 27. Radical leaves 2-3 inches long. Flowers pedicellate. Calyxes coloured, ciliated with long spreading hairs. Corolla purplish, violet, 9-10 lines long.

Lyrate-leaved Sage. Fl. June, July. Clt. 1728. Pl. ½ to 1 foot.

268 S. obova'ta (Elliott, bot. carol. 1. p. 33.) stem herbaceous, erect, rather pilose; leaves broad-obovate, entire, sinuated, nearly glabrous, narrowed a long way at the base; floral leaves ovate, rather shorter than the calyxes; racemes nearly simple; whorls 6-flowered, dense, remote; calyx tubularly-campanulate, nutant, pilose: teeth of lower lip lanceolate, acute; corolla about three times longer than the calyx: tube much exserted, widened at top; connective bearing an empty cell behind. ♃. H. Native of Georgia, at the river Oakmulgee, and of New Orleans. Nearly allied to *S. lyràta*.

Obovate-leaved Sage. Pl. 1 foot.

269 S. acau'lis (Vahl, enum. 1. p. 257.) stem herbaceous, erect, nearly simple, pilose; leaves obovate, entire, sinuated, rather hispid on both surfaces, narrowed a long way at the base: floral leaves ovate, rather shorter than the calyxes; racemes almost simple; whorls 6-flowered, remote; calyx tubularly-campanulate, nutant, pilose, the teeth of the lower lip lanceolate, acute; corolla more than twice as long as the calyx: tube slender, much exserted, widened above; connective bearing an empty cell behind. ♃. ? G. Native of the East Indies, Rottler. *S. scymoides*, Roxb. et Benth. Wall. pl. rar. 1. p. 68. This species differs from *S. obovàta*, in the corollas being smaller and slenderer, and in the leaves being narrower. Perhaps not distinct from *S. obovàta*.

Stemless Sage. Pl. ½ foot?

270 S. Japónica (Thunb. jap. p. 22. t. 5.) stem herbaceous, erect, branched, glabrous; leaves petiolate, pinnate; leaflets ovate, acuminated, narrowed at the base, deeply-toothed, or pinnatifid, glabrous; floral leaves lanceolate, shorter than the calyxes; racemes almost simple; whorls about 6-flowered, distinct; calyx tubularly campanulate, glabrous, striated, having the upper lip entire, ovate, obtuse, and the teeth of the lower lip acute; corolla twice as long as the calyx: tube hardly exserted, equal: middle lobe of the lower lip emarginate; genitals exserted. ☉. H. Native of Japan. Corollas blue, size of those of *S. verticillàta*. Leaves 3-4 inches long. This is a very elegant annual species.

Japan Sage. Pl. 1 foot?

271 S. Chinénsis (Benth. lab. p. 725.) stem herbaceous, erect, pubescent; leaves petiolate, entire, or the lower ones ternate, broad-ovate, obtuse, crenated, truncate or cordate, pilose above, and glabrous beneath: floral leaves small, bractea-formed; racemes nearly simple; calyx tubularly-campanulate, striated, glabrous or hispid; corolla about twice as long as the calyx: tube hardly exserted, upper lip incurved, lower one spreading. ☉. H. Native of China, near Kia-nang, Sir G. Staunton. Herb fasciculately-branched. Leaves about an inch long. Calyx coloured. Corolla pubescent outside. Flowers similar to those of *S. Japónica*.

China Sage. Pl.

† *Species belonging to sect.* XI. *but are not well known.*

272 S. triangula'ris (Thunb. prod. p. 96.) plant hispidly villous; stem erect, branched; leaves petiolate, cordate, triangularly-spatulate, toothed; whorls remote; flowers pedicellate; calyx angular, awned, a little shorter than the corolla. ☉. ? H. Native of the Cape of Good Hope. Branches and branchlets divaricate. Leaves hardly an inch long. Petioles length of leaves. Easily distinguished from *S. aurita* by the petioles being without auricles, and by the stem being branched.

Triangular-leaved Sage. Pl. 2 feet.

273 S. obtusa'ta (Thunb. prod. p. 97.) villous; stem erectish, simple, or branched; leaves petiolate, ovate, deeply crenated, rarely sub-hastate, glabrous above, and pilose on the veins beneath, with ciliated edges; whorls 2-flowered; flowers pedicellate; calyxes narrow, scabrous, awned, about half the length of the corollas. ♃. ? G. Native of the Cape of Good Hope. Leaves hardly an inch long. Petioles ciliated.

Blunt-leaved Sage. Pl. 1 foot.

274 S. Clayto'nii (Elliott, bot. carol. 1. p. 32.) stem herbaceous, erect; leaves ovate and cordate, lanceolate, pinnatifid, wrinkled, pubescent on the veins and margins; segments toothed; floral leaves ovate-cordate, acuminated, toothed, pubescent: whorls 6-flowered; calyx sub-campanulate, hispid on the margins and veins: the teeth of the upper lip connivent, and the segments of the lower lip acuminated, mucronate. ♃. H. Native of South Carolina, in arid, sandy pastures about Beaufort, abundant. Root thick; almost tuberous. Anthers black. Connective antheriferous at both ends.

Clayton's Sage. Pl. 1 foot.

Sect. XII. Notio'space (from νοτιος, *notios*, humid, and σφακος, *sphakos*, sage; the species contained in this section are inhabitants of humid places.) Benth. in Hook. bot. misc. 3. p. 374. lab. p. 300. Floral leaves and bracteas minute. Calyx ovate, the upper lip entire or shortly tridentate, with the teeth connivent; lower lip bifid. Corolla small; tube inclosed; upper lip straight, lower lip spreading a little. Connective fixed by the middle, remote, and extended behind, bearing a conform fertile cell.

275 S. plebe'ia (R. Br. prod. p. 501.) stem herbaceous, erect, branched, pubescent; leaves petiolate, oblong, wrinkled; whorls loose, about 6-flowered, racemose; racemes fastigiately-panicled; calyxes campanulate, the upper lip quite entire, and the teeth of the lower lip obtuse; corolla hardly longer than the calyx, the upper lip arched; connective bearing an empty cell behind. ♃. ? G. Native of the East Indies in humid places; of Nipaul, Oude, Hindostan, and Silhet, Wall.; Deyra Dhoon, and the banks of the river Jumna, Royle; Cashmere, Jacquemont; China, Reeves; Tropical New Holland, R. Br. S. minutiflòra, Bunge, enum. pl. chin. p. 50. S. brachiàta, Roxb. hort. beng. 4. fl. ind. 1. p. 146. S. parviflòra, Roxb. hort. beng. 4.? Ocymum fastigiàtum, Roth, nov. spec. 277. Lumnitzera fastigiàta, Spreng. syst. 2. p. 687. Leaves 2-3 inches long. Corolla having the upper lip and the middle segment of the lower lip emarginate.

Plebeian Sage. Pl. 2 to 3 feet.

276 S. Ægyptia'ca (Lin. spec. p. 33.) stems procumbent, humble, much branched, clothed with hoary pubescence; cauline leaves small, remote, sessile, lanceolate-linear, acute, toothed, or the lower ones are oblong, narrowed into the petioles at the base; floral leaves minute; racemes elongated, a little branched; whorls remote, usually 2-flowered; calyx ovate, pubescent, having the upper lip shortly tridentate, and the lower lip bifid, with lanceolate subulately-acuminated teeth; corolla scarcely exceeding the calyx; connective bearing an empty cell behind. ☉. S. Native of the North and West coast of Africa, as of Egypt, Libya, Arabia, Canary Islands, Cape Verd Islands, Persia, &c. Thymus Syriacus, Spreng. syst. 2. p. 697. Thymus hirtus, Viv. fl. libyc. p. 30. t. 14. f. 1. Melissa perénnis, Forsk. fl. ægypt. p. 108. S. Ægyptiaca, Jacq. hort. vind. 2. p. 49. t. 108. Plant woody at base. Branches and leaves pubescent and canescent. Leaves ½ inch long. Corolla and stamens as in *S. plebèia*.

Egyptian Sage. Pl. ½ to ¾ foot.

277 S. pu'mila (Benth. lab. p. 726.) stem humble, erect, tufted, bearded by long stiff hairs; leaves approximate at the base of the stem, oblong or linear, narrowed at the base, much wrinkled, green on both surfaces: floral leaves minute; racemes a little branched; whorls remote, 2-6-flowered: upper whorls sterile; calyx ovate, pilose: upper lip shortly-tridentate: lower lip bifid, with broad-lanceolate, very acute teeth; corolla hardly exceeding the calyx; connective bearing an empty cell behind. ♃. H. Native of Cashmere, Royle. Very nearly allied to *S. Ægyptiaca*, but differs in the stems being erect and hardly branched, and in the root being perennial.

Dwarf Sage. Pl. ½ to ½ foot.

Sect. XIII. Gymnósphace (from *γυμνος, gymnos*, naked; and *σφακος, sphacos*, sage; probably so called from the naked floriferous branches.) Benth. in Hook. bot. misc. 3. p. 374. lab. p. 810. Calyx ovate-tubular; upper lip entire, recurved; lower lip bifid. Tube of corolla short, ample, furnished with a ring of hair inside; lips short: upper one erect: lobes of lower lip spreading. Connective remote behind, deflexed, filiform, acute. Filaments erect, somewhat continuous with the connective. Perhaps a proper genus.

278 S. saxicola (Wall. ex Benth. in Wall. pl. rar. asiat. 1. p. 68. lab. p. 810.) stems tufted, branched at the base; floriferous branches erect, almost naked; radical leaves and lower cauline ones roundish-cordate, crenated, glabrous; cauline leaves very few, ovate-lanceolate, deeply-toothed; floral leaves minute, ovate; racemes a little branched; whorls loose, distinct, or the upper ones are spicate; calyx tubularly-campanulate, drooping, glabrous: teeth of lower lip lanceolate, acutish; corolla hardly exceeding the calyx; fertile anthers all adnate. ♃. F. Native of Nipaul, Wall. Stems numerous, from a thick radicant base, simple or branched under the raceme, glabrous at the base; axis of raceme villous. Radical leaves 2-3 inches long, pale beneath. Corolla small, blueish.

Rock Sage. Pl. ½ to 1½ foot.

Sect. XIV. Hemi'sphace (from *ἡμι, hemi*, half; and *σφακος, sphacos*, sage.) Benth. in Hook. bot. misc. 3. p. 374. lab. p. 810. Calyx tubular; upper lip truncate, tridentate; lower lip bifid. Tube of corolla furnished with a pilose ring inside; upper lip erectly-spreading, arched, and the lobes of the lower lip spreading. Connective remote behind, drawn out a little, deflexed, acute. Filaments straight, somewhat continuous with the connective. Herbs, native of the region of the Mediterranean, with the habit of those species contained in Sect. *Heterósphace*. Perhaps a proper genus.

279 S. verticilla'ta (Lin. spec. 37.) stems herbaceous, erect, pilosely-hispid; leaves cordate at the base, lyrate: terminal lobe very large, ovate, roundish, or entire, sinuately-crenated, hispid or woolly on both surfaces; racemes branched; whorls 20-40-flowered, remote; calyx tubular, villous: teeth of lower lip setaceously-acuminated; corolla about twice as long as the calyx: tube almost inclosed. ♃. H. Native of the South of Europe, and the North of Africa, and Caucasus.—Barrel, icon. t. 199. Horminum verticillàtum, Mill. dict. no. 3. Leaves large, irregularly crenated or sinuated, hispid on the nerves; floral leaves bractea-formed, broad, ovate, acuminated, ciliated, shorter than the calyxes. Calyx usually coloured. Corolla bluish violet. The whole plant is hoary.

Var. β. móllis (Benth. lab. p. 811.) leaves clothed with soft wool on both surfaces. ♃. H. S. móllis, Donn, hort. cant. edit. 1804, but not of Jacq. Corolla bluish purple.

Var. γ. pállida (Benth. lab. p. 811.) leaves almost quite entire, and are, as well as the stems, clothed with pale villi. ♃. H. Young leaves densely woolly beneath.

Whorled Sage. Fl. June, Nov. Clt. 1628. Pl. 2 to 3 feet.

280 S. napifòlia (Jacq. hort. vind. 2. p. 71. t. 152.) stem herbaceous, erect, pilosely-hispid; lower leaves lyrate, terminal lobe large, and is, as well as the superior leaves, ovate-oblong, sinuately-crenated, rounded, or cordate at the base, rather villous on both surfaces; racemes scarcely branched; whorls 6-12-flowered, remote; calyx tubular, villous, teeth all setaceously-acuminated; corolla half as long again as the calyx: tube inclosed. ♃. H. Native of Syria, among bushes about Smyrna, and of the island of Cois. S. verticillàta, var. D'Urv. in mem. soc. lin. par. 1. p. 260.? This hardly differs from *S. verticillàta*, except in the whorls being usually 10, but never 20-flowered, and in the corollas being about half the size. The leaves, as in *S. verticillàta*, are also sometimes entire. Corollas blueish purple.

Turnip-leaved Sage. Fl. June, July. Clt. 1776. Pl. 2 to 3 feet.?

281 S. Rossi'lii (Benth. lab. p. 812.) stems herbaceous, erect, pubescent; leaves petiolate, oblong, acute, sinuately-toothed, thick, wrinkled, clothed with white wool on both surfaces: floral leaves ovate, acuminated, shorter than the calyxes; whorls loosely many-flowered, remote; calyx tubular: teeth all acuminated; corolla half as long again as the calyxes; tube inclosed. ♃. H. Native of Syria, near Aleppo, Russell. Flowers similar to those of *S. verticillàta*, but smaller; and the leaves are almost like those of *S. pomífera*.

Russell's Sage. Pl. 2 to 3 feet.?

† *Species, the names of which are alone known.*

1 S. bysanti'na, Juss. ex. Steud. nom. p. 725. 2. *S. Hallèri*, Fisch. ex Steud. nom. 726. 3. *S. rostràta*, Schmidt, abhandl. boh. wiss. 1. p. 11.

Cult. Many of the species of *Sálvia* are very showy when in blossom, particularly most of those species belonging to sections *Horminum*, *Eúsphace*, and *Calósphace*, § 7, *Longiflóræ*. Most of them thrive in a rich, light soil. The shrubby kinds are readily increased by young cuttings, under a hand-glass; those of the stove species in heat; the herbaceous perennial kinds by dividing at the root. The seeds of the annual and biennial kinds only require to be sown in the open border where they are intended to remain.

XXX. AUDIBE'RTIA (named after M. Audibert, a nurseryman of Tarascon.) Benth. in bot. reg. 17. no. 1469. lab. p. 312; but not of Benth. in bot. reg. 15. no. 1282.

Lin. syst. *Diándria*, *Monogýnia*. Calyx ovate, bilabiate; upper lip concave, entire, or shortly tridentate; lower lip bifid; throat naked inside. Corolla having the tube equal in length to the calyx, or exserted; limb bilabiate; upper lip bifid, with spreading lobes; lower lip trifid, having the lateral lobes ovate or oblong, and the middle lobe very broad and emarginate. The two lower stamens fertile, ascending, usually exserted; the rudiments of the two upper ones small and club-shaped or wanting; anthers dimidiate with a linear connective, which is articulated in the filament, ascending, bearing a one-celled linear anther at top, but not drawn out behind, or very shortly acuminated. Style subulately-bifid.—A californian genus intermediate between *Rosmarínus* and sections *Eckinósphace* and *Pycnósphace* of *Sálvia*.

1 A. grandiflòra (Benth. lab. p. 312.) stem tall, villous; leaves oblong-elliptic, sinuately-crenated, cordate at the base, wrinkled; whorls dense, many-flowered; bracteas broad-ovate, and are, as well as the calyxes, ample, membranous, coloured, and villous; stamens much exserted. ♃. ? H. Native of North California, Douglas. Lower leaves petiolate, 3-4 inches long, villous, pale or canescent beneath: upper ones sessile, smaller; floral leaves stem-clasping. Tube of corolla exserted. Upper lip of calyx obtuse.

Great-flowered Audibertia. Pl. 2 to 3 feet.

2 A. humìlis (Benth. lab. p. 313.) suffruticose; leaves approximate at the base of the stem, petiolate, oblong-lanceolate, obtuse, crenulated, narrowed a long way at the base, wrinkled, canescent; floral leaves and bracteas lanceolate, acute, villous; genitals exserted. ♄. F. Native of North California, Douglas. Habit of a small variety of *Sálvia officinàlis*. Stem leafy and hoary at bottom, but villous at top. Lower leaves 1 to 1½ inch long. Whorls many-flowered. Upper lip of calyx tridentate. Tube of corolla hardly exserted.

Humble Audibertia. Shrub ½ foot.

3 A. stachyoìdes (Benth. lab. p. 313.) suffruticose; branches stiff, leafy; leaves on short petioles, oblong-lanceolate, obtuse, crenulated, narrowed at the base, wrinkled, canescent beneath: floral leaves and bracteas ovate, acuminated; genitals rather shorter than the corolla. ♄. F. Native of North California. Branches tomentosely-pubescent, clammy and villous above, as well as the bracteas and calyxes. Leaves 2-3 inches long, green above; petioles dilated, and stem-clasping as in the preceding species. Teeth of calyx spiny.

Stachys-like Audibertia. Shrub.

4 A. rívea (Benth. lab. p. 313.) suffruticose; branches stiff, clothed with white tomentum above; leaves nearly sessile, lanceolate, obtuse, rounded at the base, wrinkled, clothed with white tomentum on both surfaces: floral leaves and bracteas ovate-lanceolate; raceme simple; genitals exserted. ♄. F. Native of North California, Douglas. Leaves distant, 1 to 1½ inch long. Lips and teeth of calyx almost obsolete. Tube of corolla a little exserted.

Snowy Audibertia. Shrub.

5 A. incàna (Benth. in bot. reg. t. 1469.) suffruticose; branches divaricate, branched, canescent; leaves obovate-oblong, obtuse, quite entire, narrowed at the base, canescent: floral leaves broad-ovate; racemes simple; genitals exserted. ♄. F. Native of North-west America, on the plains of the river Columbia, near Priest's rapid, and on argillaceous hills. Leaves 1 to 1½ inch long, pubescent; upper floral leaves orbicular, sessile, ciliated. Calyx pubescent; upper lip entire, obtuse. Corolla pale blue; tube exserted.

Hoary Audibertia. Fl. July, Sept. Clt. 1827. Shrub 1½ foot.

6 A. polystàchya (Benth. lab. p. 314.) suffruticose, clothed with hoary tomentum; leaves petiolate, oblong-lanceolate, obtuse, crenulated, narrowed at the base, wrinkled, hoary on both surfaces: floral leaves and bracteas loose, lanceolate; racemules numerous, approximating into a dense, elongated panicle; genitals much exserted. ♄. F. Native of North California, Douglas. Upper lip of calyx obtuse, almost entire. Tube of corolla scarcely exserted.

Many-spiked Audibertia. Shrub 3 to 4 feet. ?

Cult. The species will grow in common garden soil, and will be readily increased by cuttings and seeds. Being rather tender, they will require some shelter in winter.

XXXI. ROSMARI'NUS (from *ros*, *dew*, and *marinus*, of the sea, on account of its affecting maritime situations.) Tourn. inst. t. 92. Lin. gen. no. 38. Schreb. gen. no. 49. Juss. gen. p. 111. Benth. lab. p. 314.

Lin. syst. *Diándria*, *Monogýnia*. Calyx ovate-campanulate, bilabiate; upper lip entire; lower lip bifid; throat naked inside. Corolla with an exserted tube, glabrous inside; throat a little inflated; limb bilabiate; lips nearly equal: upper lip erect, emarginate: lower lip spreading trifid: lateral lobes oblong, erect, twisted a little: middle lobe, large, concave, dependent. Stamens 2, ascending, exserted from the superior lip, without any rudiments of upper ones; filaments inserted in the throat of the corollas, shortly-toothed near the base; anthers linear, somewhat 2-celled, with connate margins, and divaricate-confluent cells. Upper lobe of style very short; stigmas minute, terminal. Achenia dry, smooth. A South European shrub, with the calyx of *Sálvia* and *Audibértia*, and corolla and stamina of *Monárda*, unless the tooth at the base of each filament, which is probably an appendage analogous to those of *Ocymum* and *Phlòmis*.

1 R. officinàlis (Lin. spec. p. 88.) ♄. H. Native of Europe and Africa, in the region of the Mediterranean; as of Portugal, Spain, South of France, Italy, Naples, Sicily, Greece, Syria, Balearic Islands, &c., on dry hills and among rocks. Sibth. and Smith, fl. græc. 1. p. 11. t. 14. Woodv. med. bot. t. 87. R. latifòlia, Mill. dict. no. 2.—Riv. mon. irr. t. 39.—Blackw. icon. 159.—Sabb. hort. rom. 3. t. 67. A densely-branched and densely-leafy shrub. Leaves sessile, linear, entire, with revolute margins, canescent beneath. Flowers disposed in short axillary racemes, few, approximate, almost sessile. Calyx purplish. Corollas white, or pale blueish-purple. Rosemary has a fragrant smell and a bitter, pungent taste. The leaves and tops are strongest in their sensible qualities; the flowers ought not to be separated from their calyxes, the active matter residing principally, if not wholly, in the latter. Rosemary yields its qualities completely to rectified spirit, but only partially to water. The leaves and tops distilled with water yield a thin, light, pale, essential oil, of great fragrancy, though not quite so agreeable as the rosemary itself. From one hundred pounds of the herb in flower eight ounces of oil have been obtained. The virtues of rosemary depend entirely on its essential oil, which seems to be combined with camphor, not only from its peculiar taste, but

from its possessing chemical properties which depend upon the presence of camphor, and from its depositing crystals of camphor when long kept. Rosemary is reckoned one of the most powerful of those plants which stimulate and strengthen the nervous system; it has, therefore, been recommended in various affections supposed to proceed from debilities or defective excitement of the brain and nerves; as in certain headachs, deafnesses, giddinesses, palsies, &c., and in some hysterical and dyspeptic symptoms.

The ancients were well acquainted with this shrub; and it is mentioned by Dioscorides, Galen, and Pliny. It has ever been treated with great respect for comforting the brain and strengthening the memory; hence the frequent allusions to this property in our old poets. Its supposed quality of strengthening the memory made rosemary an emblem of fidelity in lovers: it was accordingly worn at weddings, and perhaps, on the same principle, at funerals. Rosemary is a principal ingredient in what is known by the name of Hungary water; and the herb is taken as tea by many persons for headachs, and disorders called nervous.

There are several varieties of the rosemary, as, 1. R. angustifòlia, Mill. dict. no. 1. The narrow-leaved or garden rosemary. 2. The silver-striped-leaved rosemary. 3. The golden-striped-leaved rosemary.

Officinal, or Common Rosemary. Fl. Jan. April. Clt. 1548. Shrub 4 to 12 feet.

Cult. Rosemary thrives best on dry rocky soils by the sea-side, in the countries where it grows wild. It is hardy enough to bear our winters in the open air, provided it be planted upon a poor, dry, gravelly soil, or against a wall. Rosemary, if by accident rooted in a wall, will endure the greatest cold of our winters. The striped-leaved varieties are more tender, and therefore require the protection of a frame or green-house in winter. Rosemary may be increased by planting the young cuttings in the spring just before the plants begin to shoot, in light earth under a hand-glass. When the cuttings are rooted transplant them where they are intended to remain in September.

XXXII. MONA'RDA (so called from Nic. Monárda or Monárdes, a physician of Seville in the sixteenth century.) Benth. lab. p. 315. Monárda species of Lin. and other authors. Monárda and Cheilýctis, Rafin. Monárda and Coryánthus, Nutt.

Lin. syst. *Diándria, Monogýnia.* Calyx tubular, elongated, 15-nerved, nearly equal, 5-toothed; throat villous inside, rarely almost naked. Corolla with an exserted or inclosed tube, glabrous or pubescent inside, exannulate; throat dilated a little; limb bilabiate; lips linear or oblong, nearly equal: upper lip erect, entire, or emarginate: lower lip spreading, shortly trifid at apex: the lateral lobes ovate, obtuse: the middle one narrower, oblong, retuse, or emarginate. Stamens 2 (inferior) ascending, usually exserted from the upper lip of the corolla; the rudiments of the two superior ones almost wanting: filaments toothless, inserted at the throat of the corolla; anthers linear, somewhat 2-celled: cells divaricate, confluent, with connate margins. Style almost equally bifid at top; stigmas minute, terminal. Achenia dry, smooth.—Herbs, with entire, usually toothed or crenated leaves. Flowers collected into a few dense whorls, propped by bracteas.

Sect. 1. Eumona'rda (from *eu*, well, and *Monárda*. This section is supposed to contain the true species of the genus.) Benth. lab. p. 726. Genitals much exserted.

1 M. dídyma (Lin. spec. p. 32.) leaves petiolate, ovate-lanceolate, acuminated, roundly-subcordate at the base, rather hispid on both surfaces, rarely glabrous; floral leaves sessile, and are, as well as the outer bracteas, oblong-lanceolate, narrowed a long way at the base, coloured; calyx incurved, striated, coloured, with an almost naked throat; corollas quite glabrous. ♃. H. Native of North America, from Canada to North Carolina. Curt. bot. mag. t. 548. Mill. fig. t. 183. f. 1. Trew. ehret. t. 66. M. fistulòsa, var. Curt. bot. mag. t. 145.? S. coccínea, Michx. fl. bor. amer. 1. p. 16. M. purpùrea, Lam. dict. 4. p. 256. M. Kalmiàna, Pursh, fl. amer. sept. 1. p. 17. t. 1. bad. M. purpuráscens, Wender. ind. sem. hort. marb. 1828. M. Oswegoensis, Bart. prod. fl. pennsyl. 1. p. 34.? Stems fistular, acutely-tetragonal. Leaves 2-3 inches long. Whorls solitary or twin. Bracteas, calyxes, and corollas scarlet. The leaves emit a very grateful, refreshing odour.

Didymous Monarda, or Oswega tea. Fl. June, August. Clt. 1752. Pl. 2 to 3 feet.

2 M. fistulòsa (Lin. spec. p. 32.) leaves petiolate, ovate-lanceolate, roundly-subcordate at the base, glabrous, pubescent or hispid on both surfaces: floral leaves sessile, and are, as well as the outer bracteas, a little coloured; calyxes a little incurved, scarcely coloured: throat hispid inside; corolla villous. ♃. H. Native of North America, among bushes, &c., very common, West Coast, Canada, the States; Texas, and near Jalapa in Mexico. Rchb. icon. exot. 2. p. 28. t. 172. Mill. fig. t. 183. f. 2. M. altíssima, Willd. enum. p. 38. Rchb. icon. exot. 2. p. 27. t. 170. M. longifòlia, Lam. dict. 4. p. 255. M. glàbra, Lam. dict. 4. p. 256. M. rugòsa, Ait. hort. kew. ed. 2d. 1. p. 51. M. purpùrea, Pursh, fl. amer. sept. 1. p. 17, but not of Lam. M. 51. M. oblongàta, Ait. hort. kew. ed. 2d. 1. p. 51. M. clinopòdia, Lin. spec. p. 32. M. allophýlla, Michx. fl. bor. amer. 1. p. 16. M. affinis, Link, enum. 1. p. 9. Rchb. icon. exot. 2. p. 31. t. 182. M. undulàta, Tausch, Rchb. icon. exot. 2. p. 31. t. 181. M. mèdia, Willd. enum. p. 32. Sweet, fl. gard. 1. p. 98. M. violàcea, Desf. cat. hort. par. p. 66. M. involucràta, Wender. in ind. sem. hort. marb. 1828. M. commutàta, Wender, l. c. M. lilácina, Wender, l. c. M. hýbrida, Wender, l. c. M. barbàta, Wender, l. c. M. vàrians, Bart. prod. fl. penns. 1. p. 34.? M. cærùlea, M. cristàta, M. dùbia, &c., Hortul. This species is very variable in downiness, size and colour of flowers and bracteas, and differs from *M. didyma* in being taller; in the calyxes and bracteas being less coloured, in the corollas being smaller, more or less pubescent, and particularly in the throat of the calyx being hispid from pili inside, and usually closed. Stems fistular or filled. Leaves green or canescent. Corollas pale red or purplish, rarely deep violet or purple, never scarlet.

Var. β. móllis (Lin. spec. 32.) leaves clothed with soft pubescence; upper lip of corolla densely bearded. ♃. H. Native of the northern regions of North America; as the species is of the southern regions. M. móllis, Lin. amœn. acad. 3. p. 399. Rchb. icon. exot. 2. p. 28. t. 171. M. menthæfòlia, Graham, in edinb. phil. journ. vol. 21. (1829) p. 347. Hook. bot. mag. t. 2958.

Fistular-stemmed Monarda. Fl. June, Aug. Clt. 1656. Pl. 2 to 5 feet.

3 M. Bradburia'na (Beck, in Sill. amer. journ. scienc. 10. p. 260.) leaves nearly sessile, ovate-lanceolate, rounded at the base, clothed with canescent tomentum beneath, pilose on both surfaces: floral leaves and outer bracteas roundedly-sub-cordate at the base, coloured; calyx smoothish, striated, contracted above, with a hairy throat, and subulate-awned teeth; corolla hardly twice as long as the calyx, almost glabrous outside; upper lip very slender, and bearded at top. ♃. H. Native of North America in uncultivated places, near St. Louis, Beck; along the Missouri and Ohio, Torrey. M. fisculòsa, Hook. bot. mag. t. 3310, exclusive of the syn. Stems glabrous or ciliated on the angles. Whorls solitary, size of those of M. fistulòsa. Corolla pale, scarcely twice as long as the calyx; lower lip marked with purple dots.

Bradbury's Monarda. Pl. 3 feet.

4 M. Russellia'na (Nutt. trav. in ark. territ. p. 141.) almost glabrous; leaves nearly sessile, lanceolate, roundly-subcordate at the base: floral leaves and outer bracteas sessile, coloured, narrowed a long way at the base, acute, mutic; calyx nearly glabrous, with an almost naked throat, and nearly equal, lanceolate, short stiff teeth; corolla glabrous: tube much exserted: lower lip dotted. ♃. H. Native of the Arkansas, and among the Rocky Mountains, Sims, bot. mag. t. 2513. Hook, exot. fl. 2. t. 130. Sweet, fl. gard. 2. t. 166. Stem glabrous or ciliated on the angles. Leaves shining beneath, smoothish or ciliated on the edges, remotely toothed; floral leaves and outer bracteas purplish. Corolla slender, pale, elongated, dotted on the lower lip. (*fig.* 77.)

FIG. 77.

Russell's Monarda. Fl. Aug. Sept. Clt. 1823. Pl. 2 to 3 feet.

Sect. II. Cheilyctis (from χειλος, *cheilos*, a lip.) Benth. lab. p. 726. Cheilýctis, Rafn. Coryánthus. Nutt. in amer. phil. trans. 5. p. 186. Stamens shorter, or equal in length to the upper lip of the corolla.

5 M. punctа'ta (Lin. spec. p. 32.) clothed with fine pubescence; leaves petiolate, lanceolate, narrowed at the base: floral leaves and outer bracteas sessile, coloured a little at the base, mutic; calyxes pubescent, having the throat shortly bearded, and the teeth nearly equal, lanceolate, short, and stiff; corolla glabrous: tube hardly exserted: lower lip dotted. ♃. H. Native from Virginia and New Jersey to Florida, Carolina, and New Orleans. Andr. bot. rep. 8. t. 546. Ker. bot. reg. t. 85. M. lútea, Michx. fl. bot. amer. 1. p. 16. Stem ascending, branched. Leaves 2 inches long, sparingly toothed or entire. Whorls few, remote, all shorter than the leaves. Genitals equal in length to the upper lip of corolla. Corolla yellowish, dotted with brown.

Dotted-flowered Monarda. Fl. June, Oct. Clt. 1714. Pl. 1 to 1½ foot.

6 M. arista'ta (Nutt. trav. in ark. territ. ex Benth. lab. p. 818.) canescent; leaves oblong-lanceolate, narrowed at the base; floral leaves and outer bracteas sessile, a little coloured, subulately awned at apex; calyx striated, pubescent, with a bearded throat, and nearly equal, long, subulate teeth, which are pencilled at apex; tube of corolla hardly exceeding the calycine teeth. ♃. H. Native of Arkansas; Texas, at Bejar; and Rio de la Trinidad, &c. M. citriodòra, Cerv. ex Lag. nov. gen. et spec. 2. Habit and stature of *M. punctáta*. Leaves sharply and remotely toothed. Bracteas ciliated, often purplish or yellowish. Corolla yellowish?: lower lip almost dotless. Stamens shorter than the upper lip of corolla.

Awned-bractead Monarda. Fl. July, Sept. Clt. 1825. Pl. 1 to 1½ foot.

† *Species not sufficiently known.*

7 M. scа'bra (Beck, in Sill. amer. journ. 10. p. 260.) stem nearly glabrous; leaves ovate-lanceolate, subcordate, serrated, with revolute edges, scabrous, thick, dotted, on short petioles, rather villous; bracteas ovate-lanceolate; whorls of flowers large, terminal, by threes; calyx hairy, with a densely bearded throat, and short, acute, erectish teeth; corolla hairy; stamens equal in length to the upper lip. ♃. H. Native in woods on the banks of the Mississippi, near St. Louis. Stem branched. Leaves 2 to 2½ inches long. Corolla pale purple.

Scabrous Monarda. Pl. 3 feet.

8 M. gra'cilis (Pursh, fl. amer. sept. 1. p. 17.) quite glabrous; heads small, nearly naked, lateral and terminal; outer bracteas linear, ciliated; calyxes pubescent, ciliated; corolla short, very slender, glabrous; leaves linear-lanceolate, acuminated, serrated, glabrous; stem obtuse-angular, glabrous. ♃. H. Native of South Carolina and Virginia, among the mountains. Perhaps a species of *Blephília*; but there are no specimens in Pursh's herbarium to ascertain this point. Corollas purple.

Slender Monarda. Pl. 1 to 2 feet.

N.B. M. praténsis, M. rígida, and M. virgàta, Rafin, med. fl. 2. p. 37. not being recognizable by the descriptions given, are therefore excluded.

Cult. The species are of easy culture and propagation, growing freely in any soil; and are readily increased by dividing at the root. The *M. punctàta* and *M. aristàta* are more shy of cultivation than the others; and for this reason it is safer to grow them in pots, in a mixture of peat and sand.

XXXIII. BLEPHILIA (probably from βλεφαρις, *blepharis*, the eye-lash, in allusion to the ciliated bracteas.) Rafin. ex Benth. lab. p. 819. Monárda species of Lin. and other authors.

Lin. syst. *Diándria*, *Monogýnia*. Calyx ovate-tubular, 13-nerved, naked inside the throat, bilabiate; upper lip tridentate, with the teeth awned; lower lip bidentate, with the teeth mutic, or shortly awned. Corolla having the tube a little exserted, and exannulate inside; the throat dilated, and the limb bilabiate: lips nearly equal: the upper one erect and entire: the lower one spreading and trifid: the lateral lobes ovate-roundish, and the middle one narrower, oblong, retuse and emarginate. Rudiments of upper stamens wanting, or small and filiform: lower two fertile, ascending, exserted from the upper lip of the corolla; filaments toothless, inserted in the throat of the corolla; anthers linear, somewhat 2-celled, with connate margins, and divaricate confluent cells. Style equally bifid at top; stigmas minute, terminal. Achenia dry, smooth.—Herbs, with a habit and character between *Monárda* and *Ziziphora*; the leaves of the first, and the flowers of the latter genus. Whorls numerous, globose: upper ones approximating into a spike.

1 B. cilia'ta (Rafin, journ. phys. 89. 98.) leaves almost sessile, ovate-oblong, narrowed at the base, canescent beneath; lower floral leaves conforming to the cauline ones: upper ones and outer bracteas ovate, acute, coloured, equalling the calyxes. ♃. H. Native of Pennsylvania, Virginia, Carolina, Missouri, and near St. Louis. Monárda ciliàta, Lin. spec. 32, but not of Michx.—Mor. hist. 3. p. 374. sect. 11. t. 8. f. 6.—Pluck. phyt. t. 24. f. 1. alm. t. 164. f. 3. Stems pubescent, furnished with retrograde hairs on the angles. Leaves 2 inches long, nearly glabrous or pubescent. Whorls all distinct. Bracteas ciliated, reddish at top. Corollas blue, marked with dark purple spots.? Root creeping.

Ciliated Blephília. Fl. July. Clt. 1798. Pl. 1 to 2 feet.

2 B. hirsu'ta (Benth. lab. p. 320.) leaves petiolate, ovate, roundly cordate at the base, hairy on both surfaces; lower floral leaves conforming to the cauline ones: upper floral leaves and bracteas linear-subulate, shorter than the calyxes; calyxes pubescent, recurved. ♃. H. Native of Virginia, on the moun-

tains; at Lake Michigan; and on the banks of the Missouri. *Monárda hirsùta*, Pursh, fl. amer. sept. 1. p. 19. *Monárda ciliàta*, Michx, fl. amer. bot. 1. p. 16. but not of Lin. Habit more branched and loose than in *B. ciliàta*. Whorls more numerous: upper ones approximate. Calyx smaller, and more hairy. Corolla more exserted, and nearly glabrous, purple or blue.

Hairy Blephilia. Fl. July, Sept. Clt. 1798. Pl. 1 to 2 feet.

Cult. For culture and propagation see *Monárda*, p. 758.

XXXIV. ZIZI'PHORA (said to be from *zizi* of the Indians; and *φορεω*, *phoreo*, to bear.) Lin. gen. no. 36. Schreb. gen. no. 47. Juss. gen. 111. Gærtn. fruct. 1. p. 316. t. 66. Benth. lab. p. 320.

Lin. syst. *Diándria*, *Monogýnia*. Calyx tubular, elongated, 13-nerved, villous inside the throat, bilabiate; upper lip tridentate, with mutic teeth. Corolla having the tube hardly exserted, and exannulate inside; the throat dilated, and the lips nearly equal: upper lip erect, entire: lower one spreading, trifid, with rounded lobes, the middle lobe longer and emarginate. Rudiments of the superior stamens almost wanting: the 2 lower ones fertile, ascending under the upper lip, and equal in length to it, or longer; filaments inserted at the throat of the corolla, toothless; anthers linear, somewhat 2-celled, with divaricate, confluent cells, and subconnate margins. Upper lobe of style very short; stigmas minute, terminal. Achenia dry, smooth.—Herbs or subshrubs, with a habit between *Monárda* and *Thýmus*. Leaves quite entire, or furnished with a few minute teeth, lined with diverging veins beneath; floral leaves almost similar to the others, but sometimes broader, and sometimes narrower. Whorls few-flowered, usually approximate at the tops of the branches. Pedicels short, flattened, erect. Bracteas almost wanting. Flowers intermediate between those of *Blephilia* and *Thýmus*.

§ 1. *Permanent suffruticose plants.*

1 Z. clinopodioi'des (Bieb. fl. cauc. 1. p. 17.) suffruticose; leaves ovate-oblong or lanceolate; floral leaves similar to the others, or narrower, loose; whorls approximating into a roundish terminal head; calyx clothed with hoary pubescence, or ciliated with a few hairs. ♄. F. Native of Armenia, Iberia, Caucasus, Siberia, Altaian mountains, in grassy places. Habit of a large variety of *Thýmus serpýllum*. Branches diffuse, purplish, canescent from short tomentum, like the leaves and calyxes. Corolla bluish purple. Stamens a little exserted.

Var. α, *canéscens* (Benth. lab. p. 321.) leaves for the most part narrow; calyxes less pilose. ♄. F. Cunila capitàta, Lin. spec. p. 30. Thymus punctàtus, Willd. phyt. 1. p. 8. ex Rœm. et Schultes. Thymus lùcidus, Ehrh. beitr. 7. p. 150. ex Rœm. et Schultes. Z. clinopodioides, α. Cunila, and β. acinoides, Rudolph. in mem. acad. sc. petrop. 2. p. 313. Z. tenùior, Falck. topogr. 1. p. 98. ex Rudolph. l. c. Z. Mussini, Adam. ex Rudolph. l. c. Z. serpyllàcea, Bieb. fl. cauc. 1. p. 17. Rudolph. in mem. acad. sc. petrop. 2. p. 315. t. 12.

Var. β, *mèdia* (Benth. lab. p. 321.) leaves for the most part ovate; calyxes rather pilose. ♄. F. Native of the Caucasus, and the Altaian mountains. Z. clinopodioides, Rudolph. in mem. acad. petrop. 2. p. 311. t. 11. exclusive of var. α. and β. Z. serpyllàcea, Sims, bot. mag. t. 906. bad. Z. mèdia, Link, enum. 1. p. 17. Corollas reddish purple.

Clinopodium-like Ziziphora. Fl. July, Aug. Clt. 1803. Shrub trailing, ½ to 1 foot long.

2 Z. dasyá'ntha (Bieb. fl. cauc. 1. p. 18.) suffruticose; leaves ovate or oblong; floral leaves conforming to the others, loose; whorls approximating into an oblong head, or the lower ones are distinct; calyx hispid, very pilose. ♄. F. Native of Caucasus and Iberia, in alpine places. Z. Puschkìni, Adams, in Web. et Mohr. cat. 1. p. 42. ex Rœm. et Schultes. Sims. bot. mag. t. 1093. bad. This differs from *Z. clinopodioides*, in the broader leaves, longer heads of flowers, and the very hispid calyxes; the calycine teeth are also a little longer, the corollas usually shorter, and the stamens rarely exserted. Corollas purplish blue.

Thick-flowered Ziziphora. Fl. June, Aug. Clt. 1803. Shrub procumbent.

3 Z. canéscens (Benth. lab. p. 321.) suffruticose? leaves ovate, clothed with hoary pubescence on both surfaces; floral leaves similar to the others; whorls approximate into a terminal head; calyx clothed with soft pubescence. ♄. ? F. Native of Syria and Egypt, Labillardiere. Habit of *Z. Hispánica*. Flowers capitate, as in *Z. clinopodioides*, but the leaves are broader, and the calyxes smaller; but is distinguished from both in the hoary pubescence.

Canescent Ziziphora. Shrub.

§ 2. *Annual plants.*

4 Z. Hispa'nica (Lin. spec. p. 31.) annual; leaves nearly sessile, ovate or oblong; floral leaves rhomboid, longer than the calyxes; whorls distinct, axillary, approximate, 6-10-flowered; calyxes sessile. ☉. H. Native of Spain. Lam. ill. t. 13. f. 1.—Herb branched at base; branches stiff, villous. Teeth of calyx connivent. Corolla hardly exceeding the calyx, purplish blue.

Spanish Ziziphora. Fl. June. Clt. 1759. Pl. ½ to 1½ foot.

5 Z. Acinoi'des (Lin. spec. p. 31.) annual; leaves on short petioles, broad-ovate: floral ones similar to the others, longer than the calyxes; whorls few, distinct, axillary, loose, 6-10-flowered; calyxes pedicellate. ☉. H. Native of Spain. Allied to *Z. Hispánica*; but the stems are longer and looser, the flowers larger, and the calyxes pilosely hispid.

Acinos-like Ziziphora. Fl. July, Aug. Clt. 1786. Pl. ½ foot.

6 Z. capita'ta (Lin. spec. p. 31.) leaves lanceolate, narrowed at the base: floral ones very broad, rhomb-ovate, acuminated; whorls approximating into a terminal, nearly globose head; calyxes pilosely hispid. ☉. H. Native of the region of the Mediterranean, as of the south of Russia, in fields and on hills; on Mount Atlas, in cultivated ground; Spain; south of Italy, Armenia, Caucasus, Island of Cyprus, Tauria; Soongarian mountains, in Siberia, &c. Rudolph. in mem. acad. sc. petrop. 2. p. 308. t. 10. Lam. ill. t. 18. f. 3. Sibth. et Smith. fl. græc. 1. p. 10. t. 13.—Buxb. cent. 3. p. 28. t. 51. f. 1.—Mor. hist. sect. 11. t. 8. f. 5. Herb divaricately branched, pubescent. Floral leaves ciliated. Corolla a little longer than the calyx, red: tube slender, exserted. Stamens equalling the corolla.

Capitate-flowered Ziziphora. Fl. July, Aug. Clt. 1759. Pl. ½ to 1½ foot.

7 Z. tene'ior (Lin. spec. p. 31.) leaves lanceolate, narrowed at the base; floral leaves almost conform to the rest; whorls all distinct, axillary; calyx very pilose, hispid; corolla exserted a very little from the calyx. ☉. H. Native of the region of the Mediterranean; of the south of Russia, on hills; Spain, Mount Atlas, Caucasus, Altaia, &c. Lam. ill. t. 18. f. 2. S. spicàta, Cerv. ann. sc. matr. 4. p. 259. Z. serpyllàcea, Tenore, sylt. p. 16. ? but not of Bieb. Branches numerous, pubescent. Leaves 1 inch long, quite entire or denticulated, ciliated on the margins and middle nerve, especially the upper ones, rarely all

naked; floral leaves longer than the flowers. Teeth of calyx connivent. Corolla purplish. Stamens inclosed.

Slenderer Ziziphora. Fl. June, July. Clt. 1752. Pl. ½ to 1 foot.

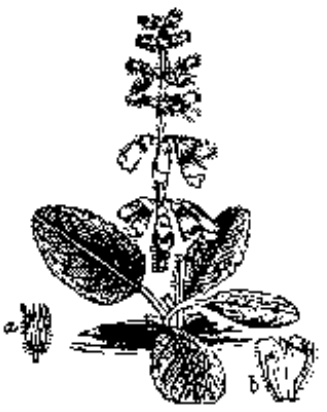
8 Z. Tau'rica (Bieb. fl. taur. 3. p. 259.) leaves lanceolate, narrowed at the base: floral ones similar to the others; whorls all distinct, axillary; calyx very pilose, hispid; corolla twice as long as the calyx. ⊙. H. Native of Tauria, in dry gravelly places; Arabia and Persia. Corollas reddish purple. Very like *Z. tenùior*, but differs in the corollas being as large as those of *Thymus alpìnus*.

Taurian Ziziphora. Fl. June, Sept. Clt. 1816. Pl. ½ foot.

† *A doubtful species.*

9 Z. Java'nica (Blum. bijdr. p. 822.) flowers capitately spicate, terminal; bracteas subulate, ciliated; calyxes villous; leaves petiolate, ovate, erosely and coarsely serrated, clothed with prostrate pubescence on both surfaces. ⊙.? H. Native of Java, in the province of Cheribon, on the top of the burning Mount Tjerimai. Upper lip of corolla reflexed, entire: lower one 3-lobed. Stamens 2, hardly exserted. Stigma unequally bifid.

Java Ziziphora. Pl.?



N.B. *Z. thymoìdes* of Roem. et Schultes, is an imaginary species.

Cult. The perennial species of *Ziziphora* are very pretty rock plants. They should be grown either on rockwork, or in small pots well drained with sherds, in any light sandy soil; they are readily increased by seeds and cuttings. The seeds of annual species only require to be sown in the open ground, in April, where they are intended to remain.

XXXV. HORMI'NUM (from ὁρμαω, *hormao*, to excite; in allusion to the qualities of the plant.) Benth. lab. p. 727. Horminum species, Lin. and other authors.—Melissa species, Jacq.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, bilabiate; upper lip tridentate; lower lip bifid. Corolla with an exserted tube, which is furnished with a pilose ring inside, an elongated widened throat, and a sub-bilabiate limb; the upper lip truncate, emarginate: the lower lip 3-lobed, with broad, short, rounded segments. Stamens 4, all fertile, ascending, didynamous: lower ones the longest; anthers cohering by pairs, linear, with divaricate cells. Style shortly bifid at apex: lobes subulate; stigmas minute. Achenia smoothish.—A tufted perennial herb, with numerous radical leaves, simple, almost naked stems, and purplish blue flowers.

FIG. 78.

1 H. Pyrena'icum (Lin. spec. p. 831.) ¼. H. Native of the temperate parts of Europe, on the mountains; as of the Pyrenees, Alps of Vallais and Salisburgh, &c. Sweet, fl. gard. 3. t. 252. Melissa Pyrenàica, Jacq. hort. vind. 2. t. 183. Lam. ill. t. 515. Leaves almost all radical, petiolate, ovate, obtuse, deeply crenated, truncate at the base, or subcordate, veiny, green on both surfaces, glabrous, or rather hispid on the nerves. Floriferous stems erect, simple, furnished with 1 or 2 pairs of small, sessile, crenated leaves. Whorls distant, 6-flowered, secund. Floral leaves bractea-formed, shorter than the calyxes. Flowers on short pedicels, nutant. Calyx 13-nerved, often coloured at top, glabrous or hispid on the nerves; lips spreading: teeth acute. Corolla bluish purple, 9-10 lines long (fig. 78.)

Pyrenean Horminum. Fl. June, July. Clt. 1820. Pl. ½ to 1 foot.

Cult. This is a very elegant plant when in blossom. It will grow in the open border, and is readily increased by dividing at the root, or by seed. In severe winters it is sometimes liable to be killed by damp; therefore a reserve plant or two should be grown in pots, so that they may be protected by placing them under a frame in winter.

Tribe IV.

SATUREI'NEÆ (so called from containing genera agreeing with *Saturèia* in the characters given below.) Benth. lab. p. 324. Calyx 5-toothed, equal or bilabiate, with the upper lip tridentate, and the lower one bifid. Tube of corolla exannulate inside, shorter, or scarcely longer than the imbricate calyx and bracteas; limb of corolla sub-bilabiate: upper lip flat, entire, or emarginately bifid: lower lip spreading, trifid, with flat, nearly equal lobes; or the middle lobe is rather the broadest. Stamens distant, straight, diverging, or scarcely ascending, equal, or the upper ones are shorter or abortive. The tetrandrous genera of this tribe are intermediate between tribe *Menthoìdeæ* and *Melissìneæ*; but the corolla is more decidedly bilabiate than in the former tribe; and the stamens are seldom ascending, as in the latter; from most genera of which they are also distinguished by the shortness of the tube of the corolla. The diandrous genus *Cunìla* connects tribe *Monárdeæ* with *Melissìneæ*.

XXXVI. BYSTROPO'GON (from βυω, *byo*, to close; and πωγων, *pogon*, a beard; the throat of the calyx is closed by villi inside.) Benth. lab. p. 324.—Bystropògon species, Lher. sert. angl. 19.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx 10-13-nerved, campanulate or tubular, equal, 5-toothed; throat villous inside. Corolla with an inclosed tube, and sub-bilabiate limb; upper lip erectish, bifid; lower lip spreading, trifid: lobes all flat and entire. Stamens 4, erect, distant, shorter than the corolla, didynamous: lower ones the longest; filaments glabrous; anthers 2-celled: cells parallel. Disk equal, glandless. Style shortly bifid at apex: lobes nearly equal, linear, a little thickened, obtuse, stigmatiferous at top. Achenia dry, smooth.—Shrubs. Flowers small, cymose in the first section; the cymes dichotomous, subcorymbose, or panicled; in the second section, disposed in dense spicate whorls. Bracteas lanceolate or subulate. This genus is scarcely distinct from *Méntha*.

Sect. I. Bystropògon (see genus for derivation.) Benth. lab. p. 325. Calyx campanulate, 10-nerved. Flowers loosely cymose.

1 B. punctà'tus (L'Her. sert. angl. p. 20. t. 23.) leaves crenated, green on both surfaces, glabrous, or hardly tomentose beneath; cymes axillary, pedunculate, corymbose; calycine teeth ovate. ½. G. Native of Madeira. Branches glabrous or pubescent. Leaves 1 to 1½ inch long. Corollas downy outside, pale purple.?

Dotted Bystropogon. Fl. July, Sept. Clt. 1775. Shrub 2 to 3 feet.

2 B. Canarie'nsis (*L'Her. sert. angl. p. 20.*) branches very villous; leaves crenated, villous or glabrous, green on both surfaces; cymes axillary, pedunculate, corymbose; calycine teeth

subulate, shorter than the tube. ♄. G. Native of the Canary Islands. Méntha Canariénsis, Lin. spec. 807. Heliotròpium Canariénse, &c., Comm. hort. amst. 2. p. 129. t. 65. Floriferous branches very hispid. Corollas white. Very like the preceding, but differs in the hairiness, and the more slender calycine teeth.

Canary-Island Bystropogon. Fl. June, Aug. Clt. 1714. Shrub 3 to 4 feet.

3 B. plumòsus (L'Her. sert. angl. p. 20. t. 22.) leaves serrately crenated, clothed with fine tomentum above, and white tomentum beneath; cymes axillary, dense; calycine teeth subulate. ♄. G. Native of the Canary Islands. Habit of *B. Canariénsis*. Leaves of *B. origanifòlius*. Floral leaves shorter than the cymes. Corollas pale purple. ?

Plumose Bystròpogon. Fl. June, July. Clt. 1779. Shrub 2 to 3 feet.

4 B. eriánthos (Benth. lab. p. 727.) leaves serrated, green above, and glabrous, and hardly tomentose beneath; cymes pedunculate, corymbose; calycine teeth ovate; corolla more than twice as long as the calyx, villous outside. ♄. G. Native of the Island of Juan Fernandez, Graham.—A humble shrub, with the habit of *B. punctàtus*; but the leaves are acute and serrated, and the flowers distinct. Tube of corolla inflated beyond the calyx.

Woolly-flowered Bystropogon. Shrub dwarf.

5 B. origanifòlius (L'Her. sert. angl. p. 20.) leaves almost quite entire, clothed with white tomentum beneath; cymes pedunculate, paniculately racemose; calycine teeth subulate. ♄. G. Native of the Canary Islands. Méntha plumòsa, Lin. mant. p. 278. Floriferous branches rather tomentose. Superior floral leaves much shorter than the flowers. Flowers of *B. Canariénsis*, but the calyxes and pedicels are less hispid.

Marjoram-leaved Bystropogon. Fl. July, Aug. Clt. 1815. Shrub 2 to 3 feet.

Sect. II. Minthóstachys (from μινθα, *mintha*, mint; and σταχυς, *stachys*, a spike; the whorls of flowers are spicate, like those of some species of mint.) Benth. lab. p. 325. Calyx 13-nerved, tubular. Whorls densely spicate. This section is intermediate between *Bystropògon* and *Pychnánthemum*.

6 B. spicàtus (Benth. lab. p. 326.) leaves subserrated, green on both surfaces, glabrous; whorls dense, spicate; calycine teeth ovate. ♄. G. Native of Peru, at Parrochuca, Mathews. Shrub quite glabrous. Leaves 1 to 1½ inch long; floral leaves much smaller, clothed with hoary tomentum on both surfaces. Whorls 6-10-flowered. Calyx very villous. Corolla hardly longer than the calycine teeth. A fifth fertile stamen sometimes occurs in this species.

Spicate-flowered Bystropogon. Shrub.

7 B. tomentòsus (Benth. lab. p. 326.) leaves a little crenated, green above, and rather hispid, at length glabrous, but clothed with tomentose wool beneath; whorls dense, subspicate; calycine teeth subulate. ♄. G. Native of Peru, Ruiz. et Pav. Young branches villous. Cauline leaves 1-2 inches long, rounded at the base, obtuse and acute, white or rufescent beneath; floral leaves gradually smaller: upper ones hardly exceeding the calyxes, and clothed with soft villi on both surfaces. Corollas like those of *B. spicàta*.

Tomentose Bystropogon. Shrub.

8 B. ca'nus (Benth. lab. p. 326.) leaves ovate-lanceolate, a little toothed, canescent beneath; lower whorls distinct: upper ones subspicate; calycine teeth subulate. ♄. G. Native of Peru, Ruiz. et Pav. Branches villous, slender. Leaves an inch long, acute, cuneately rounded at the base. Flowers smaller than in the preceding.

Hoary Bystropogon. Shrub.

† *A doubtful species.*

9 B. denta'tus (Poir. suppl. 1. p. 755.) leaves ovate, hairy, serrated; whorls of flowers hispid. ♄. ? G. Native of Peru. Probably a species of *Hyptis*.

Toothed-leaved Bystropogon. Shrub. ?

Cult. The species of *Bystropògon* are shrubs of no beauty; their culture is that of other common greenhouse plants, and they are readily increased by cuttings.

XXXVII. PYCHNA'NTHEMUM (from πυκνος, *pychnos*, dense; and ανθεμις, *anthemis*, a flower; the flowers are disposed in dense whorls.) Michx. fl. bor. amer. 2. p. 7. Benth. lab. p. 326.—Brachystèmum, Michx. fl. bor. amer. 2. p. 5.—Koéllia, Moench. meth. 407. Túllia, Leavenworth, in Sill. journ. sc. vol. 20. p. 343.

Lin. syst. *Didynàmia, Gymnospérmia*. Calyx ovate or tubular, somewhat 13-nerved; teeth nearly equal, straight, or the 3 upper ones are joined at the base into an upper lip; throat naked inside. Corolla with the tube equalling the calyx, and the limb sub-bilabiate; the upper lip straight, flat, entire, or shortly emarginate; the lower lip flat, trifid; lobes all ovate, obtuse. Stamens 4, nearly equal, or the lower ones are rather the longest, straight, diverging, exserted, or inclosed; anthers 2-celled: cells parallel. Style almost equally bifid at top; lobes subulate, stigmatiferous at top. Achenia dry, smooth, or minutely dotted.—Perennial, stiff, usually canescent herbs, paniculately corymbose at top. Whorls few, dense, many-flowered, propped by bracteas, usually forming a terminal head, sometimes one or more disposed along the stem beneath. Corollas white or purplish; the lower lip usually dotted with purple.

Sect. I. Tu'llia (meaning unknown to us.) Benth. lab. p. 327. Calyx ovate-tubular, somewhat bilabiate, with usually subulately awned teeth. Whorls few, ample, often loose; cymes much branched, many-flowered. Outer bracteas foliaceous: inner ones subulate. Leaves petiolate.

1 P. incа'num (Michx. fl. bor. amer. 2. p. 7.) leaves on short petioles, ovate-oblong, acute, remotely serrated, rounded at the base, pubescent, clothed with white tomentum beneath; whorls many-flowered, dense, cymose; bracteas linear, or the outer ones are lanceolate; calycine teeth acute, a little awned, nearly equal. ♃. H. Native of North America, in cornfields and among bushes from Canada to Carolina. Origànum incànum, Walt. fl. car. p. 165. ? Clinopòdium incànum, Lin. spec. p. 822.—Dill. elth. 1. p. 87. t. 74. Plant pubescent. Leaves 1½ inch long. Corollas whitish, tinged with red. Stamens exserted.

Hoary Pychnanthemum. Fl. July, Oct. Clt. 1732. Pl. 1½ to 3 feet.

2 P. Tu'llia (Benth. lab. p. 328.) leaves petiolate, oblong, acute, a little serrated, narrowed at the base, pubescent on both surfaces, pale beneath; whorls many-flowered, cymose; bracteas linear: outer ones oblong, awned; calyx bilabiate; teeth acute, a little awned; corolla glabrous inside. ♃. H. Native of Tenessee. Túllia pychnanthemoides, Leavenworth, in Sill. amer. journ. sc. vol. 20. p. 343. t. 5. Plant pubescent. Leaves 2 inches long. Tube of corolla a little longer than the calyx. Stamens exserted.

Tullia Pychnanthemum. Pl. 1½ foot.

3 P. Lomi'su (Nutt. acad. nat. sc. phil. 7. p. 100.) leaves petiolate, ovate, somewhat serrated, acute, short, glabrous above; flowers cymose, propped by many bracteas; bracteas lanceolate,

acuminated, hoary; calycine teeth short, acuminated, pilose at top; flowers spotted. ♃. H. Native of Georgia. Allied to *P. lanàta*; but readily distinguished from it, in the shorter, more glabrous leaves, more humble stature, and spotted flowers. Cymes large, usually terminal. Bracteas canescent. Corolla white or pale red, spotted with red.—A beautiful species, having the fragrance of *Penny-Royal*.

Lewis's Pychnanthemum. Pl. ½ to 1 foot.

4 P. Aristàtum (Michx. fl. bor. amer. 2. p. 8. t. 38.) leaves on short petioles, oblong, acute, a little serrated, rounded at the base, glabrous on both surfaces, or scarcely tomentose; whorls many-flowered, dense; bracteas very acute: outer ones oblong: inner ones subulate; calycine teeth equal, acute, a little awned; corolla pubescent inside. ♃. H. Native from Maryland to Upper Carolina. P. verticillàtum, Pursh, fl. amer. sept. 2. p. 410. exclusive of the syn. of Michx. Origanum clinopodioides, Walt. fl. car. ex Pursh, l. c. Herb a little branched, quite glabrous, pale green. Leaves 1½ to 2 inches long. Corolla hardly longer than the calyx, whitish. Stamens a little exserted.

Awned-calyxed Pychnanthemum. Fl. Aug. Clt. 1752. Pl. 1 foot.

5 P. Torrei (Benth. lab. p. 329.) leaves on short petioles, oblong-lanceolate or linear, acute, scarcely serrated, narrowed a long way at the base, almost glabrous; whorls dense, subcorymbose; bracteas oblong or subulate, awned; calycine teeth nearly equal, subulate; corolla pubescent inside. ♃. H. Native of the State of New York, near Princeton, Torrey; and of South Carolina, Mitchell. Stem a little branched, pubescent. Leaves 1 to 2½ inches long, green, finely downy on the veins. Calyxes and bracteas clothed with soft villi. Stamens exserted.

Torrey's Pychnanthemum. Pl. 1 to 2 feet.

6 P. hyssopifòlium (Benth. lab. p. 329.) leaves almost sessile, oblong-lanceolate or linear, obtuse, nearly quite entire, glabrous, or clothed with fine tomentum; whorls few, many-flowered, rather loose; bracteas subulate, awned: outer ones oblong; teeth of calyx nearly equal, subulate, stiff; corolla almost glabrous inside. ♃. H. Native of Virginia, Carolina, Georgia, and Louisiana. P. setòsum, Nutt. in journ. acad. sc. phil. 7. p. 100.? Herb a little branched, usually canescent from fine tomentum. Leaves an inch long, very rarely subserrated, with often fascicles of smaller ones in the axils. Bracteas exceeding the calyxes. Flowers similar to those of *P. aristàtum*.

Hyssop-leaved Pychnanthemum. Pl. 1 to 1½ foot.

Sect. II. Brachyste'mon (from *βραχυς, brachys*, short; and *στημων, stemon*, a stamen.) Benth. lab. p. 329. Calyx ovate, with short equal teeth. Whorls dense, numerous, head-formed, almost all terminal and panicled. Bracteas oblong, lanceolate, or subulate, adpressed. Leaves usually sessile.

7 P. mu'ticum (Pers. ench. 2. p. 128.) pubescent; stem panicled at top; leaves sessile, ovate-lanceolate, acute, a little serrated, rounded at the base, stiff; upper ones white on both surfaces; whorls very dense, capitate; bracteas ovate-lanceolate; calyxes bluntly and almost equally toothed; throat of corolla villous inside. ♃. H. Native of Upper Carolina; at St. Louis and West Chester, Drummond; Arkansas, Nuttall. Stems branched, green, villous, pubescent, or almost glabrous, as well as the lower leaves; but the upper leaves and whorls are white from tomentum. Leaves sometimes all entire, but the lower ones are usually serrated. Corolla white; lower lip dotted with purple.

Mutic Pychnanthemum. Pl. 1 to 2 feet.

8 P. pilòsum (Nutt. gen. amer. 2. p. 33.) stem pilose, branched a little at top; leaves lanceolate, pilose beneath, with prominent veins, obscurely denticulated; bracteas length of calyxes, clothed with hoary pubescence; heads larger than in *P. lanceolàtum*. ♃. H. Native of Kentucky and Tenessee, in valleys. Beck, in Sill. amer. journ. sc. 14. p. 117. Stems and leaves more or less pilose. Heads terminal, large. Bracteas and calyxes villous, mutic. Stamens exserted. Corolla pubescent, spotless. Said by Bentham to be the same as *P. mùticum*.

Pilose Pychnanthemum. Pl. 1 to 2 feet.

9 P. lanceola'tum (Pursh, fl. amer. sept. 2. p. 410.) stem panicled at top, with pubescent angles; leaves sessile, ovate-lanceolate or lanceolate, quite entire, rounded at the base, stiff, almost glabrous; whorls dense, numerous, villous; bracteas ovate-lanceolate; calyxes bluntly and unequally toothed; throat of corolla villous inside. ♃. H. Native of Pennsylvania, even to Upper Carolina, among the mountains. Allied to *P. mùticum*; but differs in the stem being more glabrous, and in the leaves being quite entire and all green. Stem often purplish. Leaves sometimes glabrous and sometimes villous. Corolla usually spotted, but sometimes also spotless.

Var. α, *latifòlium* (Benth. lab. p. 330.) leaves broader. ♃. H. Brachystèmum verticillàtum, Michx. fl. bor. amer. 2. p. 6. t. 31. Thymus verticillàtus, Poir. dict. 7. p. 653. P. verticillàtum, Pers. ench. 2. p. 128.

Var. β, *angustifòlium* (Benth. lab. p. 330.) leaves narrower. ♃. H. Népeta Virgínica, Willd. spec. 3. p. 56. Brachystèmum Virgínicum, Michx. fl. bor. amer. 2. p. 6. P. Virgínicum, Pers. ench. 2. p. 128. Brachystèmum lanceolàtum, Willd. enum. 2. p. 623. Thymus lanceolàtus, Poir. suppl. 5. p. 305.

Lanceolate-leaved Pychnanthemum. Fl. July, Aug. Clt. 1812. Pl. 1 to 2 feet.

10 P. linifòlium (Pursh, fl. amer. sept. 2. p. 409.) glabrous; stem panicled at top; leaves sessile, linear, quite entire, stiff; whorls dense, numerous, terminal, almost glabrous; bracteas linear, acute, stiff; calycine teeth lanceolate-subulate, short, acute, stiff; corolla villous inside at the throat. ♃. H. Native from New England to Carolina; Georgia, and New Orleans. P. tenuifòlium, Schrad. in Steud. nom. 669.? Thymus Virgínicus, Lin. syst. p. 453. Brachystèmum linifòlium, Willd. enum. p. 623. Koëllia capitàta, Mœnch. meth. p. 408. Origanum flexnòsum, Walt. fl. car. p. 165. ex Pursh.—Herm. par. 218.? Habit of *P. mùticum*. Margins of leaves subrevolute. Stamens a little exserted. Corolla whitish.

Flax-leaved Pychnanthemum. Fl. July, Aug. Clt. 1739. Pl. 1 to 2 feet.

11 P. nu'dum (Nutt. gen. amer. 2. p. 34.) plant glabrous, pale green; stems nearly simple, strict; leaves sessile, ovate-oblong, obtuse, quite entire, rounded at the base; whorls loose, terminal, corymbosely panicled, glabrous; outer bracteas lanceolate-linear: inner ones very short and subulate; corollas pubescent inside. ♃. H. Native of Carolina and Georgia, on the mountains. Stems more simple and strict than in other species. Leaves erect, with subrevolute edges, scarcely an inch long. Corymbs dense. Corolla pubescent, pale.? Stamens exserted from the tube, shorter than the limb.

Naked Pychnanthemum. Fl. July, Aug. Clt. 1824. Pl. 1 to 2 feet.

Cult. Plants of easy culture, very fragrant, but of little beauty. The species are readily increased by dividing at the root or by seed; and they thrive best in a pear border.

XXXVIII. MONARDE'LLA (a dim. of Monárda.) Benth. lab. p. 331. Pychnánthemum species, Michx. and other authors.

Lin. syst. *Didynàmia, Gymnospérmia*. Calyx ovate-tubular, often elongated, 10-13-nerved, 5-toothed: teeth short, nearly

equal, erect; throat naked inside. Corolla with the tube equalling the calyx, or a very little exserted; throat glabrous inside; limb sub-bilabiate: upper lip bifid: lower lip trifid: lobes all oblong or linear, flat, nearly equal. Stamens 4, nearly equal, or the lower ones are the longest, straight, diverging, exserted; anthers 2-celled: cells parallel, at length diverging or divaricate. Style shortly bifid at apex; stigmas minute. Achenia dry.—Perennial herbs. Whorls large, almost globose, propped by broad bracteas, solitary, terminal. Habit different from *Pychnánthemum*, although nearly allied in characters.

1 M. monta'na (Benth. lab. p. 331.) stem erect; leaves sessile, ovate-lanceolate, acute, serrated, rounded at the base; whorls densely globose, large; outer bracteas broad-ovate, acute; calyxes tubular, almost equally toothed. ♃. II. Native of North America, on the high mountains of Carolina. Pychnánthemum montànum, Michx. fl. bor. amer. 2, p. 8. Leaves sessile, and whorls large. Corollas purple, spotted.

Mountain Monardella. Pl. 1 to 1½ foot.

2 M. Carolinia'na (Benth. lab. p. 332.) very hairy; leaves abruptly-petiolate, somewhat cordately-oval, serrated; heads involucrated by coloured bracteas; bracteoles ciliated; calyxes bearded at top. ♃. II. Native of Carolina, on the high mountains. Pychnánthemum Monardélla, Michx. fl. bor. amer. 2. p. 8. t. 84. Habit of *Monárda fistulòsa*, ex Michx. Leaves more than an inch long, acuminated. Bracteas twice as long as the calyxes. Corollas small, pale red. Pychnánthemum Monardélla, Pursh, is nothing but *Monárda fistulòsa*.

Carolinian Monardella. Fl. July, Aug. Clt. 1816. Pl. 2 to 3 feet.

3 M. odoratíssima (Benth. lab. p. 332.) stems procumbent; leaves almost sessile, oblong-lanceolate, narrowed at both ends, quite entire, hoary; whorls densely-globose, large, solitary; outer bracteas broad-ovate, very blunt, coloured; calyx tubular, elongated, almost equally toothed. ♃. II. Native of North West America, in rocky places, at the Columbia river, and on rocks among the White Mountains, Douglas. Plant suffruticose, branched, purplish at the base. Leaves hardly half an inch long, clothed with hoary tomentum on both surfaces. Corolla rose-coloured, glabrous: tube a little exserted.

Very sweet-scented Monardella. Pl. procumbent.

4 M. undula'ta (Benth. lab. p. 332.) stem procumbent at the base; branches ascending; leaves oblong-linear, obtuse, with undulately-curled edges, narrowed a short way into the petioles, green on both surfaces, glabrous; whorls densely-globose, large, solitary; outer bracteas broad-ovate, acute, membranous, mutic; calyx tubular, elongated, almost equally toothed, mutic. ♃. H. Native of North California, Douglas. Stems perennial or suffruticose at the base. Branches purplish, glabrous, or downy. Leaves thickish, 1-nerved, usually fascicled in the axles, ½ to 1 inch long. Heads and flowers as in the preceding. Calyxes villous at top.

Undulated-leaved Monardella. Pl. ½ to 1 foot.

5 M. Dougla'sii (Benth. lab. p. 332.) stem procumbent at the base; leaves petiolate, lanceolate, or linear, narrowed at both ends, green, pubescent; whorls densely-globose, large, solitary; outer bracteas ovate-lanceolate, exceeding the calyxes, aristately-subulate; calyx ovate-tubular, inflated, villous, with nearly equal, awned teeth. ♃. H. Native of North California. Herb pubescent, divaricately-branched; branches purplish. Leaves one inch long, flattish. Heads an inch in diameter. Segments of corolla and genitals shorter than in *M. odoratissima* and *M. undulata*.

Douglas's Monardella. Pl. ½ foot.

Cult. For culture and propagation, see *Pychnánthemum*, p. 763.

XXXIX. AMARA'CUS (Αμαρακος, *amaracos*, the Greek name of Dittany, of Crete.) Mœnch. ex Benth. lab. p. 333. Origanum, spec. of Lin. and other authors.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate-campanulate, 13-nerved at the base; upper lip elongated, entire, erect; lower lip truncate, almost wanting, or very shortly bidentate; throat naked inside. Tube of corolla exserted from the calyx, equalling the imbricate bracteas; limb bilabiate; the upper lip erect, emarginate, flattish: the lower lip spreading, trifid, with nearly equal, entire lobes. Stamens 4, erect, ascending, scarcely distant, exserted, didynamous: lower ones the longest; filaments glabrous; anthers 2-celled: cells distinct, diverging, or divaricate. Upper lobe of style short; stigmas minute.—Shrubs with quite entire leaves. Flowers aggregate into oblong spikelets. Bracteas orbicular, membranous, coloured, loosely-imbricate, much longer than the calyxes, equalling the tubes of the corollas. This genus differs from *Origanum*, from which it has been separated, in habit, calyx, corolla, &c.

1 A. dicta'mnus (Benth. lab. p. 333.) leaves almost sessile, clothed with dense wool on both surfaces, as well as the branches. ♄. F. Native of Candia, on rocks, and elsewhere in Greece. A. tomentòsus, Mœnch. Origanum Dictámnus, Lin. spec. 823. Curt. bot. mag. t. 298.—Blackw. t. 462.—Sabb. hort. rom. 3. t. 76. Dictámnus Crécicus, Bauh. pin. p. 222. Branches ascending. Leaves broad-ovate, obtuse, quite entire, rounded at the base, thick; floral leaves small, almost glabrous. Corolla without a spur, purple. Heads of flowers nutant. The fabulous qualities attributed to this plant (Dictámnus) may be seen in Virgil's 12th Æneid, and in Cicero's de Natura Deorum, 2. p. 50.

Dittany of Crete. Fl. June, Aug. Clt. 1551. Shrub 1 foot.

2 A. Tournefórtii (Benth. lab. p. 333.) leaves sessile, orbicular, sub-cordate at the base, and are, as well as the branches, quite glabrous or ciliated. ♄. F. Native of the Grecian Archipelago; as in the island of Amorgos, on rocks; and of the Levant. Origanum Tournefórtii, Ait. hort. kew. ed. 1st. vol. 2. p. 311. Andr. bot. rep. t. 537. Sibth. et Smith, fl. græc. 6. p. 56. t. 569. Origanum calcarátum, Juss. ex Steud. nom. p. 572. Origanum dictamni Cretici facie, folio crasso, nunc villoso, nunc glabro, Tourn. cor. 18. itin. 1. p. 240. with a figure. This differs from the preceding in being glabrous; in the spikes being more dense; in the bracteas being broader, and the genitals a little shorter. Lower lip of calyx distinctly bidentate. Corollas purple, furnished with a small obtuse spur under the throat. Habit of *Rhodiola rósea*.

Tournefort's Amaracus, or Dittany of Amorgos. Fl. Aug. Sept. Clt. 1788. Shrub ½ foot.

Cult. The species of this genus are liable to be killed by severe frosts if allowed to remain in the open air; but in common winters, if planted against a south wall in a dry soil, will survive. It is, however, proper to keep a few reserve plants in pots, that they may be protected by placing them in a greenhouse or frame. A rich light soil suits them best; and cuttings are readily rooted under a hand-glass.

XL. ORIGANUM (said to be derived from *opos, oros*, a mountain; and *γανος, ganos*, joy, the delight of the mountain. Origanum of Pliny, and Ογιγανον of Theophrastus and Dioscorides.) Benth. lab. p. 334. Origanum, species of Lin. and other authors.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate-tubular, 10-13-nerved, striated; teeth 5, equal, or the 3 superior ones are rather the longest; throat villous inside. Corolla having the tube equal in length to the calyx, or hardly longer than it; limb sub-bilabiate; the upper lip erectish, emarginate; the lower lip spreading and trifid, with nearly equal lobes. Stamens 4, exserted, distant, somewhat didynamous, the lower ones

the longest. Style almost equally bifid at top; stigmas minute. Achenia dry, smoothish.—Herbs. Leaves quite entire, or a little toothed. Flowers collected into cylindrical or oblong spikelets. Bracteas imbricate, coloured, covering the calyxes, but more loose than in the genus *Marjorana*.

1 O. Sipy'leum (Lin. spec. 833.) stems decumbent, paniculately-branched at top; leaves on short petioles, quite entire: lower ones roundish, hispid, or woolly: upper ones ovate, quite glabrous, glaucous; spikelets oblong, solitary, or by threes, nutant; bracteas loose, ovate, coloured; calyx quite glabrous, having the three superior teeth longer. ♄. F. Native of the Levant and Greece; on Mount Sipylos in Phrygia; and between Smyrna and Bursa, Sibthorp. Near Aleppo, Russell. On Mount Delphus, Sibthorp. O. hybridum, Mill. dict. no. 12. O. Sipýleum, Sibth. et Smith, fl. græc. 6. p. 57. t. 570. Origanum, montis sipyli, Herm. lugdb. 462. t. 463. Origanum Sipýleus, marjoranæ foliis, Mor. hist. 3. p. 357. sect. 11. t. 4. f. 2. Procumbent at the base. Sterile branches short, very villous. Leaves thick, woolly on both surfaces. Floriferous stems glabrous, with a few remote leaves. Tube of corolla equalling the calyx. Corolla pale purple. ?

Sipylos Marjoram. Fl. June, Sept. Clt. 1699. Shrub 1 to 1½ foot.

2 O. compa'ctum (Benth. lab. p. 334.) humble, almost simple; leaves nearly sessile, ovate, obtuse, scarcely serrated; spikes densely capitate, cylindrical; bracteas elongated, lanceolate, acute, coloured, twice as long as the calyx. ♄. F. Native near Tangiers, Salzmann. O. glandulòsum, Salzm. pl. exsic. but not of Desf. Stems rising from a suffruticose base, simple. Leaves smaller and stiffer than in *O. vulgàre*, but the bracteas are a little larger, and all acute. Teeth of calyx bearded inside: the 3 upper ones rather the longest. Corolla pale purple. ?

Compact Marjoram. Pl. ½ to ¾ foot.

3 O. vulga're (Lin. spec. 824.) erect, villous; leaves petiolate, ovate, obtuse, serrated a little, rounded at the base, green on both surfaces; spikelets oblong or cylindrical, glomerate, corymbosely-panicled; bracteas ovate, obtuse, coloured, from half as long again as the calyx to twice as long. ♃. H. Native of Europe, North of Africa, and Middle Asia, by way-sides, in hedges, and in woods; plentiful in some parts of Britain; Caucasus, Siberia, Cashmere; also from Pennsylvania to Carolina, but probably escaped from gardens. Curt. lond. 3. with a figure. Woodv. med. bot. 451. t. 164. Oed. fl. dan. t. 638. Sab. hort. rom. 3. t. 75. Smith, engl. bot. 1143. O. stolonìferum, Bess. O. orientàle, Mill. dict. no. 5. O. decìpiens, Wallr.—Blackw. t. 280.—Riv. mon. 60. f. 1. Habit very variable. Stems numerous, erect, more or less hairy, often reddish. Leaves more or less villous, rarely almost glabrous. Bracteas usually glabrous and reddish. Corolla exserted, usually purple, rarely white, with green bracteas. The wild marjoram is an aromatic and ornamental plant. The dried leaves, used instead of tea, are extremely grateful; they are also used in fomentations; the essential oil is so acrid that it may be considered as a caustic, and was formerly used with that intention by farriers. A little cotton moistened with it and put into the hollow of an aching tooth, frequently relieves the pain. The tops will dye linen of a reddish brown. This species is only used in cookery in default of one of the other marjorams.

Var. β, prismàticum (Gaud. ex Benth. lab. p. 335.) fructiferous spikes elongated, prismatic. ♃. H. Native of the region of the Mediterranean. O. heracleóticum, Rchb. fl. germ. exc. 813, but not of Lin. O. Créticum, Lin. spec. 823. O. macrostàchyum, Link, handb. 468. O. megastàchyum, Link, enum. 2. p. 114. ? O. latifòlium, Mill. dict. no. 3. This hardly differs from the species, except in the spikelets being elongated, and the flowers generally white; but they are also purple.

Var. γ, hùmile (Mart. Mill. dict. no. 8. Benth. lab. p. 335.) hardly half a foot high, nearly glabrous; leaves narrower, spikelets small, numerous, corymbose. ♄. H. Native of Asia, in shady places. O. hùmile, Mill. dict. no. 4. Poir. suppl. 4. p. 186. Corollas purple.

Var. δ, vìrens (Benth. lab. p. 335.) bracteas hardly coloured, usually pubescent. ♃. H. Native of Portugal and Cashmere. O. vìrens, Hoffm. et Link, fl. port. 1. p. 119. t. 9. O. oblongàtum, Link, enum. 2. p. 114. O. thymiflòrum, Rchb. fl. germ. exc. p. 813.

Common or Wild Marjoram. Fl. June, Oct. Britain. Pl. 1 to 2 feet.

4 O. norma'le (D. Don. prod. fl. nep. p. 113.) ascending, villous; leaves petiolate, ovate, bluntish, cuneately-rounded at the base, green on both surfaces; spikelets small, oblong, glomerate, corymbosely-panicled; bracteas lanceolate, acute, exceeding the calyxes a little. ♃. H. Native of the Himalaya, Cashmere, Nipaul, Kamaon, and Sirmore, Wall; and Siberia, at Lake Baical. Stems paniculately branched at top. Bracteas spreading, a little green, pubescent. Calyx of *O. vulgàre*, but the corolla is smaller, and probably purple. Stamens probably always inclosed.

Normal Marjoram. Fl. June, Aug. Clt. 1819. Pl. 1 to 2 feet.

5 O. heracleóticum (Lin. spec. p. 823.) plant erectish, glabrous or villous, glandular; leaves on short petioles, ovate, obtuse, quite entire, rounded at the base; panicle elongated; spikelets oblong or elongated, glomerate; bracteas ovate, acute, green, pubescent, equalling the calyxes. ♃. H. Native of the region of the Mediterranean; as on Mount Atlas, near Muscar; Calabria; some of the Grecian Islands; and about Smyrna and Constantinople; also about Odessa. O. glandulòsum, Desf. fl. atl. 2. p. 27. O. Smyrnæ'um, Sibth. et Smith, fl. græc. 6. p. 57. t. 571, but not of Lin. O. Créticum, Sieb. pl. exsic. and of other authors, but not of Lin.—Lob. icon. 492. A very variable species, dissimilar in habit to the others, but readily recognized by the bracteas being longer than the calyxes; by the loose spikes and small flowers. Stamens more or less villous. Leaves pale green, glabrous or pubescent. Flowers one half smaller than those of *O. vulgàre*, white. Bracteas often deciduous, usually pubescent. This, the winter sweet marjoram, requires a sheltered, dry soil, and seldom ripens seed in this country, and is usually propagated by slips or cuttings. Like other marjorams it is an aromatic, of sweet flavour, much used as relishing herbs in soups and broths, stuffings, &c. The young, tender tops and leaves together are used in summer in a green state, and they are dried for winter.

Var. β, hùmile (Benth. lab. p. 336.) ♃. H. O. parviflòrum, D'Urv. enum. pl. arch. in mem. soc. Lin. par. p. 327.

Heracleon, or Winter Sweet Marjoram, or Bastard Marjoram. Fl. June, Nov. Clt. 1640. Pl. 1 foot.

6 O. laxiflòrum (Royle, in Hook. bot. misc. 3. p. 376.) stem procumbent, villous; leaves on short petioles, broad-ovate, obtuse, almost entire, rounded at the base, green on both surfaces, pubescent; bracteas acute, rather longer than the calyxes, green, and are, as well as the flowers, disposed in very loose spikes. ♃. H. Native of the Himalaya at Nagkanda, Royle. Leaves like those of *O. vulgàre*, but differs otherwise from it in the stems being procumbent; and especially in the spikes being loose, not imbricated.

Loose-flowered Marjoram. Pl. procumbent.

7 O. Majóricum (Cambess. enum. pl. balear. p. 124.) stem loosely tomentose; leaves elliptic, pubescent; flowers fasciculate; calyx and corolla bilabiate. ♃. H. Native of the Balearic Islands, in arid places. Spikes very short, globose. Calyx glandular: upper lip deeply tridentate: lower lip shorter,

bipartite. Corolla rose-coloured, deciduous. Perhaps Thymus Richárdi, Pers.?

Majorca Marjoram. Pl. 2 to 3 feet.

† *Doubtful species.*

8 O. punctátum (Poir. dict. suppl. 4. p. 186.) leaves ovate-lanceolate, dotted, glabrous; heads spherical, rather downy; bracteas acute, longer than the calyxes. ♃. H. Native country unknown. Stems glabrous. Leaves almost sessile, quite entire. Spikelets globose, size of peas. Bracteas rather pubescent. Corollas whitish. Perhaps a young specimen of *O. Heracleóticum*.

Var. β: leaves narrower, lanceolate. ♃. H.

Dotted-leaved Marjoram. Pl. 1 foot.

9 O. vestítum (Clarke, trav. 2. p. 451.) leaves subcordate, ovate, petiolate, quite entire, tomentose on both surfaces, and very soft; spikes roundish-ovate, compact, tomentose, usually by threes. ♄. F. Native of Palestine, near Cana. Plant branched, suffruticose, hoary from tomentum. Calyx bilabiate, with a woolly throat. Corollas slender, glandularly dotted. Perhaps the same as *Marjoràna crassifólia*.

Clothed Marjoram. Shrub branched.

10 O. salviifólium (Roth, ex Steud. nom. p. 572.) Nothing is known of this plant but the name.

Sage-leaved Marjoram. Pl.?

Cult. All the species are of easy culture and propagation. A sandy soil and dry situation suit them best. The herbaceous species are readily propagated by dividing at the root, and the shrubby kinds, by cuttings or slips, or by separating the rooted shoots.

XLI. MARJORA'NA (altered from the Arabic name *Maryamych*, but the marjoram of the Arabs is *Sálvia verticillata*.) Mœnch. meth. 406. Benth. lab. p. 338. Origanum species of Lin. and other authors.

Lin. syst. *Didynámia, Gymnospérmia*. Calyx shortly campanulate at the base; limb cleft, conplanately dilated above, quite entire, orbicular, with the margin implicate beneath at the base; throat naked inside. Corolla having the tube equalling the calyx, and the limb somewhat bilabiate; upper lip erectish, emarginate: lower lip spreading, trifid, with nearly equal lobes. Stamens 4, exserted, distant, somewhat didynamous: lower ones the longest; anthers 2-celled: cells parallel, diverging, or at length divaricate. Style almost equally bifid at apex; stigmas minute.—Perennial or suffruticose herbs, usually clothed with tomentose villi. Leaves quite entire or toothed. Flowers collected into short tetragonal spikelets. Bracteas orbicular, villous, not coloured, flat, equal in height to the calyxes, lying upon them, and closely imbricate.

1. M. microphy'lla (Benth. lab. p. 338.) suffruticose, procumbent; branches slender, almost glabrous, panicled; leaves small, remote, petiolate, broad-ovate, obtuse, rounded at the base, clothed with white tomentum; spikelets nearly globose, few, and sub-corymbose at the tops of the branches. ♄. F. Native of Candia, on the Sphacliotic Mountains. Origanum Màru, Sibth. et Smith, fl. græc. 6. p. 59. t. 573. Sims, bot. mag. t. 2602. Origanum microphyllum, Sieb. pl. exsic. creta. Branches purplish, smooth, filiform. Leaves not above a third the size of those of *M. hortènsis*. Branches and calyxes clothed with tomentose villi, densely ciliated at apex. Corollas of *M. hortènsis*.

Small-leaved Pot Marjoram. Shrub procumbent.

2 M. horte'nsis (Mœnch. meth. 406.) branches nearly glabrous, racemosely panicled; leaves petiolate, oblong-ovate, obtuse, quite entire, clothed with hoary tomentum on both surfaces; spikelets oblong, sessile, glomerate on the branchlets; ♄. in its native country, ☉. in our gardens. H. Native of the North of Africa, near Mascar, on hills; and of Asia, on the Alps of Kamaon, Wall. Origanum Marjoràna, Lin. spec. p. 824. Woodv. med. bot. 453. t. 165. Origanum Marjoranoides, Willd. spec. 3. p. 137. Origanum Wallichiànum, Benth. in Wall. pl. rar. asiat. 1. p. 81. Marjoràna crássa, Mœnch. meth. 406.? Origanum Onites, Lam. dict. 4. p. 608. ex De. fl. fr. 3. p. 559. but not of Lin. Marjoràna vulgàris, Bauh. pin. 224. Amáracus vulgátior, Lob. icon. 498. Origanum acinacifólium, Wallr. —Blackw. t. 319.—Mor. hist. sect. 11. t. 3. f. 2. Branches tetragonal, pubescent, a little branched. Leaves half an inch long. Spikelets 3-5 together, nearly sessile. Bracteas and calyxes complanate, closely imbricate. Corollas small, purplish, or white. A variety of this species occurs in Miller's herbarium, under the name of O. Heracleóticum. This, the sweet or knotted marjoram, is a hardy annual in our gardens, although suffruticose in the places of its natural growth. As the seed seldom ripens in this country, it is generally procured from France. When in blossom the herb is cut over and dried for winter use; so that a sowing requires to be made every year. Like the other culinary kinds of marjoram, it is much used as a relishing herb in soups, broths, stuffings, &c. The young, tender tops and leaves are used together in summer in a green state, and they are dried for winter. For a seed-bed, 3 feet by 3 feet, a quarter of an ounce of seed will be sufficient. Sow in April on a compartment of light earth, either in small drills or broad cast; or sow a portion in a hot-bed, if requisite to have a small crop forwarded. When the plants are 1-2 or 3 inches high, thin the seed-bed, and plant those thinned out in a final bed, six inches apart, giving water; or where large supplies are required, some may remain thick, where sown, to be drawn off by the root as wanted. Sweet marjoram is a moderately-warm aromatic, yielding its virtues both to aqueous and spirituous liquors by infusion, and to water in distillation.

Garden Marjoram, or Sweet or Knotted Marjoram. Fl. June, July. Clt. 1573. Pl. 1 to 2 feet.

3 M. crassifólia (Benth. lab. p. 339.) branches rather tomentose, racemosely-panicled; leaves sessile, ovate-elliptic, thick, clothed with soft tomentum; spikelets oblong, sessile, glomerate on the branches. ♄ F. Native of the Levant, Palestine, and Candia. Origanum Màru, Lin. spec. p. 825, but not of other authors. Origanum Ægyptiacum, of authors, but not of Lin. Habit of *M. hortènsis*, from which it differs in the sessile, larger, thick leaves, which are densely clothed with tomentose wool on both surfaces, as well as the calyxes and bracteas. Corollas purplish.

Thick-leaved Marjoram. Fl. June, July. Clt.? Shrub 1 foot.

4 M. nervósa (Benth. lab. p. 339.) erect, branches panicled, beset with spreading villi; leaves sessile, broad-ovate, almost quite entire, roundly-truncate at the base, or the lower ones are somewhat cordate, villous on both surfaces; spikelets oblong, small, sessile, glomerate on the branches. ♄. F., or ☉. H. Native of Arabia and Egypt. Origanum Syriacum, Lin. spec. p. 824.? Origanum Indicum Zatarhéndi, Alp. et Vesl. pl. segypt. 31. t. 33. Màrum Syriacum, Lob. icon. t. 499. Habit of *M. hortènsis*, but the panicles are more divaricate and more branched. Leaves form of those of *M. onites*. Spikelets numerous, smaller, and more distinct than in *M. hortènsis*. Calyxes and bracteas of *M. onites*. Corollas a little larger.

Nerved-leaved Marjoram. Fl. June, July. Clt. 1823. Pl. 1 foot.

5 M. Onites (Benth. lab. p. 339.) stems erect, nearly simple, hairy; leaves sessile, ovate, serrated a little, rather villous or

tomentose; spikelets small, ovoid, numerous, densely corymbose. ♄. F. Native of the eastern region of the Mediterranean; as of Dalmatia, Greece, and the neighbouring islands, &c. Origanum Onites, Lin. spec. p. 824. Sibth. et Smith, fl. græc. 6. p. 58. t. 572. Origanum Smyrnæ'um, Lin. spec. p. 843. Origanum pállidum, Desf. hort. par. ed. 2d. p. 395. Pers. ench. 2. p. 129.—Bocc. mus. 2. p. 45. t. 38. Leaves half an inch long, usually cordate at the base. Corolla of *M. hortènsis*, but a little smaller, whitish. This, the *pot-marjoram*, though hardy enough to stand our winters, seldom ripens its seeds in this country. It is in flower from July to November, and is propagated by seed, but chiefly from slips. It is used and cultivated for the same purposes as *sweet marjoram*.

Ass's or Pot Marjoram. Fl. July, Nov. Clt. 1759. Shrub 1 foot.

Cult. All the species of marjoram are shrubby if protected in winter; and they are readily increased by slips or cuttings. When any of them are sown to be reaped the same year treat them as recommended for *M. hortènsis*, p. 766.

XLII. THY'MUS (from Θυμος, *thymos*, of Theophrastus and Dioscorides; from θυμος, *thymus*, courage, strength, the smell of thyme being reviving; or from θυω, *thyo*, to perfume, because it was used for incense in the temples.) Benth. lab. p. 340. Thymus species, Lin. and other authors. Serpyllum, Pers. ench. 2. p. 130.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx ovate, 13-nerved, bilabiate; upper lip tridentate, spreading; lower lip bifid, with ciliated subulate segments; throat villous inside. Corolla having the tube inclosed in the calyx and imbricating bracteas, naked inside; limb sub-bilabiate; upper lip straight, emarginate, flattish; lower lip spreading, trifid, with equal lobes, or the middle lobe is longest. Stamens exserted, rarely inclosed, straight, distant, nearly equal or didynamous, lower two the longest; anthers 2-celled: cells parallel, or at length diverging. Style about equally bifid at apex; lobes subulate, stigmatiferous at apex.—Small, usually canescent under shrubs. Leaves small, quite entire, veiny, with usually revolute margins. Whorls few-flowered sometimes, all remote, and sometimes disposed in loose, dense, or imbricate spikelets. Bracteas minute. Flowers usually purplish, rarely white.

Sect. I. Mastichina (so called from exhaling a scent like that of Mastich.) Benth. lab. p. 341. Calycine teeth, all subulate. Very nearly allied to the genus *Bystropógon*.

1 T. mastichina (Lin. spec. 827.) plant diffuse, branched, pale green, or canescent; leaves petiolate, ovate or oblong, obtuse, narrowed at the base, naked, flat: upper and floral leaves broader; calyx villous, with plumose subulate teeth, which are longer than the tube. ♄. F. Native of Spain, Portugal, and Barbary, in sandy, uncultivated places. T. ciliàtus, Mœnch. ex Steud. nom. p. 886. Sampsùchus seu Màrum Mastichen redolens, Bauh. pin. p. 224. Màrum, Blackw. icon. t. 134. Riv. mon. t. 40. Leaves almost entire, canescent while young. Superior whorls approximating into a round head. Corolla whitish, usually shorter than the calycine teeth.

Mastich Thyme. Fl. July, Sept. Clt. 1596. Shrub 1 foot.

2 T. tomentòsus (Willd. enum. 2. p. 626.? Benth. lab. p. 341.) plant diffuse, branched, canescent; leaves scarcely petiolate, ovate or oblong, obtuse, narrowed at the base, naked, flat, clothed with hoary tomentum when young: floral leaves broad-ovate, a little imbricated; calyx very villous, having the teeth all subulate, plumose, and shorter than the tube. ♄. H. Native of Spain and the Algarves, Masson. T. marifòlius, Pourr. ex Willd. l. c. T. elongàtus, Link, enum. 2. p. 118.? This species differs from the preceding in the calyxes, and inflorescence. Heads small, numerous, almost globose.

Tomentose Mastich Thyme. Fl. June. Aug. Clt. 1816. Pl. 1 foot.

Sect. II. Serpy'llum (ἑρπυλλον, the Greek name of the wild thyme; from ἑρπω, *herpo*, to creep; in reference to the creeping stems.) Benth. lab. p. 342. Superior teeth of calyx lanceolate. Floral leaves almost of the same colour as the cauline leaves.

3 T. vulga'ris (Lin. spec. p. 825.) plant erect or procumbent at the base, clothed with hoary pubescence; leaves sessile, linear, or ovate-lanceolate, acute, with revolute edges, fascicled in the axils: floral leaves lanceolate, obtuse; whorls loose, rather distant; teeth of upper lip of calyx lanceolate, but the segments of the lower lip are subulate and ciliated. ♄. H. Native of the South West of Europe, in dry, arid, uncultivated places; as of Portugal, Spain, South of France, South of Germany, Italy, Piedmont, and Greece. Woody. med. bot. 299. t. 109.—Blackw. icon. t. 211. Shrub much branched. Flowers purplish, smaller than those of *T. Serpyllum*. Upper whorls, or all, loosely approximate into a terminal head, or the 2 or 4 lower ones are remote.

There are two kinds of thyme cultivated for culinary purposes. The common and the lemon thyme. Of the garden or common thyme there are two varieties, the broad and narrow-leaved, besides the variegated, grown for ornament. The lemon thyme, *Thymus serpyllum*, var. γ, *citrátus*, is a low, trailing shrub, of a yellowish colour, having a strong scent of lemons. The young leaves and tops of both kinds are used in soups, stuffings, and sauces. For these purposes the broad-leaved common is generally preferred; but the flavour of the lemon thyme is much liked in peculiar dishes.

To raise thyme from seed is the general and most eligible method. It is occasionally multiplied by parting the roots of stocky close plants, and by slips of the young shoots. By seed, sow in March or April in a bed or border of light fine earth, either broad-cast, scattered thin and raked in lightly, which is the general course, or in small shallow drills, six inches asunder: the young plants may either remain, or be transplanted in the summer when 2 or 3 inches high. A portion may be drilled for an edging to a border. As soon as the plants are 3 or 5 inches in growth, in June or July, taking the opportunity of rain, thin them out, and plant 6 inches asunder, and water at planting. Others may be planted in a single row to form an edging to a border, either set close to form at once a full edging, or as far as 3 inches apart. Seedlings thus treated will come in for use the same year.

Those who raise considerable supplies of thyme for the markets usually sow large portions thickly in beds, to remain till of useful growth, then to be drawn off, root and top together, at different seasons as wanted; it is then tied in small bunches for market. Some persons also transplant considerable portions in spring and summer to 6-10 or 12 inches distance, to form a stocky full growth, to be drawn off in large bushy plants. Thyme is also propagated by slips of the branching shoots in the spring or early in autumn, but more especially by sections of the bush, or by removing rooted branches. Plant all these in light rich earth, and shade and water till rooted. In autumn, to provide against the effect of frosts on exotic evergreens, dry and house a store for winter; either cutting the tops or drawing the entire plants. Seed is produced abundantly in this country, and ripens in summer and autumn. Gather the seed spikes and spread them upon a cloth to dry; rub out clean, and put the seed up for sowing the following year.

Common or Garden Thyme. Fl. June, Aug. Clt. 1548. Shrub ½ to 1 foot.

4 T. tenuifòlius (Mill. dict. no. 2. Benth. lab. p. 728.) erect or procumbent at the base; branches pubescent; leaves

sessile, linear-subulate, acute, with revolute edges, fascicled in the axils, green, nearly glabrous; floral leaves lanceolate, obtuse; whorls distant; teeth of the upper lip of the calyx ovate, and the segments of the lower lip subulate. ♄. H. Native of the South of Spain, Pavon; near Cadiz, Picard. This differs from *T. vulgàris*, in the more slender, green, glabrous leaves, which are scarcely white from pubescence beneath.

Fine-leaved Thyme. Fl. June, Aug. Clt. 1548. Shrub ½ to 1 foot.

5 T. DIFFU'SUS (Salzm. pl. exsic. ex Benth. lab. p. 342.) procumbent; floriferous branches ascending, clothed with hoary pubescence; leaves sessile, linear or lanceolate-linear, fascicled in the axils, with revolute, naked margins, clothed with hoary tomentum on both surfaces; floral leaves similar to the others; whorls approximate into an oblong head; teeth of the upper lip of calyx lanceolate, acute: segments of the lower lip subulate, ciliated. ♄. F. Native of Gibraltar. T. ascéndens, Bernh. ex Rchb. fl. germ. exc. p. 313. Habit of *T. angustifòlius*. Leaves of *T. vulgàris*, of which it is probably a variety.

Diffuse Thyme. Shrub procumbent.

6 T. DECUSSA'TUS (Benth. lab. p. 342.) erect; stems much branched, pubescent; leaves sessile, ovate, obtuse, with revolute edges, clothed with fine tomentum: those of the sterile branches decussate; floral leaves similar to the rest; whorls few-flowered, capitellate; teeth of upper lip of calyx short, ovate, obtuse: segments of the lower lip subulate, ciliated. ♄. F. Native of Arabia, in the desert of Sinai, Bove. Old branches rather spiny. Whorls few, 2-4-flowered at the tops of the branches. Corollas small.

Decussate-leaved Thyme. Shrub erect.

7 T. Bové'i (Benth. lab. p. 342.) erect; branches stiff, strict, villous; leaves on short petioles, ovate, obtuse, flattish, having the petioles and margins ciliated a little; floral leaves similar to the rest, adpressed; whorls few-flowered, spicate; upper lip of calyx large, shortly tridentate, and the segments of the lower lip subulate, ciliated. ♄. F. Native of the desert of Sinai, between Suez and Gaza, Bové; and between Aleppo and Baghdad, Olivier. Leaves almost like those of *T. piperélla*. Whorls about 6-flowered: lower one rather distant: upper whorls approximate, spicate. Calyx rather villous. Corolla of *T. Serpýllum*.

Bové's Thyme. Shrub ½ to 1 foot.

8 T. PIPERE'LLA (Lin. syst. p. 452. but not of Ait.) suffruticose, procumbent; branches ascending, stiff, pubescent; leaves petiolate, broad-ovate, obtuse, truncately subcordate at the base, not ciliated, thick, stiff, veiny, glandular: floral ones conforming to the others; calyx almost glabrous: teeth of upper lip short, ovate, and the segments of the lower lip subulate, ciliated. ♄. F. Native in the region of the Mediterranean; as of Barbary, Spain, Mount Parnassus, &c. T. graveòlens, Sibth. et Smith, fl. græc. 6. p. 61. t. 576. but not of Bieb.—Barr. icon. 694.?—Boec. mus. 2. p. 166. t. 117.? Allied to *T. Serpýllum*. Corolla exceeding the calyx a little, purple.?

Small-Peppermint Thyme. Fl. July, Aug. Clt. 1810. Shrub procumbent.

9 T. HERBABARÒNA (Lois. fl. gall. p. 360. t. 9.) procumbent, glabrous; floriferous branches shortly ascending; leaves on short petioles, ovate-lanceolate, acute, rounded at the base, ciliated a little; floral leaves conforming to the others; teeth of upper lip of calyx short, lanceolate, and the segments of the lower lip subulate, ciliated. ♄. H. Native of Corsica, Requien. T. affinis, Sieb. pl. exsic. T. lúcidus, Guss. prod. fl. sic. suppl. 193.? Aëynos hèrba barònі, G. Don, in Loud. hort. brit. 289. Hardly distinct from *T. Serpýllum*, unless in the shape of the leaves, and more loose habit.

Herb-Baron Thyme. Fl. July, Aug. Clt. 1820. Shrub procumbent.

10 T. SERPY'LLUM (Lin. spec. 825.) suffruticose, procumbent; floriferous branches shortly ascending; leaves on short petioles, ovate, narrowed at the base, cuneated or rounded, veiny, having the petioles and margins more or less ciliated; floral leaves almost similar to the rest; teeth of upper lip of calyx lanceolate, ovate: segments of the lower lip subulate, ciliated. ♄. H. Native throughout Europe and the North of Asia, in dry exposed places; as of Britain, Sweden, Lapland, Denmark, Germany, France, Spain, Italy, Greece, European Russia, even to St. Petersburgh, Caucasus, Siberia; and the Himalaya, at Simla and Choor. T. exsérens and T. inclúdens, Ehrh. arb. p. 158. This is a very variable plant. Corollas purple. Whorls 6-12-flowered, usually approximating into a terminal head. This, the Wild Thyme, has the same sensible qualities as Garden Thyme, but the flavour is milder, and rather more grateful. It is a common notion, that the flesh of sheep that feed upon aromatic plants, particularly Wild Thyme, is superior in flavour to other mutton. The truth is, that sheep do not crop these aromatic plants, unless now and then by accident, or when they are first turned on hungry to downs, heaths, or commons; but the soil and situations favourable to aromatic plants, produce a short sweet pasturage, best adapted to feeding sheep, whom nature designed for mountains, and not for turnip grounds and rich meadows. The attachment of bees to this and other aromatic plants is well known. Few plants are subject to more varieties than Wild Thyme.

Var. α, vulgàris (Benth. lab. p. 343.) leaves smaller, with very prominent veins. ♄. H. T. Serpýllum, Lin. spec. 825. Fries. nov. fl. suec. Hook. fl. lond. vol. 3. with a figure. Smith, engl. bot. t. 1514. Woodv. med. bot. p. 301. t. 110. Curt. lond. 2. t. 47. T. sylvéstris, Schreb. and Rchb. fl. germ. exc. p. 313. T. rigidus, Rchb. T. humifùsus, Bernh. ex Rchb. fl. germ. l. c. T. collínus, Bieb. fl. cauc. 3. p. 401. with narrower leaves. T. effùsus, Host, fl. austr. 2. p. 137. T. procèrus, Opiz. T. Kollmunzerìànus, Opiz. T. Sudéticus, Opiz. ex Rchb. fl. germ. exc. p. 312. T. serràtus, Opiz. l. c. T. lævigàtus, Vahl, symb. 2. p. 65. with cuneate-oblong, not linear leaves. T. arenàrius, Bernh. ex Rchb. fl. germ. l. c. T. melissoides, Fisch. T. decúmbens, Bernh. ex Rchb. fl. germ. l. c. T. glabràtus, Schultes, ex Rchb. l. c. and probably of Link. T. deflèxus, Lej. ex Rchb. l. c. T. glàber, Mill. dict. no. 6. Corollas usually purple, rarely white.

Var. β, lanuginòsus; the whole plant white from wool; stems trailing. ♄. S. Native of France, at Fontainbleau; and of England, on the Gogmagog hills. T. lanuginòsus, Willd. spec. 3. p. 138. Schkuhr. handb. 2. p. 164. with a figure. Mill. dict. no. 8. T. serpýllum, var. ε, Lin. spec. p. 825.

Var. γ, citràtum; plant almost glabrous, yellowish, trailing. ♄. H. Native of Kent, and at Downton Castle, Shropshire. O. citriodòrus, Pers. ench. 2. p. 130. Schreb. ex Link, enum. 2. p. 115. T. subcitràtus, Schreb. ex Rchb. fl. germ. exc. p. 313. T. citràtus, Dumort, floril. belg. p. 47. Lemon Thyme is frequently kept in gardens for the agreeable odour of the leaves. Plants raised from seeds of this kind have not the same scent, it is therefore an accidental variety, which is preserved by means of slips or cuttings.

Var. δ, montànus (Benth. lab. p. 344.) leaves larger and less rigid. ♄. H. Native of the more southern parts of Europe. T. montànus, Waldst. et Kit. hung. 1. p. 72. t. 71. T. chamædrys, Fries, nov. fl. suec. ed. 1st. p. 95. ed. 2d. p. 197. T. pulegioìdes, Rchb. fl. germ. exc. p. 313. Cunila thymoides, Lin. spec. p. 31. Hedeòma thymoides, Pers. ench. 2. p. 131. Ziziphora thymoides, Roem. et Schultes, syst. 1. p. 209. T. nummulàrius, Bieb. fl. cauc. 2. p. 58. Sims, bot. mag. vol. 58. t. 2666. with larger broader leaves. T. pseudoserpýllum,

Rchb. T. marjoranoides, Desf. cat. hort. par. p. 74. Poir. suppl. 5. p. 306. T. ovàtus, Mill. dict. no. 7.

N.B. Besides the above varieties, there are numerous others which run so gradually into each other as scarcely to be distinguished.

Wild Thyme, or Mother of Thyme. Fl. June, Aug. Britain. Shrub trailing.

11 T. angustifòlius (Pers. ench. 2. p. 130.) suffruticose, procumbent; floriferous branches shortly ascending, glabrous or pubescent; leaves on short petioles, oblong-linear, narrowed at the base, veiny, having the petioles and margins ciliated; floral leaves almost similar to the others; calyxes usually glabrous: teeth of upper lip short, lanceolate-ovate, and the segments of the lower lip ciliated. ♄. H. Native of the South of Europe and Middle Asia, on dry arid hills, and by way sides; as of Portugal, Spain, South of France, South of Germany, Italy, Greece, Caucasus, and Siberia; also of Madèra and the Azores. T. aciculàris, Waldst. et Kit. hung. 2. p. 157. t. 147. T. cæspititius, Link et Hoffm. fl. port. 1. t. 18.? Brot. phyt. p. 26. t. 11. T. rèpens, Link et Hoffm. fl. port. T. odoratissimus, Bieb. fl. cauc. 3. p. 405. more erect plant. T. spinulòsus, Tenore, fl. nap. prod. p. 35. T. nervòsus, Gay, pl. exs. ind. itin. T. Zygis, Lin. spec. p. 826. and of many other authors. T. variàbilis, Link et Hoffm. fl. port. 1. t. 17. T. ciliàtus, Lam. fl. fr. 2. p. 302. T. albidus, Opiz, in bot. zeit. 1824. 2. p. 526. T. inodòrus, Lej. ex Dumort, fl. belg. p. 47. T. micans, Lowe, prim. fl. mader. p. 19. Thymbra ciliàta, Tenore, fl. nap. prod. suppl. 2. p. 69. syll. fl. neap. p. 269. but not of Lin.—Barr. icon. 777. Hardly differing from some varieties of *T. Serpyllum*, unless in the narrower leaves. Corollas purple. There are varieties of this with glabrous, pubescent, or villous leaves, but usually quite glabrous. The *T. Zygis* of the gardens is an erect, narrow-leaved, canescent plant, with white flowers.

Narrow-leaved Thyme. Fl. Aug. Clt. 1771. Shrub procumbent.

12 T. Pannónicus (All. fl. ped. 1. p. 20.) suffruticose, procumbent; floriferous branches ascending, villous; leaves on short petioles, linear, or the lower ones are oblong, narrowed at the base, veiny, having the petioles and margins ciliated; floral leaves almost similar to the others; calyx villous: teeth of upper lip short, lanceolate-ovate, and the segments of the lower lip subulate, ciliated. ♄. H. Native of the South of Europe, and Middle Asia; as on the alps of Pannonia, South of Germany, Hungary, Podolia, Caucasus, Altaia, &c. T. Marschallianus, Willd. spec. 3. p. 141. T. glabrèscens, Hoffm. et Link, fl. port. 1. p. 130. t. 15.? T. Zygis, Pall. nov. act. petrop. 10. p. 313. but not of Lin. T. adscéndens, Bernh.? ex Link, enum. 2. p. 115.? T. odoratíssimus, Mill. dict. no. 9. T. lanuginòsus, Mill. dict. no. 8. and other authors. T. Austriacus, Bernh. ex Rchb. fl. germ. exc. p. 312. T. piligerus, Opiz, ex Rchb. l. c. p. 313. Corollas purple. Hardly differing from *T. angustifòlius*, unless in the floriferous branches being longer and more erect, villous, and in the leaves being twice as long.

Pannonian Thyme. Fl. June, Aug. Clt. 1817. Shrub procumbent.

13 T. Sibthórpii (Benth. lab. p. 345.) stem procumbent at the base, branched; branches erect, nearly glabrous; leaves nearly sessile, oblong-lanceolate, glabrous, nerved; floral leaves conform to the others; flowers numerous, small, somewhat spicate; calyx villous, the lips divaricate: teeth of upper lip lanceolate, very acute, and the segments of the lower lip subulate. ♄. F. Native of Greece, on the mountains. T. lanceolàtus, Sibth. et Smith, prod. fl. græc. 1. p. 419. but not of Desf. Leaves 6-9 lines long, broader than in *T. Pannónicus*. Whorls 2-6-flowered, approximating into loose spikes. Corollas hardly exceeding the calyx. Stamens exserted.

Sibthorp's Thyme. Shrub ½ foot.

14 T. lanceolà'tus (Desf. fl. atl. 2. p. 30. t. 128. but not of Smith.) suffruticose, erect, clothed with soft villi; leaves nearly sessile, ovate-lanceolate, obtuse, roundly cuneated at the base, veiny, clothed with soft pubescence beneath; floral leaves similar to the others; racemes dense, secund; calyxes villous, nutant: the teeth of the upper lip ovate, acute, and the segments of the lower lip subulate. ♄. F. Native of the North of Africa, on Mount Atlas, near Tlemsen, Desf. Erect, much branched at the base. Leaves nearly an inch long. Spikes 2-3 inches long. Corollas purple. Bentham has seen specimens of this species, in which the spikes are scarcely secund.

Lanceolate-leaved Thyme. Fl. July, Aug. Clt. 1823. Shrub ½ to ¾ foot.

15 T. linea'tus (Benth. in Wall. pl. rar. asiat. 1. p. 31. lab. p. 346.) procumbent; floriferous branches shortly ascending; leaves on short petioles, oblong-linear, narrowed at the base, veiny, having the petioles and margins ciliated; floral leaves ovate, rounded at the base, rather imbricate; calyx almost glabrous: teeth of upper lip short, lanceolate-ovate, and the segments of the lower lip subulate, ciliated. ♄.? F. Native of the Himalaya, among the mountains of Kamaon. This species differs from the more glabrous variety of *T. Pannónicus*, in the more loose habit and floral leaves.

Lined Thyme. Shrub procumbent.

16 T. bracteòsus (Visiani, mss. ex Benth. lab. p. 346.) procumbent; floriferous branches ascending; leaves petiolate, oblong, narrowed at the base, flat, veiny, having the margins and petioles of the upper leaves ciliated; floral leaves sessile, broadly roundish-cordate, imbricate, ciliated; calyx villous: teeth of upper lip short, ovate-lanceolate, and the segments of the lower lip short, subulate, ciliated. ♄. H. Native of Dalmatia. Corollas purple.? Habit of *T. lineàris*, but differs in the floral leaves; it differs also from *T. striàtus*, in the more loose habit, but is probably only a variety of it.

Bracted Thyme. Shrub procumbent.

17 T. stria'tus (Vahl, symb. 73.?) procumbent; floriferous branches ascending, pubescent; leaves nearly sessile, linear, stiff, narrowed at the base, glabrous, ciliated; floral leaves broadly cordate-ovate, striated, and are, as well as the calyxes, pubescent, rather imbricate, approximating into an oblong head. ♄. F. Native of the South of Europe, Gibraltar, Naples; on the banks of the Bosphorus, Olivier. T. Zygis, Sibth. et Smith, fl. græc. 6. p. 60. t. 574. but not of Lin. T. hirtus, Willd. enum. p. 628.? T. aciculàris, Guss. prod. fl. sic. 2. p. 127. Corollas purple. Habit of *T. angustifòlius*; but the leaves are longer and stiffer, and the inflorescence is very distinct. The floral leaves are veiny, stiff, with ciliated edges.

Striated-leaved Thyme. Shrub procumbent.

18 T. hirsu'tus (Bieb. fl. cauc. 2. p. 59. 3. p. 408.? Benth. lab. p. 346.) procumbent; floriferous branches ascending, clothed with hoary pubescence; leaves sessile, linear, somewhat fascicled in the axils, with flat ciliated margins, clothed with hoary tomentum on both surfaces; floral leaves broader, closely approximate, as well as the flowers, into an oblong head. ♄. H. Native of Greece and Tauria. T. vulgàris, Sibth. et Smith, fl. græc. prod. 1. p. 419. but not of Lin. This species differs from *T. villòsus* in the quite entire floral leaves; and from *T. diffùsus* and *T. angustifòlius*, in the broader floral leaves; and from *T. striàtus* in the hairiness.

Hairy Thyme. Fl. July, Aug. Clt. 1821. Shrub procumbent.

19 T. villòsus (Lin. spec. 827.) suffruticose, procumbent;

branches short, rather hairy; leaves oblong-linear, flattish, with ciliated margins; floral leaves oblong-lanceolate, serrated at top, and are, as well as the calyxes, coloured; whorls few-flowered, approximate. ♄. F. Native of the Grecian Archipelago. Sibth. et Smith, fl. græc. 6. p. 62. t. 578. Hoffm. et Link, fl. port. 1. t. 14. Corollas purple. Habit of *T. angustifólius*; from which it differs in the leaves being more ciliated, and especially in the calyxes being twice the size, and in the floral leaves, which are coloured as in *Thýmbra spicàta*. Whorls loose, not imbricate. Corolla scarcely exceeding the calyx.

Villous Thyme. Fl. June, July. Clt. 1759. Shrub procumbent.

20 T. CAPITELLA'TUS (Hoffm. et Link, fl. port. 1. t. 12.) shrubby, canescent; leaves lanceolate, obtuse, with revolute edges, clothed with hoary tomentum beneath; floral leaves subimbricate, broad-ovate, exceeding the calyxes; whorls few-flowered, collected into globose terminal heads. ♄. F. Native of Portugal, beyond the Tagus, near Lisbon, Link; and in the Algarves, Masson. Habit and cauline leaves of *T. vulgàris*. Heads of flowers very numerous, size of peas. Calyx small, with short spreading teeth. Corolla purplish? scarcely longer than the calyx.

Small-headed Thyme. Shrub.

21 T. NUMI'DICUS (Desf. fl. atl. 2. p. 29.? Benth. lab. p. 347.) erect or prostrate at the base; branches clothed with hoary pubescence; leaves sessile, oblong-linear or spatulate, small, fascicled, flat, glabrous, ciliated a little; floral leaves imbricating, very broad at the base; whorls closely approximate into small globose heads; calyx villous: teeth of upper lip lanceolate, acute, and the segments of the lower lip subulate. ♄. F. Native of Spain, Pavon; and of Barbary, near La Calle, Desf. Habit of *T. vulgàris*; but differs from it in the shorter glabrous leaves, and especially in the inflorescence. Heads hardly larger than peas, hairy. Floral leaves clasping the flowers, ciliated, ex Desf. Corollas small, rose-coloured.

Numidian Thyme. Fl. July, Aug. Clt. 1816. Shrub ½ foot.

22 T. HISPA'NICUS (Poir. dict. 7. p. 646.) shrubby, erect; leaves linear, ciliated; flowers capitate, rather villous. ♄. F. Native of Spain, and of North Africa, on the sea-shore. Branches numerous, slender. Leaves sessile. Teeth of calyx sub-setaceous, ciliated. Corolla purplish, longer than the calyx. Stamens rather longer than the corolla. Very nearly allied to *T. Numidicus*, and probably only a variety of it.

Spanish Thyme. Shrub ½ foot.

23 T. CAPITA'TUS (Hoffm. et Link, fl. port. 1. p. 123.) procumbent at the base, much branched; branches erect, canescent; sterile branches sub-spinescent; leaves sessile, linear or oblong, flat; floral leaves imbricate, ovate, ciliated, green, covering the calyxes. ♄. H. Native of the region of the Mediterranean, in dry, arid, stony places; as of Barbary, near Tangiers; Portugal, Spain, Sicily, Naples, Greece, Syria, Palestine, &c. *T. Créticus*, Brot. phyt. p. 27. t. 12. *T. Marinósei*, Tenore, fl. nap. prod. p. 35. syll. p. 296. *Saturèia capitàta*, Lin. spec. 795. Sibth. et Smith, fl. græc. 6. p. 36. t. 544.—An elegant, densely branched shrub. Heads of flowers globose or oblong, composed of 6-flowered whorls. Corollas exserted, purple. Stamens exserted.

Capitate-flowered Thyme. Fl. June, Oct. Clt. 1596. Shrub ½ to 1 foot.

SECT. III. PSEUDOTHY'MBRA (from ψευδος, *pseudos*, falsehood; and θυμβρα, *thymbra*, a sweet-scented herb allied to Thyme.) Benth. lab. p. 348. Floral leaves large, membranous, coloured.

24 T. CEPHALÒTUS (Lin. spec. 826.) erect, branched, clothed with hoary pubescence; leaves sessile, linear, with revolute edges, small, fascicled: floral leaves large, ovate, acute, rather membranous, coloured, covering the calyxes. ♄. H. Native of Spain and Portugal. Habit of *T. vulgàris*, but the inflorescence is very distinct. Floral leaves sessile, with ciliated edges, purplish. Heads of flowers size of cherries. Corolla downy outside, purplish or white: tube exserted from the calyx. Stamens diverging, about equal in length to the corolla.

Headed Thyme. Fl. June, Sept. Clt. 1759. Shrub ½ to 1 foot.

25 T. CILIA'TUS (Benth. lab. p. 348.) shrubby, erect; branches pubescent or villous; leaves oblong-lanceolate or linear, obtuse, flat, green, veiny, having the margins a little ciliated; floral leaves large, broad-ovate, acute, rather membranous, nerved, coloured, ciliated, imbricate, covering the calyxes. ♄. F. Native of the North of Africa, on arid hills near Mascar, Desf.; and near Galla, Masson; and the Canary Islands. *Thymbra ciliàta*, Desf. fl. atl. 2. p. 10. t. 122. An elegant much branched shrub. Heads of flowers ovate, cylindrical. Bracteas purplish. Teeth of calyx ciliated: lower teeth the longest. Corollas violaceous. Stamens scarcely longer than the corolla.

Ciliated Thyme. Fl. June, Aug. Clt. 1824. Shrub ½ to 1 foot.

† *Species not sufficiently known, or doubtful.*

26 T. PULCHE'LLUS (Meyer, verz. pflanz. p. 87.) stems shrubby at the base, erect, pubescent on the angles; leaves quite glabrous, flat, oblong or linear, obtuse: lower ones elliptic; whorls spicately approximate; teeth of the upper lip of the calyx nearly equal, subulate; stamens exserted. ♄. H. Native of Caucasus, on gypsaceous hills at the river Anticeta.

Neat Thyme. Shrub erect.

27 T. SERPYLLOI'DES (Bory, ann. gen. 3. p. 18.) stems frutiose, procumbent; leaves linear or lanceolate, obtuse, a little ciliated at the base; flowers capitate. ♄. H. Native of Spain, on Sierra Nevada, among rocks. Allied to *T. angustifólius*. There are varieties of this with white and purple flowers.

Serpyllum-like Thyme. Shrub procumbent.

28 T. RICHA'RDI (Pers. ench. 2. p. 130.) flowers capitate; bracteas ovate, and are, as well as the calyxes, stiff; leaves broad-ovate, nerved beneath. ♄. H. Native of the Balearic Islands, Ant. Richard. Perhaps the same as *Origanum Majóricum*, Cambess.

Richard's Thyme. Shrub.

29 T. MULTICÒRNIS (Pers. ench. 2. p. 131.) flowers axillary, pedunculate; peduncles many-flowered; calyxes oblong, with acute teeth; leaves ovate, glabrous, having the veins prominent beneath. ♄. ? H. Formerly cultivated in the garden of Trianon, Persoon. Allied to *Calamintha*. Leaves dotted beneath.

Many-flowered Thyme. Pl. ?

30 T. HIRSUTI'SSIMUS (Poir. dict. 7. p. 650.) leaves ovate-lanceolate, nearly sessile, hairy; spikes capitately verticillate; bracteas ciliately hairy. ♄. ?. Native of the Levant. Erect, humble, much branched. Leaves small. Flowers disposed in short spicate heads at the tops of the branches, dense, very villous. Bracteas lanceolate, equalling the flowers, ciliated. Corolla purplish, rather longer than the calyx. Teeth of calyx subulate, acuminated, rather spiny, nearly equal, ciliated. Perhaps the same as *Micromèria nervòsa*.

Very-hairy Thyme. Shrub ½ foot.

31 T. AFRICANUS (Hoffm. et Link, fl. port. t. 11.) flowers

verticillately capitate, terminal and axillary; leaves lanceolate, white beneath; calycine teeth nearly equal, subulate, ex Poir. dict. suppl. 5. p. 305. ♄. H. Native of Portugal. Perhaps the same as *Micromèria Græ'ca*.

Whitish-leaved Thyme. Shrub.

32 T. megapota'micus (Spreng. cur. post. p. 224.) stem erect, herbaceous; leaves linear, convolute, rough from dots; peduncles crowded, exceeding the leaves. Native of the South of Brazil, at Rio Grande. Perhaps the same as *Hedèoma multiflòra*.

Rio Grande Thyme. Pl. ?

33 T. longicau'lis (Presl, fl. sic. 37.) stems very long, creeping: puberulous; leaves cuneiform-oblong, obtuse, length of calyxes, which are pubescent; calycine teeth ciliated, subulate; anthers exserted. ♃. ? H. Native of Sicily.

Long-stemmed Thyme. Pl. creeping.

34 T. Ægypti'acus (Bernh. ex Steud, nom. p. 835.) Nothing is known of this plant but the name.

Egyptian Thyme. Shrub.

35 T. camphora'tus (Hoffm. et Link, fl. port.) ♄. H. Native of Portugal.

Camphorated Thyme. Shrub.

Cult. All the species of *Thymus* prefer a dry, light, sandy soil, and an exposed situation. They are of easy culture and propagation; and are readily increased either by divisions slips, cuttings, or seeds, as recommended for *Thymus vulgàris*, p. 767. Some of the more tender and rarer species should be grown in pots, and placed among other Alpine plants, that they may be sheltered from the frosts of winter.

XLIII. SATURE'IA (Ssatter is the Arabic name for all labiate plants.) Lin. gen. no. 707. Schreb. gen. 961. Juss. gen. p. 112. Benth. lab. p. 351.

Lin. syst. *Didynàmia, Gymnospérmia*. Calyx campanulate, 10-nerved, equal, 5-toothed or obscurely-bilabiate; throat naked inside, or furnished with a few hairs. Corolla having the tube equalling the calyx and imbricating bracteas; limb bilabiate; upper lip erect, flat, entire, or emarginate: lower one spreading, trifid, with flat nearly equal lobes. Stamens 4, erectish, diverging: lower ones longer, exserted; anthers 2-celled: cells parallel or diverging. Style about equally bifid at top; lobes subulate, stigmatiferous at apex.—Aromatic herbs or under shrubs. Leaves small, quite entire, often fasciculate in the axils. Whorls sometimes few-flowered, with short bracteas or without bracteas; sometimes many-flowered, or collected into heads, propped by bracteas.

Sect. I. Sature'ia (see genus for derivation.) Benth. lab. p. 352. Whorls few-flowered; bracteas small or wanting.

1 S. horte'nsis (Lin. spec. 795.) annual, erect, pubescent; whorls sub-secund, remote, or the upper ones are somewhat spicate. ☉. H. Native of the South of Europe; as of Spain, South of France, Italy: it is also to be found in North America, Cape of Good Hope, and in the Indian Peninsula; but has probably been introduced from Europe. Lam. ill. t. 504. f. 1. S. viminea, Burm. fl. ind. p. 126. but not of Lin.—Sabb. hort. rom. 3. t. 70.—Blackw. icon. t. 419.—Mor. hist. sect. 11. t. 17. f. 1. Herb much branched, usually purplish. Leaves oblong-linear, acute, entire. Whorls usually 6-flowered. Bracteas linear, or altogether abortive. Corolla pale red, scarcely exceeding the calycine teeth. Stamens shorter than the lobes of the corolla. Summer savory is raised from seed, being an annual. In March or April sow either in small drills, 9 by 6 inches apart, or on smoothed surfaces, and raked in lightly. The plants may either remain to be thinned, or some may be transplanted in June, 9 by 6 inches asunder. The herb comes in for gathering from June to October. When a store is to be dried, draw it by the roots. Abercrombie.

Garden or Summer Savory. Fl. June, Aug. Clt. 1652. Pl. ½ to 1 foot.

2 S. supe'rstris (Wulf. in Jacq. misc. 2. p. 130. icon. rar. 3. t. 404.) suffruticose; branches ascending; leaves petiolate, ovate, obtuse, glabrous, or rather canescent; racemes dense, many-flowered, sub-secund; teeth of calyx short, acutish. ♄. H. Native of Carniola, Hungary, Croatia, Carinthia, Dalmatia, &c., in dry rugged mountainous places. S. thymifòlia, Scop. fl. carn. ed. 2d. t. 29.? Calamintha rupéstris, Host, fl. austr. 2. p. 131. Melissa álba, Waldst. et Kit. pl. rar. hung. 3. p. 227. t. 205. Népeta Croática, Spreng. syst. 2. p. 727. Népeta pùmila, Spreng. cent. spec. min. cogn. p. 29. Habit between *Satureia* and *Melissa*. Leaves almost quite entire. Whorls many-flowered, disposed in dense spikes or racemes. Bracteas minute. Throat of calyx glabrous. Corolla white, 2-3 times longer than the calyx, tinged with blue.

Rock Savory. Fl. June, July. Clt. 1798. Shrub 1 to 1½ foot.

3 S. monta'na (Lin. spec. 794.) suffruticose, erect, glabrous, or scabrously-pubescent; leaves oblong-linear, acute, or the lower ones are spatulate or cuneated; whorls many-flowered, loose, secund, approximating into spikes or racemes. ♄. H. Native in the region of the Mediterranean, in arid, exposed places, and on mountains; in the Pyrenees, near Bagneres de Luchon; Spain, Portugal, North of Africa, South of France and Germany, Greece, Italy, Naples, &c. Sibth. et Smith. fl. græc. 6. p. 35. t. 543. S. trifida, Mœnch. meth. p. 386. S. subspicàta, Vis. spec. pl. dalm. 11. t. 4. S. Illyrica, Host, fl. austr. 2. p. 133. S. variegàta, Host, fl. austr. 2. p. 134. S. hyssopifòlia, Bert. ann. di stor. nat. 1829. fasc. 3. p. 406. Micromèria montàna, Rchb. fl. germ. exc. p. 311. Micromèria pygmæ'a, Rchb. l. c. S. pygmæ'a, Sieb. pl. exs. ex. Rchb. l. c. Micromèria variegàta, Rchb. fl. germ. exc. p. 859.—Sab. hort. rom. 3. t. 64.—Mor. hist. sect. 11. t. 17. f. 3. Shrub erect or ascending, much branched. Branches beset with very short reflexed hairs. Lower whorls rather remote. Corolla white or purplish, more than twice as long as the calyx. Winter Savory, Suriette, French, Saturei, Germ. Satureggia, Italian, was cultivated in England in 1562; that is as far back as we have any printed registers; for there can be no doubt that this and summer savory, with other pot-herbs, were much cultivated in far earlier times, before the spices of the East Indies were known and in common use. This kind of savory is generally propagated by slips or cuttings of the young side shoots in April, May, and June, or July, planted in a shady border and watered; also by dividing at the root. When the plants are a little advanced in branchy growth, they may be transplanted. Set some in single plants a foot apart; others to form a close edging. In spring and autumn loosen the earth a little about the plants, and trim off decayed and irregular parts. It continues useful for summer and winter; and some may be gathered, when of full growth, in autumn, to dry for winter use.

Mountain or Winter Savory. Fl. June, July. Clt. 1562. Shrub ½ to 1 foot.

4 S. mu'tica (Fisch et Meyer, ind. sem. hort. petesb. 1836. p. 49.) plant clothed with hoary pubescence; stems erect, much branched; branches twiggy: leaves oblong or almost linear; cymes axillary, few-flowered; bracteoles linear, much shorter than the calyxes; calyx bilabiate, with sub-linear mutic lobes, the lower 2 the longest. ♄. H. Native of Caucasus, on the Talusch Mountains, in arid, stony places. Allied to *S. montàna*, but differs in the segments of the calyx being mutic, and from *S. intermèdia*, in the stem being tall and erect, in the leaves being narrower and distant, in the bracteoles being minute, &c.

Mutic-calyxed Savory. Fl. June, July. Clt. 1836. Shrub erect.

5 S. virga'ta (Vis. ex. pl. exs. un. itin. wurtemb. ex Benth. lab. p. 353.) suffruticose, hispidly-scabrous; leaves oblong-linear, acute; whorls many-flowered, nearly equal, rather remote, disposed in long twiggy racemes. ♄. H. Native of Dalmatia, Naples, &c. Micromèria spicàta, Rchb. fl. germ. exc. p. 311. S. fasciculàta, Tausch, in sylt. pl. soc. ratisb. 2. p. 248.? but not of Biv. S. cuneifòlia, Tenore, fl. nap. t. 151. f. 2. sylt. p. 277. S. obovàta, Lag. ex Spreng. syst. 2. p. 720. This does not differ in any respect from *S. montàna*, unless in the inflorescence and hairiness; the teeth of the calyx is also a little shorter, and the flowers smaller. Racemes never beyond a foot in length.

Twiggy Savory. Shrub 1 to 2 feet.?

6 S. spinòsa (Lin. spec. 795.) suffruticose, erect, tortuosely-branched; branches tomentose, spinescent; leaves oblong, acute, glabrous; whorls few, few-flowered. ♄. F. Native of the Grecian Islands. Sibth. et Smith, fl. græc. 6. p. 36. t. 545. Much branched. Branches short, all ending in spines. Leaves shorter and broader than those of *S. montàna*, and the flowers smaller. Corollas purplish.?

Spiny-branched Savory. Shrub ½ foot.

7 S. ikonòra (Salzm. pl. tang. exs. ex Benth. lab. p. 354.) suffruticose, diffuse, nearly glabrous, branches ascending; leaves linear-spatulate, obtuse, with ciliated edges: superior leaves exceeding the flowers; flowers few, nearly sessile; calycine teeth bluntish. ♄. F. Native near Tangiers, Salzmann. A very distinct species, with the habit of *Thymus angustifòlius*. Branches scabrously-pubescent; branchlets short, densely clothed with leaves at top. Throat of calyx naked inside.

Scentless Savory. Shrub diffuse.

Sect. II. Tragoriganum (from τραγος, *tragos*, a goat, and ορηγανον, *origanon*, marjoram, goat's marjoram.) Benth. lab. p. 354. Whorls densely-globose, many-flowered, remote, propped by bracteas. Calyx about equal in height to the tube of the corolla.

8 S. Thy'mbra (Lin. spec. 794.) suffruticose, diffuse, scabrously hispid; leaves oblong-linear, or the lower ones are obovate-cuneated, acute; whorls many-flowered, dense, nearly globose, all remote. ♄. H. Native of the Grecian islands, and the mountains of Syria and Palestine. Sibth. et Smith, fl. græc. 6. p. 33. t. 541. Thymus tragoriganum, Lin. mant. p. 84. Satureia tragoriganum, Tausch. in sylt. pl. soc. ratish. 2. p. 248.—Sab. hort. rom. 2. t. 71.—Mor. hist. sect. 11. t. 17. f. 6.—Park. theatr. 5. f. 4.—Barr. icon. rar. t. 898. Leaves more acute, shorter and a little broader than those of *S. montàna*. Whorls 20-40-flowered. Bracteas ovate, lanceolate, acute, adpressed, equalling the calyxes, hispid from spreading pili, as well as the calyxes. Teeth of calyx nearly equal, lanceolate-subulate. Corollas smaller than those of *S. montàna*.

Thymbra Savory. Fl. May, July. Clt. 1739. Shrub 1 to 2 feet.

Sect. III. Pycnothy'mus (from πυκνος, *pyknos*, dense; and θυμος, *thymos*, thyme; in reference to the dense heads of flowers.) Benth. lab. p. 354. Whorls collected into an oblong head, propped by bracteas. Calyx minute.

9 S. rigida (Bartr. in herb. Banks ex Benth. lab. p. 354.) suffruticose, procumbent; branches ascending, rather pilose at top; leaves lanceolate, obtuse, with revolute margins; whorls collected into an oblong head; bracteas imbricate, very villous; calyx very short, membranous. ♄. F. Native of Eastern Florida. Branches almost simple, numerous. Leaves sometimes glabrous, and sometimes hispid. Bracteas a little coloured, lanceolate, obtuse. Tube of corolla equalling the bracteas; limb like that of *Pycnánthemum*.

Stiff Savory. Shrub ½ foot.

† *Doubtful species.*

10 S. interme'dia (Meyer, verz. pflanz. p. 91.) plant clothed with canescent pubescence; stems diffuse, much branched, shrubby at the base; leaves obovate-oblong, bluntish, a little crenated; cymes axillary, few-flowered; bracteas nearly linear, rather shorter than the calyxes; calyx bilabiate, with linear-lanceolate mutic lobes. ♄. H. Native of Caucasus, in stony places, near Swant. Leaves of *S. Thymbra*, and the calyxes almost of *S. montàna*.

Intermediate Savory. Shrub.

11 S. sessilifl'ora (Presl, fl. sic. p. 36.) stem shrubby at the base; branches diffuse, clothed with velvety pubescence; leaves linear-lanceolate, acute, ciliated, dotted, scabrous above; fascicles of flowers sessile, disposed into an oblong, leafy spike; mouth of calyx ciliated, and the teeth ovate, erectly spreading; tube of corolla twice as long as the calyx. ♄. H. Native of Sicily.

Sessile-flowered Savory. Shrub diffuse.

12 S. hirsu'ta (Presl, del. prag. 79.) stems simple, hairy; hairs erectly spreading; leaves ovate-lanceolate, hispid; pedunclos axillary, short, 1-3-flowered; bracteas about equal in length to the calyxes. ♄.? H. Native of Sicily. Perhaps referrible to *Micromèria microphýlla* or *M. Juliàna*.

Hairy Savory. Shrub.?

13 S. parvifl'ora (Presl, fl. sic. p. 36.) stems suffruticose at the base, villous; leaves villous, ovate-lanceolate, twice the length of the internodes; fascicles of flowers sessile, 3-flowered, disposed into a leafy spike; bracteas numerous, setaceous; teeth of the calyx erect; tube of corolla exceeding the length of calyx. ♄. H. Native of Sicily.

Small-flowered Savory. Shrub.

14 S. angustifòlia (Presl, fl. sic. 36.) stem suffruticose, spreading, scabrously-pubescent, as well as the leaves; leaves oblong-lanceolate; fascicles of flowers shorter than the leaves; teeth of calyx erectly-spreading; tube of corolla exceeding the calyx a little. ♄. H. Native of Sicily.

Narrow-leaved Savory. Shrub diffuse.

15 S. longifl'ora (Presl, fl. sic. p. 36.) stem suffruticose, diffuse; leaves ovate-lanceolate, canescent beneath; fascicles of flowers equal in length to the leaves; teeth of calyx spreading; tube of corolla twice as long as the calyx. ♄. H. Native of Sicily.

Long-flowered Savory. Shrub diffuse.

16 S. campane'lla (Ehrenb. naturg. reize, p. 13.) suffruticose; branches pubescent; leaves ovate-lanceolate, acute, quite entire, rather hispid, nearly sessile; cymes of flowers a little longer than the leaves, bracteate; calyx shortly campanulate, deeply 5-toothed. ♄. F. Native of the North of Africa, near Castelnuovo, Ehrenberg.

Small-bell calyxed Savory. Shrub.

17 S. O'lla (Ehrenb. l. c.) suffruticose; branches rather bristly; leaves narrow-linear and lanceolate-linear, acute, setosely hispid; cymes of flowers hardly longer than the leaves, bracteate; calyx shortly campanulate, deeply 5-cleft. ♄. F. Native along with the preceding. Habit almost of *S. Thymbra*, but the leaves and flowers are larger.

Olla Savory. Shrub.

18 S. sca'bra (Presl, fl. sic. p. 36.) ♄.? H. Native of Sicily. Thymus scaber. Presl, del. prag.

Scabrous Savory. Shrub.

19 S. globifera (Desf. ex Steud. nom.) Nothing is known of this plant but the name.

Globe-bearing Savory. Shrub.
Cult. For culture and propagation, see *Thymus*, p. 771.

XLIV. HYSSO'PUS (Hyssopus, of Pliny; ὕσσωπος, of Dioscorides; derived from the Hebrew name of Hyssop, *ezob*, or the Arabic name *azzof*.) Benth. in bot. reg. vol. 15. lab. p. 356. Hyssòpus species, Lin. and other authors.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx tubular, 15-nerved, equal, or with a somewhat oblique mouth; teeth 5, equal; throat naked inside. Corolla having the tube equalling the calyx, bilabiate; upper lip erect, flat, emarginate: lower lip spreading trifid, middle lobe the largest. Stamens 4, exserted, diverging, didynamous: lower ones the longest; anthers 2-celled: cells linear, divaricate. Style somewhat equally bifid at top; lobes subulate, stigmatiferous at apex. This genus differs from all others belonging to the tribe *Saturèia* in the calyx, which is more allied to tribe *Nepèteæ*.

1 H. officina'lis (Lin. spec. 767.) ♄. H. Native of the South of Europe and Middle Asia; South of France, Italy, South of Germany, South of Russia; Caucasus and the Altaian Mountains. Woodv. med. bot. 181. t. 65. Jacq. austr. 3. t. 254.—Riv. mon. irr. t. 68.—Sabb. hort. rom. 3. t. 79. Shrub usually glabrous, diffuse, much branched. Corollas blueish purple, rarely white. Whorls 6-15-flowered, approximate into terminal secund spikes, or the lower whorls are remote. Outer bracteas lanceolate-linear, acute, scarcely shorter than the calyxes; inner bracteas minute.

Var. α, latifòlius (Benth. lab. p. 357.) leaves elliptic, glabrous, quaternately decussate, green. ♄. H. H. Fischèri, Hortul. H. alopecuroìdes, Fisch. ex Hortul. H. officinàlis, β, decussàtus, Pers. ench. 2. p. 114. H. myrtifòlius, Desf. hort. par.

Var. β, vulgàris (Benth. lab. p. 357.) leaves linear, lanceolate, usually glabrous, green on both surfaces. ♄. H. H. officinàlis, Lin. spec. 767. Jacq. fl. austr. 2. t. 254. Lam. ill. t. 502. and other authors. H. rùber, Bernh.

Var. γ, angustifòlius (Benth. lab. p. 357.) leaves narrow, obtuse, quite entire, with sub-revolute edges, narrowed more to the base, green on both surfaces. ♄. H. Native of Caucasus and other places in Asia. H. angustifòlius, Bieb. fl. cauc. 2. p. 38. and 3. p. 389. H. Orientàlis, Adam. ex Willd. enum. 2. p. 600. H. Caucásicus, Spreng. ex Steud. nom.?

Var. δ, canéscens (Dl. fl. fr. suppl. 396. Benth. lab. p. 357.) The whole plant is canescent from villi of pubescence. ♄. H. Native of Switzerland and France, among the mountains. H. Schleichèri, G. Don. in Loud. hort. brit. p. 233. H. officinàlis, Schleich. Corollas blue. This is an elegant plant when in blossom.

The common hyssop, *hyssope*, French, *isop*, Germ. and *isopo*, Ital., has a strong aromatic flavour, and warm pungent taste. The leaves and young shoots are occasionally used as a pot-herb, and the leafy tops and flower-spikes are cut, dried, and preserved for medicinal purposes. Its virtues depend entirely on an essential oil, which rises in distillation both with water and with alcohol. Besides the general virtues of an aromatic, its preparations were formerly recommended in humoral asthmas, coughs, and other disorders of the breast and lungs, and were said to promote expectoration. There are several varieties of *hyssop* cultivated, as the white and red-flowered; but the blue-flowered is the original colour, and most commonly cultivated.

Common or *Officinal* Hyssop. Fl. June, Sept. Clt. 1548. Shrub 1 to 2 feet.

Cult. Hyssop is raised from seed, by slips and cuttings of the branches, and by dividing the plant at the root. It likes a dry, sandy soil. When it is propagated by seed, sow in March or April a small portion either broad-cast and raked in, or in small drills 6 inches apart. The plants may mostly be transplanted into final beds in June or July, 9 inches apart, or some may be planted as an edging, or you may also sow some seed for an edging, to remain where sown. Give the edgings occasional trimmings in their established growth, cutting away also any decayed flower-spikes in autumn. You may take rooted offsets from established plants in March, April, August, or September; cuttings from the stalks in April and May; also cuttings of the young shoots in June and July. After May shade for a time, or plant in a shady border. If for culinary purposes the distance from plant to plant may be nine inches; in the physic garden 18 inches or 2 feet. Water at planting, and twice or thrice a week in dry weather till rooted.

XLV. COLLINSO'NIA (named by Linnæus in honour of Peter Collinson, F. R. S., a most distinguished promoter of botanical studies, and the first who introduced this plant, among many others, to the English gardens, Miller.) Lin. gen. no. 40. Schreb. gen. no. 51. Gaertn. fruct. p. 317. t. 66. Juss. gen. p. 112. ed. Usteri, p. 125. Benth. lab. p. 357.

Lin. syst. *Diándria*, *Monogýnia*. Fructiferous calyx declinate, ovate, 10-nerved; throat almost naked inside; limb bilabiate; upper lip truncate, flattish, tridentate; lower lip bifid. Corolla exserted, sub-campanulate; tube a little exserted; throat widened; limb sub-bilabiate, the 4 superior lobes nearly equal: the lower lobe usually the longest, declinate, flattish, toothed or lacerately fringed. Stamens 2 or 4, divaricate, much exserted; upper ones the shortest, or altogether abortive; anthers 2-celled: cells divaricate, often confluent. Style about equally bifid at top; stigmas minute, terminal. Achenia dry and smooth.—Strong-scented herbs, with the habit almost of *Plectránthus*, Section *Germànea*. Cauline leaves large, but the floral leaves are small and bractea-formed. Flowers pedicellate, solitary; pedicels opposite, disposed in simple but usually paniculately-branched racemes. Calyx small, in the floriferous state, but increasing much to the fructiferous state. Corollas yellow, or yellowish purple.

1 C. Canade'nsis (Lin. spec. p. 80. hort. cliff. 14. t. 5.) stems almost glabrous; leaves broad-ovate, acuminated, rounded at the base, sub-cordate, or rarely cuneated, glabrous; panicles elongated, loose, many-flowered; flowers diandrous. ♃. H. Native from Canada to Carolina, among rocks and stones, in woods. C. decussàta, Mœnch, meth. p. 379. C. ovàlis, Pursh, fl. amer. sept. 1. p. 21. C. cuneàta, Wender. schrift. nat. ges. marb.? Stem branched, glabrous or a little downy. Leaves ample, glabrous, or minutely-glandular, serrately-crenated. Corolla yellow, 4 times longer than the floriferous calyx.

Mr. Bartram was the first who discovered this plant, and sent it to Europe. It has a peculiar scent, which is agreeable but very strong. It is reputed to be an excellent remedy against pains in the limbs and a cold, if the parts affected be rubbed with it: a decoction of it is also said to have cured the bite of the rattle-snake. In the States they call the plant horse-weed, because the horses eat it in the spring before any other plant comes up.

Canadian Collinsonia. Fl. Aug. Oct. Clt. 1734. Shrub 1 to 2 feet.

2 C. tuberòsa (Michx. fl. bor. amer. 1. p. 17.) leaves somewhat rhomboid-oval, acute, cuneated at the base; panicles elongated, loose, much branched, many-flowered; flowers diandrous. ♃. F. Native of Carolina, in shady, humid parts of woods. C. serótina, Walt. fl. car. 65. ex Pursh. Stem almost terete at bottom, branched. Leaves 1½ inch long; cauline ones opposite, cordate. Calycine teeth setaceous, much longer than the tube. Flowers much smaller than those of *C. Canadénsis*.

Tuberous-rooted Collinsònia. Fl. Aug. Clt. 1806. Pl. 1 to 1½ foot.

3 C. scabriúscula (Ait. hort. kew. ed. 2d. vol. 1. p. 20.) stems procumbent, almost glabrous; leaves petiolate, ovate, acute, toothed, rounded at the base, glabrous or rather pilose above, glabrous beneath; racemes simple, axillary, and terminal; flowers diandrous. ♃. H. Native of Carolina and Florida, and at Jacksonville in Louisiana. *C. scàbra*, Pers. ench. 1. p. 29. Pursh. fl. amer. sept. 1. p. 20. *C. præcox*, Walt. fl. car. p. 65. Leaves hardly 2 inches long, smaller than the rest. Racemes pubescent. Flowers one half smaller than those of *C. Canadénsis*. Corollas reddish yellow, Pursh. Stems sometimes erectish, and the racemes a little branched.

Roughish Collinsònia. Fl. July, Sept. Clt. 1776. Pl. proc.

4 C. punctàta (Elliott, bot. car. 1. p. 36.) leaves ovate-lanceolate, acuminated, acute at the base, pubescent, and dotted beneath; panicles compound; stamens 4, the 2 upper ones sterile, capitate, the 2 lower ones filiform, much exserted. ♃. F. Native of Carolina in boggy places, common. Root tuberous. Stems scabrous, pubescent, branched at top. Leaves pubescent above, and rather tomentose beneath. Corolla yellowish, downy outside, and pilose inside.

Dotted Collinsònia. Pl. 2 to 6 feet.

5 C. verticillàta (Baldw. in Elliott, bot. car. 1. p. 36.) stem glabrous and naked at the base, clothed with clammy pubescence above; leaves broad-ovate, acuminated, roundly-cuneated at the base, approximating by twin pairs, and therefore falsely verticillate; raceme loose, almost simple; flowers tetrandrous. ♃. F. Native of Georgia. Herb almost simple. Leaves large, more narrowed at the base than in *C. Canadénsis*. Lower whorls 6-flowered; upper ones 2-flowered. Corolla 3 times longer than the calyx, downy outside. Stamens nearly equal, 2 ascending and 2 declinate.

Whorled-leaved Collinsònia. Pl. 1 foot.

6 C. anisàta (Pursh. fl. amer. sept. 1. p. 21.) leaves broad-ovate, a little toothed, roundly-truncate at the base, wrinkled, pubescent on the nerves beneath, and on the stems; panicle dense; flowers tetrandrous. ♃. F. Native of Georgia, on the mountains, Lyon. Sims. bot. mag. 1219. Stem a little branched, rufescent, clothed with clammy pubescence. Leaves shorter than in *C. Canadénsis*. Corollas size of those of *C. Canadénsis*, pale yellow, glabrous outside.

FIG. 79.

Anise-scented Collinsonia. Fl. Sept. Oct. Clt. 1806. Pl. 2 to 3 feet.

Cult. The species are generally strong coarse plants, of no beauty. They grow well in common garden soil, but prefer peat, and a moist situation; and they are readily increased by dividing at the root in spring. All of them, except *C. Canadénsis*, require protection in severe frosts, by covering them over with haulm of other herbs, or by mulching them with horse litter.

XLVI. CUNILA (The name of a plant in Pliny, κονιλη of Nicander; supposed to be derived from κωνος, *konos*, a cone, because the flowers grow in heads resembling a cone.) Benth. lab. p. 360. Cunila, species of Lin. and other authors. Ziziphora species, Roem. et Schultes.

Lin. syst. *Diándria*, *Monogýnia*. Calyx about 13-nerved, ovate-tubular, equal, 5-toothed; throat villous inside. Corolla having the tube equalling the calyx, naked inside, and the limb bilabiate; upper lip erect, flattish, usually emarginate; lower lip spreading trifid, with nearly equal entire lobes, the middle lobe rather the largest and emarginate. Stamens 2, erect, exserted, without any rudiments of the upper 2; filaments glabrous, toothless; anthers 2-celled: cells parallel, or at length divaricate. Style shortly bifid at apex; lobes nearly equal, subulate, minutely stigmatiferous at top. Achenia dry, smooth.—Herbs, shrubs, and under shrubs. Whorls sometimes loosely corymbose; sometimes axillary and few-flowered, much shorter than the leaves; sometimes densely many-flowered, approximating into terminal spikes or heads. Flowers small, white, or purplish. Corolla usually villous inside; lower lip dotted.

1 C. maria'na (Lin. spec. 30.) herbaceous; leaves nearly sessile, ovate, serrated, cordate at the base: floral ones almost similar: lower ones exceeding the flowers; cymes pedunculate, loosely corymbose. ♃. F. Native from Canada to Carolina, on dry mountains. Sweet fl. gard. 3. t. 243. *Ziziphora Mariàna*, Roem. et Schultes, syst. 1. p. 208. *Saturèia origanoides*, Lin. spec. ed. 1st, p. 568.—Mor. hist. 413. sect. 11. t. 19. f. 7.—Pluck. mant. t. 344. f. 1. Herb branched; branches short, glabrous, but pubescent at the nodi. Whorls few. Cymes forked on both sides. Corolla about twice as long as the calyx, pubescent inside, red.

Mariane Cunila. Fl. July, Sept. Clt. 1759. Pl. 1 foot.?

2 C. incisa (Benth. lab. p. 361.) shrubby; leaves petiolate, ovate-rhomboid, coarsely and deeply serrated, quite entire at the base, cuneated: floral leaves conform to the others, exceeding the flowers; cymes small, pedunculate, sessile, sub-capitate. ♄. F. Native of the South of Brazil, Sello. Shrub, much branched, densely leafy; branches pubescent. Leaves glabrous, glandular, Corolla pubescent inside.

Cut-leaved Cunila. Shrub.

3 C. angustifòlia (Benth. lab. p. 361.) shrubby, glabrous; leaves on short petioles, elliptic-linear, quite entire or serrated: floral leaves conform, exceeding the flowers; whorls loose, few-flowered; flowers minute. ♄. F. Native of the South of Brazil, Sello. Shrub densely leafy, with glabrous branches. Leaves glabrous, minutely glandular. Corolla pubescent inside.

Narrow-leaved Cunila. Shrub.

4 C. inca'na (Benth. lab. p. 361.) shrubby; leaves on short petioles, ovate-oblong or obovate, obtuse, quite entire, clothed with hoary tomentum on both surfaces; floral leaves similar to the others, exceeding the flowers; whorls 2-6-flowered. ♄. F. Native of the South of Brazil, Sello. Habit of *Micromèria obovàta*. Corolla downy outside.

Hoary Cunila. Shrub.

5 C. leuca'ntha (Benth. lab. p. 361.) herbaceous, glabrous; leaves on short petioles, ovate-oblong, quite entire, rounded at the base; cymes scarcely pedunculate, rather loose, many-flowered. ♃. F. Native of Mexico. Stems erect, many from the same root. Leaves furnished with minute yellow resinous dots. Whorls loose: lower ones remote, 16-20-flowered. Pedicels and calyxes pubescent. Corollas white, pilose outside.

White-flowered Cunila. Pl.

6 C. polya'ntha (Benth. lab. p. 362.) herbaceous; stem erect, pubescent; leaves on short petioles, ovate, sub-serrated, rounded at the base; whorls loose, many-flowered, disposed in long racemes. ♃. F. Native of Mexico, Berlandier. Leaves downy. Whorls 40-50-flowered. Branches of cymes divaricately dichotomous. Corolla white, size of those of *C. Mariàna*.

Many-flowered Cunila. Pl. 1 to 1½ foot.

7 C. lythrifòlia (Benth. bot. reg. vol. 15. lab. p. 362.) herbaceous; stem erect, pubescent; leaves oblong-lanceolate, serrated; whorls dense, many-flowered, spicate; lower ones distinct; calyxes very villous. ♃. F. Native of Mexico, near Real del Monte. Leaves 1½ to 2 inches long, pubescent from

short tomentum, as well as the branches. Corollas similar to *C. Mariana*.

Loosestrife-leaved Cunila. Pl. 1 to 1½ foot.

8 C. STRI'CTA (Benth. lab. p. 362.) herbaceous; stem erect, strict; leaves linear, obtuse, quite entire, stiff; whorls dense, many-flowered, approximate into a terminal spike, which is interrupted at the base. ♃. F. Native of Brazil, in marshes near Rio6 de Senelon; also in the Missions of the Uruguay, St. Hil. Habit of *Keithia*. Plant quite glabrous. Leaves 1 to 1½ inch long, glandular. Floral leaves bractea-formed, ciliated. Corolla white, having the lower lip dotted with purple.

Strict Cunila. Pl. 1 to 2 feet.

9 C. SPICA'TA (Benth. lab. p. 362.) herbaceous, procumbent; branches villous; leaves on short petioles, obovate-oblong, obtuse, remotely serrated, narrowed at the base; whorls densely many-flowered, approximating into terminal spikes. ♃. F. Native of the South of Brazil, Sello. Stem beset with simple subfasciculate villi. Leaves scarcely ½ an inch long, subfasciculate in the axils while young, clothed with adpressed pili above, and glandular beneath, and ciliated on the nerves with long hairs. Lower whorls remote. Calyxes ciliated. Tube of corolla villous inside.

Spiked-flowered Cunila. Pl. procumbent.

10 C. MENTHOI'DES (Benth. lab. p. 363.) herbaceous, procumbent: branches villous; leaves petiolate, broad-ovate, obtuse, scarcely crenated, rounded at the base; whorls densely many-flowered, distinct, or the upper ones are approximate. ♃. F. Native of the South of Brazil, Sello. Leaves ½ an inch, downy above, glandular on both surfaces, ciliated on the nerves beneath. Corolla villous inside.

Mint-like Cunila. Pl. procumbent.

11 C. GALIOI'DES (Benth. lab. p. 363.) suffruticose, procumbent; leaves small, fascicled, lanceolate, bluntish, quite entire, whorls many-flowered, dense, approximate into an elongated spike, which is a little interrupted at the base. ♄. F. Native of Brazil, in fields and marshes in the province of St. Paul, from Castro to Curitiba, St. Hil.; South of Brazil, Sello. Branches pubescent, and upper surfaces of leaves. Leaves 2-3 lines long, glabrous and glandular beneath. Corolla pale blue, pubescent outside, twice as long as the calyx; throat villous inside.

Galium-like Cunila. Shrub procumbent.

12 C. FASCICULA'TA (Benth. lab. p. 363.) suffruticose, procumbent; branches piloscly hispid; leaves nearly sessile, fascicled, oblong, obtuse, quite entire, with revolute edges, hispid on both surfaces; whorls dense, many-flowered, collected into ovoid terminal heads. ♄. F. Native of the South of Brazil, Sello. Inner bracteas linear, striated, ciliated. Corolla downy outside, and villous inside.

Fascicled-leaved Cunila. Shrub procumbent.

13 C. MICROCE'PHALA (Benth. lab. p. 364.) procumbent; branches scarcely pubescent; leaves petiolate, oblong or obovate, obtuse, quite entire, or subsinuately serrated, narrowed at the base, glabrous, flat; whorls dense, many-flowered, forming small, globose, nearly terminal heads. ♃. G. Native of the South of Brazil and Peru. Stems much branched. Leaves distant, subfasciculate in the axils, glandular beneath. Corolla white; throat villous inside.

Small-headed Cunila. Pl. procumbent.

14 C. VERTICILLA'TA (Mœnch, ex Steud. nom. p. 899.) this plant is entirely unknown at the present day. Ziziphora verticillata, Steud. nom.

Whorled Cunila. Pl.?

Cult. A light rich soil is the best for these plants; and the species may either be increased by cuttings, seeds, or by dividing at the root. All of them require protection in winter.

Tribe V.

MELISSI'NEÆ (the genera contained in this tribe agree with *Melissa* in the characters given below.) Benth. lab. p. 365. Calyx 13, rarely 10-nerved, 5-toothed, bilabiate, rarely equal; upper lip tridentate; lower lip bifid. Tube of corolla exserted, rarely inclosed, exannulate inside; limb bilabiate: upper lip straight, entire, or emarginately-bifid, flattish, rarely galeate: lower lip spreading, with flat, nearly equal lobes, or the middle lobe is generally the broadest, entire or emarginate. Stamens ascending, didynamous; superior ones the shortest, and sometimes abortive.

XLVII. HEDEO'MA (a Greek name for Mint.) Pers. ench. 2. p. 134. Benth. lab. p. 365. Cunila species of Lin. Ziziphora species of Rœm. et Schultes.

LIN. SYST. *Diándria, Monogýnia.* Calyx ovate-tubular, somewhat gibbous below at the base, 13-striped, bilabiate; upper lip tridentate, or rather trifid: lower lip bifid; throat villous inside. Tube of corolla equalling the calyx, or a little exserted; limb bilabiate: upper lip erect, entire, emarginate or almost bifid, flat: lower lip spreading, trifid, with nearly equal lobes, or the middle lobe is rather the broadest, entire, or emarginate. Stamens 2, fertile, ascending; anthers 2-celled: cells diverging or divaricate; rudiments of the two upper stamens wanting or sterile, short, subulate, and capitate. Lobes of style nearly equal, or the lower one is elongated, or a little flattened, stigmatiferous at top and margin, involving the upper one at the base, which is very short. Achenia dry, smooth.—Herbs or subshrubs. Leaves small, quite entire, or a little toothed. Whorls loose, few-flowered, axillary, approximating into terminal racemes.

SECT. I. MÓSCA (the Nipalese name of *H. Nepalénsis.*) Benth. lab. p. 366. Calyx ovate; upper lip spreading, flattish, shortly tridentate.—Herbs, with toothed leaves.

1 H. NEPALE'NSIS (Benth. lab. p. 366.) stem herbaceous, erect, branched, almost glabrous; leaves petiolate, ovate, narrowed at both ends, serrated, flat, nearly glabrous; floral leaves small; whorls 2-flowered, secund, loosely racemose. ☉.? H. Native of the Himalaya, Deyra Dhoon, and Cashmere. Cunila Nepalénsis, D. Don, prod. fl. nep. p. 107. Lycópus dianthèra, Roxb. fl. ind. 1. p. 145. Melissa Nepalénsis, Benth. in Wall. pl rar. asiat. 1. p. 66. Mósla ocymoides, Hamilt. mss. Cunila Buchanàni, Spreng. syst. 1. p. 54. Stem roughish on the angles. Leaves ½ to 1 foot, green above, and paler beneath. Corolla hardly equalling the calyx.

Nipaul Hedeoma. Pl. 1 to 3 feet.

2 H. PULEGIOI'DES (Pers. ench. 2. p. 131.) stem herbaceous, erect, branched, pubescent; leaves petiolate, ovate, narrowed at the base, subserrated, flat, pubescent; floral leaves similar to the others; whorls axillary, 6-flowered; corolla equalling the calyx. ☉. H. Native from Canada to Carolina, in dry fields, and on the mountains. Melissa pulegioides, Lin. spec. ed. 1st. p. 593. Cunila pulegioides, Lin. spec. p. 30. Ziziphora pulegioides, Rœm. et Schultes, syst. 1. p. 209. Habit of *Melissa Clinos.* Leaves ½ an inch long. Corolla downy outside, bluish: upper lip subemarginate. Rudiments of upper filaments short, subulate, capitate. Lower lobe of style elongated.

Pennyroyal-like Hedeoma. Pl. ½ foot.

3 H. PIPERI'TA (Benth. lab. p. 730.) stem herbaceous, pubes-

cent; leaves nearly sessile, ovate, obtuse, a little crenated, rounded at the base, almost glabrous; floral leaves almost similar to the others; whorls axillary, about 6-flowered; corolla exceeding the calyx. ♀. G. Native of New Spain, Moçino et Sessé. Cunila piperita, Moc. et Sessé, mss. Stem with a perennial base, branched. Corollas purplish. Upper lobe of style very short. Habit of *Melissa*, sect. *Acinos*.

Pepper Hedeoma. Pl.?

Sect. II. Hedeòma (see genus for derivation.) Benth. lab. p. 367. Calyx tubular, terete: teeth all subulate.—Suffruticose plants, with quite entire leaves.

4 H. Gillie'sii (Benth. lab. p. 367.) stem suffruticose, glabrous; leaves nearly sessile, linear, obtuse, quite entire, narrowed at the base, glabrous; whorls 2-flowered; corolla hardly exceeding the calyx, which is glabrous. ♄. G. Native of Chili, near Mendoza, at Cerro de Achiras. Leaves like those of *Thymus vulgàris*, dotted, glandular, subfasciculate. Corolla violaceous; upper lip shortly emarginate: middle lobe of lower lip entire. Lower lobe of style flattened, recurved: upper lobe very short. Rudiments of sterile stamens short.

Gillies's Hedeoma. Shrub ¼ to ½ foot.

5 H. polygalæfòlia (Benth. lab. p. 367.) stem suffruticose at the base, much branched; leaves numerous, sessile, ovate, obtuse, quite entire, narrowed at the base, coriaceous, glabrous; flowers approximate at the tops of the branches; corolla half as long again as the calyx, which is glabrous. ♄. G. Native of the South of Brazil, Sello. Stems procumbent at the base, densely tufted. Leaves dotted. Corolla downy outside; upper lip emarginately bifid: lobes of lower lip entire. Lower lobe of style subulate, involving the upper one at the base. Rudiments of sterile stamens none.

Milkwort-leaved Hedeoma. Shrub ¼ to ½ foot, tufted.

6 H. multiflòra (Benth. lab. p. 367.) stem suffruticose, much branched at the base; branches pubescent; leaves nearly sessile, linear, quite entire, with revolute margins, scabrous from dots, shortly hispid; whorls axillary, 2-6-flowered; corolla about twice as long as the calyx, which is hispid. ♄. G. Native of the South of Brazil, Sello. Habit of *Micromèria Græ'ca*. Stems floriferous almost their whole length. Corolla pubescent outside; upper lip emarginate: middle lobe of lower lip entire. Lower lobe of style subulate, involving the upper one. Rudiments of sterile stamens wanting.

Many-flowered Hedeoma. Shrub ½ foot.

7 H. Drummóndi (Benth. lab. p. 368.) stem suffruticose, much branched; branches pubescent; leaves petiolate, oblong-linear, quite entire; whorls 6-10-flowered; corolla hardly exceeding the calyx, which is hispid. ♄. F. Native of Mexico, at Monterey, in the province of Texas. Leaves ½ an inch long, obtuse, pubescent. Corollas minute.

Drummond's Hedeoma. Shrub ¼ to ½ foot.

8 H. hi'spida (Pursh, fl. amer. sept. 2. p. 414.) annual, erect; branches rather villous: leaves sessile, linear, obtuse, quite entire; floral leaves conforming to the others, exceeding the flowers; whorls about 6-flowered; bracteas lanceolate-subulate, equalling the calyxes; calyx ciliately hispid, deeply bilabiate; corolla scarcely exceeding the calyx. ☉. H. Native of North America, at the Missouri, Mississippi, and among the Rocky Mountains. Cunila hispida, Spreng. syst. 1. p. 54. Zizíphora hispida, Roem. et Schultes, syst. mant. 1. p. 179. Hedeòma hirta, Nutt. gen. amer. 1. p. 16. Plant much branched, densely leafy. Leaves ½ an inch long, green. Whorls numerous: upper ones approximate. Calyx gibbous at the base: teeth awned.

Hispid Hedeoma. Pl. ¼ to ½ foot.

Cult. The annual species, like other half hardy annuals, are reared on a hot-bed, and afterwards planted out into the open ground about the end of May. The shrubs should be grown in pots in light rich earth; and they will be readily increased by cuttings and seeds.

XLVIII. MICROMERIA (from μικρος, *mikros*, small; and μερις, *meris*, a part; probably from the small parts of the plants.) Benth. in bot. reg. vol. 15. lab. p. 368.—Saturèia and Thymus species of Lin. and other authors.—Sabbàtia, Mœnch, meth. p. 386. but not of Pursh.—Piperélla, Presl, fl. sic.? without character.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular, 13, rarely somewhat 15-nerved, 5-toothed; teeth nearly equal, straight, or scarcely disposed into 2 lips; throat usually villous inside. Tube of corolla equal, straight, naked inside, usually shorter than the calyx; limb bilabiate: upper lip erect, flattish, entire or emarginate; lower lip spreading, with flat, nearly equal lobes, or the middle lobe is broadest, entire or emarginate. Stamens 4, didynamous: lower ones the longest, ascending, approximating by pairs at the apex, rarely a little divergent; filaments toothless; anthers free, 2-celled: connective usually thickened; cells distinct, parallel, diverging, or a little divaricate. Lobes of style sometimes equal, subulate, with minute, terminal stigmas: sometimes the superior lobe is very short, and the lower one elongated, recurved, and flattened, with a stigmatiferous margin. Achenia dry, smooth.—Undershrubs or herbs. Whorls axillary or spicate, rarely cyme-formed, sohpaided. Flowers generally small, purplish or white. This genus is nearly allied to *Saturèia* and *Melissa*; and differs from the first by the nervation of the calyx and stamens; and from the last chiefly in the calyx, which is less bilabiate.

Sect. I. Hesperothy'mus (from ἑσπερος *hesperos*, the evening; and θυμος, *thymos*, thyme; probably from their exhaling a stronger scent in the evening.) Benth. lab. p. 371. Flowers solitary, on axillary pedicels, 1-3 on both sides; pedicels longer than the calyxes. Common peduncle wanting, rarely elongated. —American herbs, having the leaves usually crenated.

1 M. glabe'lla (Benth. lab. p. 371.) glabrous; stem herbaceous, erect, small; leaves sessile, oblong-linear, obtuse, quite entire; whorls about 6-flowered; pedicels elongated, naked; calyx sub-bilabiate: teeth all subulate: throat villous inside. ♃. H. Native of North America; in Canada; near New York; and on rocks along the rivers St. Lawrence, Ohio, Tennessee, and Mississippi. Cunila glabélla, Michx. fl. bor. amer. 1. p. 18.? Hedeòma glàbra, Nutt. gen. amer. 1. p. 16. Zizíphora glabélla, Roem. et Schultes, syst. 1. p. 209. Stem stoloniferous at the base. Upper lip of corolla, and middle segment of the lower lip entire. Style about equally bifid.?

Glabrous Micromeria. Pl. small.

2 M. Arkansa'na (Benth. lab. p. 730.) stem branched; leaves linear-lanceolate, serrated in front: upper ones quite entire; whorls about 4-flowered; pedicels bibracteate at the base. ♃. H. Native of the Arkansas, Nuttal. Hedeòma Arkansàna, Nutt. in trans. amer. phil. soc. n. s. 5. p. 186. Habit of *M. glabélla*, with the scent of Pennyroyal. The whole plant is glabrous and glandular. Pedicels equalling the cylindrical calyxes; teeth of calyx setaceous. Corolla sub-campanulate, blue, with a white palate.

Arkansas Micromeria. Pl. ¼ to ½ foot.

3 M. bracteola'ta (Benth. lab. p. 371.) pubescent; stems simple, slender; leaves linear-lanceolate, acute at both ends,

quite entire; pedicels with setaceous bracteoles, 3-5-flowered; calyx oblong, equal; corolla minute. ♃. H. Native of Carolina, Nuttall. Hedeòma bracteolàta, Nutt. gen. amer. addenda. Ziziphora bracteolàta, Roem. et Schultes, syst. mant. 1. p. 179.

Bracteolate Micromeria. Pl. ¼ to ½ foot.?

4 M. stolonífera (Benth. lab. p. 371.) stems herbaceous, prostrate, radicant, glabrous; leaves sessile, ovate-roundish, obtuse, subcrenated, and somewhat cordate at the base, glabrous; pedicels elongated, naked; teeth of calyx ovate-lanceolate: throat villous inside. ♃. F. Native of New Spain, Moçino et Sessé. Nearly allied to *M. Brównei*; but differs in the more firm, acutely tetragonal stems, and broader sessile leaves.

Stoloniferous Micromeria. Pl. prostrate.

5 M. brównei (Benth. lab. p. 372.) stems herbaceous, prostrate, glabrous; leaves petiolate, ovate-rounded, obtuse, a little crenated, glabrous; pedicels elongated, naked; teeth of calyx ovate-lanceolate; throat villous inside. ♃. F. Native of Florida, Jamaica, Santa Fe de Bogota, and Brazil. Thymus Brównei, Swartz, fl. ind. occ. 2. p. 1011. prod. p. 89. Stems usually creeping, and rooting at the base. Leaves truncate or subcordate at the base. Whorls 2-flowered. Corollas pale purple, small. Tube a little exserted.

Browne's Micromeria. Pl. prostrate.

6 M. Xalapénsis (Benth. lab. p. 372.) stems herbaceous, prostrate, pilose; leaves nearly sessile, ovate, a little crenated, ciliated; pedicels elongated, naked; teeth of calyx ovate-lanceolate; throat villous inside. ♃. F. Native of Mexico, between Pikla and Xalapa, in humid places. Thymus Xalapénsis, H. B. et Kunth, nov. gen. 2. p. 316. Allied to *M. Brównei*; but differs in the nearly sessile leaves, which are ovate, not rounded, and in the hairs of the stem being long and white; and from *M. stolonífera*, in the narrower pilose leaves.

Xalapa Micromeria. Pl. prostrate.

7 M. Cunninghámii (Benth. lab. p. 730.) stems herbaceous, prostrate, finely pubescent; leaves petiolate, rounded, almost quite entire; pedicels elongated, naked; calyx hairy, with ovate-lanceolate teeth, and a naked throat. ♃. F. Native of New Zealand, on the west coast, at the river Mangamaka Hokianga, Cunningham. Habit of *M. Brównei*. Teeth of calyx villous inside, but the throat is naked. Tube of corolla inclosed.

Cunningham's Micromeria. Pl. prostrate.

8 M. Douglásii (Benth. lab. p. 372.) stems herbaceous, prostrate; leaves petiolate, ovate-rounded, obtuse, crenated, roundedly truncate at the base, glabrous on both surfaces; peduncles elongated, bracteate at the base or middle; teeth of calyx subulate: throat naked inside. ♃. F. Native of North West America, at the river Columbia. Thymus Douglásii, Benth. in Linnæa, 6. p. 80. Thymus Chamissónis, Benth. in Linnæa, 6. p. 80. Branches very long, prostrate, creeping, pubescent. Corolla purple, downy outside: upper lip emarginate; and the middle lobe of lower lip entire. Lobes of style unequal.

Douglas's Micromeria. Pl. prostrate.

Sect. II. Pipere'lla (a dim. of *Piper*, pepper.) Benth. lab. p. 373. Flowers almost sessile, or collected into sessile or pedunculate heads. Pedicels almost wanting, or shorter than the calyxes. Whorls axillary or subspicate.—Undershrubs, rarely herbs. Leaves quite entire, veiny, often hard; floral leaves almost similar to the cauline ones.

* *Species natives of Europe and Africa.*

9 M. Julia'na (Benth. lab. p. 373.) pubescent, suffruticose; branches erect, strict; leaves sessile: lower ones ovate: upper ones lanceolate-linear, all obtuse, and quite entire, with revolute edges; fascicles of flowers dense, on short peduncles; bracteas about equal in length to the sessile calyxes; calycine teeth subulate, stiff, hardly so long as the breadth of the tube: throat naked inside. ♄. F. Native of the region of the Mediterranean, on dry and stony hills; as in Sicily, Naples, Dalmatia, and several of the Grecian islands. Saturèia Juliàna, Lin. spec. 798. Sibth. et Smith, fl. græc. 6. p. 32. t. 540. Tenore, fl. nap. t. 151. f. 3. Sabbàtia corymbòsa, Mœnch. meth. p. 386.—Ger. emac. 576. f. 3.—Park. theatr. 5. f. 3.—Mor. hist. 3. p. 412. sect. 11. t. 17. f. 4.—Lob. icon. 245. Stems procumbent, much branched. Corollas very minute, pale red. Upper lobe of style the shortest. Plant with a fragrant smell.

Var. β, hirsùta (Benth. lab. p. 373.) hairy, hard, a foot high, or more, a little branched. ♄. F. Native of Sicily. Saturèia Juliàna, var. canéscens, Guss. prod. fl. sic. 2. p. 114. Saturèia hirsùta, Presl, del. prag. p. 79.

St. Julian's Micromeria. Fl. May, Sept. Clt. 1596. Shrub ½ to 1 foot.

10 M. Græ'ca (Benth. lab. p. 373.) pubescent; branches erect or ascending; leaves sessile: lower ones ovate, obtuse: superior ones lanceolate-linear, all quite entire, with revolute margins; fascicles of flowers loose, almost secund, pedunculate; bracteas, for the most part, one half shorter than the calyxes; calycine teeth subulate, longer than the breadth of the tube: throat villous inside. ♄. F. Native of the region of the Mediterranean, on dry stony hills; as of Portugal, Spain, Corsica, Italy, Naples, Sicily, Syria, and many of the Grecian islands, &c. Saturèia Græ'ca, Lin. spec. 794. Sibth. et Smith, fl. græc. 6. p. 34. t. 542. Tenore, fl. nap. t. 151. f. 2. Saturèia micrántha, Hoffm. et Link, fl. port. 1. p. 142. Thymus hírtus, Russ. nat. hist. alep. 2. p. 256. Thymus micránthus, Brot. phyt. p. 30. t. 13.—Alp. exot. 265. t. 264.—Mor. hist. 3. p. 411. sect. 11. t. 17. f. 2. This is a very variable plant. Stem woody at the base, procumbent. Corolla exceeding the calyxes a little, pale purple: upper lip shortly emarginate. Lobes of style equal.

Var. β, longiflòra (Guss. prod. fl. sic. 2. p. 117.) corolla twice as long as the calyx. ♄. F. Native of Sicily and Naples. Saturèia Consentina, Tenor. fl. nap. 3. p. 151. f. 9. syll. p. 279. This is distinguished from the species by the greater stature and larger flowers.

Var. γ, densiflòra (Benth. lab. p. 373.) fascicles of flowers more dense, and on shorter peduncles; throat of calyx less villous inside. ♄. F. Saturèia tenuifòlia, Tenore, fl. nap. t. 151. f. 4. prod. p. 33. Guss. prod. fl. sic. 115. Micromèria tenuifòlia, Rchb. fl. germ. exc. p. 310. Saturèia hirta, Host, fl. austr. 2. p. 134.? Thymus virgàtus, Tenor. fl. nap. t. 155. f. 3. syll. 296. Saturèia congésta, Horn. hort. hafn. Spreng. syst. 2. p. 720.

Grecian Micromeria. Fl. June, July. Clt. 1759. Shrub ¾ foot.

11 M. parviflòra (Rchb. fl. germ. exc. p. 859.) almost glabrous; branches erectish; leaves sessile, all linear, quite entire, with revolute margins; peduncles equalling the leaves, loosely 3-flowered; bracteas minute; calycine teeth subulate: the upper ones the broadest: throat villous inside. ♄. F. Native of Dalmatia, on the confines near Albania, among the mountains of Patrovitch. Saturèia parviflòra, Vis. pl. rar. dalm. in bot. zeit. 1829. Saturèia inodòra, Host, fl. austr. 2. p. 135. but not of Salzm. This is a very distinct species from *M. Græ'ca*; the leaves are much narrower and glabrous; the flowers are on long pedicels, and fewer; the form and length of the calycine teeth are unequal.

Small-flowered Micromeria. Shrub.

12 M. TE'NUIS (Benth. lab. p. 374. and 731.) suffruticose, procumbent; branches ascending, clothed with floccose wool; leaves sessile, linear, acute, quite entire, with revolute margins, woolly; whorls 2-6-flowered; calyxes sessile: teeth subulate, stiff, longer than the breadth of the tube. ♄. F. Native of the Canary Islands, on the mountains. Saturèia tènuis, Link, in L. de Buch, beschr. can. ins. p. 143. M. lanàta, Benth. lab. p. 374. Floriferous branches densely leafy. Flowers usually solitary, axillary, rather shorter than the floral leaves. Corolla hardly exceeding the calycine teeth.

Slender Micromeria. Shrub procumbent.

13 M. LANA'TA (Benth. lab. p. 731.) suffruticose, procumbent; branches ascending, clothed with floccose wool; leaves sessile, linear, obtuse, quite entire, with revolute margins, woolly; whorls 6-10-flowered; cymes pedunculate; calyxes sessile: teeth short, soft, tomentose. ♄. F. Native of the Canary Islands, on the mountains. Saturèia lanàta, Link, in L. de Buch. beschr. can. ins. p. 143. M. tènuis, Benth. lab. p. 374. Very nearly allied to *M. tènuis*.

Woolly Micromeria. Shrub procumbent.

14 M. VA'RIA (Benth. lab. p. 374.) suffruticose, procumbent, pubescent, or villous; leaves sessile: lower ones ovate: upper ones lanceolate, subfasciculate in the axils, all obtuse, with revolute edges, rather canescent beneath; flowers minute, sessile, disposed in pedunculate or sessile fascicles; bracteas minute; calyx tubular, pubescent, shorter than the floral leaves: throat villous inside. ♄. F. Native of the Canary Islands, very common. Saturèia vària, Berth. et Webb, mss. Thymus ericæfòlius, Roth. cat. 2. p. 50. ex Willd. enum. 624, Thymus inodòrus, Benth. in Linnæa, 6. p. 77. but not of Desf. Saturèia thymoides, Lowe, prim. fl. mader. p. 19. Stems much branched. Calyx often purplish. Corolla purplish, hardly exceeding the calyx.

Various Micromeria. Fl. June, Aug. Clt. 1806. Pl. procumbent.

15 M. APPROXIMA'TA (Rchb. fl. germ. exc. p. 859.) suffruticose, procumbent, pubescent, or villous; leaves sessile, lanceolate; superior leaves linear, somewhat fascicled, all bluntish, with subrevolute edges; flowers on short pedicels; bracteas equalling the pedicels; calyx tubular, pubescent: throat villous inside. ♄. F. Native of the region of the Mediterranean, on dry hills; as of Sicily, Naples, Albania. Saturèia fasciculàta, Ralin. prec. p. 39. Saturèia approximàta, Biv. manip. 5. p. 13. Thymus fruticulòsus, Bert. incon. ital. p. 101. Very nearly allied to *M. vària*; but differs in the flowers being almost twice the size; and in the leaves being longer. Corolla purple, twice as long as the calyx.

Approximate-leaved Micromeria. Fl. June, Aug. Clt. 1822. Shrub procumbent.

16 M. INODÒRA (Benth. lab. p. 375.) suffruticose; branches pubescent; leaves sessile, very numerous, fascicled, small, lanceolate, obtuse, with revolute edges, canescent, ciliated; whorls few-flowered; flowers almost sessile, among the fascicles of the leaves; bracteas minute; calyx tubular, almost glabrous: throat villous inside. ♄. F. Native of Algiers, on arid hills, and the Balearic Islands. Thymus inodòrus, Desf. fl. atl. 2. p. 30. t. 129. Shrub much branched, erect. Corolla purple, longer than the calyx: lobes all obtuse, entire. This differs from *M. vària*, in the stem being more erect; in the leaves being smaller, more numerous, and narrower. This is probably the same as the preceding.

Scentless Micromeria. Shrub 1 foot.

17 M. DENSIFLÒRA (Benth. lab. p. 375.) suffruticose, diffuse, glabrous; branches short; leaves approximate, sessile, lanceolate-linear, acute, with revolute margins; floral leaves equalling the calyxes; whorls about 10-flowered, densely approximate into ovate spikes; calyxes sessile, tubular, almost glabrous, having the throat villous inside, and the teeth lanceolate-subulate, erect, scarcely so long as the breadth of the tube. ♄. F. Native of the Canary Islands, Broussonet. Habit of *Thymus Serpyllum*, var. *angustifòlia*. Leaves green above, and canescent beneath. Calyx purplish. Corolla purple, a little longer than the calyx, glabrous. Style almost equally bifid.

Dense-flowered Micromeria. Shrub diffuse.

18 M. FORBE'SII (Benth. lab. p. 376.) pubescent, suffruticose, procumbent; branches ascending; leaves almost sessile, ovate, obtuse, rounded at the base, flat, or with subrevolute edges, pubescent on both surfaces; floral leaves exceeding the flowers a little; whorls dense, few-flowered; calyxes almost sessile, ovate-cylindrical: teeth short, setaceous, shorter than the corolla: throat villous inside. ♄. F. Native of the Island of St. Nicholas, one of the Cape Verds. This differs from *M. Teneriffæ*, in the pubescence, stronger branches, larger, more numerous leaves, and shorter, almost sessile calyxes.

Forbes's Micromeria. Shrub.

19 M. CANE'SCENS (Guss. pl. rar. p. 228. t. 42. prod. fl. sic. 2. p. 120.) canescent from villi; stem slender; lower leaves ovate: upper ones lanceolate-linear, acute; peduncles axillary, 2-7-flowered, solitary or twin, rather secund; bracteas short, about equal in length to the pedicels; calyx very villous. ♄. F. Native of Sicily, on arid calcareous hills. Corolla purple. Allied to *M. Græca*.

Canescent Micromeria. Shrub ½ to 1 foot.

20 M. NERVÒSA (Benth. lab. p. 376.) pubescent, suffruticose; branches ascending; leaves sessile, all ovate, acute, quite entire, flat, or with rather revolute margins; whorls many-flowered: superior ones approximate; fascicles of flowers loose, scarcely pedunculate; bracteas very short; calyx pilose, with spreading setaceous teeth: throat rather villous inside. ♄. F. Native of the region of the Mediterranean, on dry arid hills, and in the fissures of rocks; as of Mount Atlas, South of Sicily; Naples, by the sea side; Grecian Islands, and Lybia. Saturèia nervòsa, Desf. fl. atl. 2. p. 9. t. 121. f. 2. Saturèia filifórmis, Tenor. prod. and marin. viag. bot. 1. p. 299. ex Tenore, syll. p. 279. Thymus filifórmis, Sieb. pl. cret. exs. but not of Lin. Thymus Mastichina, Smith, prod. fl. græc. but not of Lin. Branches simple. Corollas hardly longer than the calyx, red: upper lip shortly emarginate.

Nerved Micromeria. Shrub ½ to 1 foot.

21 M. MICROPHY'LLA (Benth. lab. p. 377.) suffruticose, nearly glabrous, pubescent, or villously canescent; branches filiform; leaves small, ovate or oblong, obtuse, flat, or with subrevolute margins; fascicles of flowers pedunculate, loose, many-flowered; bracteas about equal in length to the pedicels; calyxes ovate, almost glabrous, or covered with short villi: throat rather villous inside. ♄. F. Native of the region of the Mediterranean; as in the fissures of rocks on Mount Atlas; Sicily, on arid hills; Naples, and Island of Melita. Stems decumbent. Corollas purple.

Var. α, glabriúscula (Benth. lab. p. 377.) small, pale green, nearly all glabrous. ♄. F. Saturèia microphýlla, var. *α*, Guss. prod. fl. sic. 2. p. 120. Thymus Teneriffæ, Hortul. but not of Pers. Saturèia Teneriffæ, Link, enum. 2. p. 101.

Var. β, villòsa (Benth. lab. p. 377.) plant firmer, often purplish or canescent; stems and calyxes villous. ♄. F. Saturèia microphýlla, b. c. d. Guss. prod. fl. sic. 2. p. 120, 121. Thymus microphýllus, D'Urv. enum. in mem. soc. Lin. par. 327. Saturèia filifórmis, Desf. fl. atl. 2. p. 8. t. 121. f. 1.?

Small-leaved Micromeria. Fl. June, July. Clt.? Shrub ½ to 1 foot.

22 M. ova'ta (Benth. lab. p. 377.) suffruticose, procumbent; branches ascending, villous; leaves sessile, ovate, bluntish, subcordate at the base, with revolute edges, pubescent on both surfaces; floral leaves shorter than the peduncles, or the upper ones are longer; fascicles of flowers pedunculate, loose; teeth of calyx setaceous; throat of calyx villous inside. ½. F. Native of Abyssinia, Salt. Saturèia ovàta, R. Br. in append. to Salt, abyss. Allied to *M. Forbèsii* and *M. microphýlla*; it differs from the first in the branches being more slender; in the flowers being smaller; and in the fascicles being pedunculate; and from the latter, in the leaves being broader at the base; in the margins being very revolute, and in the floral leaves being narrower.

Ovate-leaved Micromeria. Shrub procumbent.

23 M. filifórmis (Benth. lab. 378.) suffruticose, diffuse, glabrous; branches filiform; leaves nearly sessile, ovate: lower ones cordate: superior ones rounded at the base, all bluntish, and quite entire, flat; whorls about 2-flowered; pedicels minutely bracteate at the base, about equal in length to the calyxes; calyx tubular, declinate, or nutant: teeth subulate, rather shorter than the corolla: throat rather villous inside. ½. F. Native of the region of the Mediterranean; as of Spain and the Balearic Islands. Thýmus filifórmis, Ait. hort. kew. 2. p. 313. Piperélla filifórmis, Presl, fl. sic. p. 36. Cunìla thymoides, Gowan, herb. ex Benth. Habit of *M. microphýlla*, but the branches are more slender and the leaves more remote. Leaves generally purplish. Corollas purplish. Style about equally bifid.

Filiform Micromeria. Fl. June, July. Clt. 1770. Shrub diffuse.

24 M. puncta'ta (Benth. lab. p. 378.) suffruticose, branches elongated, slender, finely pubescent; leaves nearly sessile: lower ones ovate, acute: superior ones oblong, obtuse, narrowed at the base, with scarcely revolute edges: uppermost leaves about equalling the flowers; fascicles of flowers on short peduncles; bracteas minute; calyxes sessile, nearly glabrous, small, ovate, cylindrical, with short setaceous teeth: throat villous inside. ½. F. Native of Abyssinia, Salt. Saturèia punctàta, R. Br. in append. to Salt, abyss. Habit of *M. Græ'ca*, with the flowers of *M. Teneriffæ*. Leaves distant. Peduncles 3-6-flowered.

Dotted Micromeria. Shrub.

25 M. Teneríffæ (Benth. lab. p. 378.) suffruticose, diffuse, almost glabrous; branches stiff, slender, pubescent above; leaves sessile, ovate, acute, rigid, glabrous, flat: lower ones broader and somewhat plicate: superior ones almost lanceolate, about equal in length to the flowers; fascicles of flowers dense, on short peduncles; bracteas very short; calyxes sessile, pubescent, cylindrical; teeth setaceous, about equal in length to the corolla: throat villous inside. ½. F. Native of Teneriffe, plentiful. Thýmus Teneriffæ, Poir. dict. 7. p. 650. Thýmus terebinthinàceus, Willd. enum. p. 624. Allied to *M. microphýlla*, but differs in the branches being elongated and woody, and in the leaves being more acute, stiffer, and longer; in the flowers being sessile, and in the calyx being elongated and more slender. Corollas small, purple.

Teneriffe Micromeria. Shrub ½ to 1 foot.

26 M. biflòra (Benth. lab. p. 378.) suffruticose, much branched, tufted; branches ascending, pubescent or pilose; leaves sessile, ovate, acute, flat, with sub-revolute edges, stiff, glabrous, rather cordate at the base: superior ones shorter than the flowers; whorls loosely few-flowered; bracteas about equal in length to the pedicels; calyxes pedicellate, sub-secund, finely pubescent, or rather pilose: throat villous inside. ½. F. Native of Nipaul and Kamaon, Wall; Mussooree, Royle; Nielgherri, Wight. Thýmus biflòrus, Hamilt. in D. Don. prod. fl. nep. p. 112. Stems densely branched at the base; branches densely leafy. Corolla half as long again as the calyx: upper lip emarginate. Lobes of style nearly equal. Hardly differing from *M. Teneriffæ*, unless in habit, and in the larger, stiffer leaves.

Two-flowered Micromeria. Shrub ½ foot.

27 M. subcordà'ta (Vis. mss. ex Benth. lab. p. 379.) suffruticose; branches short, erectish, nearly simple, pubescent; leaves sessile, flat, broad-ovate, obtuse, broadly and truncately cordate at the base: floral leaves narrower; fascicles of flowers secund; peduncles few-flowered; calyx cylindrical, pubescent, with subulate teeth and a naked throat; corollas exserted. ½. F. Native of Dalmatia. Stems many, woody at the base; erect or procumbent at the base. Bracteas short, lanceolate. Corolla equal in length to the calycine teeth.

Subcordate-leaved Micromeria. Pl. ¼ to ½ foot.

28 M. piperè'lla (Benth. lab. p. 379.) suffruticose, branches ascending, pubescent; leaves sessile, broad-ovate, obtuse, rounded or sub-cordate at the base, glabrous on both surfaces: upper leaves oblong, small; fascicles of flowers loose, pedunculate, secund, few-flowered; bracteas small, oblong; calyxes nearly sessile, tubular, pubescent, with subulate teeth, the 3 superior teeth spreading; throat naked inside. ½. F. Native of the South of Europe; as of Piedmont, and Croatia. Thýmus piperélla, All. ped. 1. p. 21. t. 37. f. 3. bad. Waldst. et Kit. pl. rar. hung. 2. p. 169. t. 156. but not of Lin. Thýmus marginàtus, Smith, in Dicks. pl. sic. no. 71. Thýmus Croáticus, Pers. ench. 2. p. 130. Calamíntha Croática, Host, fl. austr. 2. p. 132. Branches herbaceous. Whorls remote. Peduncles 3-5-flowered. Calyx and Corolla purplish and pubescent.

Small Peppermint Micromeria. Shrub ½ foot.

29 M. Forskœ'lii (Benth. lab. p. 379.) stems decumbent, imbricate; leaves ovate, acute; flowers axillary, solitary, sessile. ½. F. Native of Kurma, Forsk. Thýmus imbricàtus, Forsk. fl. ægypt. p. 168. Calyx striated, having the throat closed with villi, 5-toothed. Flowers red. Leaves ciliated on the keels, ex Benth.

Forskœl's Micromeria. Shrub procumbent.

30 M. Sina'ica (Benth. lab. p. 380.) suffruticose; branches elongated, almost simple; leaves almost sessile, ovate, flat, or with revolute edges: superior ones exceeding the flowers; fascicles of flowers dense, scarcely pedunculate; calyxes almost sessile, ovate, with short setaceous teeth; corollas minute. ½. F. Native of Arabia, among rocks, in the desert of Sinai, Bové. Habit of *M. Græ'ca*, but is distinguished from it by the leaves, dense whorls, and small ovate calyxes. Leaves remote. Whorls 12-30-flowered, all remote. Flowers smaller than in any other species.

Sinai Micromeria. Shrub ½ to 1 foot.?

* * *Species natives of Australia.*

31 M. satureioìdes (Benth. lab. p. 380.) glabrous; stems erect, branched; leaves nearly sessile, rather elliptic or lanceolate, obtuse, flat; whorls loose, 3-10-flowered; calyxes finely pubescent, cylindrical, with short lanceolate teeth, and with the throat villous inside; corollas scarcely exceeding the calyxes. ½.? F. Native of New Holland, at Lake George, Cunningh.; about Port Jackson, R. Br. Méntha satureioìdes, R. Br. prod. p. 505.? Stems slender, rooting at the base. Flowers on short pedicels, 3-5 in each fascicle. Bracteas scarcely equalling the pedicels.

Savory-like Micromeria. Shrub ¼ to ½ foot.

32 M. Austra'lis (Benth. lab. p. 380.) stems ascending, with marginate scabrous angles; leaves lanceolate; calyxes tomentose: teeth obsoletely bearded inside at the base; flowers verticillate; stamens exserted; superior lip of corolla 2-lobed. ½.? F. Native of New South Wales, about Port Jackson; and of Van Diemen's Land. Méntha austràlis, R. Br. prod. p. 505.

Southern Micromeria. Shrub.?

33 M.? GRA'CILIS (Benth. lab. p. 830.) glabrous, or clothed with fine down, pale green; stems erect; leaves on short petioles, ovate, or the superior ones are ovate-lanceolate, obtuse, flat; whorls about 6-flowered; calyxes pubescent, cylindrically campanulate, with lanceolate, acute teeth, which are shorter than the breadth of the tube, and the throat is naked inside; corollas scarcely exceeding the calyxes. ♄.? F. Native of Van Diemen's Land. Méntha grácilis, R. Br. prod. p. 505.? but not of Smith. Méntha Diemémica, Spreng. syst. 2. p. 724. This differs principally from *M. satureioides* in the broader bases of the leaves, pubescence, and in the calyxes being larger and sessile, and in the throat being naked inside. This species differs from the characters of the genus in the stamens being distant and straight, not ascending.

Slender Micromeria. Shrub.?

* * * *Species natives of America.*

34 M. OBOVA'TA (Benth. lab. p. 881.) stem shrubby, divaricate, much branched; leaves obovate, obtuse, quite entire, narrowed at the base, with revolute margins, wrinkled, canescent on both surfaces; flowers almost sessile. ♄. S. Native of Jamaica. Saturèia viminea, Lin. amœn. 5. p. 399. Swartz. obs. p. 220. Saturèia incàna, Spreng. syst. 2. p. 719. Zygis aromática, Desv. in Hamilt. prod. fl. ind. occ. p. 46. Xenópnna obovàtum, Willd. ex Colla. hort. rip. p. 147. t. 25. Mentha viminea, &c. Browne, jam. 258. Leaves half an inch long. Corolla about twice as long as the calyx, whitish. Lower lobe of style long and flattened.

Obovate-leaved Micromeria. Fl. June, July. Clt. 1789. Shrub 2 to 12 feet.

35 M. NUBIGENA (Benth. lab. p. 881.) procumbent, much branched, hispid; leaves small, petiolate, broad-ovate, obtuse, quite entire; whorls 2-flowered; flowers nearly sessile; calycine teeth nearly equal, acute, and the throat villous inside. ♄.? G. Native of Peru, in rugged places, on the burning mounts Paracé and Rucu-Pichincha, and at Surucucha. Thymus nubigenus, H. B. et Kunth, nov. gen. 2. p. 316. Habit of *Thymus Serpyllum*. Stems rather woody at the base. Branches pubescent at the base. Corolla about twice as long as the calyx, pubescent outside.

Cloud-growing Micromeria. Shrub procumbent.

36 M. GILLIE'SII (Benth. lab. p. 881.) procumbent, finely clothed with pubescence; leaves sessile, oblong, obtuse, quite entire; whorls generally 2-flowered; flowers nearly sessile; calycine teeth stiff, sub-revolute, and the throat rather villous inside. ♄. F. Native of Chili, near Mendoza, Gillies. Whorls rarely so much as 6-flowered. Bracteas small, setaceous. Corolla quite glabrous, scarcely longer than the calyx; upper lip emarginate. Lobes of style flattened, at length revolute.

Gillies's Micromeria. Shrub procumbent.

37 M. BOLIVIA'NA (Benth. lab. p. 731.) glabrous or clothed with fine down; leaves nearly sessile, oblong, obtuse or obovate, quite entire, flat; whorls few-flowered; flowers nearly sessile; calycine teeth short, obtuse, erect, and the throat naked inside. ♄. F. Native of Bolivia. Nearly allied to *M. obovàta*, but differs in the leaves being much smaller, flat, and in the calyxes being shorter. Leaves greenish on both surfaces. Corolla smaller than in *M. obovàta*, scarcely half as long again as the calyx.

Bolivia Micromeria. Shrub.

SECT. III. PSEUDOMELI'SSA (ψευδος, *pseudos*, *falsehood*, and μελισσα, *melissa*, a bee, also the name of balm.) Benth. lab. p. 383. Cymes of whorls elongated, pedunculate, sub-dichotomous. Leaves often toothed.—European herbs. The species are probably referrible to the genus *Melissa* ex Benth.

38 M. RULE'GIUM (Benth. lab. p. 382.) herbaceous, ascending, pubescent: leaves petiolate, ovate, toothed, green on both surfaces; racemes coarctate, secund; cymes sub-dichotomous, few-flowered; teeth of calyx setaceous, nearly equal, and the throat villous inside. ♃.? H. Native of Austria and Hungary. Melissa Pulègium, Rochel, del. pl. rar. bannat. p. 62. t. 22. f. 8. Calamíntha origanifòlia, Host, fl. austr. 2. p. 120. Melissa subnùda, Waldst. et Kit. pl. rar. hung. 3. p. 296. t. 262.? Calamíntha subnùda, Host, fl. austr. 2. p. 130. Thymus subnùdus, Spreng. syst. 2. p. 698. Stems erect, almost simple, hoary from short reflexed pili. Calyx cylindrical. Corolla about twice as long as the calyx, form of *Saturèia*, purple.?

Pennyroyal Micromeria. Pl. ascending.

39 M. MARIFO'LIA (Benth. lab. p. 382.) plant hoary, ascending; leaves ovate or oblong, obtuse, almost quite entire, canescent above, and white beneath; racemes loose, many-flowered; teeth of calyx obtuse, nearly equal: throat villous inside; corolla about twice as long as the calyx. ♄. F. Native of Portugal, Spain, Syria, Tauria, Piedmont, &c., in dry rocky places. Melissa fruticòsa, Lin. spec. 828. Melissa Crética, Lam. dict. 4. p. 79. and of many authors, but not of Lin. Calamíntha Crética, Lam. fl. fr. 2. p. 395. Népeta Crética, Dietr. ex Steud. nom. p. 521. Thymus Crèticus, D. C. fl. fr. 3. p. 564, but not of Brot. Thymus Barrelièri, Spreng. syst. 2. p. 698. Melissa marifòlia, Pers. ench. 2. p. 132. Népeta marifòlia, Cav. icon. 6. p. 55. t. 576. Bystropògon marifòlius, Juss. ex Steud. nom. p. 521. Thymus marifòlius, Willd. enum. 2. p. 624. Népeta serpyllifòlia, Bieb. fl. cauc. 2. p. 40. cent. pl. ross. 1. t. 28. Népeta parvifòlia, Hortul.—Barr. icon. 1166. Corolla milk-coloured, spotted with purple, more than twice as long as the calyx. Habit of *Micromèria*, sect. *Calamíntha*, but the calyx is altogether that of *Micromèria*.

Cut-thyme-leaved Micromeria. Fl. June, Sept. Cult. 1800. Shrub 1 to 2 feet.

Cult. The greater number of the species of *Micromèria* are under-shrubs, very few herbaceous annuals. They are too tender to stand the open air in this country; they should therefore be grown in pots, and placed among other Alpine plants, so that they may be sheltered under glass in winter; but they will grow very well in summer on rockwork, and probably might survive our milder winters in such a situation. A light, rich earth is the best soil for them, and the pots should be well drained with sherds. The seeds of annual kinds may be sown in the open ground in April, in a warm, sheltered situation.

XLIX. MELI'SSA (from μελισσα, *melissa*, a bee; from μελι, honey: bees are said to gather abundance of honey from this plant.) Benth. lab. p. 383. Melissa Clinopòdium and Thymus species of Lin. and other authors. Calamíntha and A'cinos, Mœnch. and other authors.

LIN. SYST. *Didynàmia, Gymnospérmia*. Calyx tubular, 13-nerved, usually striated, bilabiate; upper lip generally spreading, tridentate: lower lip bifid; throat naked or villous inside. Tube of corolla straight or incurvedly ascending, naked inside, usually exserted; throat generally inflated; limb bilabiate; upper lip erect, flattish, entire, or emarginate: lower one spreading, with flat lobes, the middle lobe usually the broadest, entire, or emarginate. Stamens 4, didynamous, ascending, approximate by pairs at apex, or rarely a little distant, lower two the longest: the superior 2 sometimes sterile; filaments toothless; anthers free, 2-celled: connective often thickened; cells distinct, parallel, diverging. Lobes of style sometimes equal, subulate, with minute terminal stigmas; sometimes the lower lobe is elongated, recurved, flattened, with stigmatiferous margins. Achenia dry,

smooth.—Under shrubs, but usually herbs, with variable inflorescence. Flowers purplish, white or yellow.

Sect. 1. Calamíntha (from *καλος, kalos*, beautiful; and *μενθα, mintha*, mint; in reference to the beauty of the plants and their affinity to *Méntha*.) Benth. lab. p. 386. Calamíntha, Mœnch. meth. 408. Racemes loose, rather secund. Cymes of whorls, pedunculate, dichotomous. Bracteas minute. Calyx almost terete, striated, hardly gibbous at the base: throat villous inside.

1 M. incàna (Benth. lab. p. 386.) herbaceous or suffruticose at the base, procumbent; branches ascending, clothed with hoary tomentum; leaves petiolate, small, orbicular, almost entire, clothed with hoary tomentum on both surfaces; racemes rather secund; whorls few-flowered; cymes hardly dichotomous; calyxes shortly bilabiate, and the throat naked inside; corolla hardly twice as long as the calyx. ♃. H. Native of the Grecian Archipelago, frequent, and about Athens; also of Syria, near Aleppo. Melissa, Crética, Russel, nat. hist. alep. but not of Lin. Thymus incànus, Sibth. et Smith, fl. græc. 6. p. 62. t. 577. This species is intermediate between *Melissa* and *Micromèria*. Upper whorls dense; lower ones more loose.

Hoary Balm. Pl. ½ to 1 foot.?

2 M.? Cre'tica (Lin. spec. p. 828.) herbaceous, humble, procumbent at the base; branches ascending, pilosely hispid; leaves petiolate, small, roundish, obtuse, almost quite entire, clothed with soft villi on both surfaces; racemes sub-secund; cymes scarcely dichotomous, few-flowered; calyx shortly bilabiate, the throat villous inside; corolla scarcely twice as long as the calyx. ♃. H. Native of Candia. Thymus hírtus, Sieb. pl. exs. but not of others.—Barr. icon. t. 1166.—Bauh. hist. 3. p. 230. f. 2.—Park. theatr. p. 36. t. 37. f. 4. Allied to *M. incàna*, but differs in the stem and leaves being villous, not tomentose. Corolla white, purplish.?

Cretan Balm. Fl. June, July. Clt. 1596. Shrub ½ to 1 foot.

3 M. thymifo'lia (Benth. lab. p. 386.) stems herbaceous, ascending, clothed with hoary pubescence; leaves petiolate, ovate, obtuse, hardly crenated, cuneated at the base or rounded, rather canescent; racemes loose, secund; cymes dichotomous; flowers small; calyx shortly bilabiate, with acute teeth; corolla about twice as long as the calyx. ♃. H. Native of Carniola, on rocks and old walls. Saturèia thymifòlia, Scop. fl. carn. 1. p. 428. ex. Host. Calamíntha thymifòlia, Host, fl. austr. 2. p. 132. Thymus origanifòlius, Vis. in bot. zeit. 1850. 1. p. 15. It appears intermediate between *Micromèria marifòlia* and *Melissa Népeta*. Leaves hardly ½ an inch long, sometimes quite entire, full of glandular dots, canescent beneath from tomentum. Corolla pale purplish: upper lip emarginate.

Thyme-leaved Balm. Pl. 1 foot.

4 M. glandulòsa (Benth. lab. p. 387.) stems herbaceous; branches almost glabrous; leaves petiolate, broad-ovate, acutish, coarsely serrated, rounded at the base, nearly glabrous; racemes very loose, few-flowered, secund; cymes dichotomous: calyx bilabiate, with acute teeth; corolla hardly larger than the small calyx. ♃. H. Native of Corsica, Requien; of Sardinia, Moris. Thymus glandulòsus, Req. in ann. sc. nat. ser. 5. p. 386. Branches slender, slightly downy. Throat of calyx closed by villi. Corolla white or pale purple.

Glandular Balm. Shrub ½ to 1 foot.

5 M. ne'peta (Lin. spec. 823.) stems herbaceous; branches procumbent, ascending, or erectish, villous; leaves petiolate, broad-ovate, obtuse, crenated, rounded at the base, villous on both surfaces, pale beneath; raceme elongated, loose, many-flowered, secund; cymes dichotomous; calyx shortly bilabiate, with subulate teeth; corolla half as long again as the calyx, hardly twice as long. ♃. H. Native of the Southern parts of Europe, in dry situations, among rubbish, and by way-sides; as in the South of France, Portugal, Piedmont, Naples, Grecian Islands, South of Tauria, &c. Thymus Népeta, Smith, fl. brit. 2. p. 642. engl. bot. t. 1414. Hook. fl. lond. vol. 1. with a figure. Calamíntha parviflòra, Lam. fl. fr. 2. p. 396. Calamíntha trichòtoma, Mœnch. meth. p. 409. Thymus diffùsus, Hortul. Thymus Braunèanus, Hoppe. Calamíntha rotundifòlia, Host, fl. austr. 2. p. 131. Calamíntha obliqua, Host, fl. austr. 2. p. 131. Calamíntha Népeta, Hoffm. et Link, fl. port. Calamíntha canéscens, Presl, fl. sic. p. 37. Melissa obtusifòlia, Pers. ench. 2. p. 122.—Black, herb. t. 167.—Riv. mon. t. 47. —Lob. icon. t. 513. Leaves ½ to 1 inch long, deep green above, and hoary beneath. Throat of calyx bearded. Corolla white and pale purple. The plant has a strong aromatic smell, approaching to that of pennyroyal, and a moderately pungent taste, somewhat like spearmint, but warmer. Infusions of the leaves were given as tea in weaknesses of the stomach, flatulent cholics, &c.

Var. β, Athónica (Benth. lab. p. 387.) more humble and more glabrous; leaves greener. ♃. H. Native of Mount Athos. Thymus Athónicus, Bernh. ex Rchb. pl. germ. exc. p. 329. under no. 2242. Calamíntha Athónica, Rchb. l. c. Melissa Athèos, Hortul.

Cat-mint Balm or Field Balm. Fl. July, Oct. England. Pl. 1 to 1½ foot.

6 M. calami'ntha (Lin. spec. p. 827.) stems herbaceous; branches ascending, villous; leaves petiolate, broad-ovate, bluntish, serrately crenated, rounded or truncated at the base, green on both surfaces, villous; raceme loose, secund; cymes very loose, subdichotomous, few-flowered; calyx distinctly bilabiate, with subulate teeth: lower teeth elongated; corolla more than twice as long as the calyx. ♃. H. Native of Middle and South Europe, and Middle Asia; as of England, France, Germany, Portugal, Spain, Italy, Greece, Armenia, and Siberia, &c., on hills and in open woods. Thymus Calamíntha, Scop. fl. carn. ed. 2d. no. 733. Smith, engl. bot. t. 1676. Calamíntha montàna, Lam. fl. fr. 2. p. 396. Cal. officinàlis, Mœnch. meth. 409. Cal. menthæfòlia, Host, fl. austr. 2. p. 129. Thymus umbròsus, Spreng. cent. pl. nov. cogn. p. 41. T. moschatéllus, Poll. fl. veron. p. 15. ex Poir, supp. 5. p. 304. Cal. umbròsa, Rchb. fl. germ. exc. p. 329.? exclusive of numerous synonymes. Melissa intermèdia, Bauing.? ex Rchb. Melissa umbròsa, of German authors. Cal. vulgàris, Sweet. Melissa foliòsa, Opiz. ex unio. itin. Stems more erect and firm than in *M. Népeta*. Leaves larger, usually an inch and a half long. Flowers fewer. Calyx twice the size, and more deeply bilabiate. Corolla red, marked with deeper spots.

Var. β, villosíssima (Benth. lab. p. 388.) plant more villous; leaves smaller, but the calyx and corolla are about the same size. ♃. H. Native of Spain and the Canary Islands. Thymus calamintholdes, Rchb. fl. lus. mad. exsic.

Calamint or Mountain Balm. Fl. July, Aug. Clt. England. Pl. ½ to 1½ foot.

Sect. II. Calomeli'ssa (from *καλος, kalos*, beautiful, and *μελισσα, melissa*, a bee, also the name given to balm; so called on account of the beauty of the plants.) Benth. lab. p. 388. Whorls many-flowered, nearly equal, condensed. Bracteas ovate or oblong. Throat of calyx villous inside.

7 M. Carolinia'na (Benth. lab. p. 388.) herbaceous, glabrous; leaves petiolate, ovate, obtuse, a little crenated, narrowed at the base; whorls nearly equal, many-flowered, condensed; corolla twice as long as the calyx. ♃. H. Native of Carolina, Georgia; and Louisiana, at Covington. Thymus Caroliniànus, Michx. fl. bor. amer. 2. p. 9. Calamíntha Caroliniàna, Sweet, hort. brit. p. 409. Cal. grandiflòra, Pursh, fl. amer. sept. 2. p.

414. Thýmus grandiflòrus, Sims, bot. mag. t. 997. Floriferous branches elongated, twiggy, glabrous, or pubescent. Leaves half an inch long. Corolla an inch long, glabrous, pale red.

Carolina Balm. Fl. June, July. Clt. 1804. Pl. 1 foot.

Sect. III. A'cinos (from ακινος, *akinos*, the Greek name of a balsamic plant now unknown.) Benth. lab. p. 389. A'cinos, Mœnch. meth. 407. Whorls about 6-flowered; pedicels erect, short, stiff. Bracteas minute or wanting. Calyx gibbous beneath at the base, nearly tercte, deeply striated, and the throat villous inside.

8 M. A'cinos (Benth. lab. p. 389.) herbaceous, annual, erectish, pubescent or villous; leaves ovate, sub-serrated: floral leaves similar to the others, exceeding the flowers, which are almost sessile; whorls 6-flowered; lips of calyx short; corolla hardly exceeding the calyx. ☉. H. Native of Europe, in corn fields; as of Britain, Sweden, Portugal, Naples, Greece, about Petersburgh, and of the Caucasus. Thýmus A'cinos, Lin. spec. 826. Hook. fl. lond. vol. 1. with a figure, Smith, engl. bot. t. 411. A'cinos thymoides, Mœnch. meth. 407. A'cinos vulgàris, Pers. ench. 2. p. 131. Thýmus heterophýllus, Poir. dict. 7. p. 648. Thýmus canéscens, Dumort, floral. belg. 47. Calamíntha arvénsis, Lam. fl. fr. 2. p. 394.—Lob. icon. 1. t. 506. f. 1. —Riv. mon. t. 43. f. 2.—Mor. hist. 3. p. 404. sect. 11. t. 18. f. 1. Stems branched, usually procumbent at the base; branches usually purplish, more or less villous. Whorls distant. Corollas purplish blue: upper lip entire. Lower lobe of style flattened. This plant has a pleasant aromatic smell.

Basil Balm, or Basil Thyme. Fl. June, Aug. Britain. Pl. ½ foot.

9 M. Patavi'na (Benth. lab. p. 389.) herbaceous, ascending, pubescent; leaves petiolate, ovate, acute, scarcely serrated, veiny, almost glabrous: floral ones similar to the rest, longer than the calyxes; lips of calyx shorter than the tube; corollas scarcely twice as long as the calyxes. ♃. H. Native of the South of Europe; as of Spain, South of France, Italy, Piedmont, Naples; and on Mount Parnassus. Thýmus Patavìnus, Jacq. obs. bot. 4. p. 7. t. 87. A'cinos Patavìnus, Pers. ench. 2. p. 131. Calamíntha Patavìna, Host, fl. austr. 2. p. 133. Melissa marjoranæfòlia, Mill. dict. no. 7. Thýmus suavèolens, Smith, prod. fl. græc. 1. p. 420. Thýmus acinoides, Tenore, prod. fl. nap. p. 85. syll. 296.—Bocc. mus. t. 45. f. 3. Larger and firmer plant than *M. A'cinos*, with the flowers twice the size; and smoother and more erect than *M. alpìna*, to which it is more nearly allied. Corollas pale red, or purplish red.

Paduan Balm. Fl. June, Aug. Clt. 1776. Pl. ½ to ¾ foot.

10 M. microphy'lla (Benth. lab. p. 390.) suffruticose, small, diffuse, nearly glabrous; leaves petiolate, roundish, quite entire: floral ones similar to the others; whorls 4-6-flowered; flowers almost sessile; lips of calyx much shorter than the tube; corolla almost twice as long as the calyx. ♄. F. Native of Corsica, on the mountains. Thýmus Córsicus, Pers. ench. 2. p. 131. Plant small, much branched; branches short, pilose while young. Leaves small, glabrous, or a little pilose. Flowers similar to those of *M. Patavìna*, but the calyxes are longer and slenderer.

Small-leaved Balm. Shrub small.

11 M. alpi'na (Benth. lab. p. 390.) perennial, diffuse, pubescent, or villous; leaves petiolate, roundish, or ovate, hardly serrated; floral leaves about equal in length to the calyxes; whorls 4-6-flowered; flowers almost sessile; lips of calyx shorter than the tube; corolla more than twice as long as the calyx. ♃. H. Native of the South of Europe, in mountainous and shady places; as of the South of France, Germany, Italy, &c. Thýmus alpìnus, Lin. spec. 826. Sims. bot. mag. 2152. Jacq. austr. 1. p. 60. t. 97. A'cinos alpìnus, Mœnch. meth. p. 407. A'cinos diffùsus, Bonningh. fl. monast. ex Bot. zeit. 1825. 1. p. 338.? Thýmus nummulariæfòlius, Loiz. ex herb. D. C. Thýmus montànus, Crantz, stirp. austr. p. 278. Thýmus villosíssimus, Tausch, in syll. pl. ratisb. 2. p. 248.?—Bocc. mus. 2. p. 50. t. 45. Stem much branched at the base, rather woody; floriferous branches ascending, usually villous. Leaves smaller, but generally broader than those of *M. A'cinos*, and *M. Patavìna*. Calyx purplish. Corollas larger than those of *M. Patavina*, purplish-blue; upper lip and middle lobe of lower lip shortly emarginate. Lower lobe of style flattened.

Alpine Balm. Fl. June, Sept. Clt. 1731. Pl. ½ foot.

12 M. grave'olens (Benth. lab. p. 390.) herbaceous, annual, erect, villous; leaves petiolate, ovate, a little serrated: floral leaves similar to the rest, exceeding the flowers; whorls 6-flowered; flowers almost sessile; lips of calyx incurved, equalling the tube; corolla scarcely half as long again as the calyx. ☉. H. Native of Caucasus, Naples, Island of Cyprus, Transylvania, Tauria, and Iberia; frequent about Madrid, and between Bagdad and Kermancha, &c. Thýmus gravèolens, Bieb. fl. cauc. 2. p. 60. pl. rar. ross. 1. t. 38. A'cinos gravèolens, Link, enum. hort. berol. 2. p. 117. Thýmus cànus, Stev. ex. Hoffm. in comm. soc. phys. med. mosq. 1. p. 46. ex Bieb. Thýmus exígnus, Sibth. et Smith, fl. græc. 6. p. 61. t. 575. A'cinos cànus, Rchb. fl. germ. exc. p. 327. Herb simple or branched. Leaves like those of *M. Patavìna*, but more villous. Flowers larger than in *M. A'cinos*, but smaller than in *M. Patavina*, purplish blue.

Strong-scented Balm. Fl. June, Aug. Clt. 1820. Pl. ½ foot.

† *Species evidently belonging to sect.* III., *but are not sufficiently known.*

13 M. purpura'scens (Benth. lab. p. 391.) stem branched, divaricate, tomentose; leaves ovate, a little serrated: upper ones crowded, coloured; whorls 1-2-flowered, rather approximate. ☉. H. Native of Spain, Clemente. A'cinos purpurascens, Pers. ench. 2. p. 13. Thýmus purpuráscens, Poir. dict. 7. p. 654. Leaves reddish violet, especially the veins. Corollas rather large, red. Apparently an intermediate plant between *M. vulgàris* and *M. alpinus*, and probably only a variety of the latter.

Purplish Balm. Fl. June, July. Clt. 1820. Pl. ½ foot.

14 M. rotundifòlia (Benth. lab. p. 391.) leaves orbicular, mucronate, having the veins prominent beneath; stems procumbent, villous at top as well as the calyxes. ♃.? H. Native of Hungary. A'cinos rotundifòlius, Pers. ench. 2. p. 131. Thýmus rotundifòlius, Poir. dict. 7. p. 654. Thýmus melissoides, Bernh. ex Rchb. fl. germ. exc. p. 327.

Round-leaved Balm. Pl. procumbent.

Sect. IV. Clinopòdium (from κλινη, *kline*, a bed; and πους *pous podos*, a foot; heads of flowers like turned bed-feet.) Benth. lab. p. 391. Clinopòdium, Lin. and other authors. Whorls many-flowered or loosely few-flowered, equal; common pedunceles almost wanting; pedicels filiform, not flattened. Bracteas subulate, sometimes minute, sometimes equalling the calyxes. Calyx gibbous on the under side at the base or almost equal: throat naked, or a little villous inside.

15 M. de'bilis (Benth. lab. p. 391.) plant herbaceous, small, weak, glabrous; leaves petiolate, ovate, serrated: floral leaves smaller; whorls few-flowered; pedicels elongated, filiform; bracteas minute; throat of calyx naked inside. ♃. H. Native of Altaia, in shady places, near Alexandrowsk; and in the Soongarian desert, about Mount Kent. Thýmus débilis, Ledeb. fl. alt. 2. p. 391. fl. ross. alt. ill. t. 439. Herb hardly 3-4 inches high, quite glabrous. Leaves ⅓ inch long, narrowed a long way into the petioles at the base. Corolla shorter than the calyx.

Weak Wild Basil. Pl. ¼ to ½ foot.

16 M. umbròsa (Bieb. fl. cauc. 2. p. 63. but not of German authors) plant herbaceous, diffuse, pubescent or villous; leaves petiolate, ovate, serrately crenated, rounded at the base; whorls equal, globose, many-flowered; bracteas minute, or the outer ones are subulate, one half shorter than the calyxes. ♃. H. Native of Iberia, in woods; Caucasus, on the Talusch mountains; Himalaya, Wall. Royle; mountains in the Peninsula of India, Wight; Ceylon, Walker; Cashmere, Jacquemont. Clinopòdium rèpens, β, Benth. in Wall. pl. rar. asiat. 1. p. 66. Stems procumbent, creeping at the base. Leaves scarcely an inch long. Whorls 20-40-flowered. Corolla purplish, scarcely half as long again as the calyx.

Shaded Wild Basil. Pl. procumbent.

17 M. rèpens (Benth. lab. p. 392.) herbaceous, diffuse, rooting at the base, pubescent or villous; leaves petiolate, ovate, obtuse, serrately crenated, rounded at the base; whorls equal, globose, many-flowered; bracteas subulate, numerous, equalling the calyxes. ♃. H. Native of Nipaul. Clinopòdium rèpens, α, Wall. pl. rar. asiat. 1. p. 66. Thymus rèpens, D. Don, prod. fl. nep. p. 113. Habit of *M. umbròsa*. Bracteas more dense, and more hairy, ciliated. Corolla purplish.

Creeping Balm. Pl. procumbent.

18 M. origanifòlia (Benth. lab. p. 392.) suffruticose; stems ascending, branched, hispid; leaves ovate, quite entire, hispid; whorls nearly sessile: lower ones on long peduncles, emulating branches; bracteas linear-lanceolate, hispid, scarcely longer than the calyxes. ♄. H. Native of Mount Lebanon. Clinopòdium origanifòlium, Labill. pl. syr. dec. 4. p. 14. t. 9. Corolla rather hairy, purplish.?

Marjoram-leaved Balm. Fl. June, Aug. Clt. 1825. Shrub 1½ foot.

19 M. Clinopòdium (Benth. lab. p. 392.) herbaceous, erect, villous; leaves petiolate, ovate, obtuse, crenated a little, rounded at the base; whorls equal, globose, many-flowered; bracteas subulate, numerous, equalling the calyxes. ♃. H. Native throughout Europe and Middle Asia, in woods, hedges, and by waysides; from Scotland and Sweden to Spain, Sicily, Greece, and Caucasus; and North America; but probably introduced from Europe to the latter country. Clinopòdium vulgàre, Lin. spec. p. 821. Smith, engl. bot. t. 1401. Clinopòdium Ægyptiacum, Lam. dict. 2. p. 50. Mill. dict. no. 6. fig. t. 95. Clinopòdium atropurpùreum, and C. variegàtum, Hortul. Clinopòdium plumòsum, Sieb. in bot. zeit. 1822. t. 242.? Thymus sylvàticus, Bernh. ex Steud. nom. p. 208.—Riv. mon. irr. t. 43.—Sabb. hort. rom. 3. t. 65, 66.—Mor. hist. sect. II. t. 8. f. 1. Stems simple, or a little branched. Leaves petiolate, 1-2 inches long, pale or canescent beneath, with entire or obscurely crenulated margins: floral ones smaller, sessile. Calyxes and bracteas very pilose. Corolla twice as long as the calyx, bright red.

Bed-foot or Common Wild Basil. Fl. June, Aug. Britain. Pl. 1 to 2 feet.

Sect. V. Melìphyllum (from μελι, *meli*, honey; and φυλλον, *phyllon*, a leaf; so called from the sweet-scented leaves.) Benth. lab. p. 393. Melissa, Lin. and other authors. Whorls few-flowered, rather loose, secund. Bracteas few, usually ovate. Calyx scarcely gibbous at the base, spreading; upper lip almost glabrous; throat naked inside, or villous. Corolla white or yellowish; tube recurvedly ascending.

20 M. officinàlis (Lin. spec. 827.) herbaceous, erect, branched; leaves broad-ovate, crenated, truncate at the base, or cordate; floral leaves almost similar to the cauline leaves; whorls axillary, loose, secund; bracteas few, ovate; corolla a half again as long as the calyx. ♃. H. Native of the South of Europe and Middle Asia, in mountain woods; as of Portugal, Spain, South of France, Italy, Sicily, Greece, about Aleppo, Tauria, Iberia, and Caucasus. Woodv. med. bot. t. 147. M. gravèolens, Host, fl. austr. 2. p. 128. M. foliòsa, Opiz, ex Rchb. fl. germ. exc. p. 329. M. occidentàlis, Rafin. M. Córsica, Host. —Sabb. hort. rom. 3. t. 61.—Blackw. herb. t. 27.—Lob. icon. t. 277. Plant very variable in hairiness, size, form, and bases of leaves, and length of corollas. Leaves from ½ to 2-3 inches long, those of the stems and sterile branches truncate or cordate at the base: upper floral and rameal ones smaller, rounded or cuneated at the base, all obtuse, or the upper ones are acute, more or less villous on both surfaces. Whorls distant. Cymes distinct, 3-6-flowered. Corolla white or pale yellow, twice as long as the calyx.

Balm, in its recent state, has a weak, roughish, aromatic taste, and a pleasant smell, somewhat of the lemon kind. It is now little used, unless for making a simple balm tea, which affords a grateful diluent drink in fevers, and for forming a light agreeable beverage, under the name of balm wine. Anciently it was generally recommended in hypochondriacal affections, and by Paracelsus promised a complete renovation of man. From the fondness of bees for this plant, it was named *Apiástrum*, *Melissa*, *Melissophyllum*; and was directed by the ancients, among other herbs, to be rubbed upon the hive, to render it agreeable to the swarm.

Var. β, villòsa (Benth. lab. p. 393.) leaves shorter; plant more villous; odour disagreeable. ♃. H. Native of Italy, about Rome, Greece, &c. M. Romàna, Mill. dict. no. 2. M. hirsùta, Balb. M. cordifòlia, Pers. ench. 2. p. 132. M. Taúrica, Hortul. M. altissima, Sibth. et Smith, fl. græc. 6. p. 63. t. 579. Corollas white, smaller than those of the species.

Officinal or Common Balm. Fl. June, Oct. Clt. 1573. Pl. 2 to 4 feet.

21 M. hirsùta (Blum. bijdr. p. 830.) heads verticillate, axillary; leaves ovate-oblong, bluntly serrated, and are, as well as the calyxes, hairy. ♃. H. Native of Java, on the top of Mount Tjerimai, in the province of Cheribon. Allied to *M. officinàlis*.

Hairy Balm. Pl. 2 to 3 feet.?

22 M. parviflòra (Benth. in Wall. pl. rar. asiat. 1. p. 65. lab. p. 394.) herbaceous, erect, nearly glabrous; leaves ovate or ovate-lanceolate, acute, somewhat serrated, rounded at the base or cuneated; floral leaves similar to the others; whorls axillary, loose, secund; bracteas few, small, oblong-linear; corollas scarcely longer than the calyxes. ♃. H. Native of Nipaul and Kamaon, Wall.; Deyra Dhoun, Royle. Scutelària Japónica, Burm. fl. ind. p. 130. Geniósporum axillàre, Benth. in Wall. pl. asiat. rar. 2. p. 18. This has the character of *M. officinàlis*, but the habit is very different. The whole plant is purplish and glabrous, except a few hairs on the angles of the stem and nerves of the leaves. Leaves hardly an inch long. Inflorescence of *M. officinàlis*. Corollas blue, hardly exserted.

Small-flowered Balm. Pl.

23 M. flàva (Benth. in Wall. pl. rar. asiat. 1. p. 65. lab. p. 394.) herbaceous, erect, nearly glabrous; leaves ovate or ovate-lanceolate, acute, serrately crenated, rounded at the base; floral leaves similar to the rest; whorls axillary, loose, secund; bracteas few, oblong-linear; corolla about thrice as long as the calyx. ♃. H. Native of Nipaul, Wall. Habit of *M. parviflòra*. Calyxes coloured at top. Corolla yellow, incurvedly ascending.

Yellow-flowered Balm. Pl.?

Sect. VI. Macromelìssa (from μακρος, *makros*, long; and μελισσα, *melissa*, balm; so called in reference to the long corollas.) Benth. lab. p. 394. Whorls very loose, usually few-

flowered; cymes umbel-formed; peduncles elongated, scarcely dichotomous. Throat of calyx spreading, almost naked inside: lips very deep, spreading. Corolla elongated, purplish: tube dilated. Stamens rather distant at apex.

24 M. grandiflòra (Lin. spec. 827.) herbaceous, erectish, sparingly pilose; leaves petiolate, ovate, acute, coarsely toothed, rounded or cuneated at the base, green on both surfaces; racemes loose, few-flowered; cymes pedunculate, hardly dichotomous, few-flowered; corolla ample, more than twice the length of the calyx. ♃. H. Native of Europe, in shady woods; as of the Pyrenees, Cevennes, Piedmont, Switzerland, Germany, Mounts Athos, and Olympus; South of Tauria, about Baldar. Bieb. Curt. bot. mag. 208. Calamintha grandiflòra, Mœnch. meth. p. 408. Thymus grandiflòrus, Scop. carn. ed. 2d. no. 732. D. C. fl. fr. 3. p. 562.—Riv. mon. t. 46.—Mor. hist. sect. 11. t. 21. f. 1.—Besl. hort. eyst. 7. t. 7. f. 1. Stems branched at the base, and decumbent. Branches erectish. Whorls few, subsecund. Leaves 2-3 inches long. Corolla 1 to 1½ inch long, purplish; throat much inflated. Stamens loosely approximate. There is a variety of this with white flowers, and another with red flowers; both much inferior to the purple: there is also a variety with variegated leaves. The leaves, when bruised, have the smell of common balm.

Great-flowered Balm. Fl. June, July. Clt. 1596. Pl. 1 foot.

25 M. macrostè'ma (Moc. et Sessé, mss. ex Benth. lab. p. 395.) shrubby; branches divaricate, villous in the young state; leaves petiolate, ovate, or oblong, acute, roundly cuneated at the base, serrated, green above, and pale beneath, nearly glabrous, or rather hispid on both surfaces; whorls loose, rather secund, few-flowered; peduncles and pedicels elongated; calyxes glabrous; upper lip spreading. ½. H. Native of New Spain. Leaves distant, ½ to 1 inch long. Cymes generally 2-3-flowered. Corolla downy, about 4 times the length of the calyx, with a dilated tube: upper lip, and middle lobe of lower lip emarginate, like the preceding.

Long-crowned Balm. Shrub 1 to 2 feet.?

Sect. VII. Heteromelí'sson (from ἑτερος, *heteros*, variable; and μελισσα, *melissa*, a bee, also the name given to balm.) Benth. lab. p. 395. Whorls irregular, few or many-flowered, rather secund, usually ending in leafy branches. Bracteas subfoliaceous. Calyx elongated, not gibbous at the base, scarcely bilabiate: teeth straight, setaceous: throat almost naked inside. Corolla elongated, purple: tube erectish.

26 M. longicau'lis (Wall. mss. ex Benth. lab. p. 395.) suffruticose; branches elongated, decumbent, pubescent; leaves ovate-oblong, obtuse, a little toothed, cuneate, or narrowed at the base, rather villous: floral ones similar to the rest; whorls few-flowered, irregular, secund; calyx elongated, a little declinate, with lanceolate, subulate teeth. ♃. H. Native of Nipaul, Wall. Thymus piperìtus, D. Don, prod. fl. nep. p. 112. Thymus origanifòlius, D. Don, prod. fl. nep. p. 112. Clinopòdium longicaule, Benth. in Wall. pl. rar. 1. p. 66. Stems weak, woody at the base; branches purplish at top. Leaves scarcely ½ an inch long, quite entire, or furnished with 1 or 2 crenæ on both sides. Bracteas foliaceous. Corolla violaceous, hardly twice as long as the calyx. Superior stamens usually abortive. Probably a proper genus, intermediate between *Hedeòma* and *Melissa*.

Long-stemmed Balm. Pl. decumbent.

† *Doubtful species.*

27 M. rugòsa (Lour. coch. p. 368.) annual, erect, much branched; leaves very rugose, roundish, acuminated; racemes crowded, axillary and terminal. ☉. H. Native of Cochinchina. Stem tetragonal. Leaves serrated, petiolate. Corolla white, tinged with red. The whole plant is obscure green, except the corollas.

Wrinkled-leaved Balm. Pl. 1½ foot.

28 M. obtusifòlia (Pers. ench. 2. p. 132.) leaves broad-ovate, obsoletely serrated, rounded at apex; stem villous; peduncles simply divided and solitary, much shorter than the leaves; corolla pale violet. ♃.? G. Native of South America, Michx.

Blunt-leaved Balm. Pl.?

29 M. veronicæfòlia (Pers. ench. 2. p. 132.) leaves broad-ovate, serrated, petiolate; stem branched, diffuse; peduncles elongated, branched. ♃. H. Native of the Bahamas. Thymus veronicæfòlius, Spreng. syst. 2. p. 698. Stem villous. Leaves nearly glabrous. Calyx glabrous. Corolla purplish inside, variegated with violaceous and white spots. Habit of *Verónica arvénsis*.

Speedwell-leaved Balm. Pl. ½ foot.?

† † *Doubtful Clinopòdia of authors.*

30 M. Asia'tica; leaves oblong, nerved, wrinkled, tomentose beneath; spikes verticillate, terminal. ½. G. Native of Cochinchina. Clinopòdium Asiáticum, Lour. coch. p. 374. Stem suffruticose, tetragonal, simple, villous. Leaves ovate-oblong, blunt, serrated. Flowers violaceous, disposed in an oblong, compound, terminal spike. Calyx bilabiate, entire, unequal, very pilose. Upper lip of corolla concave, equally trifid: lower lip refracted, quite entire, longer.

Asiatic Balm. Shrub 2½ feet.

31 M. nu'milis; plant humble, branched; leaves wrinkled; heads flattened. ♃. H. Native of Carolina. Clinopòdium hùmile, Mill. dict. no. 4.

Humble Balm. Pl. dwarf.

32 M. Carolinia'na; stem erect, not branched; leaves villous beneath; whorls fewer; bracteas longer than the calyxes. ♃. H. Native of Carolina. Clinopòdium Caroliniànum, Mill. dict. no. 5.

Carolina Balm. Pl. 1 foot.?

Cult. All the species of Balm will grow in common garden earth, and are of easy culture. The perennial herbaceous kinds are readily increased by parting the roots; the suffruticose species by cuttings or parting; and seeds of annual kinds may be sown either on rockwork or in the open border. The species belonging to section *Acinos* are all well fitted for decorating rockwork.

L. GARDO'QUIA (dedicated to Don Diego Gardoqui, Minister of Finance under Charles IV. of Spain, who greatly promoted the publication of the "Flora Peruviana.") Ruiz, et Pav. prod. fl. per. et chil. p. 130. syst. veg. per. p. 149. D. Don, in Sweet, fl. gard. n. s. 3. t. 271. Benth. lab. p. 397. Rizòa, Cav. icon. 6. p. 56.—Cunila species, Nutt.—Melissa species, Spreng.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular, 13-nerved, a little incurved, with an equal or oblique mouth; teeth short, straight, nearly equal or sub-bilabiate. Tube of corolla much exserted, straight, or incurved, naked inside; limb bilabiate: upper lip erect, flattish, emarginate: lower one spreading a little, with flat lobes, the middle lobe the broadest. Stamens 4, subdidynamous, loosely ascending, rather distant at apex: lower ones the longest: superior ones now and then abortive; filaments toothless; anthers 2-celled; cells distinct, parallel, or somewhat divergent. Lobes of style nearly equal. Achenia

dry, smooth.—Much branched, leafy, shrubs or under-shrubs, often procumbent. Flowers beautiful, usually scarlet. This genus is not distinct from *Micromèria*, unless in the length of the corolla, and erect lobes of the limb.

1 G. multiflòra (Ruiz, et Pav. syst. veg. fl. per. et chil. p. 149.) shrubby, nearly glabrous; leaves petiolate, ovate, bluntish, crenated a little, rounded at the base, green, pale beneath; floral leaves conforming to the others; whorls loose, subsecund; cymes pedunculate, scarcely dichotomous; calyx almost glabrous, with acute teeth, and the throat naked inside; corolla 3 times as long as the calyx. ♄. G. Native of Chili, in the province of Conception, in fields. Rizòa ovatifòlia, Cav. icon. 6. p. 56. t. 578. bad. Stems hard at the base, but scarcely woody. Branches, leaves, and calyxes glabrous, or clothed with fine pubescence. Leaves an inch long. Corolla more than an inch long, beautiful, scarlet or purple. Stamens a little exserted.

Many-flowered Gardoquia. Shrub 1 foot.

2 G. rugòsa (Benth. lab. p. 399.) shrubby, villous; leaves petiolate, ovate-rhomboid, serrately toothed, rounded at the base, coriaceous, wrinkled, villous on both surfaces, hardly canescent beneath; whorls loose, many-flowered; calyx villous, with subulate ciliated teeth, and with the throat almost naked inside; corolla scarcely twice as long as the calyx. ♄. G. Native of Peru, Ruiz, et Pav. Hairs rufous. Leaves 1 to 1½ inch long. Cymes on short peduncles. Corolla villous. Anthers approximating by pairs.

Wrinkled Gardoquia. Shrub.

3 G. ellíptica (Ruiz, et Pav. syst. fl. per. p. 149.) shrubby, erect; branches glabrous; leaves petiolate, ovate, acutish, serrately crenated, rounded at the base, or cuneated, green on both surfaces, glabrous, or a little ciliated; floral leaves smaller; whorls usually 6-flowered; calyx green, pilose, with acute teeth, and with the throat naked inside; corolla about 4 times as long as the calyx. ♄. G. Native of Peru, towards Cheuchin and Sayan, Ruiz et Pav.; in the valley of Canta, between Obrajillo and Pacron, Chruikshanks. Leaves about an inch long. Corolla about 1½ inch long, pubescent, scarlet: lobes short. Stamens exserted.

Elliptic-leaved Gardoquia. Shrub erect.

4 G. thymoi'des (H. B. et Kunth, nov. gen. amer. 2. p. 314.) shrubby; branches pubescent; leaves ovate, acute, subcordate, with revolute, subserrated margins, nearly glabrous above, but clothed with hoary pubescence beneath; whorls many-flowered, distant; calyx pubescent, with unequal, acuminately subulate segments; corolla about 3 times the length of the calyx. ♄. G. Native on the Andes of Quito. ? Leaves 3 lines long. Flowers pedunculate. Corolla yellow? pubescent outside; throat bearded with long hairs behind; limb spotted with purple.

Thyme-like Gardoquia. Shrub.

5 G. e'legans (H. B. et Kunth, nov. gen. amer. 2. p. 315.) shrubby; branches pubescent, clothed with white tomentum while young; leaves roundish-rhomboid, obtuse, serrated, pubescent above, and clothed with white tomentum beneath; peduncles axillary, usually 3-flowered; calyx tomentose, with unequal acuminated teeth. ♄. G. Native of Quito, on the declivity of the burning mount Catopaxi, between Mulalo and Pansache. Shrub aromatic. Leaves entire towards the base, 9 lines long. Corolla red, downy outside: throat yellow, spotted with red.

Elegant Gardoquia. Shrub 3 to 4 feet.

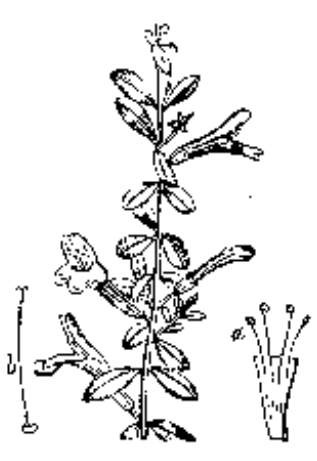
6 G. pulche'lla (H. B. et Kunth, l. c.) shrubby; branches pubescently tomentose; leaves ovate or roundish-ovate, obtuse, cuneated at the base, with subrevolute crenated margins, rather scabrous above, and clothed with white tomentum beneath; peduncles usually 3-flowered; calyx clothed with tomentose pubescence, with acuminately-subulate, unequal teeth. ♄. G. Native of Peru, in hot places between Cascas and Contumassay. Leaves 8-9 lines long. Flowers on long pedicels.

Neat Gardoquia. Shrub 3 to 4 feet.

7 G. tomentòsa (H. B. et Kunth, l. c. p. 314.) shrubby; branches pubescent; leaves roundish-ovate, acutish, rather truncate at the base, with revolute serrated margins, pubescent above, and clothed with white tomentum beneath; peduncles axillary, usually 3-flowered; calyx clothed with tomentose pubescence, with unequal acuminated teeth; corolla 3 times as long as the calyx. ♄. G. Native of the kingdom of Quito, near Llactacunga, Hambato, and Riobamba Nuevo. Shrub aromatic. Leaves hardly ½ an inch long. Flowers pedicellate, Corolla pale red, pubescent outside; tube short; throat bearded by long hairs. Stamens inclosed.

Tomentose Gardoquia. Shrub 3 feet.

8 G. grandiflòra (H. B. et Kunth, l. c.) branches pubescent; leaves roundish-ovate, obtuse, acute at the base, toothed towards the apex, pubescent above, and clothed with hoary tomentum beneath; flowers axillary, solitary; calyx clothed with hoary tomentum, with acuminated nearly equal teeth; corolla 4 times as long as the calyx. ♄. G. Native of South America, in the valley of the river Chambo, between Mount Tunguragua and Penipe. Leaves ⅓ an inch long. Flowers on short peduncles. Corolla yellow, downy outside; throat bearded inside. Stamens a little exserted. From the description, this does not appear to differ from *G. incàna*, unless in the leaves being serrated at apex.



Great-flowered Gardoquia. Shrub 3 feet.

9 G. brevifiòra (Benth. lab. p. 401.) shrubby, hoary; leaves on short petioles, roundish-ovate, obtuse, with scarcely revolute margins, pubescent above, and clothed with hoary pubescence beneath; floral leaves similar to the rest, equalling the calyxes; whorls 2-6-flowered, secund; calyx a little coloured, with lanceolate-acute teeth, and with the throat naked inside; corolla exceeding the calyx a little. ♄. G. Native of Peru, Ruiz et Pavon. Habit of *G. incàna*; but the leaves are shorter, broader, and greener above, obtuse, or shortly mucronate. Hardly distinct from the genus *Micromèria*, in consequence of the corolla hardly exceeding the calyx.

Short-flowered Gardoquia. Shrub.

10 G. inca'na (Ruiz et Pav. syst. fl. per. p. 150.) shrubby, hoary; leaves on short petioles, ovate, obtuse, quite entire, flat, pale above, and clothed with hoary tomentum beneath; floral leaves similar to the others, equalling the calyxes; whorls 2-6-flowered; calyx hoary, with an oblique mouth, and short acute teeth, and with the throat naked inside. ♄. G. Native of Peru. Ruiz et Pav. fl. per. ined. 4. t. 493. f. 4. Leaves of *Helianthemum cànum*, ½ an inch long. Corolla beyond an inch in length, yellow. Genitals a little exserted.

FIG. 80.

Hoary Gardoquia. Shrub.

11 G. Hooke'ri (Benth. lab. p. 401.) shrubby, quite glabrous; leaves obovate, quite entire, narrowed into the short petioles at the base, green on both surfaces; peduncles 2-3-flowered; calyx glabrous, subbilabiate, having the upper lip shortly tridentate, erect: throat clothed by villi inside. ♄. G. Native of Florida. D. Don, in Sweet. fl. gard. n. s. 3. t. 271.

Cunila coccinea, Nutt. ex Hook. exot. fl. 3. t. 168. Melissa coccinea, Spreng. syst. 2. p. 224. Leaves ½ an inch long, 1-3 nerved, glandularly dotted. Peduncles sometimes short and 1-flowered. Corolla scarlet, clothed with glandular pubescence. Stamens distant, a little exserted. (fig. 80.)

Hooker's Gardoquia. Fl. June, Oct. Clt. 1834. Shrub 1 to 2 feet.

12 G. sericea (Presl, mss. ex Benth. lab. p. 402.) suffruticose, procumbent, clothed with silky tomentum; leaves sessile, linear, quite entire, with revolute margins, clothed with silky wool on both surfaces; floral leaves and bracteas similar to the cauline leaves, but smaller; flowers axillary, solitary; calyx silky, with short, nearly equal teeth: throat naked inside. ♄. G. Native of Peru, in the valleys of the Cordillera. Leaves 3-5 lines long. Corolla 10-11 lines long, scarlet, pubescent. Stamens exserted: superior ones inclosed or abortive.?

Silky Gardoquia. Shrub procumbent.

13 G. argentea (H. B. et Kunth, nov. gen. amer. 2. p. 313.) shrubby, clothed with silky silvery pubescence; leaves oblong-lanceolate, obtuse, with revolute, quite entire margins; flowers axillary, solitary; calyx bilabiate, silky, with acute teeth, and a naked throat; corolla 3 times as long as the calyx. ♄. G. Native of Peru, on the Andes near Micuipampa. Leaves 2-3 lines long. Calyx tridentate. Corolla scarlet, downy outside; throat bearded below. Stamens inclosed.

Silvery Gardoquia. Shrub.

14 G. discolor (H. B. et Kunth, nov. gen. 2. p. 312.) branchlets clothed with canescent pubescence; bark soluble; leaves oblong, acute, cuneated at the base, quite entire, puberulous above, but clothed with silky hoary pubescence beneath; flowers axillary, solitary; calyx villous, having the throat closed with white hairs: the limb bilabiate, with lanceolate-acute, unequal segments; corolla 2-4 times as long as the calyx. ♄. G. Native of the Spanish Main, on Silla de Caracas. Leaves on short petioles, 4-8 lines long. Throat of corolla naked. Corolla purple.

Discoloured-leaved Gardoquia. Fl. April, July. Clt. 1827. Shrub.

15 G. Gillie'sii (Graham, in edinb. phil. journ. 1831. sept. 377. Benth. lab. p. 402.) suffruticose; branches divaricate, pubescent; leaves oblong-linear or cuneated, obtuse, quite entire, narrowed at the base, green on both surfaces, flat; floral leaves similar to the others, and are, as well as the bracteas, rather shorter than the calyxes; whorls few, many-flowered, rather loose, irregular; calyx elongated, erect, with lanceolate-subulate, nearly equal teeth, and the throat naked inside. ♄. G. Native of Chili, near Valparaiso. G. Chilénsis, Hook. et Arn. in Beech. voy. pt. bot. p. 58. Stems divaricate or procumbent. Branches ending each in a long terminal raceme. Leaves 3-6 lines long. Calyx bilabiate. Corolla pubescent, scarlet.

Gillies's Gardoquia. Fl. April, July.? Clt. 1828. Shrub procumbent.

16 G. obova'ta (Ruiz, et Pav. syst. fl. per. p. 150.) shrubby; branches canescent; leaves obovate-oblong, narrowed at the base, with revolute, quite entire margins, smoothish above, pale and few-veined beneath, glabrous on both surfaces; whorls about 2-flowered, secund; calyx nearly glabrous, with short obtuse teeth, and with the throat villous inside. ♄. G. Native of Peru, at Cheuchin. Ruiz, et Pav. fl. per. ined. 4. t. 494. f. a. Leaves 3-4 lines long, on very short pedicels. Corolla about 3 times as long as the calyx, very villous. Stamens much exserted.

Obovate-leaved Gardoquia. Shrub 3 feet.

17 G. glabra'ta (H. B. et Kunth, nov. gen. 2. p. 313.) branches pubescent; leaves lanceolate-oblong, acute at both ends, with revolute serrated margins, glabrous, full of glandular dots beneath; flowers axillary, solitary; calyx glandularly dotted, bilabiate, with acuminated, nearly equal teeth, or the 3 upper teeth are longest; corolla twice as long as the calyx. ♄. G. Native near Quito. Leaves on short petioles, scarlet, shining above, ⅓ an inch long. Corolla downy outside, with a pilose throat. Stamens inclosed.

Glabrous Gardoquia. Shrub.

18 G. taxifo'lia (H. B. et Kunth, l. c. p. 312.) branches clothed with hoary villi; leaves linear-lanceolate or oblong, obtuse, narrowed at the base, quite entire, glabrous, dotted beneath; flowers axillary, solitary; calyx bilabiate, with acuminated, nearly equal teeth, and having the throat closed by hairs. ♄. G. Native of New Granada, on the Andes, especially on the declivity of Paramo de Saraguro, near Oña. Leaves 4-5 lines long. Corolla red,? pubescent outside, with a rather pilose throat. Genitals exserted.

Yew-leaved Gardoquia. Shrub.

19 G. stria'ta (Ruiz, et Pav. syst. fl. per. p. 148.) shrubby; branches clothed with wool-like villi; leaves small, ovate, quite entire, flat, or complicate, quite glabrous on both surfaces, striated or ciliated on the back; whorls 2-flowered, secund; calyx glabrous, with short obtuse teeth, and the throat rather villous inside. ♄. G. Native of Peru, on arid hills in the provinces of Tarma and Huanuco. Ruiz, et Pav. fl. per. ined. 4. t. 494. f. b. Leaves sessile, 2 lines long, rounded or subcordate at the base: upper ones obtuse. Corolla scarlet, downy outside, 3 times the length of the calyx. Stamens a little exserted.

Striated-leaved Gardoquia. Shrub 3 feet.

20 G. microphy'lla (H. B. et Kunth, l. c. p. 311.) branches crowded, pubescently pilose while young; leaves ovate, obtuse, cordate, with revolute, quite entire margins, glabrous, having the margins and middle nerve ciliated; flowers axillary, solitary; calyx rather scabrous, bilabiate, with acute, ciliated, unequal teeth, and a naked throat; corolla 5 times as long as the calyx. ♄. G. Native of the Andes of Pasto, in frigid places near Rio Blanco, between Guachucal and Tulcan. Leaves on short petioles, hardly a line long. Pedicels short. Corolla red, downy outside; throat bearded. Stamens hardly exserted.

Small-leaved Gardoquia. Shrub 2 to 3 feet.

21 G. Jameso'ni (Benth. lab. p. 404.) shrubby, procumbent, glabrous; leaves small, broad-ovate, obtuse, quite entire, flat, or conduplicate, green and glabrous on both surfaces; whorls about 2-flowered; calyx glabrous, with short obtuse teeth, and with the throat naked inside. ♄. G. Native of Peru, at Paramo de Antisana, Jameson. Leaves hardly a line long, numerous, sessile. Corolla smaller than that of *G. revoluta*, pale red, pubescent outside. Stamens all fertile.

Jameson's Gardoquia. Shrub procumbent.

22 G. revolu'ta (Ruiz, et Pav. syst. fl. per. p. 149.) suffruticose, procumbent; branches pubescent; leaves small, roundish, very blunt, quite entire, cordate at the base, with revolute margins, glabrous above, clothed with white tomentum beneath; whorls about 2-flowered; calyx tomentose, with short broad teeth, and the throat almost naked inside. ♄. G. Native of Peru, in the fissures of rocks towards Huassa-huassi, Panao, and Huariaca, Ruiz, et Pav.; Cordilleras, Hænke and Mathews. Leaves numerous, sessile, hardly a line long, blistered. Flowers usually solitary, but sometimes 3 on each peduncle. Corolla scarlet, 10-11 lines long, pubescent, a little incurved. Stamens all fertile.

Revolute-leaved Gardoquia. Shrub procumbent.

† *Doubtful species.*

23 G. capita'ta (Spreng. syst. cur. post. p. 225.) heads

ovate, on long peduncles; bracteas and calyxes spinose; leaves fascicled, linear-oblong, with revolute, quite entire margins, hispid, as well as the stem, which is branched. ♄.? G. Native of Rio Grande.

Capitate-flowered Cardoquia. Shrub.?

24 G. SPICA'TA (Spreng. l. c.) spikes terminal, villous; leaves subfascicled, spatulate, almost quite entire, rough. ♄. G. Native of Rio Grande.

Spiked-flowered Cardoquia. Shrub.?

Cult. Most of the species of *Gardóquia* bear large scarlet blossoms, and are, therefore, showy, and worth cultivating. A light rich soil, or one composed of equal parts of sand, loam, and peat, will suit the species well. Cuttings strike root readily in the same kind of soil, with a hand-glass placed over them.

LI. GLE'CHON (from γληχων, *glechon*, the Greek name for Pennyroyal; this genus has been so called from its similarity to Pennyroyal.) Spreng. syst. cur. post. p. 227. Benth. lab. p. 405.

Lin. syst. *Diándria, Monogýnia.* Calyx ovate or tubular, 13-nerved, equal or sub-bilabiate, 5-toothed, the 2 lower teeth usually the longest. Tube of corolla equalling the calyx, naked inside; limb bilabiate; upper lip emarginate or semi-bifid, falcate, arched or galeate, erect, or lying on the lower lip; lower lip spreading, with flat entire lobes: lateral lobes the broadest, often adhering to the upper lip at the base. Two lower stamens fertile, ascending under the upper lip, or exserted a little from the notch; filaments glabrous; anthers 2-celled: cells linear, parallel, diverging, or at length divaricate. Style glabrous, having the upper lobe very short, and the lower one elongated and flattened. Achenia oblong, smooth, dry.—Usually canescent, suffruticose plants. Leaves for the most part small; floral leaves similar to the others, rarely smaller, and bractea-formed. Whorls axillary, 2-6-flowered, rarely disposed in short racemus towards the tops of the branches. Corollas yellowish, flesh-coloured, or blue. The galeate upper lip of the corolla in this genus separates it from all other genera of tribe *Melissineæ*.

1 G. SPATULA'TA (Benth. lab. p. 406.) leaves petiolate, roundish-spatulate, subcrenated, thick, clothed with canescent tomentum on both surfaces; teeth of calyx short, the 2 lower ones the longest; upper lip of corolla erect, subgaleate. ♄. F. Native of Brazil, near Anjo, in the Missions of the Uruguay; and near Santa Maria, in the province of Rio Grande do Sul, very plentiful. Shrub procumbent at the base; branches ascending, clothed with tomentose pubescence. Floral leaves conforming to the rest, shorter than the flowers. Corolla pubescent.

Spatulate-leaved Glechon. Shrub procumbent.

2 G. THYMOI'DES (Spreng. syst. cur. post. p. 227.) leaves petiolate, obovate, subcrenated, greenish on both surfaces, and nearly glabrous; calycine teeth very short, nearly equal; upper lip of corolla large, galeate. ♄. F. Native of the South of Brazil, Sello. Branches clothed with hoary pubescence. Leaves obtuse or emarginate, glandular beneath: floral ones similar to the others. Whorls 2-flowered. Corolla twice as long as the calyx, downy outside.

Thyme-like Glechon. Shrub.

3 G. SERPYLLIFÒLIA (St. Hil. mss. ex Benth. lab. p. 407.) leaves small, petiolate, ovate, obtuse, quite entire, greenish on both surfaces, glabrous; calycine teeth subulate, rather unequal: longer ones equalling the tube; upper lip of corolla large, falcate. ♄. F. Native of Brazil, in the province of Cisplatin, among stones from Santa Theresa to Rocha. Branches prostrate, glabrous, or finely tomentose. Leaves 2-3 lines long, form of those of *Thymus Serpyllum*, glandularly dotted; floral leaves conforming to the others, but usually a little larger, exceeding the calyxes. Whorls 2-flowered. Corollas flesh-coloured, size of those of *G. thymoides*, but the upper lip is less incumbent. Perhaps a variety of *G. marifólia*.

Serpyllum-leaved Glechon. Shrub prostrate.

4 G. MARIFÒLIA (Benth. lab. p. 407.) leaves on short petioles, ovate, quite entire or scarcely crenated, pale on both surfaces, and finely tomentose; calycine teeth setaceous, nearly equal, about equal in length to the tube; upper lip of corolla erect, subgaleate. ♄. F. Native of the South of Brazil, Sello. Shrub procumbent, rooting at the base; branches clothed with hoary tomentum. Adult leaves nearly glabrous, glandular on both surfaces; floral leaves conforming to the others. Whorls 2, rarely many-flowered. Corollas size of those of *G. thymoides*, pubescent outside.

Cat-Thyme-leaved Glechon. Shrub procumbent.

5 G. CANE'SCENS (St. Hil. mss. ex Benth. lab. p. 407.) leaves nearly sessile, roundish, sub-crenated, canescent on both surfaces; calycine teeth setaceous, nearly equal, equalling the tube in length; upper lip of corolla erect, subgaleate. ♄. F. Native of Brazil, in the Missions of the Uruguay, in sandy places, among palms, near Carapuru, Villanova, &c.; also in the provinces Cisplatin and St. Catharine. G. *cándida*, Benth. mss. in mus. berol. Rooting at the base; branches elongated, clothed with hoary tomentum as well as the leaves; floral leaves conforming to the others. Whorls 2-6-flowered. Corolla flesh-coloured or yellowish, dotted with purple. Perhaps a variety of *G. marifólia*.

Canescent Glechon. Shrub 1½ to 2½ feet.

6 G. ORIGANIFÒLIA (Benth. lab. p. 408.) stem hairy; leaves sessile, broad-ovate, or roundish, crenated, cordate at the base, green on both surfaces, tomentosely pubescent, or villous; calycine teeth subulate, lower ones longer than the tube; corolla hardly exceeding the calycine teeth; upper lip galeate. ♄. F. Native of Brazil, in the province of Minas Geraes, on the Jaruoca mountains, and near Villa Rica, St. Hil.; South of Brazil, Sello. Procumbent; branches elongated. Floral leaves conforming to the others, rather shorter than the flowers. Whorls 6-10-flowered. Corolla white or yellowish.

Marjoram-leaved Glechon. Shrub procumbent.

7 G. SQUARRÒSA (Benth. lab. p. 408.) leaves almost sessile, ovate, rounded at the base, or sub-cordate, stiff, complicate, glabrous, or ciliated; calycine teeth subulate: lower ones equal in length to the tube; upper lip of corolla galeate. ♄. F. Native of Brazil, in humid pastures, near Carrancas, in the province of Minas Geraes; and in the Campos Geraes, in the province of St. Paul, St. Hil.; South of Brazil, Sello. Procumbent at the base; branches ascending or erect, glabrous, pubescent, or villous. Leaves 3-4 lines long, glandular on both surfaces; floral leaves conforming to the rest, shorter than the flowers. Whorls about 6-flowered. Corolla white or pale blueish, villous outside, exceeding the calycine teeth.

Squarrose Glechon. Shrub.

8 G. CILIA'TA (Benth. lab. p. 408.) stem pilose; leaves ovate or oblong, quite entire, narrowed at the base, green on both surfaces, ciliated; calycine teeth subulate, longer than the tube; upper lip of corolla galeate. ♄. F. Native of Brazil, in the province of Rio Janeiro,? Sello. Procumbent at the base; branches erect, pubescent, or pilose. Leaves ½ an inch long; superior and floral leaves almost sessile: lower ones on short petioles, quite entire, or furnished with 1 or two teeth, glandular on both surfaces; floral ones twice the length of the flowers. Whorls about 6-flowered. Corolla longer than the calycine teeth, villous outside.

Ciliated-leaved Glechon. Shrub procumbent.

9 G. ri'gens (Benth. lab. p. 409.) leaves petiolate, ovate, quite entire, rather canescent on both surfaces; floral leaves small; calycine teeth lanceolate, shorter than the tube; corolla 3 times the length of calyx: upper lip elongated, falcate. ½. F. Native of the South of Brazil, Sello. Shrub clothed with hoary tomentum, with the habit of *Helianthemum halimifolium*. Leaves glandular; floral leaves shorter than the calyxes. Corolla downy outside. Whorls 6-10-flowered.

Ringent-flowered Glechon. Shrub erect.

10 G. myrtoi'des (St. Hil. mss. ex Benth. lab. p. 409.) branches villous; leaves ovate, crenated, narrowed at the base, green on both surfaces, or rather canescent beneath, roughish; calyx tubular, with lanceolate, acute teeth, which are shorter than the tube; upper lip of corolla erect, arched. ½. G. Native of Brazil in elevated places, on Serra do Papagaio, in the province of Minas Geraes. Shrub much branched. Floral leaves conforming to the others, equalling the calyxes. Corolla blue, about half again as long as the calyx. Odour of *Méntha Pulégium*. Habit between *Glechon* and *Keithia rubiácea*.

Myrtle-like Glechon. Shrub 3-4-feet.

Cult. For culture and propagation, see *Gardòquia*, p. 787.

LII. KEI'THIA (named in honour of the Rev. Patrick Keith, F. L. S., a distinguished physiological botanist, and author of "System of Physiological Botany," two vols. 8vo. London, 1816.) Benth. lab. p. 409.

Lin. syst. *Diándria, Monogýnia*. Calyx tubular, about 13-nerved, striated, with an equal or oblique mouth, and 5 nearly equal teeth; throat naked, or villous inside. Corolla with an exserted tube, and a bilabiate limb: upper lip erect, emarginate, flat: lower lip spreading, trifid, with flat nearly equal lobes. Two lower stamens fertile, ascending, without any vestiges of the upper ones; anthers 2-celled, with a thick connective and distinct divaricate cells. Lobes of style nearly equal, or the lower one is longest and flattened, involving the base of the upper one.—Herbs, sub-shrubs, or shrubs. Whorls sometimes axillary and sometimes approximating into terminal spikes. Corollas usually scarlet. This genus differs from *Melissa* in the more regular calyx, and the abortion of the 2 upper stamens, which latter character alone separates it from *Gardòquia*.

Sect. I. Eriothy'mus (from *εριον, erion*, wool; and *θυμος, thymos*, thyme; woolly thyme.) Benth. lab. p. 410. A shrub, with divaricate leafy branches. Cymes pedunculate, few-flowered. Throat of calyx villous inside. Upper lip of corolla bifid. Perhaps a proper genus.

1 K. rubia'cea (Benth. lab. p. 410.) shrubby; branches and leaves nearly glabrous; cymes umbel-formed, clothed with soft hairs; calyx acutely toothed. ½. G. Native of Brazil, in the province of Minas Geraes, on mountains at Villa Ricca and elsewhere. Angles of branches pubescent. Leaves ½ an inch long, sessile, ovate, obtuse, quite entire, glabrous, rounded or sub-cordate at the base. Throat of calyx closed by a ring of hairs. Stamens exserted.

Rubiaceous Keithia. Shrub.

Sect. II. Kei'thia (see genus for derivation.) Benth. lab. p. 410. Branches herbaceous, elongated, procumbent, leafy. Whorls axillary, few-flowered. Throat of calyx naked inside. Upper lip of corolla scarcely emarginate.

2 K. scutellarioi'des (Benth. lab. p. 410.) branches glabrous or ciliated on the angles; leaves glabrous; flowers nearly sessile; corolla hardly twice as long as the calyx. ¼. G. Native of Brazil, in the province of Minas Geraes, on the top of Mount Itambe, Mart.; and in marshes near Silio, &c., South of Brazil, Sello. Leaves sessile, lanceolate, crenated, cordate at the base. Whorls usually 6-flowered, secund. Corolla downy outside, purple. Stamens equalling the corolla.

Skull-cap-like Keithia. Pl. procumbent.

3 K. pilòsa (Benth. lab. p. 411.) branches, leaves, and calyxes pilose; flowers almost sessile; corolla more than twice the length of the calyx. ¼.? G. Native of Brazil, in humid pastures, at Morangava and near Castro in Campos Geraes, in the province of St. Paul, St. Hil.; South of Brazil, Sello. Habit of the preceding, but the flowers are generally solitary, and twice the size. Corolla deep purple, 9-10 lines long.

Pilose Keithia. Pl. procumbent.

4 K. ciliа'ta (Benth. lab. p. 732.) erect; leaves and calyxes ciliated with long stiff hairs; whorls sub-racemose; flowers sessile; corolla half again as long as the calyx. ¼.? F. Native of Texas. Herb a little branched; branches clothed with fine tomentose pubescence. Leaves ½ to 1 inch long. Whorls 6-flowered.

Ciliated Keithia. Pl. ½ foot.

Sect. III. Rhabdocau'lon (from *ραβδος, rhabdos*, a twig; and *καυλον, kaulon*, a stem; in reference to the twiggy branches.) Benth. lab. p. 411. Under shrubs or herbs; branches twiggy, erect, leafy at the base, or nearly altogether naked. Whorls approximating into terminal spikes. Calyx acutely toothed; throat very villous inside.

5 K. villòsa (Benth. lab. p. 411.) stem erectish, branched, clothed with hoary villi; leaves sessile, oblong-linear, obtuse, with revolute margins, villous on both surfaces; racemes spike-formed, dense, a little branched; whorls 6-flowered; flowers sessile; corolla about twice as long as the hoary villous calyx. ¼.? F. Native of the South of Brazil, Sello. Leaves ½ an inch long. Corollas villous outside. Stamens hardly exserted.

Villous Keithia. Pl. 1½ foot.

6 K. lavanduloi'des (Benth. lab. p. 411.) stem erect, branched, clothed with silky tomentum; leaves sessile, oblong-linear, acute, with sub-revolute edges, silky on both surfaces; racemes spike-formed, dense, interrupted at the base; whorls many-flowered; flowers sessile; corolla half again as long as the calyx. ¼.? G. Native of Brazil, in the province of Minas Geraes, in fields near Congonhas do Campo; and in humid places near Fazenda de Carapicuva, in the province of St. Paul, St. Hil.; South of Brazil, Sello. Nearly allied to *K. villòsa*, but differs in the pubescence being short, silky, and adpressed, and in the corollas being shorter, &c.

Lavender-like Keithia. Pl. 1½ foot.?

7 K. oka'ensis (Benth. lab. p. 412.) stem herbaceous; branches erect, tetragonal, almost naked, nearly glabrous; raceme terminal; whorls remote, 2-6-flowered; teeth of calyx acute. ¼.? F. Native of Brazil, in grassy fields, in the provinces of Minas Geraes, St. Paul, and Rio Grande do Sul. Stems nearly simple, glabrous, or with lines of pubescence. Leaves few, 2-3 lines long; floral ones and bracteas hardly a line long. Corolla purplish, pubescent, half as long again as the calyx. Stamens inclosed.

Slender Keithia. Pl. 1 to 1½ foot.

8 K. dendra'ta (Benth. lab. p. 412.) stem herbaceous; branches erect, somewhat articulated, nearly naked, glabrous; racemes short, terminal, dense; flowers pedicellate; corolla more than twice as long as the calyx, which is pubescent. ¼.? F. Native of Brazil, in dry desert fields, in the province of Minas Geraes, Mart. and St. Hil.; South of Brazil, Sello. Stems rising from a hard base, almost simple. Leaves few, ses-

sile, 6-8 lines long, linear, obtuse, quite entire, glabrous: floral ones smaller. Racemes branched a little. Corolla clothed with silky villi outside. Stamens hardly exserted.

Naked-branched Keithia. Pl. 2 to 3 feet.

SECT. IV. GYMNOCY'LIX (from γυμνος, *gymnos*, naked; and κυλιξ, *kylix*, a calyx; in allusion to the throat of the calyx being naked inside.) Benth. lab. p. 412. Herbs, with erect, strict, nearly naked branches. Whorls few-flowered, distinct, sub-racemose. Calyx bluntly toothed; throat naked inside.

9 K. COCCI'NEA (Benth. lab. p. 412.) branches tetragonal, like other species, but sub-articulated, glabrous; whorls few, sub-racemose towards the tops of the branches. ♃.? C. Native of Brazil, in the province of Minas Geraes, on Mount Itambe, Mart.; and in marshes on Serra da Ibitipoca, St. Hil. Branches and leaves altogether as in *K. denudàta*. Whorls usually 2-flowered. Flowers on short pedicels. Corolla scarlet, more than an inch long, about 3 times as long as the calyx. Stamens exserted.

Scarlet-flowered Keithia. Pl. 2 to 3 feet.

Cult. For culture and propagation, see *Gardòquia*, p. 787.

LIII. THY'MBRA (θυμβρα, *thymbra*, is the Greek name for a sweet-scented herb.) Lin. gen. no. 708. Schreb. gen. no. 962. Juss. gen. 115. Benth. lab. 413.

LIN. SYST. *Didynàmia, Gymnospérmia*. Calyx erect, oblong, flat above, bilabiate; upper lip tridentate, erect; lower lip bifid; throat villous inside. Tube of corolla a little exserted; upper lip erect, emarginate, flattish; lower lip spreading trifid, with flat lobes, middle lobe rather the largest. Stamens 4, ascending under the upper lip, lower ones the longest; anthers approximate by pairs, 2-celled: cells distinct, parallel. Style about equally bifid at apex; lobes subulate, stigmatiferous at top. An under shrub, with the habit of *Hyssòpus*, and the characters of *Melissa*.

1 T. SPICA'TA (Lin. spec. 795.) ½. F. Native of the region of the Mediterranean, on dry hills, among heath; as of Achaia, Melos, Samos, Cyprus, Candia; Asia Minor, about Smyrna, and of Palestine. Sibth. et Smith, fl. græc. 6. p. 57. t. 546. T. verticillàta, Lin. spec. p. 796.; this is a monstrous garden variety.? T. ambìgua, Clarke, trav. 4. p. 289.—Barr. icon. 281. t. 1230.—Pluk. phyt. t. 116. f. 5. A stiff, hard, procumbent shrub, with ascending hardly pubescent branches. Leaves of the sterile branches small, decussate, obtuse; those of the fertile branches an inch long, linear, acute, stiff, flat or complicate, ciliated. Whorls many-flowered, disposed in spikes, which are sometimes interrupted. Floral leaves and bracteas broad-lanceolate, acute, coloured, ciliated, and closely imbricated with the flowers, and covering the calyxes. Calyx glabrous or ciliated on the nerves. Corolla purple.

Spicate-flowered Thymbra. Fl. June, July. Clt. 1699. Shrub ½ to 1 foot.

Cult. This is a plant well fitted for rockwork, or to be grown in pots among other Alpine plants. A poor stony or gravelly soil suits it best; for in no other soil will it survive our winter without shelter. The plant is readily propagated by young cuttings and by seed.

LIV. DICERA'NDRA (from δις, *dis*, twice, κερας, *keras*, a horn, and ανηρ ανδρος, *aner andros*, a male; the anthers are 2-horned, each of the cells being spurred at top.) Benth. in bot. reg. vol. 15. lab. p. 413. Ceranthèra, Elliott, bot. car. 2. p. 93. but not of Beauv.

LIN. SYST. *Didynàmia, Gymnospérmia*. Calyx about 13-nerved, tubular, striated, bilabiate; upper lip spreading, entire, or shortly tridentate; lower lip bifid; throat pilose inside. Corolla bilabiate, with an exserted, straight tube, which is naked inside. Stamens 4, didynamous, ascending, approximate: lower ones the longest; anthers 2-celled: cells divaricate, spurred at top: spurs in both cells equal, straight, acute, and length of the cells. Style villous, bifid at top; lobes subulate, equal, stigmatiferous at top. This genus is readily distinguished by the form of the anthers.

1 D. LINEA'RIS (Benth. l. c.) ♄.? F. Native of Carolina, between the rivers Flint and Chatahouchie, Elliott. Ceranthèra linearifòlia, Elliott, l. c. Habit of the narrow-leaved variety of hyssop. Stems erect, twiggy, pubescent. Leaves sessile, narrow, ½ to 1 inch long, quite entire, glabrous, fascicled in the axils. Whorls 6-flowered. Corolla twice as long as the calyx, downy.

Linear-leaved Dicerandra. Pl.?

Cult. For culture and propagation, see *Thymbra*, above.

LV. POGO'GYNE (from πωγων, *pogon*, a beard; and γυνη, *gyne*, a female; in reference to the villous style.) Benth. lab. p. 414.

LIN. SYST. *Didynàmia, Gymnospérmia*. Calyx about 13-nerved, campanulate, striated; teeth straight, lanceolate, the 2 lower ones twice as long as the 3 upper ones; throat naked inside, Corolla bilabiate; tube exserted, straight, naked inside; upper lip erect, flattish, entire; lower lip spreading, trifid, with flat entire lobes. Stamens 4, didynamous, ascending, approximate at apex, lower 2 the longest; anthers 2-celled: cells parallel, distinct, mutic. Style villous, bifid at apex; lobes subulate, equal, stigmatiferous at top.—Herbs. Whorls densely spicate at the tops of the branches. Floral leaves, bracteas, and calyxes ciliated with long white hairs.

1 P. DOUGLA'SII (Benth. lab. p. 414.) floral leaves and bracteas exceeding the flowers; stamens shorter than the corolla; lower calycine teeth more than twice as long as the tube. ♃.? F. Native of North California, Douglas. Stems a little branched, quite glabrous. Leaves petiolate, 1 to 1½ inch long, oblong, obtuse, quite entire, green, glabrous. Corolla purplish?; throat pilose inside.

Douglas's Pogogyne. Pl. 1 foot.

2 P. MULTIFLÒRA (Benth. lab. p. 414.) floral leaves and bracteas shorter than the corollas; stamens exserted. ♃.? F. Native of North California, Douglas. This differs from *P. Douglàsii*, in the stem being divaricately branched; in the spikes being smaller, and more numerous; and in the flowers being smaller. Lower calycine teeth hardly twice as long as the tube.

Many-flowered Pogogyne. Pl. 1 foot.?

3 P. PARVIFLÒRA (Benth. lab. p. 414.) floral leaves exceeding the flowers; stamens shorter than the corolla; lower calycine teeth hardly longer than the tube. ♃.? F. Native of North California, Douglas. Allied to *P. Douglàsii*; but the spikes are hardly an inch long; the leaves narrower and smaller, and the flowers one half smaller.

Small-flowered Pogogyne. Pl. 1 foot.?

Cult. For culture and propagation see *Prunélla*, p. 791.

Tribe VI.

SCUTELLARI'NEÆ (this tribe contains plants agreeing with the genus *Scutellària* in the characters given below.) Benth. lab. p. 416. Calyx bilabiate; upper lip truncate, entire, or sub-tridentate. Tube of corolla exserted, ascending, annulate inside or naked; upper lip of limb arched. Stamens 4, ascend-

ing under the upper lip, didynamous: the 2 lower ones the longest.

LVI. PRUNE'LLA (from the German die Braune, a disease of the jaws and throat which this plant is said to cure.) Lin. gen. no. 785. Schreb. gen. no. 990. Benth. lab. p. 416. Brunélla, Tourn. inst. t. 84. Juss. gen. p. 116. Mœnch, meth. F. Hamilt. mon. in Ser. bull. bot. 1. p. 153.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx tubularly campanulate, irregularly somewhat 10-nerved, and reticulately veined, flat above, bilabiate; upper lip flat, broad, truncate, shortly tridentate: lower lip semi-bifid, with lanceolate segments: throat naked inside. Tube of corolla ample, exserted, ascending, annulate inside, near the base, with short hairs or scales, inflated under the throat beneath, and a little contracted at the throat; upper lip erect, galeate, rather carinated above, entire; lower lip dependent, with the lateral lobes oblong and deflexed, and the middle lobe roundish concave and crenulated. Stamens 4, didynamous, ascending: lower 2 the longest; filaments toothless at the base, glabrous, shortly bidentate at top, especially the upper ones; the lower tooth antheriferous. Anthers approximate by pairs under the upper lip, free, 2-celled: cells distinct, divaricate. Style glabrous, bifid at top; lobes subulate, stigmatiferous at the extremity. Achenia oblong, dry, smooth. —Herbs. Whorls 6-flowered, densely spicate. Floral leaves bractea-formed, orbicular, permanent, equalling the calyxes, and imbricated with them.

1 P. hyssopifòlia (Lin. spec. 837. Lam. fl. fr. 2. p. 366. under Brunella.) leaves sessile, oblong, or lanceolate, quite entire, strigosely hispid; lateral teeth of upper lip of calyx lanceolate. ♃ H. Native of Spain, South of France and Piedmont, in dry open places. Brunélla Canadénsis. Mill. dict. no. 2. P. hyssopifòlia, Rchb. icon. bot. eur. 3. p. 42. t. 243.—Mor. hist. 3. p. 564. sect. 11. t. 5. f. 7. Stems ascending, and like the leaves stiffer than in *P. vulgàris*. Superior leaves somewhat stem clasping. Corollas smaller than those of *P. grandiflòra*, but larger than those of *P. vulgàris*, purple, rarely white.

Hyssop-leaved Self-heal. Fl. July, Aug. Clt. 1731. Shrub ½ to 1 foot.

2 P. grandiflòra (Lin. spec. p. 837. Mœnch. meth. 414. under Brunella.) leaves petiolate, ovate, quite entire or toothed; lateral teeth of upper lip of calyx lanceolate; corollas large, more than twice as long as the calyxes. ♃ H. Native throughout Europe, along with P. vulgàris, in woods and other shady places. Jacq. austr. 4. t. 377. Curt. bot. mag. t. 337. and 2014. P. speciòsa, Wender. schrift. nat. gesel. marb. ex Benth. P. hastæfòlia, Brot. fl. lus. 1. p. 181. This hardly differs from *P. vulgàris*, unless in the size of the flowers. Herb glabrous or villous. Leaves usually toothed at the base, sometimes sub-hastate, and sometimes quite entire. Corolla more than an inch long, violet or purple, seldom white.

FIG. 81.

Great-flowered Self-heal. Fl. July, Sept. Clt. 1598. Pl. ½ to ¾ foot.

3 P. vulga'ris (Lin. spec. p. 837.) leaves petiolate, ovate or oblong, entire, toothed or deeply pinnatifid; teeth of upper lip of calyx truncate, awned or almost mutic, rarely sub-lanceolate: corolla half as long again as the calyx, or scarcely twice as long as the calyx. ♃ H. Native throughout the world in temperate regions, Europe, Asia, Africa, America, and Australia. Stems branched from the base; branches decumbent at the base. Plant glabrous or pilose. Corollas violaceous, purple, white, rarely pale red.

Var. α, hispida (Benth. lab. p. 417.) stem and leaves villously hispid; leaves almost entire. ♃ H. Native of the mountains of India and South of Europe. P. hispida, Benth. in Wall. pl. asiat. rar. 1. p. 66. P. hirsùta, Wender. schrift, nat. gesel. marb.? P. hirta, Bernh.? ex Benth. Corollas violaceous.

Var. β, vulgàris, (Benth. lab. p. 417.) leaves entire, ovate or oblong, glabrous or sparingly hispid. ♃ H. Native of Europe and Asia, very plentiful, America, Australia. P. vulgàris, Lin. spec. p. 837. Hook. fl. lond. vol. 3. icon. Curt. lond. 4. t. 42. Fl. dan. 910. Mart. fl. rust. t. 197. Smith, engl. bot. t. 961. Sabb. hort. rom. 3. t. 32. P. officinàlis, Crantz, fl. austr. 279. P. intermèdia, Brot. fl. lus. 1. p. 180. but not of Rchb. P. latifòlia, Donn. hort. cant. P. réptans, Dumort, fl. belg. p. 44. P. surrécta, Dumort, fl. belg. p. 44. P. Fischeriàna, F. Hamilt. mon. p. 164.? P. Pennsylvánica, Willd. enum. p. 631. P. Caroliniàna, Mill. dict. no. 6. P. æquinoxiàlis, H. B. et Kunth, nov. gen. amer. 2. p. 323. t. 162. P. ovàta, Pers. ench. 2. p. 137. Riv. mon. t. 29. f. 1. Mill. fig. t. 70. f. 2. Corolla violaceous, seldom white or red. This plant being astringent, it was formerly used in fluxes and in gargarisms, for aphthæ and inflammations of the fauces. It was considered as one of the best vulnerary herbs, but is now out of use.

Var. γ, elongàta, (Benth. lab. p. 417.) leaves entire, oblong-lanceolate, glabrous or sparingly villous. ♃ H. Native of North America, plentiful, but rare in Asia and Europe. P. elongàta, Dougl. mss. B. Pennsylvánica, Willd. enum. p. 631. B. Australácica, Moric. ex Hamilt. mon. p. 162. t. 7. f. A. B. P. angustifòlia, Wender. schrift, nat. gesel. Marb.? ex Benth. Corollas violaceous.

Var. δ, parviflòra, (Benth. lab. p. 417.) leaves almost entire, ovate, sparingly hispid; corolla scarcely exceeding the calyx. ♃ H. Native of Europe, in the region of the Mediterranean. B. parviflòra, Poir. suppl. 1. p. 711.

Var. ε, pinnatífida (Benth. lab. p. 418.) cauline leaves all or many of them cut or pinnatifid; corollas purple. ♃ H. Native of the South of Europe. P. longifòlia, Pers. ench. 2. p. 137. Rchb. icon. bot. eur. 6. p. 21. t. 588. P. pinnatífida, Pers. ench. 2. p. 137. P. incìsa, Link, enum. 2. p. 121.? P. dissécta, Wender. schrift. nat. gesell. Marb.? P. vulgàris pinnatífida, Rchb. icon. bot. eur. 3. p. 39. t. 239.

Var. ζ, laciniàta (Benth. lab. p. 418.) cauline leaves deeply pinnatifid, or the lower ones are entire; corollas white or cream-coloured. ♃ H. Native of Europe, plentiful, but rare in North America. P. laciniàta, Lin. spec. p. 837. Jacq. fl. austr. 4. p. 41. t. 378. Rchb. icon. bot. eur. 3. p. 38. t. 289. B. sulfùrea, Mill. dict. no. 5. P. álba, Pall ex Bieb. fl. cauc. 2. p. 67. B. verbénæ foliis, Vaill. bot. par. t. 5. f. 1.

Common Self-heal. Fl. July, Sept. Britain. Pl. ½ to 1 foot.

Cult. All the species and varieties of *Prunélla* are showy when in blossom, and are therefore well fitted for decorating the front of flower borders, or ornamenting rockwork. They grow in any common garden soil, but prefer a moist, shady situation; for in rich land, or in an open situation, they seldom continue more than two years. They are readily increased by division and by seed. The seed should be sown in autumn as soon as gathered, and the plants will rise early in spring; but if the sowing be deferred till spring, the plants seldom rise until the spring of the following year.

LVII. CLEO'NIA (probably adopted by Linnæus from Cleonicum of Pliny, and κλεωνικον of Dioscorides.) Lin. gen. no. 736. Schreb. gen. no. 991. Gærtn. fruct. 1. t. 66. Brunélla species, Lam. et Juss.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, 10-nerved, obliquely bilabiate; upper lip broad, shortly tridentate: lower lip bifid, with pilose sinuses. Tube of corolla slender, exserted, ascending, naked inside, and the throat a little dilated; upper lip erect, galeate, keeled, entire; lower lip short, dependent, with oblong, erectish, lateral lobes, and a spreading, emarginately bifid middle lobe. Stamens 4, didynamous, ascending; lower two longest; filaments toothless at the base, glabrous, but shortly bifurcate at apex, the upper fork subulate, and the lower fork a little flattened and antheriferous; anthers approximate by pairs, 2-celled: cells divaricate. Style shortly quadrifid at apex, with nearly equal subulate lobes, which are stigmatiferous at top. Achenia large, orbicular, a little compressed. This genus has most of the characters of *Prunélla*, with the corolla of *Scutellària*.

1 C. Lusita'nica (Lin. spec. p. 837.) ☉. II. Native of Spain, in the sterile fields of Arragon; Portugal, Barbary. Mill. fig. t. 70. f. 1. Prunélla intermèdia, Rchb. icon. bot. eur. 3—4. t. 205, but not of Brot. Búgula, Gærtn. fruct. 1. p. 318. t. 66. f. 7.—Mor. hist. 3. p. 363. and 391. sect. 11. t. 5. f. 4. Habit of *Prunélla vulgàris*, var. laciniàta. Stem branched at the base; branches hispid. Leaves sessile, oblong-lanceolate or linear, green, rather hispid. Whorls 6-flowered, disposed in loose spikes. Corollas form and size of those of *Scutellària galericulàta*, blue or violet, pubescent outside, 3 times as long as the calyx.

Portugal Cleonia. Fl. June, July. Clt. 1710. Pl. ½ to 1 foot.

Cult. The seeds of *Cleònia* should be sown in autumn, and the plants will come up the following spring; as seeds sown in the spring frequently take a whole year to vegetate.

LVIII. SCUTELLA'RIA (from *scutella*, a little saucer; in reference to the form of the calyx.) Lin. gen. no. 734. Schreb. gen. no. 989. Juss. gen. no. 117. Benth. lab. p. 419. Cássida, Tourn. inst. t. 84. Mœnch.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, bilabiate; lips entire, from the coalition of the sepals, closed after the falling of the corollas, and at length cleft even to the base: superior lip furnished with a dilated scale at top, which is concave above, falling away at maturity; lower lip permanent. Tube of corolla much exserted, naked inside, straight or usually recurvedly ascending beyond the calyx, dilated into the throat above; limb bilabiate; upper lip entire at apex, or emarginate; lower lip spreadingly dilated, convex, emarginate at apex; the lateral lobes sometimes free and spreading, but usually joined to the upper lip, rarely to the lower lip. Stamens 4, ascending under the galea, didynamous; the 2 lower ones the longest. Anthers approximate by pairs, ciliated, those of the lower stamens dimidiate, and those of the superior stamens 2-celled, cordate; cells sub-divaricate. Superior lobe of style very short; lower one stigmatiferous at top. Ovarium oblique, elevated upon the incurved gynophore. Achenia dry, naked, tuberculed, glabrous or clothed with adpressed tomentum.—Annual or perennial herbs, rarely shrubs. Inflorescence sometimes tetragonally spicate, with membranous, sub-imbricated coloured floral leaves; sometimes racemose, with small floral leaves; sometimes axillary, with the floral leaves almost similar to the cauline leaves. Peduncles solitary, 1-flowered in the axils of the floral leaves, short, usually opposite, except in sect. *Heteranthèsia*, in which both the floral leaves and flowers are scattered. Bracteas almost wanting. Corollas blue or yellow, rarely purple or scarlet.

Sect. I. Lupulina'ria (so called from containing *S. lupulina.*) A. Hamilt. mon. p. 11. Benth. lab. p. 423. § 1. Spicàtæ, Benth. in bot. reg. vol. 18. Floral leaves usually membranous. Flowers disposed in tetragonal spikes; or sub-racemose, and scarcely secund.

1 S. orienta'lis (Lin. spec. p. 834.) stems procumbent; leaves petiolate, ovate, deeply toothed or pinnatifid, hoary beneath; floral leaves membranous, entire, sub-imbricated; spikes tetragonal, oblong. ♃. H. Native of the South-east of Europe and Middle Asia, among rocks and on calcareous mountains; as of Croatia, Syria, Persia, Armenia, Tauria, and Caucasus; Altaian mountains, Himalaya, Kamaour, &c. Sibth. et Smith, fl. græc. 6. p. 64. t. 580. Rchb. icon. bot. eur. 1. p. 10. t. 8. f. 17. Sims, bot. mag. 2120. S. Sievérsii, Bunge, in Led. fl. alt. 2. p. 394. fl. ross. alt. ill. t. 123. S. Caucásica, Arth. Hamilt. mon. 141.—Tourn. itin. 3. p. 306. icone.—Comm. rar. 30. icone.—Mart. cent. t. 18. Stems much branched, radicant, creeping; branches ascending, clothed with fine hoary tomentum. Leaves obtuse, cuneately truncate at the base. Corolla yellow, pubescent. The floral leaves vary much in size. (*fig. 82.*)

FIG. 82.

Var. β, pinnatifida (Lin. spec. p. 834. Rchb. icon. bot. eur. 1. p. 10. t. 8. f. 16.) leaves smaller, deeply pinnatifid. ♃. H. Native of the region of the Mediterranean. S. orientàlis incàna, foliis laciniatis, flore luteo, Tourn. cor. 11.

Eastern Skullcap. Fl. July, Sept. Clt. 1729. Pl. ½ foot.

2 S. grandiflòra (Sims, bot. mag. t. 635.) stems procumbent; leaves petiolate, ovate-roundish, deeply toothed, hoary from soft tomentum beneath, or on both surfaces; floral leaves entire, rather membranous, imbricate; spikes tetragonal, oblong. ♃. H. Native of the Altaian mountains, in stony places at the river Tschuja. S. pulchélla, Bunge, enum. crit. pl. alt. ined. Allied to *S. orientàlis*, but with a different habit and leaves. Branches smoothish. Leaves not half the size of those of *S. orientàlis*. Floral leaves greenish, pubescent. Corollas red, with a yellow lip, about the size of those of *S. orientàlis*.

Great-flowered Skullcap. Fl. July, Aug. Clt. 1804. Pl. ½ foot.

3 S. prostra'ta (Jacquemont, mss. ex Benth. lab. p. 783.) stems prostrate; leaves petiolate, broad-ovate, deeply crenated, green on both surfaces, and clothed with soft pubescence; floral leaves quite entire, rather membranous, imbricate; spikes tetragonal, oblong. ♃. H. Native of the North of India, about Pangui, Rarang, and Choupienna, Jacquemont. Habit and form of leaves of *S. grandiflòra*, and the flowers of *S. orientàlis*; but differs from both in the leaves being green on both surfaces. Corolla yellowish, size of that of *S. orientàlis*: upper lip violaceous above.

Prostrate Skullcap. Pl. prostrate.

4 S. frutiòsa (Desf. cat. hort. par. p. 69.? Benth. lab. p. 424.) stems suffruticose; branches ascending, clothed with hoary tomentum or wool; leaves on short petioles, ovate-cordate, deeply crenated; floral leaves ovate, quite entire, wrinkled, hoary, and rather woolly; flowers opposite, subsecund? racemose. ½. F. Native of Syria, near Aleppo, Russel; Persia, Persoon.? Stems numerous, branched a little, clothed with white wool on the upper part. Leaves similar to those of *S.*

orientàlis. Corollas size of those of *S. orientàlis*, with a yellow tube, and blueish-yellow lips.

Shrubby Skullcap. Shrub ascending.

5 S. PINNATI'FIDA (Arth. Hamilt. mon. 16. t. 2. f. 2.) the whole plant pilose; leaves ovate, of the same colour on both surfaces, petiolate, pinnatifid: lobes oblong, obtuse; flowers loosely imbricated into a spike; bracteas ovate, toothed, coloured a little. ♃. H. Native of the Levant, between Kermancha and Amadan. This differs from *S. orientàlis*, in the flowers being a little larger; in the bracteas being pinnatifid; in the leaves being deeply cut, and in being covered with wool on both surfaces.

Pinnatifid-leaved Skullcap. Pl. ½ foot.?

6 S. ALPI'NA (Lin. spec. p. 834.) stems procumbent; leaves nearly sessile, or on short petioles, ovate, serrately crenated, of the same colour on both surfaces; floral leaves membranous, imbricated; spikes tetragonal, oblong. ♃. H. Native of the Pyrenees, Switzerland, Upper Italy, Calabria, Croatia, Galicia, Siberia, in all temperate parts, and on the Altaic mountains. All. ped. p. 142. t. 26. f. 3. Waldst. et Kit. hung. 2. p. 146. t. 137. Sweet, fl. gard. 1. t. 90. Bot. reg. 1460. S. Altàica, Fisch. cat. hort. gorenki. p. 39. Sweet, fl. gard. 1. t. 45. S. variegàta, Spreng. fil. tent.—Gmel. sib. 3. p. 229. no. 52. t. 48. S. compréssa, Arth. Hamilt. mon. p. 29. Habit of *S. orientàlis*. Branches pilose or pubescent. Leaves green, pubescent, or pilose; floral leaves coloured, pilose. Corolla altogether purple, or the tube and lower lip is yellow, 12-15 lines long.

Var. β, lùtea; flowers yellow. ♃. H. S. lupulina, Lin. spec. p. 835. Schmidt, icon. t. 73. Bot. reg. 1493. S. vérna, Bess. prim. fl. gal. 2. p. 43.

Alpine Skullcap. Fl. June, Oct. Clt. 1752, β. 1731. Pl. procumbent.

Sect. II. Heteranthe'sia (from ἕτερος, *heteros*, variable; and ἄνθος, *anthos*, a flower; in allusion to the flowers being scattered, not opposite, as in the other sections.) Benth. lab. p. 425. § 2. Racemosæ, floribus sparsis, Benth. in bot. reg. vol. 18. Floral leaves small, green. Flowers racemose, second, all or only the upper ones scattered, not opposite.

7 S. LONGIFÒLIA (Benth. in bot. reg. vol. 18. lab. p. 425.) glabrous; stems erect; leaves petiolate, ovate-lanceolate, acuminated, remotely toothed, roundly cuneated at the base; floral leaves linear, minute, deciduous; racemes elongated, a little branched; flowers secund, scattered; corolla 8 times as long as the calyx, which is glabrous. ♃. F. Native of New Spain. Leaves 3 inches long. Corolla scarlet, pubescent, more than an inch long: lips short, erect.

Long-leaved Skullcap. Pl. 1½ foot.

8 S. MULTIFLÒRA (Benth. l. c. lab. p. 426.) stems erect, finely pubescent; leaves petiolate, ovate, acuminated, bluntly and sinuately toothed, roundly truncate at the base; floral leaves lanceolate-linear, rather longer than the calyxes; racemes elongated, simple; flowers secund, scattered; corolla 5 times the length of the calyx, which is villous. ♃. F. Native of New Spain, Moçino et Sessé. Stem a little branched. Leaves similar to those of *S. longifòlia*, but broader; floral leaves permanent. Flowers sometimes alternate, usually many, and collected into false whorls. Corolla purple? 10-11 lines long, incurved, villous.

Many-flowered Skullcap. Pl. 1 foot.?

9 S. ATRIPLICIFÒLIA (Benth. l. c. lab. 426.) plant clothed with hoary pubescence; leaves petiolate, broad-ovate, bluntish, almost quite entire or repand, truncate at the base, and subcordate, rather fleshy; floral leaves ovate, acuminated, rather longer than the calyxes; racemes elongated, simple; flowers secund, scattered; corolla about 6 times the length of the calyx. ♃.? G. Native of Peru? Pavon. Lower flowers opposite: upper ones falsely verticillate. Floral leaves deciduous. Corolla about an inch long, almost straight, nearly glabrous.

Atriplex-leaved Skullcap. Pl. 1 foot.?

10 S. COCCI'NEA (H. B. et Kunth, nov. gen. amer. 2. p. 335.) stems erect, branched, downy; leaves oblong, obtuse at both ends, quite entire, glabrous, of a violet-purple colour beneath; racemes terminal; flowers scattered. ♃. G. Native of New Granada.? Roots fascicled, terete, nearly simple. Leaves sometimes puberulous beneath, about 2 inches long. Pedicels and petioles pubescent. Bracteas lanceolate, obtuse, pubescent, equalling the pedicels. Corolla scarlet, smoothish.

Scarlet-flowered Skullcap. Pl. 1 foot.?

11 S. INCARNA'TA (Vent. choix. t. 39.) stems erect, pubescent, branched; leaves cordate, toothed, tomentose beneath; spikes terminal, secund; bracteas linear-lanceolate, equalling the pedicels. ♃.? G. Native near Santa Fe de Bogota. Leaves petiolate, 1-3 inches long, pubescent above. Calyx tubular, compressed, villous, nearly entire. Corolla pubescent, of a beautiful red, 6 times the length of the calyx.

Flesh-coloured-flowered Skull-cap. Pl. 1 foot.?

12 S. TURIFLÒRA (Benth. l. c. lab. p. 427.) stems ascending, branched, pubescent; leaves petiolate, ovate, obtuse, coarsely crenated, rounded at the base, rather hispid above, and clothed with soft pubescence beneath; floral leaves ovate, imbricate before the expansion of the flowers; racemes simple; flowers secund, scattered; corolla 6 times as long as the calyx. ♃.? G. Native of the South of Brazil, Sello. Herb many-stemmed; branches terete. Leaves an inch long, pubescent; floral leaves rather large. Corolla an inch long, with a slender tube.

Tube-flowered Skullcap. Pl. 1 foot.?

13 S. ULIGINÒSA (St. Hil. mss. ex Benth. lab. p. 427.) stems ascending or erect, branched, pubescent; leaves petiolate, ovate, coarsely crenated, rounded or subcordate at the base, almost glabrous on both surfaces; floral leaves small, loose; racemes simple; flowers subsecund, scattered; corolla 5 times as long as the calyx. ♃.? G. Native of Brazil, in boggy parts of woods in the province of St. Paul, St. Hil. Branches terete. Leaves twice the size of those of *S. tubiflòra*, sometimes glabrous, and sometimes rather pilose; the upper surfaces hispid. Floral leaves oblong, rather shorter than the calyxes, glabrous. Corolla scarcely ½ an inch long, blue, with a white palate and slender tube.

Bog Skullcap. Pl. ½ to 1 foot.

14 S. BREVIFLÒRA (Benth. l. c. lab. p. 427.) glabrous; stems erect; leaves petiolate, ovate, acuminated, bluntly and sinuately toothed, roundly truncate at the base; floral leaves lanceolate-linear, rather longer than the calyxes; racemes elongated, simple, loose; flowers secund, scattered; corolla about 3 times as long as the calyx, which is glabrous. ♃. G. Native of Peru, Pavon. Intermediate between *S. multiflòra* and *S. uliginòsa*. Leaves 1½ to 2 inches long. Corolla glabrous, bluish, 4-5 lines long, with a spreading limb.

Short-flowered Skullcap. Pl. 1½ foot.

15 S. PURPURA'SCENS (Swartz, fl. ind. occ. 2. p. 1013.) stems erectish, humble, finely pubescent, or almost glabrous; leaves petiolate, broad-ovate, obtuse, sinuately crenated, very broadly truncate at the base, rounded or subcordate, rather hispid above, glabrous beneath, or on both surfaces; floral leaves minute, deciduous; racemes loose; flowers secund, scattered, or the lower ones are opposite; calyxes shorter than the pedicels, large, and nearly glabrous in the fructiferous state. ♃. G. Native of Brazil, in the province of Bahia; and of Caracas; also of the West Indies, in Guadaloupe and St. Vincent. S. Pelisbérti, Nees et Mart. in nov. act. bonn. 11. p. 77. Herb slender,

flaccid. Floral leaves minute. Corolla half an inch long, pubescent, purplish.

Purplish-flowered Skullcap. Fl. June, July. Clt. 1820. Pl. ½ foot.

16 S. agrestis (St. Hil. mss. ex Benth. lab. p. 428.) stems erectish, finely pubescent; leaves petiolate, ovate-roundish, obtuse, sinuately crenated, cordate at the base, rather hispid above, and nearly glabrous beneath; floral leaves minute, almost wanting; racemes short, simple; flowers scarcely secund, scattered. ♃. G. Native of Brazil, at San Miguel da Jetiquinhonha, in the province of Bahia. Herb much branched at the base. Branches, petioles, and nerves of leaves, canescent from fine tomentum. Leaves ½ to 1 inch long, green on both surfaces. Corolla blue, about 4 lines long. Nearly allied to the preceding.

Field Skullcap. Pl. ¼ to ½ foot.

17 S. discolor (Colebr. in Wall. pl. rar. asiat. 1. p. 66.) stems rooting at the base, leafy, ascending, almost naked above; leaves petiolate, ovate, obtuse, crenated, roundly cuneated at the base; lower leaves cordate: floral ones minute; racemes elongated, somewhat branched at the base; flowers secund, scattered. ♃. F. Native of Nipaul and Silhet. *S. indica*, D. Don, prod. fl. nep. p. 109. but not of Lin. Leaves 1½ to 2 inches long, pubescent on both surfaces, usually purplish beneath. Corolla hardly downy outside, violaceous, ½ an inch long.

Two-coloured-leaved Skullcap. Pl. 1 to 1½ foot.

Sect. III. Stachydiaceæ (from σταχυς, *stachys*, a spike; and μακρος, *macros*, long; in reference to the long spikes or racemes of flowers.) Arth. Hamilt. mon. p. 17. Benth. lab. 428. § 2. Racemosæ, * * floribus oppositis, Benth. in bot. reg. vol. 18. Floral leaves green, small, different in form from the cauline leaves. Flowers racemose, secund, opposite.

18 S. indica (Lin. spec. p. 839. but not of D. Don.) stems procumbent at the base; branches ascending, villous; leaves small, petiolate, roundish, crenated, cordate at the base, clothed with soft pubescence on both surfaces; floral leaves minute; racemes almost simple, dense; flowers opposite, secund; floriferous calyxes pubescent, shorter than the pedicels; lower lip of corolla very broad. ♃. G. Native of China, near Macao, Sir G. Staunton; Japan, Thunb.; Java, in hedges about Tugu, in the province of Buitenzorg, Blume.—Pluck. alm. t. 441. f. 1.? Leaves scarcely ½ an inch long, form of those of Ground-ivy. Corolla smoothish, white, ex Thunb. Anthers of upper stamens bearded.

Indian Skullcap. Pl. ½ to 1 foot.

19 S. japonica (Morren, et Decaisne, in ann. sc. nat. par. 1834. 2. p. 315.) stems prostrate at the base; branches ascending, quadrifariously puberulous; leaves ovate, obtuse, coarsely crenated, rounded at the base, glabrous, petiolate; floral leaves becoming gradually smaller; flowers opposite, loose; calyx rather pilose; corolla pubescent, blue. ♃. H. Native of Japan, Siebold.

Japan Skullcap. Pl. ascending.

20 S. Colebrookiana (Wall. pl. rar. asiat. 1. p. 67.) stem erect, branched, finely pubescent; leaves petiolate, ovate-roundish, obtuse, crenated; lower leaves cordate at the base: upper leaves deltoid, roundly truncate at the base, all finely pubescent on both surfaces: floral leaves minute; raceme simple, loose; flowers opposite, secund; floriferous calyxes pubescent, shorter than the pedicels, but increased and glabrous in the fructiferous state; lower lip of corolla very broad. ♃. G. Native of the Peninsula of India. Allied to *S. violacea*; but the stem is firmer and more branched, and the form of the leaves is different. Leaves scarcely an inch long.

Colebrooke's Skullcap. Pl. ½ to 1 foot.

21 S. violacea (Heyne, ex Wall. pl. asiat. rar. 1. p. 66. Benth. lab. p. 429.) stem erect or ascending, pubescent; leaves petiolate, cordate-ovate, crenated, rather hispid above, and pubescent beneath, or glabrous; floral leaves sessile, ovate, shorter than the pedicels; raceme loose, nearly simple; flowers opposite, secund. ♃. G. Native of the Indian Peninsula, Ceylon, &c. *S. indica*, Roxb. hort. beng. p. 45. but not of Lin. Stem a little branched, hispid, or pubescent, rarely almost glabrous. Corolla ½ an inch long, violaceous.

Var. β, *hispidior* (Benth. lab. p. 429.) plant more hispid. ♃. G. *S. Wightiana*, Benth. in Wall. pl. rar. asiat. 1. p. 67. *S. nodulosa*, Arth. Hamilt. mon. p. 26.?

Violaceous-flowered Skullcap. Pl. ½ to 1 foot.

22 S. oblonga (Benth. in bot. reg. vol. 18. lab. p. 429.) stems ascending, pubescent; leaves petiolate, oblong-elliptic, acutish, subserrated at apex, rounded at the base, and quite entire, almost glabrous; floral leaves ovate, minute; raceme loose, almost simple; flowers opposite, secund; calyxes equalling the pedicels: fructiferous ones large, nearly glabrous; lower lip of corolla very broad. ♃. S. Native of Ceylon, Macrae. Very nearly allied to *S. violacea*, but differs in stature, inflorescence, and flowers. Leaves scarcely an inch long.

Oblong-leaved Skullcap. Pl. procumbent.?

23 S. incurva (Wall. pl. asiat. rar. 1. p. 67. Benth. lab. p. 430.) stems ascending, branched, pubescent; leaves almost sessile, oblong-elliptic, acute, remotely serrated, nearly glabrous; floral leaves minute; racemes terminal, simple; flowers opposite, secund; pedicels 3 times as long as the calyxes; tube of corolla slender, incurved; lips of corolla deeply cleft: the upper lip large, cucullate, the lower one shorter. ♃. S. Native near Ava, on Mount Taong Dong.

Incurved-flowered Skullcap. Pl. ascending.

24 S. grossa (Wall. l. c. Benth. l. c.) stems procumbent at the base; branches ascending, villous; leaves petiolate, ovate, acuminated, crenated, roundly truncate at the base, almost glabrous; floral leaves petiolate: lower ones almost similar to the cauline leaves: upper ones scarcely exceeding the calyxes; racemes loose, simple; flowers opposite, secund; corollas elongated, slender. ♃. S. Native of the mountains of Kamaon and Syen, &c. Stem rather woody at the base. Leaves 1 to 1½ inch long, pubescent on the nerves. Corolla 9 lines long, hardly pubescent.

Coarse Skullcap. Pl. procumbent.

25 S. Columnæ (All. pedem. 1. p. 40. t. 84. f. 2.) stems erect, branched, pubescent; leaves petiolate, ovate, crenated, broadly-cordate or truncate at the base, scarcely wrinkled, finely pubescent; floral leaves ovate, shorter than the fructiferous calyxes; raceme elongated, loose, branched a little, pilose; flowers opposite, secund; pedicels shorter than the fructiferous calyxes, which are large and pilose; corolla 6 times longer than the calyx. ♃. H. Native of the South of Europe, in woods and in fields; as near Paris, North of Sicily; Italy, from Piedmont to Naples; Hungary, Dalmatia, Island of Cyprus, and near Constantinople. Sweet, fl. gard. 1. t. 52. *S. peregrina*, Sibth. et Smith, fl. græc. 6. p. 66. t. 582. but not of Lin. *S. altissima*, Arth. Hamilt. mon. 18. and many other authors, and probably of Lin. *Cassida racemosa*, Moench. meth. 414.? *S. pallida*, Guss. fl. sic. prod. 2. p. 137.? but not of Bieb.—Column. ecphr. 1. p. 187. t. 189. Leaves 2 inches long. Corolla dark purple, pubescent, almost an inch long: lips white.

Columna's Skullcap. Fl. June, Aug. Clt. 1806. Pl. 2 to 3 feet.

26 S. Tournefórti (Benth. in bot. reg. vol. 18. lab. p. 431.) quite glabrous; stems erect, branched; leaves petiolate, ovate, or ovate-lanceolate, coarsely crenated: lower ones broadly subcordate at the base: superior ones roundish, truncate: floral leaves ovate-lanceolate, rather shorter than the fructiferous calyxes; racemes elongated, loose, glabrous; flowers opposite, secund; calyxes longer than the pedicels: fructiferous ones large, glabrous; corolla 6 times longer than the calyx. ♃. H. Native of Persia; and at the Caspian Sea, near Lenkoran. This is very nearly allied to *S. commutàta*, but differs in the cordate leaves, and larger, glabrous corollas.

Tournefort's Skullcap. Pl. 1 to 2 feet.

27 S. commuta'ta (Guss. prod. fl. sic. 2. p. 136.) stems erect, branched, nearly glabrous; leaves petiolate, ovate, or ovate-lanceolate, crenated, broadly cordate at the base, scarcely wrinkled, glabrous; floral leaves ovate, rather shorter than the fructiferous calyxes; racemes elongated, loose, a little branched, glabrous; flowers opposite, secund; calyxes longer than the pedicels, large and glabrous in the fructiferous state; corolla 4 times longer than the calyx. ♃. H. Native of the South-east of Europe, and Middle Asia, in groves; as of Hungary, Dalmatia, Tauria, and Caucasus. S. peregrina, Waldst. et Kit. pl. rar. hung. 2. p. 154. t. 125. but not of Lin. S. altissima, Lin. spec. p. 836.? Benth. in bot. reg. vol. 18. Nearly allied to *S. Colúmnæ*; but differs from it in smoothness, and in the corollas being half the size. Corollas purple. There are several plants in the gardens similar to this; one with dark purple, pubescent, dense flowers, *S. altissima*, Hort.; another with bluish purple flowers, having the lower lip whitish, *S. colúmnæ*, Hort.; and a third with the flowers altogether blue, *S. peregrina*, Hort.

Changed Skullcap. Fl. June, Oct. Clt. 1683. Pl. 2 feet.

28 S. peregri'na (Lin. spec. p. 836.) stems procumbent; branches elongated, glabrous or pubescent at top; leaves petiolate, ovate, obtuse, crenated, roundly truncate at the base, glabrous; floral leaves bractea-formed, petiolate, ovate-oblong, acute at both ends, quite entire, pubescent; racemes elongated, loose; flowers nearly sessile, opposite, secund; calyxes large, rather pilose; corolla pubescent outside. ♃. H. Native of Tauria and Sicily. S. rubicúnda, Horn. hort. hafn. Spreng. syst. 2. p. 702. Stems dark purple, or reddish. Whorls almost an inch distant. Corolla violaceous, hardly 5 lines long.

Foreign Skullcap. Fl. June, Oct. Clt. 1823. Pl. 2 feet.

29 S. a'lpina (Lin. mant. p. 248.) branches divaricate, pubescent; leaves petiolate, broad-ovate, obtuse, crenated, roundly truncate at the base, or the lower ones are cordate, finely pubescent; floral leaves petiolate, ovate-oblong, acute at both ends, quite entire, pilose, exceeding the calyxes; racemes elongated, loose; flowers nearly sessile, opposite, secund; calyxes very pilose; corolla villous outside. ♃. H. Native of the South-east of Europe, and Middle Asia, in mountain woods; as of the Bithynian Olympus; near Constantinople, Candia, Mount Lebanon, South of Tauria, Siberia, &c. Arth. Hamilt. mon. 21. t. 1. Sibth. et Smith, fl. græc. 6. p. 65. t. 581. S. Crética, Mill. dict. S. nigréscens, Spreng. syst. 2. p. 702. S. pállida, Bieb. fl. cauc. 2. p. 65. but not of Gussone.—Sab. hort. rom. 3. t. 29. Rachis of raceme villous. Corolla half an inch long, dirty white.

Whitish-flowered Skullcap. Fl. June, Aug. Clt. 1771. Pl. 1 to 2 feet.

30 S. hi'rta (Sibth. et Smith, fl. græc. 6. p. 66. t. 589.) very hairy; leaves petiolate, ovate, obtuse, crenated, roundly truncate at the base, or cordate, hairy on both surfaces, scarcely wrinkled; floral leaves petiolate, oblong, about equal in length to the calyxes; racemes loose; flowers nearly sessile, opposite, secund; fructiferous calyxes inflated, very pilose; corolla villous outside. ♃. H. Native of Candia, and Mount Lebanon. Stem branched. Corollas almost of *S. Colúmnæ*.

Hairy Skullcap. Fl. June, July. Clt. 1825. Pl. 1 foot.

31 S. salviæfo'lia (Benth. lab. p. 433.) stems ascending, hispid; leaves petiolate, ovate, subcordate at the base, much wrinkled, hispid; floral leaves bractea-formed, petiolate, oblong, wrinkled, about equal in length to the calyxes; racemes loose; flowers opposite, secund; calyxes villous. ♃. H. Native of Greece. Corollas pubescent, size of those of *S. peregrina*, or a little larger.

Sage-leaved Skullcap. Pl. ½ foot.

32 S. versi'color (Nutt. gen. amer. 2. p. 38.) stems erect, branched, pubescent; leaves petiolate, broadly-ovate, crenated, deeply cordate at the base, pubescent on both surfaces, wrinkled; floral leaves sessile, broad-ovate, quite entire, rather longer than the calyxes; raceme simple, or a little branched, elongated, many-flowered; flowers opposite, subsecund; calyxes hairy. ♃. H. Native of the flats and open woods of Ohio and Arkansas, Nuttall; at Lexington, in Kentucky, Torrey; Louisiana, Drummond. S. cordifólia, Muhl, cat. The whole plant pubescent, the racemes viscid. Leaves 2-4 inches long. Corolla pubescent, with a slender tube, a dilated blue throat, and a white lower lip.

Var. β, bracteàta (Benth. lab. p. 433.) floral leaves larger, and coloured a little. ♃. H. Native of Texas, at Rio Brazos.

Party-coloured-flowered Skullcap. Pl. 3 to 4 feet.

33 S. cane'scens (Nutt. gen. amer. 2. p. 38.? Benth. lab. p. 433.) stems tall, branched, pubescent; leaves petiolate, ovate, or ovate-lanceolate, acute, crenated, narrowed at the base, rounded, or the lower ones are cordate, pubescent on both surfaces, hoary beneath: floral leaves oblong, exceeding the calyxes; racemes loose, panicled, canescent; flowers opposite, secund; calyxes clothed with hoary tomentum; corolla pubescent outside. ♃. H. Native of Canada, Ohio, Kentucky, Upper Louisiana, &c., in open woods. S. serràta, Spreng. syst. 2. p. 703. and many other authors, but not of Andr. S. pubéscens, Muhl, cat.? S. incàna, Spreng. in Steud. nom. p. 757.? Leaves 2-3 inches long. Corolla blue, 8-9 lines long.

Canescent Skullcap. Pl. 2 to 3 feet.

34 S. serra'ta (Andr. bot. rep. t. 494.) stem tall, branched, glabrous; leaves petiolate, ovate, acutish, crenately serrated, cuneated at the base, quite entire, nearly glabrous on both surfaces; floral leaves oblong-lanceolate: upper ones scarcely longer than the pedicels; racemes loose, nearly simple; flowers opposite, secund; calyxes strigosely pubescent; corollas large, pubescent outside. ♃. H. Native of North America, Andrews; near Fredericstown, Herb. monac. Leaves purplish above, and pale beneath. Racemes glabrous or pubescent. Corolla blue, beyond an inch long.

Serrated-leaved Skullcap. Fl. June, Sept. Clt. 1800. Pl. 4 feet.

35 S. pilo'sa (Michx. fl. bor. amer. 2. p. 11.) stem erect, almost simple, pubescent; leaves remote, on short petioles, ovate, obtuse, crenated: lower ones rounded at the base; superior ones cuneated, or narrowed, pubescent on both surfaces, or pilose; floral leaves obovate-lanceolate, about equal in length to the calyxes; racemes loose, a little branched, panicled; flowers opposite, secund; calyxes villous; corollas pubescent outside: throat a little dilated. ♃. H. Native of Pennsylvania; at West Chester, Virginia, Carolina, Georgia, &c., in shady woods. S. Caroliniàna, Walt. fl. car. p. 163. S. ellíptica, Muhl, cat.? Leaves 1½ inch long. Corolla blue, 8-9 lines long, pubescent.

Var. β, pubéscens; plant clothed with fine pubescence, not

pilose. ♃. H. Native of New Jersey, at Princetown, Torrey. S. ovalifòlia, Pers. ench. 2. p. 136. ?

Pilose Skullcap. Fl. June, Aug. Clt. 1825. Pl. 1 to 3 feet. ?

36 S. villòsa (Elliott, bot. car. 2. p. 90.) stem erect, branched, villous; leaves large, lanceolate, acute at both ends, coarsely toothed, villous beneath, rather hispid above; racemes panicled, crowded with flowers. ♃. H. Native of Georgia, between the rivers Oakmalgu and Flint, Elliott.

Villous Skullcap. Pl. 2 to 3 feet. ?

37 S. integrifòlia (Lin. spec. 836.) stems erect, almost simple, pubescent; leaves remote, on short petioles, oblong-lanceolate or linear, obtuse, quite entire, or the lower leaves are toothed, nearly glabrous; floral leaves exceeding the calyxes; racemes a little branched, loose; flowers opposite, secund; calyx pubescent; corolla almost glabrous, having the top of the tube and the throat widely dilated. ♃. H. Native from Pennsylvania and New York, to Carolina and Georgia, in dry or humid places. S. polymórpha, Arth. Hamilt. mon. p. 38. S. hyssopifòlia, Lin. spec. p. 836. S. Caroliniàna, Lam. dict. 7. p. 706, ill. t. 515. f. 3. S. ovalifòlia, Pers. ench. 2. p. 136. ?—Pluckn. phyt. t. 313. f. 4. Habit of *S. pilòsa*, but the leaves and flowers are very different. Leaves purplish beneath: upper ones 1 to 1½ inch long, glabrous or pubescent. Corollas large, blue, 8-9 lines long, the lower lip marked with deeper spots.

Var. β, hispida (Benth. lab. p. 435.) stems hispid; corollas villous. ♃. H. Native of New Orleans.

Entire-leaved Skullcap. Fl. June, Sept. Clt. 1731. Pl. 1 to 2 feet.

38 S. linea'ris (Benth. in Wall. pl. rar. asiat. 1. p. 66. lab. p. 435.) stems procumbent; leaves nearly sessile, oblong-linear, obtuse, almost entire, with subrevolute margins, canescent beneath; floral leaves ovate, concave, rather longer than the calyxes; racemes simple, dense; flowers opposite, subsecund; calyxes pilose; corollas almost glabrous. ♃. H. Native of Kamaon. Stems numerous from a thick woody base, pilosely pubescent. Leaves 6-9 lines long, almost glabrous above. Corollas cream-coloured, nearly an inch long: lips broad, purplish. Genitals a little exserted.

Linear-leaved Skullcap. Pl. procumbent, ½ foot.

39 ? S. visci'dula (Bunge, enum. pl. chin. p. 52.) stems decumbent; leaves sessile, linear-oblong, obtuse, quite entire, flat, green on both surfaces, viscid; floral leaves ovate, concave, rather longer than the calyxes; calyxes pilose; corollas nearly glabrous. ♃. H. Native of the North of China, in gravelly places between Jui-lin and Zsimin-i, Bunge. Habit of *S. linearis*; but differs in the leaves being green on both surfaces, and viscid, and a little broader. Corollas cream-coloured. Perhaps this species, with *S. linearis*, should have been placed in section *Lupulinària*.

Viscid Skullcap. Pl. decumbent.

40 S. macra'ntha (Fisch. Rchb. icon. bot. eur. 5. p. 52. t. 488. Benth. lab. p. 436.) stems procumbent at the base, ascending, almost glabrous; leaves sessile, lanceolate, obtuse, quite entire, rounded at the base, nearly glabrous, ciliated; floral leaves longer than the calyxes; racemes simple; flowers opposite, secund; calyxes pilose; corolla ample, pubescent outside, the tube dilated above. ♃. H. Native of Daburia, North of China. S. grandiflora, Bunge, but not of Sims. Scutellària, &c., Gmel. sib. 3. p. 228. no. 50. Stems usually purplish, having the angles usually ciliated, the rest glabrous. Leaves deep green above, glabrous, or with a few short hairs, paler beneath, and quite glabrous. Corolla an inch long, blue. This species connects sections *Stachymórpha* and *Galericulàta*, but has the habit of the latter.

Long-flowered Skullcap. Fl. July, Sept. Clt. 1827. Pl. ½ to ¾ foot.

Sect. IV. Galericula'ta (from *galericulus*, a narrow-brimmed hat; in reference to the form of the calyx.) Arth. Hamilt. mon. p. 31. Benth. lab. p. 436. § 3. Axillàres, Benth. in bot. reg. vol. 18. Floral leaves green, similar to the cauline leaves, but gradually smaller. Flowers opposite, secund, axillary, or the upper ones are somewhat racemose.

41 S. angustifòlia (Pursh, fl. amer. sept. 2. p. 412.) nearly glabrous; stems erect, almost simple; lower leaves petiolate, ovate, toothed: superior ones nearly sessile, oblong-linear, quite entire, all roundly cuneated at the base; floral leaves similar to the rest: upper ones sterile; flowers axillary, opposite, secund; calyxes shorter than the pedicels. ♃. H. Native of North-west America, along the river Kooskoosky, Pursh; at Fort Vancouver, on the Columbia, Douglas. Herb glabrous, or finely pubescent. Corolla 8 lines long, blue. ?

Narrow-leaved Skullcap. Pl. ½ foot.

42 S. scordifòlia (Fisch, ind. sem. hort. petrop. p. 62. Trev. in nov. act. bonn. 13. p. 185.) glabrous; stems branched; leaves on short petioles, oblong-lanceolate, obtuse, quite entire, or remotely serrated, rounded or cuneated at the base; floral leaves similar to the rest; flowers axillary, opposite, secund. ♃. H. Native of the Altaic mountains, and at Lake Baikal, and of Kamtschatka. S. Adámsii, Spreng. syst. 2. p. 701. ? Arth. Hamilt. mon. p. 34. t. 2. f. 3. Scutellària, &c., Gmel. sib. 3. p. 229. no. 51. t. 47. ? Cássida, &c., Amm. stirp. 43. t. 55.—A species intermediate between *S. angustifòlia* and *S. galericulàta*. Corollas blue, longer than those of *S. angustifòlia*.

Var. β, Adámsii (Benth. lab. p. 437.) leaves less toothed; floral leaves smaller; flowers subracemose. ♃. H.

Scordium-leaved Skullcap. Fl. June, July. Clt. 1817. Pl. ½ foot.

43 S. galericula'ta (Lin. spec. p. 835.) stems branched, divaricate; leaves on short petioles, ovate-lanceolate, acute, roundly cordate at the base, crenated: floral leaves similar; flowers axillary, opposite, secund, on short pedicels. ♃. H. Native of Europe, Asia, and North America, in humid places, by the sides of ditches, ponds, rivers; almost in every part of Europe; plentiful in Britain. Smith, engl. bot. t. 523. Hook. fl. lond. vol. 2. with a figure. Curt. lond. 3. t. 36. Fl. dan. t. 637. S. epilobiifòlia, Arth. Hamilt. mon. p. 32.—Riv. mon. t. 77. f. 1.—Sabb. hort. rom. 3. t. 30.—Mör. hist. sec. 11. t. 20. f. 6. ord. 3. Cássida galericulàta, Scop. carn. no. 741. Hall. helv. no. 23. Mœnch. meth. p. 413. Plant very variable in stature and pubescence, but readily distinguished by the form of the leaves and flowers. Corolla 7-8 lines long, blue, whitish underneath. The plant was formerly considered a cure for certain fevers.

Hooded or Common Skullcap. Fl. June, Sept. Britain. Pl. ½ to 1 foot.

44 S. hastifòlia (Lin. spec. p. 835.) stems ascending, nearly simple, glabrous; leaves on short petioles, ovate-lanceolate, obtuse, quite entire, truncate at the base, and hastately sub-lobate: floral ones similar to the rest; flowers opposite, secund, subracemose; calyxes pubescent; corolla elongated, with a dilated throat: galea shorter than the lower lip. ♃. H. Native of France, Austria, and Germany, Sweden; and Caucasus, at the river Kuma. Cássida hastifòlia, Scop. fl. carn. 1. p. 439.—Riv. mon. irr. t. 77. f. 2. This differs from *S. galericulàta* in the leaves being hastate at the base, in the corollas being a little longer, and more approximate into a terminal raceme. Corollas blue.

Halbert-leaved Skull-cap. Fl. June, July. Clt. 1798. Pl. ½ foot.

45 S. RIVULA'RIS (Wall. pl. rar. asiat. 2. p. 66. Benth. lab. p. 438.) quite glabrous; stem procumbent at the base; branches ascending, almost simple; lower leaves petiolate, ovate-roundish, and the middle ones ovate-lanceolate, obtuse, crenated, dilated and cordate at the base: superior and floral leaves smaller, narrowed at the base; flowers opposite, secund, sub-racemose; calyxes and corollas glabrous. ♃. H. Native of Nipaul and China, by sides of rivulets and rivers. S. peregrina, Roxb. hort. beng. p. 45. but not of Lin. S. barbàta, D. Don. prod. fl. nep. p. 109. S. squamulòsa, Arth. Hamilt. mon. p. 35. Stems rooting at the base. Lower cauline leaves an inch long, those of the sterile branches hardly ½ an inch. Corolla 4 lines long, bluish, hairy.

Rivulet Skullcap. Pl. ½ to 1 foot.

46 S. RUMICIFÒLIA (H. B. et Kunth, nov. gen. amer. 2. p. 324.) quite glabrous; stems humble, diffuse, branched; lower leaves petiolate, broad-ovate, hastately cordate at the base: middle ones lanceolate, acute, hastate at the base: upper and floral leaves nearly sessile, lanceolate, or linear, rounded or narrowed at the base; flowers minute, opposite, secund. ♃. F. Native of Mexico, at the Hacienda de la Laguna; Santa Fe de Bogota; Montevideo; Brazil, at Rio Pardo, in the province of Rio Grande do Sul; Mendoza, Valparaiso, and Buenos Ayres. Herb small, much branched, and rooting at the base. Leaves of sterile branches, often shaped like those of *Rùmex acetocélla*. Lower cauline leaves ½ an inch long: upper 3 lines long. Corolla hardly 3 lines long, downy outside. Genitals a little exserted.

Sorrel-leaved Skullcap. Pl. ½ to 1 foot.

47 S. MI'NOR (Lin. spec. p. 835.) plant humble, glabrous; leaves on short petioles: lower ones broad-ovate: middle ones ovate-lanceolate, cordate at the base, sub-hastate: upper and floral leaves lanceolate, rounded at the base, all obtuse; flowers small, axillary, opposite, secund; corolla almost glabrous, with the throat hardly dilated. ♃. H. Native of Europe and Siberia; plentiful in Britain in moist places, as by the sides of rivulets, rivers, canals, ponds, &c. Smith, engl. bot. t. 524. Hook. fl. lond. vol. 2. icone. Curt. fl. lond. 4. t. 43. S. breviflòra, Turez. mss.—Mor. hist. sect. 11. t. 20. f. 8. Leaves like that of *S. galericulàta*, but the plant is of lower stature. Leaves a little toothed or entire. Corolla 3 lines long, red.

Smaller Skullcap. Fl. July, Aug. Britain. Pl. ¼ to ½ foot.

48 S. HAVANE'NSIS (Jacq. obs. 2. p. 5. t. 29.) stem branched, procumbently erect; leaves cordate-ovate, obtuse, crenated, nearly glabrous; flowers axillary; both lips of corolla trifid. ♃. G. Native of Cuba, among rocks; near Havana, by the sea-side. Jacq. amer. pict. 85. t. 165. Leaves hardly ½ an inch long. Corolla nearly an inch long, blue.

Havana Skullcap. Fl. May, June. Clt. 1793. Pl. proc.

49 S. MICROPHY'LLA (Moc. et Sesse, ex Benth. lab. p. 439.) pubescent; stem diffuse, humble, branched; leaves petiolate: lower ones roundish, sinuately crenated: superior leaves ovate: uppermost ones almost quite entire, narrowed at both ends; flowers small, axillary, opposite, secund; pedicels longer than the calyxes. ♃. F. Native of New Spain. Very nearly allied to *S. humilis*, but villous. Corollas size of those of *S. minor*.

Small-leaved Skullcap. Pl. humble.

50 S. NU'TANS (R. Br. prod. p. 507.) plant strigosely pubescent; stem humble; leaves on short petioles: lower ones rounded, deeply crenated: upper ones ovate, roundly dilated, sub-hastately lobed, all cordate at the base: upper floral leaves hardly exceeding the calyxes; flowers small, axillary, opposite, secund. ♃. F. Native of New South Wales, about Port Jackson; and of Van Diemen's Land. Leaves hardly 3-4 lines long. Corolla twice as long as the calyx. Genitals a little exserted.

Humble Skullcap. Fl. June, July. Clt. 1823. Pl. ¼ foot.

51 S. PA'RVULA (Michx. fl. bor. amer. 2. p. 12.) stem humble, divaricate, branched, pubescent; lower leaves on short petioles, ovate-roundish: middle, superior, and floral leaves sessile, ovate, or ovate-lanceolate, all obtuse, quite entire, rarely toothed, subcordate at the base; flowers small, axillary, opposite, secund; corolla nearly glabrous, with a scarcely dilated throat, hardly twice as long as the calyx. ♃. H. Native of Canada, on the banks of rivers, and in other humid places, Virginia, banks of Missouri; at Lexington in Kentucky; Texas, at Rio Brazos. Hook. exot. fl. 2. t. 106. S. ambìgua, Nutt. gen. amer. 2. p. 37. Herb densely leafy, more or less pubescent. Leaves small. Corollas small pale blue. Genitals a little exserted.

Small Skullcap. Fl. June, Aug. Clt. 1822. Pl. ¼ foot.

52 S. RESINÒSA (Torrey, in ann. lyc. 2. p. 232.) clothed with minute glandular pubescence; stem humble, erect, much branched; leaves scarcely petiolate, broad-ovate, obtuse, quite entire, rounded at the base: floral leaves similar to the rest; flowers axillary, opposite, secund; corolla villous, more than 4 times as long as the calyx. ♃. H. Native of North America, at the river Canadian, among the Rocky Mountains. Habit of *S. párvula*, but more stiff and more branched. Leaves 4-5 lines long. Corolla blue, size of those of *S. galericulàta*, villous.

Resinous Skullcap. Pl. ½ foot.

53 S. ANTIRRHINOI'DES (Benth. lab. p. 440.) stem diffuse, branched, glabrous; leaves on short petioles, ovate, obtuse, quite entire, narrowed at the base, thickish, glabrous or finely pubescent; floral leaves similar to the rest: upper ones sterile; flowers axillary, opposite, secund; calyxes shorter than the pedicels. ♃. H. Native of North-west America, near Fort Vancouver, on the Columbia river. Habit of *Antirrhìnum serpyllifòlium*. Leaves ½ an inch long. Flowers similar to those of *S. angustifòlia*.

Snap-Dragon-like Skull-cap. Pl. diffuse.

54 S. NERVÒSA (Pursh, fl. amer. sept. 2. p. 412.) stem almost simple, glabrous; lower leaves petiolate, rounded: middle ones sessile, broad-ovate, dentately crenated, cordate at the base: upper floral leaves ovate-lanceolate, quite entire, all glabrous or rather hispid above, with scabrous margins; flowers small, axillary, opposite, secund; corollas almost glabrous, twice or thrice longer than the calyxes. ♃. H. Native of North America, among bushes on the banks of the rivers Schuylkill, Susquehanna, Missouri, and Ohio. Herb slender, pale green. Largest leaves 10-12 lines long. Corollas full a little larger than those of *S. párvula* or *S. minor*, blue.

Nerved-leaved Skullcap. Fl. July, Aug. Clt. 1826. Pl. ½ to 1 foot.

55 S. DRUMMÓNDI (Benth. lab. p. 441.) stems ascending, a little branched, villous; leaves petiolate, ovate, obtuse, crenated, cuneated at the base: floral leaves more entire, smaller, all villous on both surfaces; flowers small, axillary, opposite, secund; corolla villous, scarcely thrice as long as the calyx. ♃. F. Native of Texas, at Rio Brazos. Leaves ½ an inch long. Corolla 3-4 lines long, blue.

Drummond's Skullcap. Pl. ½ foot.

56 S. MÒLLIS (R. Br. prod. p. 507.) stem nearly simple, pubescent; leaves petiolate, ovate-roundish, obtuse, coarsely crenated, broadly cordate at the base: upper and floral leaves ovate-lanceolate, acute, all clothed with soft villi on both surfaces; flowers opposite, secund, axillary, or the upper ones are sub-racemose; corolla twice as long as the calyx, which is shorter than the pedicels. ♃. H. Native of New Holland. Stem a little branched. Corolla 3-4 lines long.

Soft Skullcap. Pl. 1 to 1½ foot.

57 S. TUBERÒSA (Benth. lab. p. 441.) stem humble, simple, erect, villous; leaves petiolate, broad-ovate, obtuse, coarsely

crenated, roundly truncate at the base: floral leaves oblong, all villous on both surfaces; flowers axillary, opposite, secund; corolla villous, more than 4 times as long as the calyx. ♃. H. Native of North California, Douglas. Stems simple, rising from a tuberous root. Leaves 4-5 lines long: floral ones shorter than the flowers, but exceeding the calyxes. Corolla size of that of *S. galericulàta*, with a slender tube.

Tuberous-rooted Skullcap. Pl. 1-3 inches.

58 S. cerúlea (Moc. et Sessé, ex Bench. lab. p. 442.) stem nearly simple, pubescent; leaves on short petioles, ovate-rhomboid, obtuse, crenated, rounded at the base: floral leaves nearly similar to the others but narrower, the uppermost ones lanceolate, almost quite entire, all pubescent above; flowers opposite, secund, axillary, or the uppermost ones are sub-racemose, nearly sessile; corolla 6 times longer than the calyx. ♃. F. Native of Mexico. Stems ascending. Lower leaves small: middle ones an inch long. Corolla 8-9 lines long, pubescent, blue.

Var. β. Leaves pubescent on both surfaces. ♃. F. Mexico, near Tlalpuxuhua.

Blue-flowered Skullcap. Pl. ½ to 1 foot.

59 S. Mocinia'na (Benth. lab. p. 442.) branches ascending, ? villous at the base; leaves petiolate, ovate, somewhat sinuately crenated, green on both surfaces, rather hispid above, and almost glabrous beneath: lower floral leaves similar to the rest: uppermost ones small and oblong; flowers opposite, secund; corolla 6 times longer than the calyx, which is pedicellate. ♃. F. Native of New Spain. Branches rather woody at the base. Leaves an inch long. Corolla showy, scarlet, 1½ inch long, nearly glabrous.

Mocino's Skullcap. Pl. ?

60 S. malvæflòra (H. B. et Kunth, nov. gen. 2. p. 325.) stem branched, pubescent; leaves roundish, ovate, obtuse, coarsely serrate-crenated, beset with adpressed hairs above, and glabrous beneath; flowers opposite, pedicellate, sub-spicate. ♃. G. Native of New Granada, in bushy, mountain places, near St. Anna, in the province of Mariquito. Leaves petiolate, 8-10 lines long. Calyx pubescent. Corolla blue. ? This species with the two following probably belong to the genus *Perilòmia*.

Mallow-flowered Skull-cap. Pl.

61 S. Cumane'nsis (H. B. et Kunth, l. c.) shrubby; leaves ovate, or ovate-orbicular, obtuse, rounded at the base or cuneated, crenated, clothed with hairy pubescence on both surfaces, canescent beneath; flowers opposite, pedicellate. ♄. G. Native of America, in dry places near Cumana and Bordones. Leaves 8-12 lines long. Pedicels and calyxes pubescent. Corolla 5 times as long as the calyx, pubescent.

Cumana Skullcap. Shrub.

62 S. volu'bilis (H. B. et Kunth, l. c.) twining; leaves elliptic, rounded at both ends, crenated, pubescent above, but clothed with soft pilose tomentum beneath and hoary; flowers opposite, pedicellate. ♃. ? ◠. S. Native of New Granada, in woods, near Loxa and Gonzanama. Leaves petiolate, reticulately 5-nerved, 14-16 lines long. Stem pilose. Calyx pilosely pubescent. Corolla downy, red. ?

Twining Skullcap. Pl. twining.

Sect. V. Maschalóstachys (from μασχάλη, *maschale*, an axil, and στάχυς, *stachys*, a spike; in reference to the axillary spikes.) Benth. lab. p. 443. § 4. Lateriflòræ, Benth. in bot. reg. vol. 18. Floral leaves green, similar to the lower cauline leaves: upper ones small, bractea-formed. Flowers opposite, secund, disposed in axillary and terminal racemes.

63 S. re'pens (Hamilt. in D. Don. prod. fl. nep. p. 110.) clothed with hoary pubescence, clammy above; branches scandent; leaves petiolate, ovate, crenated, rounded at the base, subcordate: uppermost ones acute, rather cuneated at the base: floral leaves ovate, obtuse, rather exceeding the calyxes; racemes numerous, axillary, and terminal, short, loose; flowers opposite, secund. ♄. ◠. G. Native of the East Indies, in Nipaul, Kamaon, Ava, &c. S. càna, Wall. pl. asiat. rar. 1. p. 67. S. Wallichiàna, Arth. Hamilt. mon. 28. t. 2. f. 1. Leaves 1½ inch long. Corolla 7-8 lines long, yellow.

Creeping Skullcap. Shrub climbing.

64 S. scá'ndens (Hamilt. in D. Don. prod. fl. nep. p. 110.) stem scandent; branches glabrous, very acutely tetragonal; leaves on short petioles, ovate-lanceolate, acuminated, crenated, roundedly cordate at the base, glabrous; floral leaves broad-ovate, acuminated, hardly exceeding the calyxes; racemes axillary and terminal, pubescent; flowers opposite, secund. ♄. ◠. G. Native of Nipaul and Kamaon. S. angulòsa, Benth. in Wall. pl. asiat. rar. 1. p. 67. S. cæltidifòlia, Arth. Hamilt. mon. p. 27. Branches often glaucescent. Corolla an inch long, hairy.

Climbing Skullcap. Shrub climbing.

65 S. lateriflòra (Lin. spec. p. 835.) glabrous; stems erect, fleshy; leaves petiolate, ovate-lanceolate, acuminated, rounded at the base: upper floral leaves hardly exceeding the calyxes; racemes axillary and terminal, flowers opposite, secund. ♃. H. Native of North America, on margins of ponds, lakes, and ditches, from New York to the North-west coast, and from Canada to Carolina. Cássida lateriflòra, Mœnch. meth. Plant glabrous. Stem much branched. Corolla blue, hardly 3 lines long. Achenia tubercled.

Lateral-flowered Skullcap. Fl. June, Sept. Clt. 1752. Pl. 1 foot.

Cult. Most of the species of *Scutellària* are very pretty while in blossom, and are therefore well fitted for decorating the fronts of flower borders, being short in stature. They will grow in any common soil, and are readily increased by division and by seed. Those species marked greenhouse and frame require protection in winter, but answer well when planted out into the open ground during the summer months. The shrubby kinds will be readily increased by young cuttings.

LIX. PERILO'MIA (from περι, *peri*, around, and λωμα, *loma*, a fringe; in allusion to the membranaceously winged achenia.) H. B. et Kunth, nov. gen. 2. p. 328. Benth. lab. p. 445.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, bilabiate; lips entire, closed after the falling of the corolla, at length cleft even to the base: the upper lip furnished with a short scale, deciduous: lower lip permanent. Corolla with an exserted, recurvedly ascending tube, which is naked inside, a rather dilated throat, and a short bilabiate limb, having the upper lip erectish, emarginately bifid, and the lower lip trifid; the lateral lobes short and spreading a little, and the middle lobe larger, spreading, and emarginate. Stamens 4, ascending, didynamous, the lower ones the longest; anthers approximate by pairs, glabrous, those of the lower stamens dimidiate, and those of the upper stamens 2-celled. Upper lobe of style very short; lower one stigmatiferous at apex. Ovarium nearly sessile, on a thick disk, which is usually increased into an obtuse tooth. Achenia dry, with membranaceously winged margins.—Herbs or shrubs. Flowers axillary, solitary. Floral leaves almost similar to the cauline ones. This genus differs from *Scutellària*, in the form of the corolla and winged achenia.

1 P. scutellarioi'des (H. B. et Kunth, nov. gen. 2. p. 327. t. 157.) glabrous; leaves petiolate, ovate, rounded at the base or subcordate, those of the panicle, branches, and floral ones small; racemes slender; flowers secund; corolla scarcely 3 times as long as the calyx, which is glabrous. ♃. S. Native of Peru, Jos. de Jussieu. Stems apparently scandent. Leaves 1½ inch

long, coarsely crenated; upper and floral ones hardly 2-3 lines long. Panicle like that of *Odontites rùbra*. Flowers opposite, scarlet, ? clothed with rufous pubescence outside.

Skullcap-like Perilomia. Pl. climbing.

2 P. ocymoi'des (H. B. et Kunth, l. c. p. 328.) glabrous or scarcely pubescent; leaves petiolate, ovate, crenated, roundedly truncate at the base: floral leaves similar to the rest, but gradually smaller; racemes elongated; corolla 4-5 times longer than the calyx. ♃. G. Native of Peru, in dry places, near Alausi, Humb. et Bonpl.; near Obrajillo, Cruikshanks; at Cuesta de Parrochuta, Mathews. Leaves ½ to 1½ inch long. Corolla scarlet, 7-8 lines long.

Basil-like Perilomia. Pl. erect.

3 P. frutico'sa (Schiede et Deppe, in Linnæa, 5. p. 102.) pubescent or hairy; leaves ovate or elliptic, acuminated, coarsely and unequally serrated, and almost entire, pale beneath; racemes 3-9-flowered. ♄. G. Native of Mexico, among bushes at Jalapa, and on Serro Colorado. Leaves 1 to 4 inches long. Flowers opposite. Corolla showy, scarlet, about 15 lines long, pubescent underneath.

Shrubby Perilomia. Shrub.

4 P. tomentò'sa (Benth. lab. p. 446.) leaves ovate, pubescent above, clothed with white tomentum beneath; corolla about 3 times longer than the calyx, which is clothed with woolly villi. ♃. G. Native of Mexico, Moçino et Sessé. Habit of *P. ocymoides*. Flowers a little smaller. Perhaps woody.

Tomentose Perilomia. Shrub. ?

† *A doubtful species.*

5 P. pu'bia (Spreng. syst. 2. p. 704.) leaves ovate-oblong, acute, serrated; calyxes and fruit pubescent. ♃. ? S. Native of Brazil, Sello.

Doubtful Perilomia. Pl. ?

Cult. For culture and propagation, see *Prostanthèra*, p. 800.

Tribe VII.

PROSTANTHE'REÆ (this tribe contains genera agreeing with the genus *Prostanthèra*, in the characters given below.) Benth. lab. p. 447. Calyx campanulate, sometimes bilabiate; lips flat, entire, or the lower lip is bidentate or bifid; sometimes equal and 5-toothed; throat naked inside. Corolla with a short ample tube, a campanulate throat, and a bilabiate limb; lips flattish; upper lip emarginate or bifid; lower lip trifid. Stamens 4, didynamous, shorter than the corolla; lower ones sometimes the longest and sometimes abortive. Achenia coriaceous, wrinkled reticulately. Style almost permanent.

LX. CHILO'DIA (from χειλος, *cheilos*, a lip, and ὀδους, *odous*, a tooth; application not evident.) R. Br. prod. p. 507. Benth. lab. p. 447.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, bilabiate; tube short, 13-nerved; upper lip entire; lower lip emarginate; throat naked inside. Corolla with a short ample tube and a campanulately sub-bilabiate limb: upper lip erect, flattish, emarginately bifid: lower lip trifid, the middle lobe the largest and bifid, all flat and spreading. Stamens 4, nearly equal, shorter than the tube; filaments glabrous, naked; anthers 2-celled: cells parallel, glabrous, naked, mutic. Style shortly bifid at apex; lobes unequal, stigmatiferous at apex.—A shrub, with the habit of *Prostanthèra*.

1 C. scutellarioi'des (R. Br. p. 507.) ♄. G. Native of New Holland, about Port Jackson. Prostanthèra empetrifòlia, Sieb. pl. nov. holl. exs. no. 187. A shrub, with glabrous or pubescent branches. Leaves sessile, scarcely ½ an inch long, linear or lanceolate, acute, quite entire, with sub-revolute edges, green on both surfaces, glabrous or finely downy beneath in the young state; floral leaves exceeding the flowers. Pedicels axillary, bibracteate. Calyxes ciliated. Corolla blue, glabrous, exceeding the calyx a little.

Skull-cap-like Chilodia. Shrub.

Cult. For culture and propagation, see *Prostanthèra*, p. 800.

LXI. CRY'PHIA (from κρυφιος, *kryphios*, hidden; in allusion to the inclosed corollas.) R. Br. prod. p. 508. Benth. lab. p. 448.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx bilabiate, bibracteate, closed; lips entire, equal. Corolla inclosed, ringent; upper lip or galea very short; middle segment of the lower lip rather the largest. Anthers mutic.—Glandular, strong-scented shrubs. Leaves small, entire, size of those of *Thymus Serpyllum*. Peduncles axillary, solitary, 1-flowered. Intermediate between *Chilòdia* and *Prostanthèra*.

1 C. serpyllifò'lia (R. Br. p. 508.) leaves oblong-linear, flattish, and are, as well as the calyxes, glabrous, scarcely longer than the fructiferous peduncles; branchlets almost glabrous; down very fine and adpressed. ♄. G. Native of New Holland, on the South Coast.

Wild Thyme-leaved Cryphia. Shrub.

2 C. microphy'lla (R. Br. p. 508.) leaves oval, convex, very minute, fascicled, and are, as well as the calyxes, pubescent; much longer than the peduncles; branches pubescent; down spreading, curved. ♄. G. Native of New Holland, on the south coast. Probably only a variety of the preceding.

Small-leaved Cryphia. Shrub.

Cult. For culture and propagation, see *Prostanthèra*, p. 800.

LXII. PROSTANTHE'RA (from προσθηκη, *prosthèke*, an appendage, and ανθηρα, *anthera*, an anther; in reference to the connectives of the anthers being spurred underneath.) Labill. nov. holl. 2. p. 18. R. Br. prod. p. 508. Benth. lab. p. 448.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate; tube short, 13-striped; lips undivided, closing the fruit; throat naked inside. Corolla with a short ample tube, a campanulate throat, and a bilabiate limb; upper lip erect, flattish, emarginately bifid; lower lip spreading, 3-lobed, the middle lobe the largest, entire, or bifid. Stamens 4, ascending, scarcely didynamous: lower ones rather the longest; filaments glabrous, naked; anthers all approximate, 2-celled: cells parallel, having the connective spurred beneath. Style shortly bifid at apex: lobes nearly equal, stigmatiferous at apex. Achenia nucumentaceous, rather baccate, coriaceous, and reticulately wrinkled in the dried state. Albumen wanting or small.—Strong-scented shrubs, beset with sessile glands. Leaves opposite. Flowers sometimes racemose, terminal, the floral leaves soon falling off; sometimes solitary in the axils of the floral leaves, which are similar to the cauline ones. Bracteas small, under the calyx.

1 P. lasia'nthos (Labill. nov. holl. 2. p. 18. t. 157.) shrubby; leaves oblong-lanceolate, dentately serrated, glabrous; racemes panicled; corolla hairy; longer spur of anther exceeding the cell: shorter one equal in length to the cell, adnate. ♄. G. Native of New South Wales, about Port Jackson; and of Van Diemen's Land. Andr. bot. rep. t. 641. Ker. bot. reg. t. 143. Sims, bot. mag. t. 2434. Branches nearly glabrous. Leaves green. Corolla white, tinged with red; throat spotted with red inside.

Woolly-flowered Prostanthera. Fl. June, July. Clt. 1808. Shrub 3-6 feet.

2 P. cæru'lea (R. Br. prod. p. 508.) shrubby; leaves lanceolate, dentately serrated, glabrous; racemes rather panicled, divided a little; corolla beardless outside; spurs of anthers nearly equal, adnate, scarcely exceeding the cells. ♄. G. Native of New South Wales, about Port Jackson, &c. Habit of *P. lasiánthos*. Leaves narrower. Corolla glabrous, blue, size of those of *P. lasiánthos*.

Blue-flowered Prostanthera. Shrub 3 to 4 feet.?

3 P. inci'sa (R. Br. prod. p. 509.) branchlets nearly glabrous; leaves ovate-oblong, narrowed at the base, toothed or cut, glabrous, glandular on both surfaces; racemes few-flowered; upper lip of calyx narrower, and twice as long as the lower lip; spurs equal, adnate, shorter than the cells. ♄. G. Native of New South Wales, about Port Jackson. Leaves ½ to ¾ inch long. Floral leaves small: upper ones wanting or deciduous. Corolla twice as long as the calyx, nearly glabrous.

Cut-leaved Prostanthera. Shrub 3 to 5 feet.?

4 P. Sieber'i (Benth. lab. p. 451.) branchlets nearly glabrous; leaves ovate-oblong, deeply toothed, narrowed a long way at the base, glabrous: racemes loose, few-flowered; lips of calyx equal; spurs of anthers equal, adnate, shorter than the cells. ♄. G. Native of New South Wales, from Port Jackson towards the south. P. incisa, Sieb. fl. nov. holl. exs. 189. but not of R. Br. Leaves on long petioles, nearly an inch long; floral leaves smaller: upper ones minute. Very like *P. incisa*.

Sieber's Prostanthera. Shrub 6 feet.

5 P. prunelloi'des (R. Br. prod. p. 508.) leaves thick, ovate, entire, or coarsely toothed, glabrous: floral leaves bracteaformed, deciduous; racemes terminal, a little panicled; corolla hairy outside; longer spur of anther twice as long as the cell. ♄. G. Native of New South Wales, about Port Jackson; frequent on stony hills at Hunter river. Angles of stem denticulated. Leaves an inch long: floral leaves ciliated, deciduous. Corolla twice as long as the calyx. Flowers almost like those of *P. lasiánthos*.

Prunella-like Prostanthera. Shrub.

6 P. ovalifo'lia (R. Br. prod. p. 509.) branches clothed with fine down; leaves oval, glabrous, entire, and sometimes with a few crenatures; racemes short, terminal, and axillary; calyx glabrous, glandular; spurs of anthers equal, adnate, equal in length to the cells. ♄. G. Native of New Holland, on the east coast, within the tropic, and on the north-west coast. Leaves 4-6 lines long.

Oval-leaved Prostanthera. Shrub humble.

7 P. atriplicifo'lia (Cunningh. mss. ex Benth. lab. p. 451.) branchlets tomentose; leaves ovate-oblong, quite entire, glabrous; racemes loose, terminal; calyxes glabrous; spurs of anthers equal, adnate, equal to the cells in length. ♄. G. Native of the interior of New Holland; on arid, sterile hills at the river Lachlan. Shrub dense, sweet-scented. Leaves on short petioles, 4-6 lines long. Corollas purple. Very nearly allied to *P. ovalifo'lia*.

Atriplex-leaved Prostanthera. Shrub.

8 P. cotinifo'lia (Cunningh. mss. ex Benth. lab. p. 452.) branches tomentose; leaves orbicular, thickish, glabrous, quite entire, retuse, or emarginate at apex; racemes elongated; lips of calyx quite entire. ♄. G. Native of New Holland, in the interior. Very nearly allied to *P. rotundifo'lia*, but differs in the leaves being never crenated, and in the longer racemes.

Cotinus-leaved Prostanthera. Shrubs.

9 P. rete'sa (R. Br. prod. p. 509.) leaves orbicular, crenated, glabrous, glandular on both surfaces; flowers axillary; lower lip of calyx retuse; spurs of anthers scarcely exceeding the cells. ♄. G. Native of Van Diemen's Land. Very nearly allied to *P. rotundifo'lia*.

Retuse-leaved Prostanthera. Shrub.

10 P. rotundifo'lia (R. Br. prod. p. 509.) branchlets tomentose; leaves orbicular or spatulate, thickish, glabrous, entire, or crenated; flowers sub-racemose; calyx glabrous, with quite entire lips; spurs of anthers equal, adnate, shorter than the cells. ♄. G. Native of Van Diemen's Land. Leaves 3-4 lines long. Racemes sub-secund, simple or compound. Corolla large, nearly glabrous outside.

Round-leaved Prostanthera. Clt. 1824. Shrub 3 to 6 feet.

11 P. ni'vea (Cunningh. mss. ex Benth. lab. p. 452.) quite glabrous; leaves linear, quite entire, with smooth revolute margins; racemes loose, terminal; calyx glabrous, having the upper lip large, ciliated, one half shorter than the lower lip; one spur of each anther twice as long as the cell; the other shorter, adnate. ♄. G. Native of the interior of New Holland, on sterile rocky mountains. Leaves ½ to 1 inch long. Flowers sub-secund. Corolla snow-white, twice as long as the calyx, downy outside.

Snow-white-flowered Prostanthera. Shrub 3 feet.

12 P. Baxte'ri (Cunningh. mss. ex Benth. lab. p. 452.) branches clothed with white tomentum; leaves linear, quite entire, with smooth revolute edges, glabrous; flowers sub-axillary; calyx clothed with silky tomentum; upper lip large, lower one shorter. ♄. G. Native of New Holland, at King George's Sound, Baxter. Leaves ½ an inch long. Flowers in the axils of the floral leaves.

Baxter's Prostanthera. Shrub.

13 P. linea'ris (R. Br. prod. p. 509.) quite glabrous; leaves linear, quite entire, glabrous, smooth, with sub-recurved margins; racemes terminal; calyxes glabrous, finely ciliated; longer spur of each anther twice as long as the cell. ♄. G. Native of New South Wales, at Port Jackson, R. Br.; on rocks at Springfield and elsewhere, Cunningh. Leaves about an inch long, obtuse. Corolla a little longer than the calyx, downy outside, with a villous throat.

Linear-leaved Prostanthera. Clt. 1824. Shrub 3 to 4 feet.

14 P. denticula'ta (R. Br. prod. p. 509.) branchlets scabrous from pubescence; leaves linear, entire, glabrous, glandular beneath, tuberculately denticulated above, near the recurved margin; calyxes ciliated, rather pilose; longer spur of anther rather exceeding the cell. ♄. G. Native of New South Wales, about Port Jackson, and on mountains near Bathurst. Habit of *Westringia*. Branches nearly terete. Leaves sessile. Racemes loose, secund, terminal. Corolla twice as long as the calyx.

Denticulated-leaved Prostanthera. Clt. 1824. Shrub 3 to 4 feet.?

15 P. cryptanthoi'des (Cunningh. mss. ex Benth. lab. p. 453.) glabrous; leaves lanceolate or linear, obtuse, quite entire or denticulated, fascicled in the axils: floral leaves similar to the rest; flowers few, axillary; calyx glabrous, having the upper lip tridentate; longer spur of anther twice the length of the cell. ♄. G. Native of New Holland, on rocks at Hunter's river.—An humble, glandular, rather clammy shrub, glabrous, or furnished with a few scattered hairs. Leaves scarcely 2-3 lines long. Bracteas foliaceous, equalling the calyxes. Corolla more than twice as long as the calyx.

Cryptantha-like Prostanthera. Shrub humble.

16 P. aspalathoi'des (Cunningh. mss. ex Benth. lab. p. 453.) branches pubescent; leaves small, linear, quite entire, with revolute margins, nearly glabrous, fascicled; floral leaves similar to the others; flowers few, axillary, nearly sessile; calyx glabrous, with nearly equal, quite entire lips. ♄. G. Native of the interior of New Holland, on sterile hills at the river Lachlan. Shrub decumbent. Branches clammy. Leaves 1-2 lines long, furnished with a few hairs while young. Corolla scarlet, glabrous outside, more than twice as long as the calyx.

Aspalathus-like Prostanthera. Shrub decumbent.

17 P. Cale'yi (Benth. lab. p. 454.) branches pubescent;

leaves small, ovate-elliptic, obtuse, with revolute edges, fascicled in the axils, scarcely pubescent; floral leaves conforming to the others; flowers few, axillary, pedicellate; calyx pubescent, with quite entire lips; longer spur of anther about equal in length to the cell. ♄. G. Native of New Holland, Caley. Allied to *P. aspalathoides*, but distinct. Leaves 1-2 lines long, convex. Corolla hardly exceeding the calyx.

Caley's Prostanthera. Shrub humble.

18 P. microphy'lla (Cunningh. mss. ex Benth. lab. p. 454.) branches almost glabrous: leaves small, thick, all obtuse, quite entire, spreadingly recurved, glabrous: floral leaves similar to the others; flowers few, axillary; calyx pubescent, with nearly equal, quite entire lips; spurs of anthers adnate: longer one scarcely exceeding the cell. ♄. G. Native of the interior of New Holland, in desert places near the river Lachlan.—A humble, much branched shrub. Leaves numerous, scarcely a line long: the floral ones and bracteas similar. Corolla scarlet, hardly twice as long as the calyx, pubescent outside.

Small-leaved Prostanthera. Shrub humble.

19 P. saxi'cola (R. Br. prod. p. 509. Benth. lab. p. 454.) leaves linear-oblong, quite entire, thick, rather pilose while young; floral leaves similar to the others, exceeding the flowers: flowers axillary; calyx hairy at top; longer spurs of anther twice the length of the cell. ♄. G. Native of New South Wales, about Port Jackson; and on rocks near Bathurst, on the west side of the Blue Mountains. Stem diffuse, suffruticose at the base, R. Br.—A slender shrub, with twiggy, hairy branches. Leaves sessile, 3-6 lines long, obtuse. Corolla twice as long as the calyx, pubescent outside, ex Benth. Lips of calyx nearly equal, R. Br.

Stone Prostanthera. Shrub diffuse.

20 P. marifo'lia (R. Br. prod. p. 509.) branches hairy; leaves ovate, or elliptic-lanceolate, quite entire, with revolute edges, hispid on both surfaces; flowers axillary, subracemose; calyx hairy, with nearly equal lips; lower lip retuse; spurs of anthers exceeding the cells a little. ♄. G. Native of New South Wales, at Port Jackson, and on the Blue Mountains. Leaves distant, nearly sessile, 2-4 lines long; floral leaves equalling the calyxes. Calyx bluish at top. Corolla a little longer than the calyx.

Cat-Thyme-leaved Prostanthera. Shrub 1 to 1½ foot.

21 P. thymifo'lia (Cunningh. mss. ex Benth. lab. p. 455.) branchlets finely pubescent; leaves ovate, roundish, few-crenated, glabrous, with recurved margins; flowers shortly racemose; calyx almost glabrous, with quite entire lips; spurs of anthers equal, adnate, shorter than the cells. ♄. G. Native of New South Wales, near Port Jackson; and at Springwood. P. retusa, Sieb. fl. nov. holl. exs. but not of R. Br. Leaves on short petioles, 1-2 lines long, glabrous, or ciliated with a few hairs on the nerves beneath: floral leaves minute, deciduous. Calyx glabrous, or ciliated on the stripes. Corolla white, glabrous, exceeding the calyx a little. Nearly allied to *P. violacea*.

FIG. 83.

Thyme-leaved Prostanthera. Shrub.

22 P. viola'cea (R. Br. prod. p. 509.) leaves roundish, crenated, with revolute edges, pubescently hairy on both surfaces, as well as on the branches; racemes dense, few-flowered: calyx pubescently hairy, with quite entire lips: lower lip twice as long as the upper, and narrower; spurs of anthers equal, rather shorter than the cells. ♄. G. Native of New South Wales, at Port Jackson. Bot. reg. 1072. Leaves 3-4 lines long; floral leaves small: upper ones minute. Corolla violaceous, twice as long as the calyx. (Fig. 83.)

Var. β, glàbrior (Benth. lab. p. 455.) leaves smaller, and more glabrous. ♄. G. Native of New South Wales, near Port Jackson; at Springwood, and on the Blue Mountains. This appears to be an intermediate plant between *P. violàcea* and *P. thymifòlia*.

Violaceous-flowered Prostanthera. Fl. May, Aug. Clt. 1820. Shrub 4 to 6 feet.

23 P. inca'na (Cunningh. mss. ex Benth. lab. p. 455.) leaves ovate, obtuse, crenated, bullately wrinkled, hispid from villi on both surfaces, as well as the branches; racemes very short, dense; spurs of anthers equal, adnate, shorter than the cells. ♄. G. Native of New South Wales, on the Blue Mountains; and on rocks at the junction of the rivers Nepean and Warragumba. Shrub divaricately branched. Leaves ¼ an inch long; floral leaves smaller, sometimes coloured a little. Flowers almost sessile. Corolla purple, scarcely pubescent outside, exceeding the calyx a little.

Hoary Prostanthera. Shrub 5 to 6 feet.

24 P. rugo'sa (Cunningh. mss. ex Benth. lab. p. 456.) leaves crenated, bullately wrinkled, hispid from villi on both surfaces, as well as the branches; flowers few, axillary; calyx hispid: upper lip somewhat tridentate, and the lower one emarginate; spurs of anthers shorter than the cells. ♄. G. Native of New Holland, at the river Hunter. Habit and leaves that of *P. violàcea*, but more hispid; but the inflorescence and calyx are very distinct. Corolla almost glabrous outside.

Wrinkled-leaved Prostanthera. Shrub 5 to 6 feet. ?

25 P. rhombea (R. Br. prod. p. 509.) leaves rhombeo-orbicular, quite entire, shining above in the adult state, glandular beneath; branches and calyxes pubescent; flowers axillary; spurs of anthers shorter than the cells. ♄. G. Native of New South Wales, about Port Jackson. Branches divaricate, sparingly pilose. Leaves almost sessile, bullately convex above, 2-4 lines long; floral leaves similar to the rest, on short pedicels. Corolla scarcely exceeding the calyx.

Rhomb-leaved Prostanthera. Clt. 1823. Shrub 3 to 4 feet. ?

Cult. All the species are showy when in blossom. A light rich soil, or one composed of equal parts of loam, peat, and sand, will answer. Cuttings of young wood strike root readily in the same kind of soil, with a hand-glass over them.

LXIII. HEMIA'NDRA (from *ἡμι, hemi*, a half; and *ανηρ ανδρος, aner andros*, a male; so called in allusion to the dimidiate anthers.) R. Br. prod. p. 502. Benth. lab. p. 456.

Lon. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, striated at the base; lips flat, closed over the fruit: upper lip entire, mucronate: lower one semi-bifid. Corolla with a short ample tube, a campanulate throat, and a bilabiate limb; lips flat, spreading: upper one bifid: lower one 3-lobed, the middle lobe emarginate. Stamens 4, loosely ascending, didynamous: lower ones the longest; filaments glabrous, naked; anthers dimidiate: fertile cell ascending, and the sterile cell slender, and descending on the filament. Style almost equally bifid at apex; lobes subulate, stigmatiferous at tops.—A small shrub, with the habit of *Prostanthèra*.

1 H. pu'ngens (R. Br. prod. p. 502.) ♄. G. Native of New Holland, on the south coast, R. Br.; on hills near Swan River, Fraser.—A stiff, decumbent, densely leafy shrub; branches hard, glabrous or pubescent at the base. Leaves ses-

sile, lanceolate, very acute, pungent, quite entire, glabrous, rigid, 1-3-nerved beneath; floral leaves similar, exceeding the calyxes. Corolla glabrous, twice as long as the calyx, white, tinged or dotted with purple. Plant without any scent when dried, not aromatic like the species of *Prostanthèra*.

Pungent-leaved Hemiandra. Shrub decumbent.

Cult. For culture and propagation see *Prostanthèra*, p. 800.

LXIV. HEMIGE'NIA (from ἡμι, *hemi*, a half, and γενεα, *genea*, an offspring; in reference to only one of the cells of each anther being fertile.) R. Br. prod. p. 502. Benth. lab. p. 457.

Lin. syst. *Didynàmia*, *Gymnospèrmia*. Calyx subcampanulate, deeply 5-cleft, equal. Corolla with a short tube, which is naked inside; a wide throat, and a sub-bilabiate limb: upper lip flat, sub-bifid: lower lip spreading, trifid, the middle lobe semi-bifid. Stamens 4, somewhat ascending, didynamous: lower ones the longest. Anthers approximate; one of the cells ascending and polliniferous; the other descending, of a different form, and empty. Style shortly bifid at apex. Achenia reticulately wrinkled.—Shrubs, with the habit of *Westringia* or *Macrocòrys*. Flowers axillary, solitary. Beard of upper anthers very short, similar to the crest of the spurs in *Prostanthèra*.

1 H. purpu'rea (R. Br. prod. p. 502.) leaves 3 in a whorl; corolla shorter than the calyx. ♄. G. Native of New South Wales, at Port Jackson.—A slender shrub, with twiggy, leafy, glabrous branches. Leaves sessile, half an inch long, or longer, linear, acute, nearly terete, glabrous. Corolla bluish-purple, glabrous outside; but the lower lip is villous above.

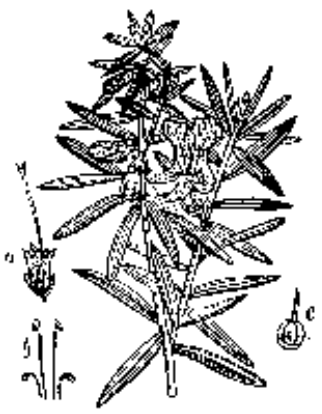
Purple-flowered Hemigenia. Shrub.

2 H. Sieberi (Benth. lab. p. 457.) leaves 4 in a whorl; corolla exceeding the calyx. ♄. G. Native of New South Wales, about Port Jackson. H. purpùrea, Sieb. pl. nov. holl. exs. no. 191. Shrub more rigid, and larger than *H. purpùrea*. Leaves thicker, broader, and blunter, often mucronulate. Lower lip of corolla densely villous.

Sieber's Hemigenia. Shrub.

Cult. For culture and propagation see *Prostanthèra*, p. 800.

LXV. WESTRINGIA (named, by Sir J. E. Smith, after J. P. Westring, physician to the king of Sweden.) Smith, tracts, p. 277. t. 3. R. Br. prod. p. 501. Benth. lab. p. 457.



Lin. syst. *Didynàmia*, *Gymnospèrmia*. Calyx campanulate, 10-nerved, equal, 5-toothed; throat naked inside. Corolla with a short tube, which is naked inside: a wide throat, and a sub-bilabiate limb; upper lip flat, bifid, rather spreading; lower lip spreading, 3-lobed, the middle lobe rather bifid. Stamens 4, erect, distant, inclosed in the tube of the corolla; superior 2 fertile, bearing dimidiate, 1-celled, glabrous anthers: lower 2 sterile, bearing bipartite anthers, the lobes linear, dependent, and empty. Style about equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia coriaceous, reticulately wrinkled.—Shrubs. Leaves permanent, 3-4 in a whorl, quite entire; floral leaves similar to the rest, with 1-flowered axils. Flowers 3-4 in a whorl, sometimes distant, and sometimes approximate into a short terminal raceme. Bracteas minute, adpressed to the calyx.

1 W. rosmarinifórmis (Smith, tracts. p. 277. t. 3.) leaves 4 in a whorl, lanceolate, with revolute edges, almost glabrous above, and silvery beneath; floral leaves about twice as long as the calyxes; calyx silvery, having the teeth one half shorter than the tube. ♄. G. Native of New South Wales, frequent on sandy hills about Port Jackson, Botany Bay, and towards the South. Andr. bot. rep. t. 214. Conila fruticòsa, Willd. spec. 1. p. 122. Young branches covered with dense silky hairs. Leaves an inch long, sessile. Flowers 4 in a whorl, like the leaves. Corollas villous outside, and bearded inside by a few hairs, white; lower lip spotted. Filaments villous.

Rosemary-formed Westringia. Fl. May, Aug. Clt. 1791. Shrub 1 to 3 feet.

2 W. Dampie'ri (R. Br. prod. p. 501.) leaves 4 in a whorl, linear, with revolute margins, nearly glabrous above, and cinereous beneath; floral leaves twice as long as the calyxes; calyx silvery, having the teeth one half shorter than the tube. ♄. G. Native of New South Wales, about Port Jackson; and on sandy hills at King George's Sound. Hook. bot. mag. t. 3308. Hardly to be distinguished from *W. rosmarinifórmis*, except in the more numerous, narrower, longer leaves, which are less silky beneath. Corolla white; lower lip spotted with red and yellow. (*Fig* 84.)

FIG. 84.

Dampier's Westringia. Fl. May, Aug. Clt. 1803. Shrub 1 to 3 feet.

3 W. brevifòlia (Benth. lab. p. 459.) leaves 4 in a whorl, elliptic-lanceolate, with revolute margins, shining above and silvery beneath; floral leaves rather shorter than the calyxes; calyx silvery, having the teeth one half shorter than the tube. ♄. G. Native of Van Diemen's Land, Gunn. Very similar to *W. rosmarinifórmis*; but differs from it in the much smaller, more glabrous leaves, and smaller flowers.

Short-leaved Westringia. Shrub.

4 W. ri'gida (R. Br. prod. p. 501.) leaves 3 in a whorl, linear-lanceolate, with revolute edges, glabrous above, and cinereous beneath, as well as the calyxes; teeth of calyx one half shorter than the tube. ♄. G. Native of New Holland, on the south coast; frequent on rocks by the sea side in Rottnest Island; and at the mouth of Swan River, on the west coast. Very nearly allied to *W. Dampièri*; but differs in the shorter leaves being 3 in a whorl, and usually shortly mucronate.

Stiff Westringia. Fl. May, Aug. Clt. 1823. Shrub 1 to 3 feet.

5 W. cine'rea (R. Br. prod. p. 501.) leaves 3 in a whorl, linear-lanceolate, divaricate, mucronate, pungent, with revolute margins, cinereous on both surfaces, as well as the calyxes; calycine teeth very short. ♄. G. Native of New Holland, on the south coast, R. Br.; on the south-west coast, at King George's Sound; and in the Dirk Hartog Island, on the west coast, Cunningham. Hook. bot. mag. t. 3307.—A much branched, humble shrub. Leaves form of those of *W. Dampièri*. Flowers sessile. Upper lip of corolla villous, pale purple; but the lower lip is white; both lips are spotted with purple dots.

Cinereous Westringia. Fl. May, Aug. Clt. 1821. Shrub humble.

6 W. angustifòlia (R. Br. prod. p. 501.) leaves 3 in a whorl, linear; spreading, with revolute edges, scabrous above in the adult state, and cinereous beneath, as well as the calyxes; calycine teeth one half shorter than the tube. ♄. G. Native of Van Diemen's Land.

Narrow-leaved Westringia. Fl. May, Aug. Clt. 1823. Shrub.

7 W. erem'cola (Cunningh. mss. ex Benth. lab. p. 459.)

leaves 3 in a whorl, linear, with revolute margins, cinereous beneath; calyxes clothed with silky pubescence, having the teeth rather longer than the tube. ♄. G. Native of New Holland, in the interior; in deserts near the river Lachlan, and on rocks near Bathurst, Cunningh.; at the river Macquarie, and in the valleys of Lushington and Glen Finlas, ex herb. Hook. Branches divaricate, very leafy. Leaves scarcely ½ an inch long.

Desert Westringia. Shrub.

8 W. LONGIFÒLIA (R. Br. prod. p. 501.) leaves 3 in a whorl, linear, with recurved margins, and are, as well as the calyxes, green on both surfaces; calycine teeth length of tube. ♄. G. Native of New South Wales, about Port Jackson, on the banks of rivulets. Prostanthèra linearis, Sieb. fl. nov. holl. exs. but not of R. Br. Angles of branches rough. Leaves an inch long, rather scabrous above, and pilose beneath while young.

Long-leaved Westringia. Clt. 1823. Shrub 1 to 3 feet.?

9 W. GLA'BRA (R. Br. prod. p. 501.) leaves 3 in a whorl, linear-lanceolate, flat, glabrous on both surfaces, as well as the calyxes. ♄. G. Native of tropical New Holland. Allied to *W. longifòlia*; but the leaves are broader, and flat, and the whole plant quite glabrous. Leaves about an inch long. Flowers nearly sessile.

Glabrous Westringia. Clt. 1824. Shrub.

10 W. RUBIFÒLIA (R. Br. prod. p. 501.) leaves 4 in a whorl, elliptic, flattish, quite glabrous, shining; calyx nearly glabrous, having the teeth rather longer than the tube. ♄. G. Native of Van Diemen's Land. This differs from *W. rosmariniformis* in its smoothness, acuter calycine teeth, shorter, broader leaves, with the edges almost flat. Whorls 6-8-flowered.

Madder-leaved Westringia. Clt. 1820. Shrub.

Cult. For culture and propagation see *Prostanthèra*, p. 800.

LXVI. MICROCO'RYS (from *μικρος, micros*, small; and *κορυς, korys*, a helmet; probably from the upper lip or galea of corolla.) R. Br. prod. p. 502. Benth. lab. p. 460.

LIN. SYST. *Didynàmia, Gymnospèrmia.* Calyx campanulate, about 10-nerved, equal, 5-toothed; throat naked inside. Corolla with the tube equal in length to the calyx, naked inside: throat widened: limb sub-bilabiate; upper lip flattish, emarginately bifid, erectly spreading: lower lip spreading, trifid. Stamens 4, erect, distant, inclosed in the tube of the corolla: upper 2 fertile, bearing dimidiate, 1-celled, bearded anthers: lower 2 sterile, bearing bipartite anthers, the lobes linear, dependent, and empty. Style almost equally bifid at top; lobes subulate, stigmatiferous at apex.—Shrubs, with the habit of *Westringia*. Leaves 3 in a whorl. Flowers small, white or purple, solitary in the axils of the floral leaves, which are similar to the cauline leaves, and, like them, 3 in a whorl.

1 M. VIRGA'TA (R. Br. prod. p. 502.? Benth. lab. p. 461.) leaves oblong-linear, obtuse, and are, as well as the calyxes, glabrous; bracteas caducous; corolla hairy outside. ♄. G. Native of New Holland, on the south coast; and in boggy places at King George's Sound.

Twiggy Microcorys. Shrub.

2 M. BARBA'TA (R. Br. prod. p. 502.) leaves linear, obtuse, glabrous; calyxes and corollas hairy outside; bracteas caducous. ♄. G. Native of New Holland, on the south coast, R. Br.; at King George's Sound, ex herb. Hook. Very nearly allied to *M. virgàta*, but differs from it in the calyxes being densely villous, &c.

Bearded-flowered Microcorys. Shrub.

3 M. PURPU'REA (R. Br. prod. p. 502.) leaves oval-oblong, with recurved margins, furnished with a few short hairs on both surfaces, dotted beneath; branchlets silky; calyxes greyish; bracteas setaceous, permanent. ♄. G. Native of New Holland, on the south coast.

Purple-flowered Microcorys. Shrub.

Cult. For culture and propagation see *Prostanthèra*, p. 800.

Tribe VIII.

NEPE'TEÆ (the genera contained in this tribe agree with *Népeta* in the characters given below.) Benth. lab. p. 462. Calyx equal, oblique, or sub-bilabiate; upper teeth the largest. Corolla inclosed or exserted; throat usually inflated; upper lip rather arched: lower lip spreading. Stamens 4, didynamous, ascending or diverging, the upper ones the longest. The whole of this tribe may not inappropriately be considered as a single genus, ex Benth.

LXVII. LOPHA'NTHUS (from *λοφος, lophos*, a crest; and *ανθος, anthos*, a flower; in allusion to the crenated or crested middle lobe of lower lip of corolla.) Benth. in bot. reg. vol. 15. lab. p. 462. Hyssòpus species of authors.

LIN. SYST. *Didynàmia, Gymnospèrmia.* Calyx tubular, 15-nerved, rather incurved, with an oblique, 5-toothed mouth; superior teeth rather the longest. Corolla having the tube equalling the calyx, naked inside; and the limb bilabiate; the upper lip erectish, emarginately bifid: lower one spreading a little, trifid, the middle lobe broadly crenated. Stamens 4, didynamous, distant or divaricate: lower ones the shortest; anthers 2-celled: cells parallel, at length rather diverging. Style shortly bifid at apex; lobes nearly equal, subulate, stigmatiferous at apex. Achenia dry, smooth, naked.

SECT. I. CHIASTA'NDRA (probably from *χιαω, cheio*, to scatter abroad, and *ανηρ ανδρος, aner andros*, a male; perhaps from the inequality of the stamens.) Benth. lab. p. 462. Whorls collected into terminal spikes. Upper stamens declinate: lower ones ascending. Leaves entire.

1 L. URTICIFÒLIUS (Benth. lab. p. 462.) glabrous; leaves cordate-ovate, crenated, green on both surfaces; spikes dense, oblong; calycine segments linear-subulate; genitals much exserted. ♃. H. Native of North-west America, at Lewis and Clark's River, frequent. Stem branched. Bracteas rather shorter than the calyxes, coloured. Corollas purplish. Fl. July, Aug. Clt. 1826.

Nettle-leaved Lophanthus. Fl. July, Aug. Clt. 1826. Pl. 3 to 4 feet.

2 L. ANISA'TUS (Benth. in bot. reg. t. 1282.) glabrous; leaves ovate or ovate-lanceolate, acute, crenated, green above and white beneath; spikes cylindrical, interrupted at the base; calycine segments lanceolate, acute; genitals exserted. ♃. H. Native of North America, in bushy places at the rivers Missouri, Nutt.; Saskatchawan, Columbia, and Red River, Douglas. Hyssòpus anisàtus, Nutt. gen. amer. 2. p. 27. Hyssòpus discolor, Desf. cat. hort. par. ed. 3d. p. 97. Stachys foeniculum, Spreng. Pursh, fl. amer. sept. 2. p. 407. Hyssòpus Foeniculum, Spreng. cent. pl. min. cogn. p. 24. Stem branched. Flowers one half smaller than those of *L. urticifòlius*. Corollas blue, incurved. Fl. July, Sept. Clt. 1825.

Anise-scented Lophanthus. Fl. July, Sept. Clt. 1825. Pl. 2 to 3 feet.

3 L. RUGÒSUS (Fisch. et Meyer, ind. sem. hort. petrop. 1835. p. 30.) nearly glabrous; leaves wrinkled, cordate-ovate, caudately acuminated, serrately toothed, of the same colour on both surfaces; spikes dense, oblong; calycine lobes lanceolate,

acutish; genitals much longer than the corolla. ♃. H. Native of China. Stature of *L. urticifolius*; but differs in the leaves being caudately acuminated; in the calycine lobes being acutish. Corollas blue. Odour of Peppermint.

Wrinkled-leaved Lophanthus. Pl. 2 to 4 feet.

4 L. scrophulariæfòlius (Benth. lab. p. 463.) stem pubescent; leaves ovate, serrately crenated, green on both surfaces, glabrous above, and pubescent beneath; spikes cylindrical, interrupted at the base; calycine teeth lanceolate, acute. ♃. H. Native of North America, in shady humid places from Pennsylvania to Virginia, rare, Pursh; at West Chester, Drummond. Hyssòpus scrophulariæfòlius, Willd. spec. 3. p. 48. Hyssòpus catariæfòlius, Hort. par. Habit of *L. nepetàtus*; but differs in the leaves being broader, pubescent beneath, not white; and in the flowers being a little larger. Corolla blue.? Calyx coloured at top.

Scrophularia-like Lophanthus. Fl. July, Aug. Clt. 1800. Pl. 3 to 4 feet.

5 L. nepetoi'des (Benth. lab. p. 463.) glabrous; leaves ovate, acutish, serrately crenated, green on both surfaces, glabrous, or scarcely pubescent beneath; spikes cylindrical, interrupted at the base: calycine teeth ovate, bluntish. ♃. H. Native from Pennsylvania to Virginia, Pursh; near St. Louis, on the Mississippi; and near West Chester, Drummond. Hyssòpus nepetoides, Lin. spec. p. 796. Jacq. hort. vind. 1. p. 28. t. 69. Leaves 1½ to 2 inches long, rounded or subcordate at the base. Corolla yellowish-white, scarcely exceeding the calycine teeth. Achenia villous at top.

Nepeta-like Lophanthus. Fl. Aug. Oct. Clt. 1692. Pl. 3 to 5 feet.

Sect. II. Resupina'ria (so called from the almost resupinate flowers of the species.) Benth. lab. p. 464. Cymes axillary, pedunculate, loose, few-flowered. Flowers almost resupinate. Lower stamens nearly erect; upper ones ascending.

6 L. Chine'nsis (Benth. lab. p. 464.) leaves ovate or oblong, crenated: floral ones similar to the others; cymes axillary, pedunculate, loose, few-flowered. ♃. H. Native of the North of China, ex Lin.; Siberia, about Peslikova, near Nertscha, Patrin. Hyssòpus lophánthus, Lin. spec. p. 796. Jacq. hort. vind. 2. p. 85. t. 182. Hyssòpus resupinàtus, Mœnch. Népeta lophántha, Fisch. Plant rather clammy, glabrous, or scarcely pubescent. Leaves an inch long. Peduncles subsecund, bearing unilateral cymes at apex. Corollas blue: tube shortly exserted. Achenia oblong, smooth.

China Lophanthus. Fl. Aug. Sept. Clt. 1752. Pl. 1½ to 2 feet.

Cult. For culture and propagation see *Népeta*, p. 811.

LXVIII. NE'PETA (a name used by Pliny; derived from *nepa*, a scorpion; being supposed to be efficaceous against the bite of the scorpion. Linnæus derives it from Nepet, a town in Tuscany.) Lin. gen. no. 710. Schreb. gen. no. 964. Juss. gen. p. 113. ed. Usteri, p. 126. Benth. lab. p. 464. Catària, Tourn. inst. p. 202. t. 95. Mœnch. Glechòma, *Lin.*

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular, 13-15-nerved, for the most part incurved, with an obliquely 5-toothed mouth; rarely ovate, straight, with the mouth and teeth equal. Corolla having the tube slender at the base, inclosed or exserted, naked inside, the throat widened, and the limb bilabiate; upper lip straight, and rather concave, emarginate or bifid; lower lip spreading, trifid, the middle lobe large, sometimes sub-bifid, with reflexedly spreading lobes, and sometimes entire, concave, and crenulated. Stamens 4, didynamous, ascending: lower ones the shortest. Anthers usually approximate by pairs, 2-celled; cells diverging, at length divaricate. Style about equally bifid at apex; lobes subulate, stigmatiferous at apex. Achenia dry, smooth, naked.

Sect. I. Schizone'peta (from σχίζω, *schizo*, to cut; and *Népeta*; in allusion to the cut leaves of the species.) Benth. lab. p. 468. Whorls crowded: upper ones approximating into somewhat interrupted terminal spikes; cymes all sessile. Bracteas various. Calyx tubular, straight, but usually incurved, with an equal or oblique mouth. Stamens exserted a little, loosely ascending. Leaves dissected or lobed.

1 N. botryoi'des (Ait. hort. kew. 2. p. 287.) plant ascending, humble, much branched, pubescent; leaves petiolate, deeply sub-bipinnatifid: segments oblong-lanceolate or linear, obtuse, quite entire, or somewhat pinnatifid; floral leaves linear-subulate; spikes cylindrical, hardly interrupted at the base; racemes simple, spike-formed; bracteas and calycine teeth acute. ♃. H. Native of Eastern Siberia, in the Altaic region, at the rivers Katunga and Tschuja, Bunge; in the Kirghisean Steppe, Meyer. N. multífida, Lin. fil. suppl. 273. N. ánnua, Pall. in act. petrop. 1779. 2. p. 268. t. 12. N. bipinnàta, Cav. icon. 1. p. 36. t. 49. Leaves usually bipinnatifid; upper ones simply pinnatifid: floral ones minute. Bracteas minute. Calyx with an oblique mouth. Corolla cream-coloured or white, villous. Stamens rather shorter than the corolla.

Botrys-like Cat-mint. Fl. June, July. Clt. 1779. Pl. ½ to 1 foot.

2 N. tenuifòlia (Benth. lab. p. 468.) stems procumbent, glabrous, or finely pubescent; leaves petiolate, pinnate: segments oblong-linear, acute, a little serrated, narrowed at the base, almost glabrous on both surfaces; upper leaves and floral ones entire; spikes slender, interrupted at the base; corollas minute, exceeding the calyxes a very little. ♃. H. Native of China, between Pekin and Jehol, Sir G. Staunton. This species differs from *N. lavandulácea*, in the leaves, slender spikes, and minute flowers; and from *N. botryoides*, in the elongated, procumbent stems, &c.

Fine-leaved Cat-mint Pl. procumbent.

3 N. lavandula'cea (Lin. fil. suppl. 272.) plant ascending, pubescent; leaves petiolate, deeply pinnatifid at the base, with oblong or ovate, obtuse segments; floral leaves ovate, acuminated; spikes cylindrical, interrupted at the base; calycine teeth very short, ovate; corolla about twice as long as the calyx. ♃. H. Native of Eastern Siberia, in the Altaic region, in dry mountain places frequent. N. multífida, Lin. spec. 799. Rchb. icon. bot. exot. 6. p. 22. t. 530. N. lobàta, Rudolph. ex Stend. nom. p. 552. Lophánthus multífidus, Benth. in bot. reg. vol. 15. under no. 1282. Saussùrea pinnatífida, Mœnch. meth. p. 388. Lavándula foliis ovatis, &c., Gmel. sib. 3. p. 242. t. 55. Stems many, simple. Leaves sometimes all cut into 5-7 segments, sometimes deeply pinnatifid, or nearly entire. Corolla blue, incurved. Mouth of calyx hardly oblique.

Lavender-like Cat-mint. Fl. July, Aug. Clt. 1796. Pl. 1 2 feet.

Sect. II. Pychnone'peta (from πυκνος, *pychnos*, dense; and *Népeta*; so called in allusion to the dense spikes of the species.) Benth. lab. p. 469. Whorls crowded: upper ones, or all, collected into terminal spikes; cymes all sessile. Outer bracteas alone imbricate, equalling the calyxes. Calyx tubular, straight or incurved, with an equal or oblique mouth.

4 N. linea'ris (Royle, ex Benth. in Hook. misc. 3. p. 377.) stems ascending, nearly glabrous; leaves sessile, linear, acutish, quite entire, narrowed at the base, green and glabrous on both surfaces; spikes ovate, few-flowered; bracteas lanceolate-subu-

late; calyx elongated, with lanceolate teeth, which are shorter than the tube. ♃. H. Native of the Himalaya. Stems procumbent at the base. Leaves 1-2 inches long. Spike short, rather interrupted. Teeth of calyx villous. Corolla blue? with a slender exserted tube.

Linear-leaved Cat-mint. Pl. humble.

5 N. connàta (Royle, l. c.) stems erect, villous; leaves sessile, lanceolate, acute, quite entire, cordately stem-clasping at the base, rather connate, green on both surfaces, glabrous; spike oblong, dense, or rather interrupted at the base; bracteas lanceolate-subulate, ciliated, equalling the calyxes; calycine teeth subulate, longer than the tube. ♃. H. Native of the valley of Cashmere, Royle. Stems simple. Leaves 2-3 inches long. Corolla incurved, exceeding the calycine teeth a little.

Connate-leaved Cat-mint. Pl. 1 to 2 feet. ?

6 N. nervòsa (Royle, l. c.) glabrous; stem humble, erect, branched; leaves on short petioles, lanceolate, acute, serrated, rounded at the base, green on both surfaces; spike oblong, dense; outer bracteas ovate, very acute, ciliated, longer than the calyxes; calycine teeth long-subulate, about equal in height to the tube. ♃.? H. Native of the valley of Cashmere, Royle. Herb branched at the base. Leaves 1-2 inches long. Mouth of calyx almost equal. Corolla incurved, twice as long as the calyx.

Nerved-leaved Cat-mint. Pl. ½ to 1 foot.

7 N. erio'stachys (Benth. lab. p. 734.) stem erect, nearly simple, pubescent; leaves almost sessile, ovate, obtuse, crenated, roundly subcordate at the base, green above, and glabrous, hoary beneath; spike oblong, dense; bracteas oblong-linear and subulate, equalling the calyxes; calycine teeth subulate, rather longer than the tube, and are, as well as the bracteas, villous. ♃.? H. Native of Cashmere, in the valleys of Baspa and Paber, in elevated grassy places on the margins of woods, &c., Jacquemont. Allied to *N. connàta* and *N. nervòsa*, but the leaves are very distinct. Leaves 1 to 1½ inch long. Bracteas entire.

Woolly-spiked Cat-mint. Pl. 1 to 2 feet.

8 N. campe'stris (Benth. lab. p. 734.) pubescent, or nearly glabrous; stems ascending, almost simple; leaves almost sessile, lanceolate, acute, serrated, rounded at the base, green on both surfaces; spike elongated, somewhat interrupted at the base; outer bracteas lanceolate, very acute, ciliated, about equal in length to the calyxes; calycine teeth subulate, about equal in length to the tube. ♃. H. Native of Cashmere, in fields, frequent, Jacquemont. Allied in the form of the leaves to *N. nervòsa*; and in the flowers to *N. spicàta*. Spikes and bracteas altogether that of *N. spicàta*.

Field Cat-mint. Pl. 1 to 2 feet. ?

9 N. rùta (Royle, ex Benth. in Hook. bot. misc. 3. p. 378. lab. p. 469.) stem erect, glabrous; leaves petiolate, oblong-ovate, or ovate-lanceolate, crenated, broadly cordate at the base, green and glabrous on both surfaces; spikes oblong-cylindrical, rather interrupted; bracteas lanceolate-subulate, rather shorter than the calyxes; calyx glabrous, with subulate teeth, which are about equal in length to the tube. ♃. H. Native of the Himalaya, at Simlah, and in the valley of Cashmere. Stem a little branched. Leaves 2-3 inches long. Corolla incurved, twice as long as the calyx, with an exserted tube. Plant glabrous in every part except the calycine teeth, which are pubescent; and the petioles and floral leaves, which are somewhat ciliated.

Tall Cat-mint. Pl. 2 to 3 feet.

10 N. spica'ta (Benth. in Wall. pl. asiat. rar. 1. p. 64. lab. p. 470.) plant erect, nearly glabrous; leaves petiolate, ovate, obtuse, crenated, cordate at the base, green on both surfaces; racemes spike-formed, short, dense; bracteas oblong or lanceolate-linear, subulate, acuminated, equalling the calyxes; calycine teeth long-subulate, about equal in length to the tube. ♃. H. Native of Himalaya, in the provinces of Kamaon and Bhuddrinah, Wall.; Valley of Cashmere, Royle, and at Simlah, Lady Dalhousie. Betónica lævigàta, D. Don. prod. fl. nep. p. 110. Stem a little branched, with pubescent angles. Leaves 1 to 1½ inch long: floral leaves broad-ovate, sessile. Calyxes sessile, incurved, with a nearly equal mouth. Corolla incurved, twice as long as the calyx, red.? Bentham has specimens of this gathered in Cashmere by Jacquemont, having the stems and leaves sometimes hispid, and the leaves scarcely cordate at the base.

Spiked Cat-mint. Pl. ½ to 1 foot.

11 N. raphanorhi'za (Benth. lab. p. 734.) stem ascending, pubescent at the base, rather clammy; leaves petiolate, ovate, bluntish, serrately crenated, truncate at the base, rather hispid, green on both surfaces; spike short, dense, somewhat interrupted at the base; outer bracteas oblong, narrowed at both ends, almost equalling the calyxes; teeth of calyx subulate, hispid, unequal, shorter than the tube, which is nearly glabrous. Root ♃. Native of Cashmere, in grassy places, Jacquemont. Root thick, like that of *N. tuberòsa*. Leaves like those of *N. spicàta*, but smaller.

Raddish-rooted Cat-mint. Pl. ?

12 N. bi'color (Royle, ex Benth. in Hook. bot. misc. 3. p. 378. lab. p. 470.) stem ascending, villous at the base; leaves petiolate, ovate, obtuse, crenated, sub-cordate at the base, green above and hoary beneath; spike oblong, dense, or somewhat interrupted at the base; bracteas oblong-linear, very acute, equalling the calyxes; calyx nearly glabrous, with subulate teeth, which are about equal in length to the tube. ♃. H. Native of the Himalaya, Syen, and Mussooree, Royle. Leaves like those of *N. Mussini*, but smaller. Bracteas and calycine teeth ciliated.

Discoloured-leaved Cat-mint. Pl. ascending.

13 N. móllis (Benth. lab. p. 734.) stems ascending, villous; leaves on short petioles, ovate, obtuse, a little crenated, cordate at the base, clothed with soft villi on both surfaces, rather canescent beneath; superior leaves small, remote; spikes slender, rather interrupted; bracteas oblong-linear, very acute, equalling the calyxes; calyx finely pubescent, having the teeth much shorter than the tube. ♃. H. Native of the valley of Cashmere, Jacquemont. Allied to *N. discolor*. Whorls distinct, scarcely 6-flowered. Corolla pale red, the lower lip dotted with purple, not blue, as in the other species of the present section.

Soft Cat-mint. Pl. ascending.

14 N. elli'ptica (Royle, ex Benth. in Hook. bot. misc. 3. p. 378. lab. p. 470.) stem erect, rather villous; leaves sessile, ovate, elliptic, obtuse, toothed, cordate at the base, green on both surfaces, glabrous; spike interrupted at the base; floral leaves and bracteas ovate-lanceolate, very acute, ciliated, rather longer than the calyxes; calycine teeth subulate, about equal in length to the tube. ♃. H. Native of the Himalaya, from Cashmere to Syen, Royle. N. polystachya, Benth. in Hook. bot. misc. 3. p. 378. Leaves elegantly and regularly toothed, an inch long. Calyx and corolla of *N. spicàta*.

Var. β, parviflòra (Benth. lab. p. 470.) flowers smaller. ♃. H. Native of Simlah, Lady Dalhousie.

Elliptic-leaved Cat-mint. Pl. 1 to 2 feet.

15 N. gra'ta (Benth. lab. p. 735.) stem erect, branched, clothed with fine pubescence; leaves nearly sessile, ovate, obtuse, crenated, rounded at the base or sub-cordate, wrinkled, pubescent on both surfaces, or nearly glabrous above, rather canescent beneath; spikes ovate-oblong, thick, interrupted at the base; mouth of calyx very oblique, sub-bilabiate; corolla scarcely twice as long as the calyx. ♃. H. Native of Cash-

mere, in stony, grassy, and humid places, Jacquemont. Very like *N. supina*; odour of *Sálvia officinàlis*.

Grateful-scented Cat-mint. Pl. 1 to 1½ foot.

16 N. multibractea'ta (Desf. fl. atl. 2. p. 11. t. 123.) erect, pubescent; leaves on short petioles, ovate-oblong, crenated, cordate at the base, green on both surfaces; racemes spike-formed, dense, simple, somewhat interrupted at the base; bracteas linear-subulate, coloured, equalling the calyxes; tube of corolla equalling the calycine teeth. ♃. H. Native of Mount Atlas, near Tlemsen. Stems almost simple. Lower leaves 1-2 inches long, striped, purplish; whorls dense, many-flowered: lower ones distant. Corollas purple, similar to those of *N. reticulàta*.

Many-bracteed Cat-mint. Fl. July, Aug. Clt. 1817. Pl. 3 feet.

17 N. Vaillan'ti (Benth. lab. p. 471.) plant erect, nearly glabrous; leaves petiolate, broad-ovate, obtuse, cordate at the base: superior leaves almost sessile, green on both surfaces; raceme simple, interruptedly spike-formed; whorls few-flowered; outer bracteas oblong, bluntish, adpressed, striated, coloured a little, and are, as well as the calyxes, pubescent; tube of corolla shortly exserted. ♃. H. Native of the Levant. Stems many from the same root. Leaves an inch long, broadly crenated, rather pubescent on the veins beneath. Corolla glabrous, incurved, twice as long as the calyx. Calycine teeth linear-lanceolate; upper ones narrower.

Vaillant's Cat-mint. Pl. 1 foot.

18 N. Apu'lea (Ucria, ex Guss. prod. fl. sic. 2. p. 80.) plant erect, nearly glabrous; leaves sessile, ovate-lanceolate, crenated, cordate at the base, green on both surfaces; racemes spike-formed, dense, simple; bracteas oblong-lanceolate, coloured a little, about equal in length to the calyxes; calycine teeth lanceolate, longer than the tube; tube of corolla much exserted. ♃. H. Native of Sicily, on calcareous hills; and of the North of Africa, at Tangiers. N. tuberòsa, Desf. fl. atl. 2. p. 10. but not of Lin. N. rósea, Salzm. pl. tang. exs. ex Benth. lab. p. 471. Stems generally simple, glabrous, or downy. Leaves smaller, shorter, and less wrinkled than in *N. tuberósa*. Calyx 5-toothed, nearly equal. Corolla pubescent, violaceous, middle lobe of lower lip crenulated.

Apulean Cat-mint. Pl. 1 foot.

19 N. tuberósa (Lin. spec. p. 798.) stem erect, simple, rather woolly; lower leaves petiolate; superior ones sessile, ovate-lanceolate, crenated, dilated at the base, cordate, green on both surfaces, or rather woolly beneath, wrinkled; racemes spike-formed, dense, simple, elongated; bracteas broad-ovate, reticulated, coloured, equalling the calyxes; tube of corolla equalling the calycine teeth. ♃. H. Native of the South of Spain, Portugal; Atlas, near Tlemsen, Sicily. N. tuberósa, Rchb. icon. bot. eur. 5. p. 23. t. 439. N. lanàta, Jacq. obs. bot. 3. p. 21. t. 75. N. reticulàta, Desf. fl. atl. 2. p. 11. t. 124. Rchb. icon. bot. eur. 5. p. 23. t. 440. N. violàcea, Brot. N. scábra, Tausch, in bot. zeit. 1831. 1. p. 218. N. fóliosa, Mor. elench. sard. ex Linnæa, 5. p. 69.—Barrel. icon. t. 603.—Ger. emac. t. 685. f. 7. Root fasciculately tuberous. Stems beset with rather clammy loose wool. Leaves 2-3 inches long. Calyx a little incurved, with narrow-lanceolate teeth. Corollas blue, or pale purple; middle lobe of lower lip crenulated.

Tuberous-rooted Cat-mint. Fl. June, Aug. Clt. 1688. Pl. 1 to 2 feet.

20 N. Scordótis (Lin. spec. p. 798.)-plant ascending, tomentose; leaves petiolate, ovate-roundish, obtuse, cordate at the base, villously woolly on both surfaces, wrinkled; raceme simple, rather spike-formed; whorls distinct, densely many-flowered; bracteas ovate, acute, adpressed, and are, as well as the calyxes, villously woolly. ♃. H. Native of Candia. Viv. fl. libye. t. 6. f. 2. N. tomentósa, Sieb. pl. exsic.—Alp. exot. p. 284. t. 283. Leaves scarcely an inch long: floral leaves sessile. Teeth of calyx nearly equal. Corolla glabrous, white?; tube incurved, a little exserted.

Var. β, viridis (Benth. lab. p. 473.) base of plant almost glabrous, and the top very villous; leaves green on both surfaces. ♃. H. Native of Sicily. S. hirsùta, Lin. spec. 798. but not of others. N. Scordòtis, Lin. spec. 798. N. procúmbens, Mill. diet. no. 10.—Bocc. sic. p. 48. t. 25. f. 2. Corollas white.

Scordotis Cat-mint. Fl. June, Aug. Clt. 1817. Pl. 1 to 1½ foot.

21 N. circinna'ta (Willd. enum. p. 602.) stem simple, erect; spikes ovate, solitary; leaves ovate-cordate, crenated, petiolate; bracteas ovate, acute. ♃. H. Native of Cappadocia. Leaves 3 inches long.

Circinnate Cat-mint. Pl. 1 foot.?

22 N. suffi'na (Stev. in mem. soc. nat. car. mosq. 3. p. 165.) stems decumbent; leaves oval, sub-cordate, sessile, villous; bracteas subulate, about equal in length to the calyxes; whorls almost sessile, approximate. ♃. H. Native of Eastern Caucasus, in stony places at the falls of Choodgal, Steven; on Alp Tafandagh, among fragments of schistous. N. fissa, Meyer, verz. pflanz. p. 98. Meyer, in his verz. pflanz. p. 98, gives the following description of the plant: plant villous; root creeping; stem erectish, a little branched; leaves nearly sessile, ovate or oblong, bluntish, crenately toothed; cymes nearly sessile, collected into a terminal head; calyxes membranaceous, exceeding the subulate bracteas, but shorter than the tube of the corolla; lobes acuminated, mucronate. Corollas blue.

Trailing Cat-mint. Pl. decumbent.

23 N. glutinósa (Benth. lab. p. 735.) stem erect, branched, clothed with clammy pubescence; leaves sessile, ovate or lanceolate, deeply toothed, green on both surfaces, clammy, finely pubescent; raceme simple; whorls distant, or the upper ones are sub-spicate; bracteas linear, very acute: outer ones a little shorter than the calyxes; calyx elongated, striated, with short acute teeth; tube of corolla much exserted. ♃. H. Native of the Himalaya, between Poyé and Rici, Jacquemont. Leaves rather bullate above, ⅓ to ¾ inch long, the nerves very prominent beneath; inflorescence almost of *N. Itálica*, and *N. distans*, but the lower cymes are, for the most part, solitary. Calyx clothed with clammy pubescence. Corolla violaceous; tube incurved, twice as long as the calyx; lips short.

Clammy Cat-mint. Pl. 1 to 1½ foot.

Sect. III. Stegione'peta (*from στεγω, stego*, to cover, and *Nepèta*.) Benth. lab. p. 474. Cymes condensed into many-flowered whorls, often pedunculate: superior ones sub-spicate. Racemes simple, rarely remote. Bracteas about equal in length to the calyxes, or exceeding them. Calyx sometimes elongated, incurved, with an oblique mouth, and lanceolate or subulate teeth, the upper teeth the largest; sometimes almost straight, with nearly equal teeth. Corolla having the tube hardly or a little exserted, and the throat inflated.

24 N. Sibthórpi (Benth. lab. p. 474.) plant ascending or erect, branched at the base, tomentose or woolly; leaves petiolate, ovate, obtuse, crenated, cordate, wrinkled, clothed with soft hoary tomentum or wool; whorls dense, many-flowered: lower ones distant: the superior ones crowded into a terminal-oblong spike; bracteas ovate or oblong, subulately awned, equalling the calyxes; calyx ovate, with nearly equal awned teeth, which are equal in length to the tube; corolla hardly twice as long as the calyx. ♃. H. Native on mountains about Athens, and near Zara in Dalmatia. N. Itálica, Sibth. et Smith, fl. græc. 6. t. 548. but not of Lin. Stems decumbent at the base, and woody;

branches erect or ascending. Leaves ½ to 1 inch long; floral leaves sessile. Corollas purplish.

Sibthorp's Cat-mint. Pl. 1 to 2 feet.

25 N. Ita'lica (Lin. spec. p. 798.) erect, tall, clothed with fine hoary pubescence; leaves petiolate, ovate, crenated, cordate, canescent on both surfaces; racemes almost simple; bracteas linear or lanceolate, stiff, rather longer than the calyxes; calyx elongated, a little incurved, with a scarcely oblique mouth, and lanceolate, acute teeth, the superior teeth the largest; corolla hardly twice as long as the calyx. ♃. H. Native of Spain, Pavon; Mogodor, Brouss.; Italy, Lin. but is now wanting in Italian, Neapolitan, and Sicilian floras. Jacq. hort. vind. 2. p. 51. t. 112.; a variety with broader, shorter bracteas. Rchb. icon. bot. cur. 5. p. 50. t. 483. N. teucrioides, Lam. dict. 1. p. 711. N. marrubioides, Willd. enum. 2. p. 603. N. imbricàta, Lag. ex Spreng. syst. 2. p. 729. O. orientàlis, Mill. dict. no. 9. N. calamíntha, Tausch, in bot. zeit. 1831. 1. p. 219.? Catària canéscens, Mœnch. meth. p. 388. N. macrostàchya, Jan. pl. exsic. Leaves hardly an inch long. Whorls all distinct. Corollas reddish white; tube almost inclosed.

Italian Cat-mint. Fl. June, Aug. Clt. 1640. Pl. 1½ to 2 feet.

26 N. di'stans (Royle, ex Benth. in Hook. bot. misc. 3. p. 379. lab. p. 475.) erect, tall; stem villous; leaves petiolate, ovate-lanceolate, obtuse, crenated, deeply cordate at the base, wrinkled, villous beneath; whorls dense: lower ones remote: upper ones approximate; bracteas linear-lanceolate, about equal in length to the calyxes; calyx elongated, incurved, with an oblique mouth: the superior teeth lanceolate: lower ones subulate; all setaceously acuminated; corolla about twice as long as the calyx. ♃. H. Native of the Himalaya, at Mussooree, and Syen, Royle. Allied to *N. Itálica*, but differs in the simple depauperate raceme, in the lower leaves being more wrinkled, densely villous beneath, and in the calycine teeth being all setaceous at top. Superior leaves few, remote, and smaller.

Distant-whorled Cat-mint. Pl. 2 to 3 feet.

27 N. cilia'ris (Benth. in Wall. pl. rar. asiat. 1. p. 64. lab. p. 475.) erect, clothed, with hoary pubescence; leaves petiolate, broadly-ovate, obtuse, crenated, cordate at the base, clothed with hoary tomentum beneath or on both surfaces; racemes almost simple; bracteas ovate or broadly lanceolate: outer ones almost equal in length to the calyxes; calyx elongated, pubescent, incurved, with an oblique mouth, and lanceolate-subulate rather spreading teeth; corolla about twice as long as the calyx. ♃. H. Native of Nipaul, and towards Cashmere. Habit and inflorescence of *N. ruderàlis*, from which it differs in the branches and leaves being usually canescent, &c.

Ciliated Cat-mint. Pl. 1 to 2 feet.

28 N. rudera'lis (Hamilt. ex Benth. in Wall. pl. asiat. rar. 1. p. 64.) erectish, clothed with fine pubescence; leaves petiolate, ovate, obtuse, crenated, cordate at the base, pubescent on both surfaces, rather greenish; racemes nearly sessile, secund; cymes dense: lower ones pedunculate; bracteas subulate: outer ones equalling the calyxes; calyx ovate, pubescent, with an oblique mouth and subulate teeth, the superior teeth the longest; corolla a half longer than the calyx. ♃. H. Native of Nipaul, at the foot of the mountains, Hamilt; Hurdwar and Rajemahl, Wall; Hindostan, Heyne?; Saharumpur and Deyra Dhoon, Jacquemont. Glechòma erécta, Roxb. fl. ind. 3. p. 7. Thymus nepetoides, D. Don. prod. fl. nep. p. 113. Glechòma Hindostàna, Roth. nov. pl. spec. p. 258. Glechòma Indica, Spreng. syst. 2. p. 727. Leaves 1½ inch long. Corollas small, purplish.

Rubbish Cat-mint. Pl. 1 to 2 feet.

29 N. clinopodioi'des (Royle, ex Benth. in Hook. bot. misc. 3. p. 379. lab. p. 476.) plant ascending, clothed with fine pubescence; leaves petiolate, ovate, obtuse, crenated, broadly subcordate at the base, green on both surfaces, and finely pubescent; racemes almost simple; whorls rather loose, many-flowered, subsecund; bracteas subulate, rather shorter than the calyxes; calyx tubular, pubescent, with an oblique mouth; the superior teeth lanceolate; and the lower teeth subulate; corolla scarcely exceeding the calyx. ♃. H. Native of the banks of the river Jumna, Royle. Allied to *N. ruderàlis*, but differs in the calyxes being smaller and slenderer, in the corollas being small, scarcely exceeding the calyxes.

Clinopodium-like Cat-mint. Pl. 1 to 2 feet.?

30 N. leucophy'lla (Benth. lab. p. 476.) plant ascending or erectish; branches clothed with hoary tomentum; leaves petiolate, ovate or roundish, crenated, truncate at the base or cordate, green above, wrinkled, clothed with white tomentum beneath; racemes nearly simple, secund; cymes nearly sessile, dense, many-flowered; bracteas subulate, rather shorter than the calyxes; calyx tubular, clothed, with hoary pubescence, with an oblique mouth and lanceolate-subulate teeth: the superior teeth the longest; corollas a half longer than the calyx. ♃. H. Native of Himalaya, at Mussooree, Royle; Sinlab, Jacquemont. This differs from *N. ruderàlis* in the leaves being small, wrinkled, and white beneath.

White-leaved Cat-mint. Pl. 1 to 2 feet.

31 N. floccòsa (Benth. lab. p. 736.) erect, divaricately branched, clothed with white floccose wool; leaves petiolate, roundish, cordate at the base; racemes very loose, a little branched; cymes head-formed, few, many-flowered, on long peduncles; bracteas linear-subulate, equalling the calyxes. ♃. H. Native of the North of India, between Nako and Chango, Jacquemont. This species is distinguished from *N. ruderàlis* in the wool, form of leaves, and inflorescence. Corolla small, hardly exceeding the calyx.

Floccose Cat-mint. Pl. 1 to 2 feet.?

Sect. IV. Cata'ria (from *catus*, a cat; so called because cats are fond of *N. catària*.) Benth. lab. p. 476. Cymes usually condensed into many-flowered whorls: lower cymes pedunculate. Racemes simple or panicled. Bracteas shorter than the calyxes, usually very short. Calyx elongated, incurved, with an oblique, rarely erectish mouth, and lanceolate teeth, the superior teeth generally the largest. Tube of corolla a little exserted, with an inflated throat.

32 N. gracilifló'ra (Benth. in Wall. pl. rar. asiat. 1. p. 65. lab. p. 476.) ascending, glabrous, or finely pubescent; leaves petiolate, ovate or lanceolate, obtuse, crenated, cordate at the base, finely pubescent on both surfaces, rather canescent beneath; racemes branched; cymes very loose, dichotomous; peduncles and branches elongated, filiform; bracteas subulate, shorter than the calyxes; calyx ovate-tubular, with an oblique mouth and subulate teeth; corolla scarcely twice as long as the calyx. ♃. H. Native of the East Indies, in the province of Hurdwar, Wall; Deyra Dhoon, Royle. Stem branched at the base; branches very slender. Leaves on long petioles, scarcely an inch long. Corollas small, blue. This is intermediate between Sect. *Catària* and Sect. *Stagionépeta*.

Slender-flowered Cat-mint. Pl. 1 to 2 feet.

33 N. micra'ntha (Bunge, in Ledeb. fl. alt. 2. p. 401.) plant ascending, humble, pubescent, or glabrous; leaves petiolate, ovate, obtuse, crenated, rounded at the base, pale on both surfaces; racemes loose, branched; bracteas scarcely longer than the pedicels; calyx tubular, incurved, pubescent, with an oblique mouth; corolla scarcely exceeding the calyx. ☉. H. Native of Siberia in Altaia; on the mountains of Arkaul and Dolenkara. Ledeb. fl. ross. alt. ill. t. 412. Corollas blue.

Small-flowered Cat-mint. Pl. 1 foot.

34 N. Cata'ria (Lin. spec. p. 796.) plant erect, tall, clothed

with hoary pubescence; leaves petiolate, ovate, acute, deeply crenated, cordate at the base, green above, but clothed with hoary tomentum beneath; racemes a little branched; whorls dense, many-flowered; bracteas scarcely longer than the pedicels; calyx ovate, pubescent, a little incurved, with an oblique mouth and lanceolate-subulate rather spreading teeth; corolla one half longer than the calyx. ♃. H. Native almost throughout the whole of Europe, and Middle Asia, on walls, in hedges, and in waste places; plentiful in Britain. Smith, engl. bot. t. 137. Fl. dan. t. 580. Catària vulgàris, Mœnch. meth. p. 387. N. vulgàris, Lam. fl. fr. 2. p. 398. N. citriodòra, Becker, fl. francof. p. 218. N. minor, Mill. dict. no. 2. N. Americàna, Mœnch. ex Steud. nom. bot. p. 552. ?—Sabb. hort. rom. 3. t. 80.—Ioh. icon. 511. f. 1. Pubescent or tomentosely canescent. Leaves 1½ inch long. Lower cymes on short peduncles. Corollas white, with a tinge of red, spotted with purple. The whole plant has a strong scent between mint and pennyroyal. It is called cat-mint, because cats are very fond of it, especially when it is withered, when they will roll themselves on it, tear it to pieces, and chew it with great pleasure. Ray observes, that plants, which he transplanted from the field into his garden, were always destroyed by cats, unless he protected them with thorns till they had taken root and came into flower, but that they never meddled with plants raised from seed; hence the old saying: "if you set it the cats will eat it; if you sow it the cats don't know it." Mr. Miller has confirmed this by his own experience, having frequently set a plant from another part of the garden within two feet of others which came up from seed, when the former was torn in pieces and destroyed by the cats, whilst the latter remained untouched. The true reason of this difference is assigned by Ray; that cats are fond of it in a withering state, or when the peculiar scent of the plant is excited by being handled or bruised in gathering or transplanting.

An infusion of Cat-mint is deemed a specific in chlorotic cases. Two ounces of the expressed juice may be given for a dose. Sheep are said to eat it; but all other domestic animals are said to refuse it.

Var. β, cándida (Benth. lab. p. 477.) leaves deeply crenated, pale above and white beneath. ♃. H.

Cat-mint, Common. Fl. July, Sept. Britain. Pl. 2 to 4 feet.

35 N. Nepetélla (Lin. spec. p. 797.? Benth. lab. p. 477.) plant erect, pubescent, or clothed with hoary tomentum; leaves on short petioles, lanceolate, crenated, rounded or cordate at the base, clothed with hoary pubescence or tomentum on both surfaces; racemes many-flowered, nearly simple; bracteas scarcely longer than the pedicels; calyx tubular, incurved, with an oblique mouth; corolla twice as long as the calyx. ♃. H. Native of the South of Europe, especially on the mountains; as of Spain, Provence, Switzerland; Italy, from Piedmont and Liguria to Naples. This is a very variable plant, especially in gardens. Corollas usually twice the size of those of *N. Catària*, white, purplish, or blue.

Var. α, màjor (Benth. lab. p. 477.) raceme elongated, many-flowered; flowers white or purplish. ♃. H. Native of shady places. N. Nepetélla, All. ped. 1. p. 37. t. 2. f. 1. bad. Rchb. icon. bot. eur. 3. p. 35. t. 261. Catària Nepetélla, Mœnch. meth. p. 388. N. amethýstina, Desf. ex Poir. suppl. 3. p. 206. N. paniculàta, Mill. dict. no. 4. Stems 3-4 feet high. Whorls as in *N. Catària*, large and dense, many-flowered, disposed in a long raceme.

Var. β, hùmilis (Benth. lab. p. 478.) racemes short, dense; flowers white or purplish. ♃. H. Native in dry exposed places. N. lanceolàta, Lam. dict. 1. p. 710. Rchb. icon. bot. eur. 6. p. 20. t. 536. N. angustifòlia, Vahl, symb. 1. p. 41. N. graveolens, Vill. dauph. 2. p. 366. N. Arragonénsis, Lam. dict. 1. p. 703. Plant humble. Racemes 2-3 inches long.

Var. γ, incàna (Benth. lab. p. 478.) leaves clothed with hoary tomentum, and more wrinkled. ♃. H. N. incàna, Ait. hort. kew. 2. p. 285.

Small-Nepeta Cat-mint. Fl. July, Sept. Clt. 1728. Pl. 1 to 4 feet.

36 N. ovánea (Stev. in mem. soc. nat. cur. mosq. 3. p. 265. Benth. lab. p. 478.) ascending, humble, paniculately branched; branches clothed with hoary tomentum; leaves petiolate, small, ovate or oblong, crenated, wrinkled, clothed with hoary tomentum on both surfaces; racemes numerous, short, secund; bracteas very short; calyx tubular, incurved, clothed with hoary tomentum; corolla scarcely longer than the calyx: tube inclosed. ♃. H. Native of Eastern Caucasus, in gravelly places at the Falls of Chodgal, Steven; at the Falls of the Terek, and in stony places near Nartzana, C. A. Meyer. N. incàna, Bieb. fl. cauc. 2. p. 40. 3. p. 392. Rchb. icon. bot. eur. 4. t. 305. and numerous other authors, but not of Aiton. N. acinifòlia, Spreng. pug. 1. p. 41. syst. 2. p. 727. N. mollissima, Tausch, in bot. zeit. 1831. 1. p. 219.? Stems trichotomously paniculed, as in *N. Ucràinica*, but the branches are terminated by short unilateral racemules, not corymbs. Corollas small, blue or white.

Blue-flowered Cat-mint. Pl. 1 foot.?

37 N. Meyéri (Benth. lab. p. 478.) plant humble, ascending; branches finely pubescent; leaves petiolate, ovate, obtuse, crenated, cordate at the base, greenish on both surfaces, pubescent beneath; racemes nearly simple, many-flowered; bracteas much shorter than the calyxes; calyx elongated, incurved, pubescent, with an oblique mouth; corollas scarcely half as long again as the calyx, with an inclosed tube. ♃. H. Native of Caucasus, in dry, stony places on the Talusch mountains near Swant. N. micrántha, Meyer, verz. pflänz. p. 91. but not of Bung. An intermediate plant between *N. Mussini* and *N. Catària*. Cauline leaves an inch long; upper floral leaves minute. Corollas like those of *N. Catària*.

Meyer's Cat-mint. Pl. ½ to 1 foot.

38 N. agrestis (Lois. nouv. not. 25.? Benth. lab. p. 479.) erect, almost glabrous; leaves petiolate, ovate-lanceolate, deeply toothed, subcordate at the base, nervosely wrinkled, green on both surfaces; racemes elongated, nearly simple; bracteas scarcely longer than the pedicels; calyx elongated, incurved, villous, with an oblique mouth; corolla scarcely twice as long as the calyx, having the tube shortly exserted. ♃. M. Native of Corsica and Spain, on Mount Urchillo, near Orcelia. Stem a little branched, clammy. Leaves ½ to 1 inch long, rather clammy. Calyx clammy, villous. Corollas white, a little larger than those of *N. Catària*.

Field Cat-mint. Pl. 2 feet.

39 N. azurea (R. Br. in append. to Salt. abyss. Benth. lab. p. 479.) plant erect; leaves sessile, ovate or ovate-oblong, crenated, subcordate at the base, wrinkled, canescent beneath; racemes simple; cymes nearly sessile; whorls dense, the upper ones subspicate; bracteas minute; calyx subovate, incurved, pubescent, with an oblique mouth; corolla twice as long as the calyx. ♃. H. Native of Abyssinia, Salt. Stems finely tomentose. Leaves green above. Corolla blue, with the tube a little exserted, and attenuated at the base.

Azure-flowered Cat-mint. Pl. 1 to 2 feet.

40 N. racemòsa (Lin. spec. 1. p. 711.) plant erect, pubescent; leaves petiolate, ovate, obtuse, crenated, cordate at the base, green and wrinkled above, and canescent beneath; racemes loose, nearly simple; cymes almost sessile, or the lower ones are pedunculate, few-flowered; bracteas much shorter than the calyxes; calyx elongated, incurved, clothed with soft wool, with

an oblique mouth; corolla twice as long as the calyx, with a shortly exserted tube. ♃. H. Native of the Levant, Tournefort. Rchb. icon. bot. eur. 6. p. 19. t. 585. This species differs from *N. Mussini* in the erect stem.

Racemose-flowered Cat-mint. Pl.

41 N. Mussi'ni (Henkel, adumb. pl. p. 15. Benth. lab. p. 480.) diffuse; branches ascending, clothed with hoary pubescence; leaves petiolate, ovate, obtuse, crenated, cordate at the base, green and wrinkled above, and canescent beneath; racemes loose, simple, secund; cymes nearly sessile, few-flowered; bracteas much shorter than the calyxes; calyx elongated, incurved, clothed with soft wool, with an oblique mouth; corolla twice as long as the calyx, with a shortly exserted tube. ♃. H. Native of Caucasus and Iberia, on stony hills. Rchb. icon. bot. eur. 6. p. 20. t. 587. N. longiflòra, Sims, bot. mag. t. 923.? had, but not of Vent. N. salviæfòlia, Pers. ench. 2. p. 115. N. cyanótricha, Tausch, in bot. zeit. 1831. 1. p. 218.? N. argéntea, N. diffùsa, N. incàna, N. lamiifòlia, N. teucrioìdes, N. violàcea, N. Willdenoviàna, &c. &c. Hort. Corollas pale blue, a little smaller than those of *N. coloràta*. The leaves in the cultivated specimens are very like those of *N. coloràta*, but those of the wild specimens are much smaller, more wrinkled, and more woolly beneath.

Mussin's Cat-mint. Fl. May, Aug. Clt. 1804. Pl. diffuse, 2 feet.

42 N. grandiflòra (Bieb fl. cauc. 2. p. 42.) erect, almost glabrous; leaves on short petioles, ovate, obtuse, crenated, cordate at the base, green above, and pale and canescent beneath; racemes a little branched at the base; cymes pedunculate, many-flowered; bracteas much shorter than the calyxes; calyx elongated, incurved, nearly glabrous, with an oblique mouth; corolla twice as long as the calyx, with a shortly exserted tube. ♃. H. Native throughout Caucasus, in grassy mountain woods; island of Melos. Rchb. icon. bot. eur. 3. p. 68. t. 279. N. melissæfòlia, Pers. ench. 2. p. 115. and many other authors, but not of Lam. N. lamiifòlia, Hoffm. hort. mosc. ex Bieb. N. coloràta, Willd. enum. 2. p. 602. N. argéntea, N. grándis, N. incàna, N. teucrioìdes, N. violàcea, &c. Hortul. Stems many feet high, branched, glabrous or pubescent towards the tops. Corollas blue, 7 lines long, incurved. This with *N. Mussini* have produced various hybrids in the gardens.

Great-flowered Cat-mint. Fl. June, Aug. Clt. 1806. Pl. 4 to 6 feet.

43 N. betonicæfòlia (Meyer, verz. pflanz. p. 92.) erect, almost simple, villously tomentose; lower leaves petiolate: superior ones sessile, ovate-lanceolate, crenated, cordate at the base, green on both surfaces, and clothed with soft pubescence; racemes short, simple; whorls all dense; bracteas much shorter than the calyxes; calyx elongated, villous, with a scarcely oblique dilated mouth; corolla twice as long as the calyx, with an exserted tube, which is attenuated at the base. ♃. H. Native of Caucasus, on the Talusch mountains. This differs from *N. grandiflòra*, in the superior part of the stem, leaves, calyxes, and corollas being clothed with soft tomentum; and in the racemes being short and spike-formed.

Betony-leaved Cat-mint. Pl. 2 to 4 feet.?

44. N. salviæfòlia (Royle, ex Benth. in Hook. bot. misc. 3. p. 379.) erect, clothed with hoary tomentum; leaves petiolate, ovate, or ovate-lanceolate, obtuse, crenated, wrinkled at the base, clothed with soft tomentum on both surfaces, canescent above and white beneath; racemes loose, almost simple; cymes pedunculate, elongated, many-flowered; bracteas very short; calyx oblong, erect, pubescent, with an oblique mouth; corolla more than twice as long as the calyx. ♃. H. Native of the Valley of Cashmere, Royle; on the mountains of Pyr-Pundjal and Illamabad, Jacquemont. Leaves hardly an inch long. Corolla slender, 6-7 lines long.

Sage-leaved Cat-mint. Pl.

45 N. melissæfòlia (Lam. dict. 1. p. 711. but not of Bieb.) plant erect, pubescent; leaves petiolate, ovate, obtuse, crenated, cordate at the base, green on both surfaces, villous: the superior ones sessile, acute; racemes loose, nearly simple; bracteas shorter than the calyxes; calyx elongated, incurved, pubescent, with an oblique mouth; corolla scarcely twice as long as the calyx. ♃. H. Native of the Grecian Archipelago, on arid hills; as of Candia and Melos, &c. Desf. in ann. mus. 10. p. 301. t. 23. Allied to *N. grandiflòra*. Hairs on stem rather glandular. Leaves scarcely an inch long. Calyx coloured a little. Corollas blue or purple, a little smaller than those of *N. grandiflòra*. Perhaps this species is referrible to Sect. *Macronépeta*. Branches of root fusiform.

Balm-leaved Cat-mint. Fl. July, Aug. Clt. 1752. Pl. 1 to 2 feet.

Sect. V. Macrone'peta (from μακρος, *macros*, long, and Nepeta; in allusion to the long corollas.) Benth. lab. p. 482. Cymes pedunculate, few-flowered. Racemes terminal, very loose, a little branched. Superior floral leaves or all bracteaformed. Calyx elongated, with an oblique mouth and lanceolate or ovate teeth; the superior teeth rather the broadest. Corolla much exserted, with a slender exserted tube, and an inflated throat.

46 N. macra'ntha (Fisch. hort. gorenk. Benth. lab. p. 482.) erect, branched, nearly glabrous; leaves on short petioles, ovate-lanceolate, serrately crenated, truncate, or subcordate at the base, green on both surfaces; racemes elongated, rather loose; bracteas minute; calyx incurved, with lanceolate teeth; corolla 3 times as long as the calyx, having the tube much exserted and attenuated at the base. ♃. H. Native of Siberia, among the Altaian mountains. Dracocéphalum Sibíricum, Lin. spec. 830. Pall. fl. ross. 3. t. 13. Sims. bot. mag. 2185. Moldávica elàta, Mœnch. meth. p. 410. Moldávica Sibírica, Mœnch. ex Steud. nom. bot. p. 285. Dracocéphalum, &c. Gmel. sib. 3. p. 334. t. 51. Root creeping. Leaves 2-3 inches long. Corolla showy, 1 to 1½ inch long, blue.

Long-flowered Cat-mint. Fl. June, Aug. Clt. 1760. Pl. 1 to 2 feet.

47 N. Govania'na (Benth. lab. p. 482.) plant erect, branched, clothed with fine pubescence; leaves on short petioles, ample, oblong-elliptic, crenated, rounded at the base; racemes elongated, loose, a little branched, bracteas minute; calyx a little incurved, with lanceolate teeth; corolla 4 times as long as the calyx, with a very slender much exserted tube. ♃. H. Native of the Himalaya; as in Cashmere, Kidarkonta, and Kanaour, Royle; Sirmore and Kamaon, Wall. Dracocéphalum Govaniànum, Wall. pl. rar. asiat. 2. p. 65. Allied to the preceding. Corollas yellowish.

Govan's Cat-mint. Pl. 2 to 3 feet.?

48 N. ere'cta (Benth. lab. p. 482.) stem erect, pubescent; leaves petiolate, ovate-lanceolate, obtuse, crenated, wrinkled, cordate at the base, rather canescent beneath; racemes elongated, rather loose; bracteas minute; calyx rather incurved; corolla more than twice as long as the calyx, having the tube much exserted and attenuated at the base. ♃. H. Native of Kamaon, on the mountains, Royle. Dracocéphalum erèctum, Royle, ex Benth. in Hook. bot. misc. 3. p. 380. Allied to *N. macrántha*, but differs in the leaves being wrinkled and canescent beneath, and in the flowers being a little smaller. Perhaps both this and the preceding are varieties of *N. macrántha*. Corolla violaceous.

Erect Cat-mint. Pl. 2 to 3 feet.?

49 N. pérsica (Meyer, verz. pflanz. p. 93.) erectish, quite glabrous; leaves petiolate, ovate-roundish, broadly subcordate at the base, deeply crenated, green on both surfaces; racemes very loose, few-flowered, a little branched; calyx incurved, with oblong teeth; corolla 3 times longer than the calyx, with a very slender much exserted tube. ♃. H. Native of Caucasus, in stony places on the Talusch mountains. N. láxa, Benth. lab. p. 483. Stems decumbent at the base. Leaves scarcely an inch long. Corollas blue, 10-12 lines long.

Cleft Cat-mint. Pl. 2 to 3 feet.

50 N. longiflòra (Vent. hort. cels. t. 66.) plant, ascending, rather canescent; leaves on short petioles, superior ones sessile, all ovate, crenated, cordate at the base, wrinkled, pale on both surfaces; racemes elongated, few-flowered; bracteas scarcely equalling the pedicels; calyx a little incurved, with lanceolate teeth; corolla about 3 times as long as the calyx, with a very slender much exserted tube. ♃. H. Native of Persia, between Teheran and Ispahan, and of Caucasus. Stems decumbent at the base. Calyx blue, as well as the corolla. (fig. 77.)

Fig. 77.

Long-flowered Cat-mint. Fl. June, Aug. Clt. 1802. Pl. 1 to 2 feet.

51 N. brevifòlia (Meyer, verz. pflanz. p. 93.) decumbent, pubescent; leaves on long petioles, roundish, crenated, broadly cordate, clothed with hoary pubescence on both surfaces, or only beneath; racemes few-flowered, loose; bracteas shorter than the calyxes; calyx incurved, pubescent, with lanceolate teeth; corolla more than twice as long as the calyx, with a slender much exserted tube. ♃. H. Native of Eastern Caucasus, on the Alps of Tafandagh. N. longiflòra, Fisch. ex Hortul. Habit of *N. longiflòra*, but more humble. Calyx coloured at top. Corollas blue, 8-9 lines long, form of those of *N. longiflòra*.

Short-leaved Cat-mint. Pl. decumbent.

52 N. cal'sea (Willd. spec. 3. p. 50.) erect,? pubescent; leaves petiolate, ovate, obtuse, deeply crenated, cordate at the base, clothed with hoary pubescence on both surfaces: racemes nearly simple; bracteas scarcely longer than the pedicels; calyx elongated, incurved, villous, with an oblique mouth; corolla twice as long as the calyx, with a shortly exserted slender tube. ♃. H. Native of the Levant. Allied to *N. Cataria*, but differs in the smaller stature, in the leaves being hoary on both surfaces, and in the flowers being twice as long; and from *N. Mussini* in the racemes being scarcely secund, in the calyxes being villous, not woolly, and in the cymes being almost sessile. Corollas blue. Very nearly allied to *N. brevifòlia*, but the racemes are more dense.

Curled-leaved Cat-mint. Fl. July, Aug. Clt. 1800. Pl. 2 feet.?

53 N. septemcrena'ta (Ehrenb. mss. ex Benth. lab. p. 484.) erect, clothed with rather clammy villi; lower leaves petiolate, superior ones sessile, all roundish, obtuse, crenated, cordate at the base, green on both surfaces; racemes elongated, few-flowered; bracteas scarcely longer than the pedicels; calyx a little incurved, with lanceolate teeth; corolla more than twice as long as the calyx, with a very slender much exserted tube. ♃. H. Native of Egypt, Ehrenberg; in the desert of Sinai, Bové. Leaves like those of ground-ivy, but thinner. Corolla 7-8 lines long, blue, slender.

Septemcrenate Cat-mint. Pl. 1 foot.

54 N. teucrifòlia (Willd. enum. p. 602.) ascending; leaves ovate, cordate, obtuse, petiolate, toothed, pubescent; cymes pedunculate, few-flowered; corolla with a very long filiform tube. ♃. H. Native of Armenia. Leaves on long petioles not serrated, but furnished with 4-6 deep teeth on each side, half an inch long. Racemes composed of dense few-flowered cymes. Corollas blue or purple.

Germander-leaved Cat-mint. Fl. July, Aug. Clt. 1816. Pl. ascending, 1½ foot.

55 N. lamiifòlia (Willd. enum. p. 602.) ascending, pubescent; leaves ovate, cordate, obtuse, petiolate, serrated; cymes pedunculate, many-flowered; tube of corolla filiform, curved. ♃. H. Native of Armenia. Habit of *Lámium amplexicaúle*. Flowers verticillately capitate at the tops of the branches.

Dead-nettle-leaved Cat-mint. Fl. July, Aug. Clt. 1806. Pl. ½ foot.

Sect. VI. Glechòma (from γληχων, *glechon*, the Greek name of a kind of thyme.) Benth. lab. p. 484. Glechòma, Lin. and other authors. Chamæclèma, Moench, meth. 387. Whorls axillary, few-flowered. Floral leaves conforming to the cauline leaves. Calyx tubular, a little incurved, with an oblique mouth and lanceolate-awned teeth, the superior teeth drawn out. Corolla exserted, having the tube dilated beyond the calyx.—Creeping herbs.

56 N. Glechòma (Benth. lab. p. 485.) procumbent, creeping; leaves petiolate, roundish, crenated, cordate at the base, green on both surfaces; bracteas hardly equalling the pedicels; calyxes villous; corollas 3 times as long as the calyx. ♃. H. Native throughout Europe and the North of Asia, in hedges, ditches, in woods and waste places; plentiful in Britain. Glechòma hederàcea, Lin. spec. p. 802. Hook. fl. lond. vol. 2. with a figure. Woodv. med. bot. t. 28. Fl. dan. t. 789. Mart. fl. rust. t. 61. Smith, engl. bot. t. 853. Calamíntha hederàcea, Scop. carn. no. 780. Chamæclèma hederàcea, Moench. meth. p. 393. Chamæclèma vulgàre, Vaill. bot. par. t. 6. f. 4-5-6. Glechòma micrántha, Bonningh. ex Rchb. fl. germ. exc. p. 316. Stems more or less villous. Leaves about an inch long; superior ones smaller, but similar. Corollas blue, 6-7 lines long, varying to white. The leaves of ground ivy were formerly thrown into the vat with ale to clarify it and to give it a flavour. This was called gill-ale, ground ivy being named gill or gell, and creep by ground, in some places. From this use of the plant and the form of its leaves, it has also the names *ale-hoof* and *tun-hoof*, but it has gradually grown into disuse since the introduction of hops. The expressed juice, mixed with a little wine, and applied morning and evening, destroys the white specks upon horses' eyes. Ground ivy has a peculiar strong smell and a bitterish taste, somewhat aromatic. It was formerly in considerable credit for pectoral, detergent, aperient, diuretic, corroborant, and other qualities, and was recommended particularly in pulmonary and nephritic complaints. In obstinate coughs it is still a favourite remedy with the common people. It acts also as an errhine, and is consequently useful in headache. It is usually taken in the form of an infusion or tea; the expressed juice is also used with honey in coughs; a conserve or syrup is also made with it. A plant so common and so much esteemed by the multitude has, of course, many local names besides those mentioned.

Var. β, hirsùta, (Benth. lab. p. 485.) plant hairy in every part. ♃. H. Native of Germany and Hungary, in shady mountain places. Glechòma hirsùta, Waldst. et Kit. pl. rar. hung. 2. p. 124. t. 119. Glechòma mágna, Merat, fl. par. p. 225.

Var. γ, parviflòra (Benth. lab. p. 485.) all parts of the plant smaller and more glabrous than the species. ♃. H. Glechòma heterophýlla, Opiz, ex Rchb. fl. germ. exc. p. 316. Glechòma intermèdia, Schrader.

Ground Ivy, Common. Fl. April, June. Britain. Pl. creeping.

57 N. nivàlis (Benth. lab. p. 737.) root creeping; stems humble; leaves sessile, roundish, wrinkled, green on both surfaces; bracteas scarcely equalling the pedicels; corollas resupinate, with a twisted tube; superior stamens exserted. ♃. H. Native of the north-east of India, on high, gravelly mountains about Yurpo, Jacquemont. Glechòma nivàlis, Jacquem. mss. Habit, inflorescence, and scent, almost the same as that of *N. Glechòma*. Stems branched at the base; floriferous ones erectish, simple, pubescent. Superior cauline leaves and floral ones approximate, ½ to 1 inch long, hardly pubescent, cordately stem-clasping. Corollas pale blue.

Snowy Ground-ivy. Pl. ½ foot.

58 N. Thibe'tica (Benth. lab. p. 737.) stems diffuse, humble, much branched; leaves roundish, on short petioles, truncately cuneated at the base, rather coriaceous, pubescently woolly; bracteas longer than the pedicels; corollas straight, with a dilated throat; genitals shorter than the corolla. ♃. H. Native of the north-eastern parts of India, near Koo-Khio-ghung, and Lari, Jacquemont. Glechòma Thibética, Jacquem. mss. Very nearly allied to *N. nivàlis*, but differs in the corollas being larger, and in the calyxes and bracteas being clothed with soft villi.

Thibet Ground-ivy. Pl. diffuse.

59 N. longibractea'ta (Benth. lab. p. 737.) stems diffuse, humble, much branched; leaves petiolate, ovate-roundish, truncately cuneated at the base, clothed with soft villi; whorls dense, crowded at the tops of the branches; bracteas linear, equalling the corollas; calyx tubular, having the teeth equal in length to the tube; corolla straight, having the throat a little dilated; genitals inclosed. ♃. H. Native of the north-east of India, in stony places, near Kang-rang-ghan, Jacquemont. This is an intermediate plant between Sect. *Glechòma* of *Népeta*, and the genus *Marmorìtis*. Habit more loose than in *N. nivàlis* and *N. Thibética*. Corollas azure blue, pubescent outside.

Long-bracteed Ground Ivy. Pl. diffuse.

Sect. VII. Orthone'peta (from ὀρθος, *orthos*, straight, and Népeta; in reference to the straight calyxes of the species.) Benth. lab. p. 485. Cymes of flowers dense, on short peduncles. Whorls distant, racemose. Racemes simple, but usually paniculately branched. Calyx ovate-tubular, erectish, with nearly equal, subulate, stiff, but not pungent, teeth. Corollas exserted. Tall herbs, with nearly sessile leaves.

60 N. latifòlia (D.C. fl. fr. 3. p. 528.) erect, tall, pubescent; leaves sessile, ovate, obtuse, crenated, rather cordate at the base, green on both surfaces; racemes elongated, many-flowered; bracteas lanceolate-subulate, shorter than the calyxes; calyx pubescent; corolla twice as long as the calyx. ♃. H. Native of Spain, the Eastern Pyrenees, and the Canary Islands. N. grandiflòra, Lapeyr. abr. p. 329. N. cerùlea, Ait. hort. kew. 2. p. 285. Allied to *N. nùda*. Plant pubescent, often clammy. Leaves twice the size and more wrinkled than those of *N. nùda*. Cymes dichotomous. Corollas blue, pubescent outside.

Broad-leaved Cat-mint. Fl. June, Aug. Clt. 1777. Pl. 2 to 4 feet.

61 N. nu'da (Lin. spec. p. 797.) erect tall, nearly glabrous; leaves sessile or scarcely petiolate, oblong, crenated, subcordate at the base, green on both surfaces; racemes panicled, many-flowered; bracteas scarcely longer than the pedicels; calyx pubescent; corolla half again as long as the calyx, or twice as long. ♃. H. Native of the South of Europe and Siberia, in woods; as of Spain, Provence, Piedmont, Naples, Mount Parnassus, South of Germany, Austria, Hungary, Podolia, Tauria, Caucasus, Altaian mountains, &c. Plant glabrous or pubescent. Leaves 1½ to 2 inches long, usually glabrous, but sometimes downy beneath. Corolla white or blueish, 4-6 lines long.

Var. α, grandiflòra (Benth. lab. p. 486.) corollas usually purplish or blueish. ♃. H. N. Pannónica, Jacq. fl. austr. 2. p. 18. t. 129. and other authors, and probably of Lin. spec. p. 797.? N. paniculàta, Crantz. stirp. p. 270. N. violàcea, Vill. fl. dauph. 2. p. 367. and many other authors, and probably of Lin. spec. 797.? Catària nùda, Mœnch, meth. p. 388. Catària violàcea, Mœnch, ex Steud. nom. p. 553.—Bocc. mus. 2. t. 136.

Var. β, parviflòra (Benth. lab. p. 486.) corollas usually white. ♃. H. N. Pannónica, Lin. spec. 797.? N. nùda, Jacq. austr. 1. p. 17. t. 24. N. Ucràtica, Bieb. fl. cauc. 2. p. 41. and of many other authors, but not of Lin. N. álba, Desf. ex Steud. nom. p. 552. Catària paniculàta, Mœnch, meth. ex Steud. nom. p. 553.

Naked Cat-mint. Fl. July, Oct. Clt. 1683. Pl. 2 to 4 feet.

Sect. VIII. Oxyne'peta (from ὀξυς, *oxys*, sharp, and Népeta; in reference to the pungent teeth of the calyx.) Benth. lab. p. 486. Flowers distinct, or collected at the tops of the branches, corymbosely panicled. Calyx tubular, erectish, with nearly equal, subulate, rather pungent teeth. Teeth of corolla equalling the calycine teeth, or scarcely exceeding them.—Humble herbs. Leaves usually petiolate. The plants contained in this section are very distinct in habit from the species of the other sections.

62 N. parviflòra (Bieb. fl. cauc. 2. p. 41.) plant erectish, panicled, villous; leaves petiolate, ovate or ovate-lanceolate, obtuse, serrately crenated, rounded at the base or cordate, green on both surfaces; cymes loose, trichotomously panicled; bracteas linear, equalling the calyxes; calyx pubescent, having the teeth exceeding the corolla. ♃. H. Native of Tauria and Caucasus; also of Iberia, on dry hills and fields, Bieb.; near Cherson, Besser, Odessa, Lang and Szovits. Lower leaves 1 to 1½ inch long, pubescent or nearly glabrous above, and villous beneath. Flowers 3-5 at the tops of the branches of the panicle. Corollas minute, blue,? pubescent outside.

Small-flowered Cat-mint. Fl. June, Aug. Clt. 1820. Pl. 1 foot.

63 N. Ucra'nica (Lin. spec. p. 797. ex Benth. lab. p. 487. but not of other authors.) erect, panicled, nearly glabrous; cauline leaves nearly sessile, oblong-lanceolate, obtuse, a little toothed, roundly cuneated at the base, green on both surfaces; cymes loose, trichotomously panicled; bracteas linear; calyx elongated and hispid: teeth of calyx about equal in length to the corolla. ♃. H. Native of Siberia, about Orenburgh, Prescot; Kirghisean Steppe, Ledebour. Teùcrium Sibíricum, Lin. spec. p. 788. N. Sibírica, Bieb. fl. taur. 2. p. 41. in obs. Habit of *N. parviflòra*, but the leaves and stems are glabrous, or rather cinescent from very fine tomentum. Corollas blue.

Ukraine Cat-mint. Fl. July, Aug. Clt. 1798. Pl. 1 to 2 feet.

64 N. heliotropifòlia (Lam. dict. 1. p. 711.) erect, paniculed, canescent; leaves on very short petioles, oblong, almost quite entire, narrowed at the base, canescent on both surfaces; cymes loose, trichotomously panicled; bracteas linear; calyx elongated, hispid; the teeth about equal in length to the corolla. ♃. H. Native of the Levant, Lam.; Syria, near Aleppo, Russell. Saturèia stricta, Russ. nat. hist. alep. Very like *N. Ucrànica*; but differs in the nearly entire leaves, which are narrowed at the base; and in the whole plant being canescent from pubescence.

Turnsol-leaved Cat-mint. Pl. 1 to 2 feet.

65 N. PU'NGENS (Benth. lab. p. 487.) erect, nearly glabrous; leaves petiolate, ovate, acute, narrowed at the base, rather fleshy, somewhat canescent on both surfaces; racemes nearly simple; bracteas foliaceous, rather spiny, longer than the calyxes; calyx elongated, with linear, stiff teeth; corolla scarcely exceeding the calyx. ♃. H. Native of Syria, between Bagdad and Kermancha, Olivier, and Bruguiere. Whorls 30-flowered, and more.

Pungent-bracteed Cat-mint. Pl. ½ to 1 foot.

66 N. PUSI'LLA (Benth. lab. p. 488.) dwarf, erect, finely pubescent; leaves small, ovate, acutely serrated; upper floral leaves and bracteas lanceolate-linear, very acute, pungent; flowers cymosely capitate, subcorymbose; calyx tubular, pubescent; teeth of calyx very acute, exceeding the corolla. ♄. H. Native of Altaia, on Mount Arkaul. Ziziphora púngens, Bunge, in Ledeb. fl. alt. 1. p. 23. fl. ross. alt. ill. t. 124. Stems filiform, almost simple. Leaves 3-4 lines long. Corollas minute, slender.

Least Cat-mint. Pl. ¼ to ½ foot.

† *Doubtful species.*

67 N. JAPÓNICA (Willd. spec. 3. p. 52.) stems decumbent, and naked at the base, tomentose at top; leaves petiolate, ovate, acute, serrated, tomentose on both surfaces, white beneath; panicles of flowers axillary, trifid, fastigiate. ♃. H. Native of Japan, on the tops of the mountains called Kosido. N. inclìna, Thunb. jap. p. 244. Leaves ½ an inch long.

Japan Cat-mint. Pl. decumbent.

68 N. MACNOU'RA (Led. ex Spreng. syst. 2. p. 729.) cymes many-flowered, spreading, panicled, almost leafless; calyx hoary, striated; leaves subcordately triangular, on long petioles, serrated, canescent: upper ones quite entire. ♃. H. Native of Siberia. Corollas whitish. The plant in the gardens under this name appears to be hardly distinct from the common form of *N. Catària*.

Long-tailed Cat-mint. Fl. July, Aug. Clt. 1820. Pl. 2 to 4 feet.

69 N. NEPALE'NSIS (Spreng. syst. 2. p. 730.) spikes compound, subsecund; calyxes hoary; leaves lanceolate, serrated in the middle, petiolate, a little reflexed, attenuated at both ends, and quite entire. ♃. H. Native of Nipaul.

Nepaul Cat-mint. Pl.?

†† *Species only known by name.*

1 N. CANE'SCENS (Ræusch. ex Steud. nom. p. 552.) Perhaps nothing but *Hyptis canéscens*.

2 N. PATAVI'NA (Fisch. ex Steud. l. c.) Perhaps *Melissa Patavìna*.

3 N. PAUCIFLÒRA (Spreng. ex Steud. l. c.)

4 N. SIDÆFÒLIA (Ræusch. ex Steud. l. c.) Perhaps *Hyptis polyántha*.

5 N. SUAVE'OLENS (Roem. ex Steud. l. c.) Perhaps *Hyptis suaveòlens*.

Cult. Some of the species are rather pretty when in blossom, and are therefore well fitted for flower borders; and others are coarse plants, without beauty. They all grow in common garden soil, but prefer one light and dry. They are increased by dividing at the root in spring or autumn, or by seeds.

LXIX. MARMORITTIS (probably from *μαρμαρος, marmoros*, white, in allusion to the plant being clothed with white tomentum.) Benth. in Hook. bot. misc. 3. p. 377. lab. p. 480.

LIN. SYST. *Didynàmia, Gymnospérmia.* Calyx 13-15-nerved, tubularly campanulate, deeply 5-toothed: teeth equal, acute. Corolla shorter than the calyx; upper lip erect, bifid, flat; lateral lobes of lower lip erect: middle lobe spreading, broad, crenulated. Stamens 4, ascending, didynamous: lower ones the shortest; anthers 2-celled: cells parallel. Style shortly bifid at apex; lobes nearly equal, subulate, stigmatiferous at apex. Achenia dry, smooth, naked.—A small Himalayan plant, very nearly allied to *Népeta*, of which, like the other genera of this tribe, it might be considered a section.

1 M. ROTUNDIFÒLIA (Royle, ex Benth. in Hook. bot. misc. 3. p. 377. lab. p. 490.) ♃. H. Native of Himalaya, on mountains in the province of Kanaour, Royle. Stem thick at the base, branched. Branches procumbent, nearly simple, clothed with tomentose villi, densely leafy at top. Leaves like those of *Làmium amplexicaùle*, reniform, all petiolate, wrinkled, crenated, clothed with white loose tomentum on both surfaces, but especially beneath. Whorls few-flowered, secund in the axils of the superior leaves, shorter than the petioles.

Round-leaved Marmoritis. Pl. procumbent.

Cult. For culture and propagation see *Népeta* above.

LXX. DRACOCE'PHALUM (from *δρακων, dracon*, a dragon; and *κεφαλη, kephale*, a head; in reference to the ringent corollas.) Lin. gen. no. 729. Schreb. gen. no. 984. Juss. gen. p. 116. Gaertn. fruct. t. 66. Benth. lab. p. 490. Moldávica et Zùrnia, Mœnch, meth. p. 410. Ruyschiàna, Mill. dict. Dracocéphalum and Moldávica, Tourn. inst. t. 83. and t. 85.

LIN. SYST. *Didynàmia, Gymnospérmia.* Calyx tubular, 13-15-nerved, straight, rarely incurved, with a straight or equal 5-toothed mouth; upper tooth the broadest, usually large, the 3 upper teeth sometimes joined into an upper lip. Corolla with the tube slender at the base, inclosed, or more often exserted, with a very wide throat, and a bilabiate limb; upper lip erect, rather concave, emarginate; lower lip spreading, trifid, the middle lobe large, and rather bifid. Stamens 4, didynamous: lower ones the shortest, ascending. Anthers approximating by pairs, 2-celled; cells divaricate. Style about equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia dry, smooth, naked.—Perennial herbs. Whorls many-flowered, axillary, or approximate into a terminal spike. Bracteas usually foliaceous, aristately toothed. Corollas generally large, blue or purplish, rarely white or yellowish. This genus is readily distinguished by the broad toothed bracteas.

SECT. I. KEIMODRA'CON (from *κειμαι, keimai*, to lie down; and *δρακων, drakon*; in reference to the procumbent stems of the species.) Benth. lab. p. 492. Stems procumbent, much branched. Leaves nearly orbicular, deeply crenated, or somewhat palmately pinnatifid. Flowers capitate, or disposed in oblong spikes. Anthers glabrous.

1 D. PALMA'TUM (Steph. in Willd. spec. 3. p. 151.) stems procumbent, villous; leaves petiolate, ovate-roundish, palmately pinnatifid, green on both surfaces, villous; whorls capitately spicate; bracteas small, cuneated, setaceously toothed; upper tooth of calyx broad, truncate; corolla about 3 times longer than the calyx; superior lip elongated, incurved. ♃. H. Native of Eastern Siberia, near Ishinginsk. Stems suffruticose at the base. Floriferous branches ascending. Whorls 2-6-flowered, approximate. Corollas showy, purplish, nearly glabrous.

Palmate-leaved Dragon's-head. Fl. June, Aug. Clt. 1815. Pl. procumbent.

2 D. botryoïdes (Stev. in mem. soc. nat. cur. mosq. 3. p. 266.) stems procumbent, villous; leaves petiolate, ovate-roundish, palmately pinnatifid, greenish on both surfaces, villous; whorls capitate, or in oblong spikes; bracteas cuneated, cut, villous; upper tooth of calyx ovate, acute; corolla a half again as long as the calyx: the upper lip short and straight. ♃. H. Native of Eastern Caucasus. Nepeta pinnatifida, Fisch. cat. hort. gorenk. 1812. p. 22. ex Bieb. This differs from *D. palmàtum*, in the larger leaves, and in the whorls being 6-10-flowered, and more densely spicate, &c. Corollas purple, villous outside.

Botrys-like Dragon's-head. Fl. July, Aug. Clt. 1822. Pl. procumbent.

3 D. discolor (Bunge, mss. ex Benth. lab. p. 492.) stem procumbent, branched; leaves petiolate, ovate, deeply pinnatifid, green, and nearly glabrous above, and white beneath: margins of segments revolute; whorls oblong-spicate; outer bracteas cuneated, setaceously toothed; upper tooth of calyx broad, truncate, awned; corolla twice as long as the calyx. ♃. H. Native of Altaia, among chalky or schistous mountains in saltish rugged places from the river Tscharysch, to the mouth of the rivers Kerlyk and Kan, Ledebour. D. origanoides, Led. fl. alt. 2. p. 383. but not of Steph. Stems prostrate, rooting; floriferous branches ascending, pubescent or canescent. Leaves 3-4 lines long. Spikes 1 to 1½ inch long. Corollas blue.

Two-coloured-leaved Dragon's-head. Pl. creeping.

4 D. pinnatum (Lin. spec. 829.) stems procumbent, branched; leaves petiolate, ovate-roundish, somewhat palmately pinnatifid, green on both surfaces, rather villous; whorls disposed in capitate spikes; outer bracteas cuneated, deeply toothed; upper tooth of calyx ovate, awned; corolla one half longer than the calyx, about equal in length to the bracteas. ♃. H. Native of Siberia, in stony, rugged, alpine places of Altaia, at the river Tschuja; on Mount Tarbagutai, in the Kirghisean Steppe; and on the island called Olchon, in Lake Baical, Bunge, Ledeb. fl. ross. alt. ill. t. 445. D. pinnatifidum, Lam. dict. 2. p. 319. —Gmel. sib. 3. p. 234. t. 52. Stems prostrate, much branched. Leaves 3-4 lines long. Spikes dense, 1½ inch long, ovate. Corollas small, blue. Bracteas bluish.

Pinnate-leaved Dragon's-head. Pl. prostrate.

5 D. origanoides (Steph. in Willd. spec. 3. p. 151.) stems procumbent; branches villous; leaves petiolate, ovate-roundish, deeply crenated, green on both surfaces, pubescent; whorls disposed in capitate spikes; bracteas large, broad-cuneated, deeply toothed; teeth of calyx all lanceolate, membranous: the upper tooth scarcely broader than the rest; corolla scarcely exceeding the calyx. ♃. H. Native of the tops of the Altaian alps, at the river Tschuja, Bunge. Leaves broader and less cut than in *D. pinnàtum*: floral leaves large. Spikes globose, nearly 1½ inch in diameter. Corollas blue, about equal in length to the bracteas.

Marjoram-like Dragon's-head. Fl. July. Clt. 1820. Pl. procumbent.

Sect. II. Calodra'con (from καλος, *kalos*, pretty; and δρακων, *dracon*; in reference to the beauty of the flowers of the species.) Benth. lab. p. 494. Stems thick at the base; floriferous branches erect, few-leaved. Leaves nearly all radical, on long petioles, crenated. Whorls disposed in capitate or oblong spikes. Anthers glabrous.

6 D. imbe'rbe (Bunge, enum. pl. alt. crit. mss. ex Benth. lab. p. 494.) nearly glabrous; stem erect, humble; radical leaves on long petioles: cauline ones few, on short petioles, all reniform, deeply crenated, green on both surfaces; whorls disposed in capitate spikes; bracteas cuneated, cut, glabrous; upper teeth of calyx oblong; corolla twice as long as the calyx. ♃. H. Native of Siberia, on the tops of the Altaian mountains, at the river Tschuja, Bunge. Stems tufted. Floriferous branches erect, glabrous, or finely pubescent. Floral leaves, bracteas, and calyxes coloured. Corollas blue, an inch long: lips nearly equal. Radical leaves an inch long.

Beardless Dragon's-head. Pl. ½ foot.

7 D. grandiflòrum (Lin. spec. 830.) stems erect, pilose above; radical leaves on long petioles, oblong, obtuse, crenated, cordate at the base; cauline leaves few, on short petioles, ovate, all green, and nearly glabrous; floral leaves orbicular, pilose: the upper ones bractea-formed; whorls disposed in oblong spikes; bracteas large, orbicularly cuneated, deeply toothed; superior teeth of calyx oblong; corolla ample, 3 times as long as the calyx. ♃. H. Native of Siberia, frequent, particularly in the Altaian range. Sims, bot. mag. t. 1009. D. Altaiénse, Laxm. in nov. comm. petrop. 15. p. 556. t. 29. f. 5. Rebb. icon. pl. cult. 1. t. 90. Sweet, fl. gard. n. s. 1. t. 57. Radical leaves 1-2 inches long. Petioles of the cauline leaves short, dilated, subconnate, ciliated. Spikes 2-3 inches long. Bracteas a little coloured. Corollas showy blue, nearly 2 inches long.

Great-flowered Dragon's-head. Fl. July, Aug. Clt. 1759. Pl. ½ to ¾ foot.

8 D. speciòsum (Benth. in Wall. pl. rar. asiat. 2. p. 65.) stems erect, pubescent; radical leaves on long petioles, broadly heart-shaped: cauline ones few, on short petioles, all wrinkled and green on both surfaces, and pubescent beneath; floral leaves orbicular, somewhat bractea-formed; whorls disposed in oblong spikes; bracteas orbicular, deeply crenated, much shorter than the calyxes; upper tooth of calyx ovate; corolla about twice as long as the calyx. ♃. H. Native of the Himalaya, and Nipaul. Leaves scarcely an inch long, and 2 inches broad. Whorls 2-4, dense, subsecund. Corolla very villous outside, purple.

Showy Dragon's-head. Pl. 1 to 1½ foot.

9 D. fra'gile (Turcz. mss. ex Benth. lab. p. 495.) stems decumbent, articulated, rather pilose; leaves petiolate, oblong, obtuse, obscurely crenated, rounded at the base, green on both surfaces, pilose or glabrous; floral leaves and bracteas sessile, elliptic, quite entire, mucronate, membranous, pilose; whorls disposed in oblong spikes, equalling the calyxes; upper tooth of calyx large, ovate; corolla about twice as long as the calyx. ♃. H. Native of Dauria, at Lake Nossogal, Turczaninow. Branches articulated at the nodi. Bracteas ciliated on the veins and edges. Calyxes purplish. Corolla yellowish? incurved.

Brittle Dragon's-head. Pl. procumbent.

10 D. lamiifòlium (Desf. pl. cor. Tourn. in ann. mus. 10. p. 305. t. 26.) stems simple, tufted; leaves petiolate, ovate, obtuse, crenated, rather pilose, as well as the stems; flowers capitate at the tops of the stems; upper lip of corolla bifid, with toothed segments. ♃. F. Native of Candia, in the fissures of rocks. Calyx dilated, with 5 deep, nearly equal, acute segments. Corollas large, rose-coloured, 1½ inch long; lower lip emarginate, crenated, spotted with purple. Perhaps a species of *Nepeta*.

Dead-Nettle-leaved Dragon's-head. Pl. ½ to 1 foot.

Sect. III. Cryptodra'con (from κρυπτος, *cryptos*, hidden; and δρακων, *dracon*, a dragon; so called in consequence of the corolla hardly exceeding the calyx.) Benth. lab. p. 495. Stems erect, branched, leafy. Whorls disposed in capitate spikes. Anthers glabrous.

11 D. parviflòrum (Nutt. gen. amer. 2. p. 35.) stems erect,

branched, pubescent; leaves petiolate, lanceolate, deeply crenated or serrated, green on both surfaces, pubescent beneath; whorls disposed in capitate spikes; bracteas ovate-cuneated, aristately toothed; upper tooth of calyx broad-ovate; corolla scarcely exceeding the calyx. ♃. H. Native of North America, at the river Missouri, near Fort Mandan, Nuttall; Red River, Douglas; and at Cumberland House Fort, on the Saskatschawan, Drummond. Leaves like those of *D. Moldávicum*. Spikes globose or oblong, dense. Corollas small, bluish.

Small-flowered Dragon's-head. Fl. July, Aug. Clt. 1825. Pl. ½ to 1 foot.

Sect. IV. Molda'vica (so called from the first species being originally found in Moldavia.) Benth. lab. p. 496. Stems erect or ascending, leafy. Whorls distant, subracemose. Anthers glabrous.

12 D. Molda'vicum (Lin. spec. p. 880.) stem erect, branched; leaves petiolate, lanceolate, deeply crenated; floral leaves narrower, aristately serrated at the base; whorls distinct, disposed in long racemes; bracteas lanceolate, aristately serrated; calyx bilabiate: upper lip semitrifid: lower one bipartite; corolla more than twice as long as the calyx. ☉. H. Native of Eastern Siberia; and of the East Indies and South America, but probably escaped from gardens. Lam. ill. t. 513. f. 1.—Blackw. herb. t. 551. Moldávica punctàta, Mœnch, meth. p. 410. Herb glabrous, or finely downy. Leaves an inch long. Whorls 6-10-flowered. Corolla blue or white, with a very wide throat.

Moldavian Dragon's-head. Fl. July, Aug. Clt. 1596. Pl. 1 to 1½ foot.

13 D. Heterophy'llum (Benth. lab. p. 738.) stem ascending; leaves petiolate, obtuse, crenated: lower ones rounded, rather reniform, cordate at the base: superior ones oblong; floral leaves narrowed at the base, and are, as well as the bracteas, oblong, and aristately toothed; calyx bilabiate: the upper lip broadly semitrifid, and the lower lip bipartite; raceme subspicate. ☉.? H. Native of the North-east of India, on the mountains of Koo-khio-ghang, Jacquemont. This differs from *D. Moldávicum*, in its humble stature, nearly simple branches, dense spikes, and form of leaves. Upper leaves usually pubescent; cauline leaves never awned. Corollas pubescent, a little larger than those of *D. Moldávicum*.

Various-leaved Dragon's-head. Pl. humble.

14 D. Fœ'tidum (Bunge, in Led. fl. alt. 2. p. 386.) stem humble, divaricate, much branched; leaves petiolate, ovate-oblong, obtuse, crenated; floral leaves narrower, aristately serrated at the base; whorls distinct, disposed on short racemes; bracteas oblong, aristately serrated; calyx bilabiate: upper lip broadly semitrifid; lower lip bipartite; corolla more than twice as long as the calyx. ☉.? H. Native of Siberia, on sandy hills near the river Tschuja, Bunge. Leaves short, on long petioles. Branches and calyxes pubescent.

Fetid Dragon's-head. Pl. ⅓ foot.

15 D. Pelta'tum (Lin. spec. p. 881.) stem erect; leaves petiolate, ovate, obtuse, crenated; floral leaves oblong-lanceolate, more entire; whorls distinct, many-flowered, disposed in long racemes; bracteas orbicular, aristately toothed; upper tooth of calyx ovate: lateral ones oblong: lower ones lanceolate; corollas scarcely exceeding the calyxes. ☉. H. Native of Syria, between Bagdad and Kermancha. Lam. ill. t. 513. f. 2. D. ocymifòlium, Mill. dict. no. 4. Zórnia peltàta, Mœnch, meth. 411. Stem nearly simple, glabrous, or finely tomentose. Leaves 1½ inch long, green, glabrous, gradually becoming narrower to the top, all exceeding the flowers. Whorls 10-12-flowered. Corollas small, blue, nearly glabrous.

Peltate Dragon's-head. Pl. 1 foot.

16 D. Royle'anum (Wall. in pl. rar. asiat. 1. p. 65. Benth. lab. p. 497.) stem erect, strict; leaves petiolate, ovate, crenated; floral leaves narrower: superior ones aristately serrated at the base; whorls distinct, disposed in interrupted spikes; bracteas oblong, aristately toothed; calyx scarcely bilabiate: superior teeth the broadest; corolla hardly exceeding the calyx. ☉.? H. Native of the East Indies, in the province of Kumawur, Royle. Stem glabrous at the base, and pubescent at top. Leaves distant, green, nearly glabrous: floral ones rather longer than the calyxes. Corolla very slender, yellowish.

Royle's Dragon's-head. Pl. ½ to 1 foot.

17 D. Ine'ricum (Bieb. fl. cauc. 2. p. 64.) stem decumbent? leaves petiolate, ovate-oblong, narrowed a long way at the base, a little toothed; floral leaves lanceolate, nearly entire, all glabrous; whorls distinct, disposed in long racemes, about 6-flowered; bracteas linear-cuneated, aristately awned at top; calyx smoothish, having the upper tooth ovate, and the lower ones lanceolate; corollas hardly exceeding the calyxes. ☉.? H. Native of Iberia, Steven; of Caucasus, on the Talusch mountains, near Swant, C. A. Meyer. Allied to *D. Royleánum* and *D. canéscens*; and differs from the first in the narrower, more entire, glabrous leaves, and in the calyxes being twice the size; and from the second in the smoothness, and minute corollas. Corollas blue, slender.

Iberian Dragon's-head. Fl. July, Aug. Clt. 1820. Pl. decumbent.?

18 D. cane'scens (Lin. spec. p. 881.) stem erectish, branched, clothed with fine hoary tomentum; leaves petiolate: lower ones ovate or oblong, rather deeply crenated: floral ones lanceolate, almost quite entire, all canescent from fine tomentum; whorls distinct, disposed in long racemes, usually 6-flowered; bracteas ovate-cuneated, aristately toothed; calyx hoary, having the upper tooth ovate, and the lower ones lanceolate; corolla twice as long as the calyx. ☉. H. Native of Syria, near Aleppo, Russell. Sweet. fl. gard. 1. t. 38. Zórnia canéscens, Mœnch, meth. p. 411.—Mill. fig. t. 129.—Commel. rar. t. 28.—Volk. norib. t. 353. Bracteas shorter than the calyxes. Corollas blue.

Canescent Dragon's-head. Fl. July, Aug. Clt. 1711. Pl. 1 to 1½ foot.

19 D. peregri'num (Lin. spec. p. 829.) decumbent; branches ascending, nearly glabrous; leaves quite glabrous, on short petioles, lanceolate, for the most part few-toothed, the teeth awned; floral leaves, and sometimes all, are quite entire; whorls distinct, few-flowered, secund, disposed in short racemes; bracteas oblong or lanceolate, awned, a little toothed; calyx bilabiate: upper lip broadly tridentate: lower lip narrowly bifid; corolla ample, about 3 times as long as the calyx. ♃. H. Native throughout Siberia, Pallas. Sims, bot. mag. t. 1084. Lher. stirp. nov. 2. t. 28. Ruyschiàna verticillàta, Mill. dict. no. 3.?—Mor. hist. 364. no. 9. sect. 11. t. 5. f. 9. Stems loosely branched at the base, procumbent. Leaves an inch long. Corollas 15-18 lines long, blue: upper lip broad, emarginate.

Foreign Dragon's-head. Fl. July, Aug. Clt. 1759. Pl. ascending, a foot long.

20 D. thymiflòrum (Lin. spec. p. 498.) stem erect; leaves on short petioles, ovate-lanceolate or lanceolate, crenated; floral leaves narrower, more entire; whorls distinct, many-flowered, disposed in long racemes; bracteas ovate-oblong, almost quite entire; upper tooth of calyx broad-ovate: lower ones lanceolate; corolla scarcely exceeding the calyx. ☉. H. Native of the East of Europe; about Upsal, Wahl; about Moscow, Klustine; South of Podolia, Besser. Gærtn. fruct. 1. p. 319. t. 66. Zórnia parviflòra, Mœnch, meth. p. 411.—Gmel. sib. 3. p. 233. t. 50.

Stems a little branched, pubescent. Floral leaves twice the size of the cauline leaves, green, scarcely pubescent. Whorls usually 10-12-flowered. Calyx a little coloured. Corollas very slender, purplish.

Thyme-flowered Dragon's-head. Fl. June, Sept. Clt. 1752. Pl. 1 to 1½ foot.

21 D. nu'tans (Lin. spec. p. 831.) stem erect; leaves petiolate, ovate, crenated; floral leaves oblong-lanceolate, more entire; whorls distinct, many-flowered, disposed in long racemes; bracteas ovate or oblong, almost quite entire; upper tooth of calyx broad-ovate: lower ones lanceolate; corolla more than twice as long as the calyx. ☉. H. Native throughout Siberia. Ker. bot. reg. t. 841. Zórnia nùtans, Mœnch, meth. p. 411.—Gmel. sib. 3. p. 231. t. 49. Habit, leaves, and calyxes of *D. thymiflòrum*, but differs in the longer corollas, &c.

Nutant-racemed Dragon's-head. Fl. July, Aug. Clt. 1731. Pl. 1 foot.

22 D. fruticulòsum (Steph. in Willd. spec. 3. p. 152.) suffruticose, glabrous; leaves nearly sessile, elliptic, mucronate, quite entire, or the superior and floral ones are aristately toothed; whorls few-flowered, the superior ones subspicate; bracteas ovate, aristately toothed; teeth of calyx all lanceolate: the upper one the broadest; corolla scarcely twice as long as the calyx. ♄. F. Native of Siberia, Steven; about Kiachta, Sievers. Stem branched. Leaves 4 lines long. Calyx coloured. Corollas like those of *D. integrifòlium*.

Shrubby Dragon's-head. Shrub dwarf.

23 D. integrifòlium (Bunge, in Ledeb. fl. alt. 2. p. 387.) suffruticose, glabrous; branches erectish; leaves nearly sessile, lanceolate, obtuse, quite entire; floral leaves bractea-formed; whorls racemose, secund; bracteas ovate, aristately toothed; upper tooth of calyx broad-ovate: lower ones lanceolate; corolla about twice as long as the calyx. ♄. F. Native of the Altaia, on the Kurtschum mountains, near Baty, and on rocks near the ruins of Ablakit; also of Dahuria. Habit of *D. nùtans*, but the leaves are very different. Calyx purple. Corollas purplish blue.

Entire-leaved Dragon's-head. Shrub 1 foot.

Sect. V. Ruyschia'na (so named in honour of Dr. Ruysch, who was professor of anatomy and botany at Amsterdam.) Benth. lab. p. 499. Stems erect, leafy. Whorls somewhat interruptedly spicate. Anthers villous.

24 D. Argune'nse (Fisch, ex Link, enum. 2. p. 118.) glabrous; stems erect; leaves linear-lanceolate, quite entire, glabrous; whorls subspicate; bracteas cuneate-elliptic, acute; calyx quite glabrous, bilabiate: upper lip semitrifid: lower one narrowly bipartite; corolla ample, about 3 times as long as the calyx. ♃. H. Native of Dahuria. Rchb. icon. pl. cult. 1. t. 1. Lodd. bot. cab. 797. Nearly allied to the following; but differs in the glabrous calyxes and larger flowers. Leaves nearly sessile, 2-3 inches long, with fascicles of small ones in the axils. Corollas pubescent, blue, showy.

Argun Dragon's-head. Fl. July, Aug. Clt. 1822. Pl. 1 to 1½ foot.

25 D. Ruyschia'num (Lin. spec. p. 830.) stems erect, finely pubescent: leaves linear-lanceolate, quite entire, glabrous; whorls subspicate; bracteas ovate-lanceolate, quite entire; calyx pubescent; upper tooth of calyx ovate: lower ones lanceolate; corollas more than twice as long as the calyxes. ♃. H. Native of Europe and Asiatic Russia, on the mountains; as of Norway, Provence, Dauphiny, Switzerland, Galicia, Caucasus, Altaia, &c. Oed. fl. dan. t. 121. D. hyssopifòlium, Mart. ex Steud. nom. p. 285. Ruyschiàna spicàta, Mill. dict. no. 1. Zórnia linearifòlia, Mœnch, ex Steud. nom. p. 285.—Zanon. nov. t. 146. Ruyschiàna glàbra, Amm. ruth. p. 50. Branched from the base. Leaves 1 to 1½ inch long, nearly sessile, with revolute edges, having young ones in the axils. Whorls approximate, generally 6-flowered. Corolla purplish, an inch long.

Ruysch's Dragon's-head. Fl. June, July. Clt. 1699. Pl. 2 feet.

26 D. Austria'cum (Lin. spec. p. 829.) stems erect, rather pilose; leaves 3-5-cleft, or the rameal ones are almost entire; segments of leaves linear, with revolute edges; whorls somewhat interruptedly spicate; bracteas 3-7-cleft, awned; upper tooth of calyx ovate: lower ones lanceolate; corolla about 3 times as long as the calyx. ♃. H. Native of Europe and Asiatic Russia, on the mountains; as of the Pyrenees, Dauphiny, Switzerland, South of Germany, Galicia, Transylvania, Podolia, Caucasus, &c. Jacq. icon. rar. 1. t. 112. Zórnia partìta, Mœnch, ex Steud. nom. p. 285. Ruyschiàna laciniàta, Mill. dict. no. 2. Ruyschiàna hirsùta, Amm. ruth. p. 50. Habit of *D. Ruyschiàna*, but differs in the leaves being divided. Stem hairy, nearly pinnatifid. Whorls 6-10-flowered, all usually distinct. Floral leaves and bracteas hispid. Corolla showy blue, more than 1½ inch long.

Austrian Dragon's-head. Fl. June, July. Clt. 1597. Pl. 1½ foot.

† *Doubtful species.*

27 D. odorati'ssimum (Poir. suppl. 2. p. 521.) stems slender; branches divaricate; leaves petiolate, small, ovate-oblong, quite entire, narrowed at the base, glabrous; bracteas narrow-lanceolate, ciliated, longer than the flowers; flowers sessile, approximating into a short imbricate spike; calyx striated, ciliated, with 5 very short straight teeth. ♃. H. Native of the Crimea. Branches reddish-grey, with pubescent angles. Leaves 4-5 lines long. Corolla white or purplish, hairy outside; tube slender, scarcely longer than the calyx; throat wide. Pl. ¼ to ½ foot.

Very sweet-scented Dragon's-head.

28 D. Cochinchine'nse (Lour. coch. p. 371.) stem erect, villous; leaves ovate-lanceolate, quite entire, villous, few; bracteas roundish, acute, many-flowered; flowers disposed in a terminal spike. ☉. ? H. Native of Cochinchina. Flowers violaceous; upper lip of corolla concave. Filaments pilose. Pl. 1 foot.

Cochinchina Dragon's-head.

Cult. The greater part of the species of *Dracocéphalum*, being showy when in blossom, are favourites with all lovers of flowers. They are all hardy, and will grow in any common garden soil; they are, therefore, well adapted for decorating flower borders and rockwork. The perennial species are readily increased by divisions of the root and top in spring. The seeds of annual kinds only require to be sown in the open ground in spring. The two shrubby species, *D. fruticulòsum* and *D. integrifòlium*, and all the species belonging to sect. I. *Keimodracon*, will require protection in severe weather in winter; these are all readily propagated by cuttings, under a hand-glass.

LXXI. CEDRONELLA (probably a dim. of *cèdros, cedrus*, the cedar; from the sweet odour of *C. triphýlla*.) Mœnch, meth. p. 411. Benth. lab. p. 501.—Dracocéphalum species, Lin. and other authors.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular or campanulate, about 15-nerved, with an equal or oblique 5-toothed mouth. Corolla with an exserted tube, naked inside, a dilated throat, and a bilabiate limb; upper lip straight, flattish, emarginate or bifid; lower lip trifid: middle lobe large. Stamens 4, ascending, didynamous; lower ones the shortest. Anthers 2-

celled; cells parallel. Style about equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia dry, smooth.—Herbs. Whorls approximate into terminal spikes or racemes. Floral leaves bractea-formed. Bracteas small, setaceous.

1 C. cordà'ta (Benth. lab. p. 502.) herbaceous, stoloniferous; leaves cordate-ovate, crenated; whorls few-flowered, secund, approximating into short spikes or racemes. ♃. II. Native of North America, at the river Ohio, below Pittsburgh, Nuttall. Dracocéphalum cordàtum, Nutt. gen. amer. 2. p. 35. Stems creeping, and rooting at the base. Floriferous branches erect, simple, villous. Leaves 1 to 1½ inch long, form of those of *Lámium*, quite entire, obtuse, pubescent, or nearly glabrous. Cymes on short peduncles, 1-3-flowered. Corolla showy, pale blue, 1½ inch long.

Cordate-leaved Cedronella. Fl. July, Aug. Clt. 1824. Pl. ½ foot.

2 C. Mexica'na (Benth. lab. p. 502.) tall; leaves ovate-lanceolate, cordate at the base, toothed; whorls many-flowered, approximating into a terete, interrupted spike or raceme. ♃. H. Native of Mexico, among corn and in meadows, in the woody region near Valladolid, Pazcuaro, Chalco, and Tlalpuxalma. Dracocéphalum Mexicànum, H. B. et Kunth, nov. gen. amer. 2. p. 302.—Herb glabrous, or finely pubescent. Leaves on short petioles, 1½ to 2 inches long, acuminated, acute, glandular beneath. Whorls loose, 20-40-flowered. Corolla purplish, 3 times as long as the calyx. Genitals exserted.

Mexican Cedronella. Pl. 2 to 3 feet.

3 C. thuthy'lia (Mœnch, meth. 411.) shrubby, tall; leaves ternate; leaflets oblong-lanceolate; whorls loose, collected into terete oblong spikes. ♄. F. Native of America, and probably of the Canary Islands. Dracocéphalum Canariénse, Lin. spec. p. 829. C. Canariénsis, &c., Comm. hort. amst. 2. p. 81. t. 41.—Volk. norib. t. 145. Lateral leaflets sessile, terminal one petiolate, larger, all nearly glabrous, or pubescent beneath. Whorls 10-12-flowered. Corolla white or pale purple, scarcely twice as long as the calyx. The plant was first brought to Europe under the name of *Permenta de Tana*. It is now known under the name of Balm of Gilead, which it has obtained from its rich odour on being gently rubbed.

Three-leaved Cedronella, or Balm of Gilead. Fl. July, Sept. Clt. 1697. Shrub 3 to 4 feet.

Cult. For culture and propagation see *Dracocéphalum*, p. 814, for the herbaceous species, and *Prostanthèra*, p. 800, for the shrubby kind.

Tribe IX.

STACHYDEÆ (this tribe contains genera agreeing with *Stáchys*, in the characters given below.) Benth. lab. p. 503. Calyx irregularly veined or 5-10-nerved, equal, oblique, rarely sub-bilabiate, 5-10-toothed. Tube of corolla inclosed or exserted, often annulate inside; limb bilabiate: upper lip galeate or flat, entire or emarginate: lower lip variously trifid. Stamens 4, ascending, didynamous, all fertile, or the anthers of the lower ones are empty or dimidiate; superior ones short.

LXXII. MELITTIS (from μελιττα, *melitta*, a bee; a name used by Pliny as synonymous with Melissa.) Lin. gen. no. 731. Schreb. gen. 985. Juss. gen. p. 116. Benth. lab. p. 508.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx campanulate, membranaceous, irregularly veined, subbilabiate; upper lip broad, roundish, obscurely 2-lobed or shortly 2-3-toothed; lower lip bifid, with rounded lobes. Corolla, with an ample exserted tube, which is not annulate inside, and a bilabiate limb; superior lip orbicular, entire, rather concave, spreading: lower lip 3-lobed, spreading. Stamens 4, ascending, didynamous, lower ones the longest; filaments without any appendages; anthers approximating by pairs, 2-celled: cells distinct, diverging. Style shortly bifid at apex; lobes ovate, stigmatiferous at apex. Achenia dry, smooth, or finely reticulated.

1 M. melissophy'llum (Lin. spec. p. 892.) ♃. H. Native of Europe, in shady places; as of France, Germany, Portugal, Spain, Sicily, Italy, Greece: in England; as in Devonshire, about Totness, Barnstable, &c.; Hampshire, in the New Forest; Pembrokeshire, about Haverford West, in woods and other shady places. Stems erect, simple, more or less hairy. Leaves on short petioles, 1½ to 2 inches long, ovate, crenated, cordate at the base, or the upper ones are rounded, wrinkled, villous, green on both surfaces; floral leaves narrower; all exceeding the flowers. Whorls about 6-flowered, axillary. Corolla 1½ inch long, red, or red and white. Pedicels rather shorter than the calyxes. Much honey is secreted by a gland that encircles the base of the germ; hence it is a favourite plant with bees.

Var. α, *grandiflòra*; plant pale green; corolla cream-coloured, with the middle of the lower lip violaceous. ♃. H. M. grandiflòra, Smith, fl. brit. 2. p. 644. engl. bot. t. 636. Hook. fl. lond. vol. 2. icone. Rchb. icon. bot. eur. 3. p. 41. t. 242. M. melissophýllum, Curt. lond. no. 64. Mill. fig. t. 32.—Riv. mon. irr. t. 21. f. 1. M. álbida, Guss. prod. fl. sic. 2. p. 140. M. sylvéstris, Lam. fl. fr. 2. p. 401.

Var. β, *melissophýllum*; stems purplish; leaves deep green; flowers altogether purple, and sometimes white. ♃. H. M. melissophýllum, Jacq. fl. austr. 1. t. 26. Smith, engl. bot. t. 577. Rchb. icon. bot. eur. 3. p. 41. t. 241.

Balm-leaved Bastard Balm. Fl. May, June. England. Pl. 1 to 1½ foot.

Cult. Both varieties are very showy when in blossom, and are, therefore, well fitted for decorating flower borders, woods, and shrubberies. They are readily increased by dividing the root in spring or autumn.

LXXIII. PHYSOSTE'GIA (from φυσα, *physa*, a bladder; and στεγω, *stego*, to cover; in allusion to the inflated calyx.) Benth. in bot. reg. vol. 16. lab. p. 504. Dracocéphalum species, Lin. and other authors.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx tubularly campanulate at the time of florescence, but afterwards becoming inflated and campanulate, with about 10 obscure veins, almost equally 5-toothed, or truncate and scarcely toothed at top. Corolla with a long exserted tube, which is exannulate inside, an inflated throat, and a bilabiate limb; upper lip erectish, rather concave, entire, or emarginate; lower lip spreading, trifid, with roundish lobes, the middle lobe large and emarginate. Stamens 4, ascending under the upper lip, somewhat didynamous; lower ones eminent; anthers approximate, 2-celled: cells parallel, distinct, naked. Style about equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia dry, smooth. Habit peculiar.

1 P. Virginia'na (Benth. lab. p. 504.) calyx acutely 5-toothed. ♃. H. Native of North America, from Canada to Texas, in rather humid places: and on the North-west coast at the Columbia river. Dracocéphalum Virginiànum, Lin. spec. 828. Curt. bot. mag. t. 467. D. lancifòlium, Mœnch, meth. p. 410. D. variegàtum, Vent. cels. t. 44. D. denticulàtum, Ait. hort. kew. 2. p. 317. Curt. bot. mag. 214. D. speciósum, Sweet, fl. gard. 1. t. 93. D. obovàtum, Elliott, bot. car. 2. p. 86. D. intermèdium, Nutt, in amer. phil. trans. n. s. 5. p. 187. Prásium purpùreum, Walt. fl. car. p. 166. Prásium coccíneum, Walt. fl. car.

p. 116. Herb usually glabrous, rarely pubescent in the upper part. Stems erect. Leaves sessile, usually lanceolate, sometimes oblong-ovate or obovate, usually acute, irregularly and acutely serrated, narrowed at base, green on both surfaces; upper floral leaves bractea-formed, shorter than the calyxes. Racemes terminal, simple, or paniculately branched. Flowers nearly sessile, approximate, or distant. Corolla flush coloured or purple, showy, 10-11 lines long, and sometimes more than an inch.

Virginian Physostegia. Fl. July, Sept. Clt. 1683. Pl. 1½ to 3 feet.

2 P. imbrica'ta (Hook. bot. mag. 3386.) tall; leaves elliptic-lanceolate, coarsely serrated; spikes panicled, tetragonal; flowers erect, densely imbricate; upper lip of corolla concave: tube scarcely inflated. ♃. H. Native of Texas. Corollas reddish purple above, pale and almost white below.

Imbricate-flowered Physostegia. Fl. July, Sept. Clt. 1834. Pl. 2 to 3 feet.

3 P. trunca'ta (Benth. lab. p. 505.) calyx truncate, obscurely 3-5-lobed; lobes very broad, denticulated. ♃. H. Native of Mexico, in the province of Texas. Stems erect, nearly simple, pubescent. Leaves and inflorescence similar to those of *P. Virginiàna*. Floral leaves broad-ovate at the base, equalling the calyxes. Corollas red.

Truncate-calyxed Physostegia. Fl. July, Sept. Pl. 1½ foot.

Cult. Elegant plants of easy culture, well fitted for decorating flower borders. Any common garden soil suits them, and they are readily propagated by dividing at the root.

LXXIV. MACBRI'DEA (named in memory of James Macbride, M.D. of South Carolina.) Elliott, bot. car. 2. p. 86. Benth. lab. p. 505.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, membranaceous, irregularly veined, 3-lobed; superior lobe oblong, lower ones roundish. Corolla with a long exserted tube, which is exannulate inside, an inflated throat, and a bilabiate limb; upper lip erect, entire, rather concave; lower lip shorter and spreading, with roundish lobes, middle lobe the broadest. Stamens 4, didynamous, ascending under the upper lip, lower ones the longest; anthers approximate by pairs, 2-celled: cells divaricate. Style shortly bifid at apex. A genus closely allied to *Physostègia*.

1 M. pulche'lla (Elliott, l. c.) ♃. H. Native of Carolina, in bogs, Elliott; near Augusta, Wray. Thýmbra Carolinìàna, Walt. fl. car. p. 162. Melíttis Carolinìàna, Sprang. syst. 2. p. 700. Pràsium incarnàtum, Walt. fl. car. p. 165. Stems erect, glabrous. Leaves petiolate, oblong-elliptic, bluntish, obscurely serrated or sinuated, rounded or cuneated at the base, thin, quite glabrous, or furnished with a few scattered hairs above. Whorls 1 or 2 at the top of the stem, about 6-flowered. Corolla 1½ inch long, glabrous, pale red.? Filaments villous.

Neat Macbridea. Pl. 1 foot.

Cult. For culture and propagation, see *Physostègia* above.

LXXV. SYNA'NDRA (from *συν, syn*, together; and *ανηρ ανδρος, aner andros*, a male; in reference to the anthers approximating by pairs.) Nutt. gen. amer. 2. p. 29. Benth. lab. p. 506. Làmium species, Michx.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx inflately campanulate, membranaceous, irregularly veined, with 4 nearly equal teeth. Corolla with a much exserted tube, which is dilated above as well as the throat, and exannulate inside; limb bilabiate: upper lip erect, rather concave, entire: lower lip spreading, 3-lobed: lobes ovate, middle one broader and emarginate. Stamens 4, ascending, didynamous: lower pair the longest; filaments exappendiculate, hairy; anthers approximating by pairs, glabrous, 2-celled: cells distinct, divaricate; upper cells of the superior anthers connate, obtuse, empty; the rest all acute and fertile. Upper lobe of style very short; lower one longer, stigmatiferous almost from the base. Achenia dry, large, somewhat inflatedly compressed, smooth. The want of the upper lobe of the calyx is peculiar to this genus.

1 S. grandiflòra (Nutt, l. c.) ♃.? H. Native of North America; in Kentucky, Torrey; Tenessee, in woods, Michx; in shady places, near Cincinnati, on the Ohio, Nutt. Habit of *Làmium*. Stem nearly simple, beset with long hairs. Leaves few; lower ones on long petioles, broad-ovate, subacuminated, crenated, cordate at the base, thin, green on both surfaces, furnished with a few hairs; superior leaves ovate-lanceolate, quite entire; uppermost ones hardly longer than the calyxes. Whorls few, distant, few-flowered. Corolla showy, cream-coloured, 1½ inch long.

Great-flowered Synandra. Pl. 1 foot.

Cult. For culture and propagation, see *Làmium*, below.

LXXVI. LA'MIUM (from λαιμος, *laimos*, the throat; so called from the ringent flowers.) Lin. gen. no. 716. Schreb. gen. 971. Tourn. inst. t. 85. Juss. gen. p. 113. Benth. lab. p. 507. Orvàla, Lin. gen. 715. Pàpia, Michell, gen. p. 17. Galeóbdolon, Huds. and other authors. Pollíchia, Roth, fl. germ. Erianthèra, Benth. in Hook. bot. misc. 3. p. 350. but not of Nees.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubularly campanulate, about 5-nerved, with an equal or often oblique mouth; teeth 5, nearly equal, or the upper ones are longer, subulate at apex. Corolla with an inclosed or exserted tube, naked or with a hairy ring inside; limb bilabiate; upper lip ovate or oblong, somewhat arched or galeate, for the most part narrowed at the base; throat dilated; lateral lobes truncate at the margins of the throat, rarely oblong, furnished with a tooth-formed appendage or mutic; middle lobe broad, emarginate, contracted at the base, substipitate. Stamens 4, didynamous, lower pair the longest; anthers approximate by pairs, 2-celled: cells at length divaricate, oblong, hairy outside or naked. Style about equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia dry, triquetrous, with acute angles, truncate at apex, smooth or wrinkled from minute tubercles.—Herbs decumbent at the base. Lower leaves on long petioles, small; middle cauline leaves large, usually cordate at the base, wrinkled, for the most part doubly or deeply toothed; floral leaves almost similar to the rest: upper ones smaller and more sessile; all exceeding the calyxes. Whorls dense, axillary; lower ones or all remote, but the superior ones are usually approximate. Bracteas few, shorter than the calyxes, subulate, rarely lanceolate. Corollas red, purplish, white, or yellow.

Sect. I. Orva'la (Orvala is a name applied to *sálvia sclárea* by old botanists, which is probably derived from Orval in France.) Benth. lab. p. 508. Orvàla, Lin. gen. no. 715. Tube of corolla straight, transversely annulate inside; throat very wide. Gales ovate. Anthers glabrous.

1 L. Orva'la (Lin. spec. p. 808.) stems erect; leaves large, broad-ovate, truncate or cordate at the base, rugose, rather villous; tube of corolla straight, exserted, furnished with a ring of hairs inside: throat very wide: galea ovate, entire: lateral lobes very short, mutic. ♃. H. Native of Italy, Pannonia, and Istria, Willd.; Piedmont, Allioni; France, near Nanncte, Ronamy. Curt. bot. mag. t. 172. Mill. fig. t. 158. *L. Pannónicum*, Scop. fl. carn. t. 27. Orvàla lamioides, D.C. fl. fr. 3.

p. 539. L. melissæfòlium, Mill. dict. no. 5.—Mor. hist. sect. 11. t. 11. f. 7.—Till. pis. 92. t. 34. f. 1.—Clus. hist. 2. p. 95. t. 36.—Park. par. p. 387. f. 7. Stem red, hispid, or nearly glabrous. Whorls about 10-flowered. Calyx coloured, nearly glabrous. Corollas red or purple, nearly 1½ inch long. Galea downy outside, with ciliated edges.

Var. β, leaves deeply toothed. ♃. H. Orvàla Gargánica, Lin. spec. p. 807. Pàpia Gargánica, Micheli, gen. 20. t. 17.

Orvala, or Balm-leaved Archangel. Fl. May, July. Clt. 1596. Pl. 1 to 3 feet.

Sect. II. Lamiópsis (so named by Dumort, who considers it a distinct genus, from its resemblance to the true species of Lámium.) Benth. lab. p. 509. Lamiópsis, Dumort, florul. belg. p. 45. Tube of corolla straight, naked inside, or furnished with a transverse ring of hairs; throat very wide. Anthers hairy, outside.

2 L. multi'fidum (Lin. spec. p. 809.) superior leaves deeply lobed, glabrous on both surfaces; tube of corolla straight, exserted, annulate inside? ; galea oblong: throat very wide: lateral lobes very short, mutic. ♃. H. Native of the Levant. L. orientale foliis eleganter laciniatis, Tourn. cor. 11. Commel. rar. t. 26. Stems erect, pubescent. Lower leaves oval, very blunt, quite entire at top; middle leaves crenated, cuneated at the base; superior ones 1½ inch long, obtuse, deeply and bluntly lobed; floral leaves more acute, narrower: all cut and rather shotter than the flowers. Whorls many-flowered, distant. Calyxes villous. Corolla an inch long; galea narrowed at the base, woolly outside. Anthers villous on the back.

Multifid-leaved Archangel. Fl. April, May. Clt. 1782. Pl. ½ to 1 foot.

3 L. rhombor'bicum (Benth. lab. p. 509.) humble, simple; leaves rhomboid, wrinkled, clothed with velvety wool on both surfaces, as well as the calyxes; corolla ample, 3 times as long as the calyx: tube straight, naked inside: throat wide: galea broad: lateral lobes ovate, entire. ♃.? H. Native of the East Indies, in the province of Kamaon, Royle. Erianthèra rhomboídea, Benth. in Hook. bot. misc. 3. p. 880. Plant tomentosely villous. Leaves small; lower floral ones nearly entire; upper ones deeply crenated; all obtuse. Whorls about 2-flowered. Corollas nearly 1½ inch long, downy outside. Very nearly allied to *L. Gargánicum*.

Rhomboid-leaved Archangel. Pl. ½ foot.

4 L. Garga'nicum (Lin. spec. p. 808.) leaves cordate, wrinkled, clothed with soft villi on both surfaces; calyx villous; corolla 4 times as long as the calyx, with an erect tube, which is naked inside, a wide throat, a broad helmet, and the lateral lobes angular or furnished with a very short tooth. ♃. H. Native of Piedmont, on Mount Gargano; Greece, on Mount Hametto; Mountains of Laconia and Candia. Smith, exot. bot. 1. t. 48. L. Micheliànum, Tausch, in bot. zeit. 1831. 1. p. 215.—Till. pis. 93. t. 34. f. 2. act. par. 1717. p. 272. t. 9. Plant canescent or hoary. Leaves form of those of *L. vulgàtum*. Floral leaves for the most part shorter than the flowers. Whorls 10-20-flowered. Corolla 15 lines long, villous outside, red.

Gargano Archangel. Fl. June, Aug. Clt. 1729. Pl. ascending, 1 foot.

5 L. longiflòrum (Tenore, fl. nap. prod. p. 34. syll. 285.) stems nearly glabrous; leaves cordate, wrinkled a little, glabrous, or somewhat villous; whorls many-flowered; calyxes glabrous; corolla about 4 times longer than the calyx: tube straight, naked inside: throat very wide: galea broad: lateral lobes angular, or furnished with a short tooth. ♃. H. Native of the South of Europe, on the mountains; as of the Pyrenees, Provence on Mount Ventoso, Piedmont, Apennines, Naples, Sicily, Greece. L. lævigàtum, D. C. fl. fr. 3. p. 541. and many other authors, but not of Lin. L. Pedemontànum, Rchb. fl. germ. exc. p. 322.? Hardly to be distinguished from *L. Gargánicum*, unless in being glabrous, or nearly so.

Long-flowered Archangel. Pl. ascending.

6 L. galeobdolo'des (Smith, in Rees' cycl. vol. 20. Benth. lab. p. 788.) plant nearly glabrous; leaves small, on long petioles, cordate, crenated, or the superior ones are a little cut; whorls 6-10-flowered; calyx nearly glabrous, with short acute teeth; corolla about 4 times longer than the calyx: tube straight, naked inside: throat very wide: galea oblong: lateral lobes angular, appendiculate by a short tooth. ♃.? H. Native of the Levant, Tournefort. This differs from *L. longiflòrum*, in the small leaves and short calycine teeth, which are broad, not elongated and subulate.

Ground-Ivy-like. Pl. ascending.

7 L. veronicæfòlium (Benth. lab. p. 510.) glabrous; leaves small, on long petioles, reniform, deeply crenated, broadly subcordate at the base; upper leaves approximate, exceeding the flowers, or hardly shorter; corolla 3 times as long as the calyx, which is glabrous: tube straight, slender: throat dilated: galea very long, bifid at apex: lateral lobes angular, furnished with a short obtuse tooth. ♃. H. Native of Greece.—A very distinct species, having the lower leaves like those of *L. amplexicaùle*, and the corolla like that of *L. longiflòrum*. Leaves almost like those of *Verónica hederàcea*. Corolla ½ an inch long, red or purple.?

Speedwell-like Archangel. Pl. ascending.

8 L. stria'tum (Sibth. et Smith, fl. græc. 6. p. 46. t. 557.) leaves ovate, deeply crenated, broadly subcordate at the base: upper ones approximate, exceeding the flowers, or scarcely shorter; corolla 3 times as long as the calyx, which is glabrous: tube straight, slender: throat dilated: galea very long, bifid at apex: lateral lobes angular, appendiculate, by a short blunt tooth. ♃. H. Native of Greece, in waste places plentiful. Habit of *L. vulgàtum*; but the leaves are thinner, smaller, and less cordate at the base; petioles of the floral leaves shorter than the calyxes. Corollas 1½ inch long.

Striated Archangel. Pl. ascending.

9 L. bi'fidum (Cyr. pl. rar. fasc. 1. p. 22. t. 7.) leaves ovate: superior ones acuminated, all deeply lobed, crenately toothed: upper ones approximate, exceeding the flowers, or hardly shorter; tube of corolla straight, naked inside: throat dilated: galea elongated, and divaricately bifid at apex: lateral lobes appendiculate by a short linear tooth. ☉.? H. Native of the region of the Mediterranean; as in Corsica, Sicily, Naples. Tegione, fl. nap. t. 153. f. 2. Habit of *L. purpùreum*. Leaves more, green on both surfaces, or more or less lined with white, and more or less villous. Upper whorls subcapitate: lower ones remote. Corolla white, a little longer than those of *L. purpùreum*.

Var. β, clandestinum (Benth. lab. p. 511.) corollas minute from abortion. ☉. H. L. cryptánthum, Guss. prod. fl. sic. 2. p. 97. Rchb. icon. bot. eur. 8. p. 3. t. 707.

Bifid-helmeted Archangel. Fl. June, July. Clt.? Pl. ½ foot.

10 L. amplexicau'le (Lin. spec. 809.) leaves orbicular: cauline ones petiolate; floral leaves stem-clasping, all deeply crenated; tube of corolla straight, slender, naked inside: throat dilated: galea oblong, entire: lateral lobes mutic. ☉. H. Native of Europe, North of Africa, and Middle Asia, in cultivated fields and waste grounds; plentiful in Britain. Smith, engl. bot. t. 770. Hook. fl. lond. vol. 2. icone. Rchb. icon.

bot. eur. 3. p. 22. t. 224. f. 873. Curt. lond. 2. t. 109. Fl. dan. 752. *L.* palmàtum, Smith, in Rees' cycl. vol. 20. Galeóbdolon amplexicaúle, Mœnch, meth. p. 393. Pollíchia amplexicaúlis, Willd. fl. berol. 198. Roth, fl. germ. 1. p. 254.—Mor. hist. sect. 11. t. 11. f. 12.—Petiv. brit. t. 83. f. 4.—Rivin. mon. t. 63. Herb decumbent, branched at the base. Leaves glabrous, or rather hispid. Whorls densely many-flowered. Corolla purple or red, pubescent.

Var. β, *clandestìnum* (Rchb. icon. bot. eur. 8. p. 3. t. 708.) corollas minute by abortion. ☉. H.

Stem-clasping-leaved Archangel, or Great Henbit. Fl. March, July. Britain. Pl. ½ to 1 foot.

11 *L.* interme'dium (Fries, nov. fl. suec. ed. 1st. p. 105. and 2d. p. 192.) leaves orbicular; cauline leaves petiolate: floral ones stem-clasping, all deeply crenated; calycine teeth subulate, longer than the tube; tube of corolla straight, slender, naked inside: throat dilated: galea oblong, entire: lateral lobes appendiculate by a short tooth. ☉. H. Native of Sweden, North of Germany, and North of Scotland. Rchb. icon. bot. eur. 3. p. 22. t. 224. f. 872. and 8, 9. t. 721. *L.* moluccellæfòlium, Fries, nov. fl. suec. 72. ex Rchb. l. c. Habit and leaves like *L. amplexicaúle*; and scarcely differs from it, unless in the elongated calycine teeth, and lateral lobes of corolla.

Intermediate Archangel. Fl. March, July. Scotland. Pl. ½ to 1 foot.

12 *L.* purpu'reum (Lin. spec. p. 809.) lower leaves orbicular; floral leaves ovate, all crenated: uppermost ones approximate, exceeding the flowers; tube of corolla straight, slender, furnished with a pilose ring inside at the base: throat dilated: galea oblong, entire: lateral lobes appendiculate by a short linear tooth. ☉. H. Native throughout Europe and Asia, in waste and uncultivated grounds, in a light soil; plentiful in Britain. Hook. fl. lond. 2. icone. Smith, engl. bot. t. 769. Curt. lond. 1. t. 42. Fl. dan. t. 523. Martyn, fl. rust. t. 25. *L.* ocymifòlium, Smith, in Rees' cycl. vol. 20. *L.* nùdum, Mœnch, meth. p. 393. Crantz, stirp. austr. p. 259.—Riv. mon. t. 62. f. 2. Herb decumbent at the base. Leaves on long petioles, villous on both surfaces. Whorls densely many-flowered: upper ones approximate. Corolla ¼ an inch long, red. The floral leaves are usually coloured. According to Linnæus, it is boiled in Upland, a province of Sweden, as a pot-herb. The plant was formerly used medicinally, but is now disregarded.

Var. β, *mòlle* (Benth. lab. p. 512.) leaves less wrinkled, blunter, and with fewer crenatures. ☉. ? H. Native of England, in fields; as on road sides about Croydon. Flowers white.

Purple Archangel. Fl. May, Sept. Britain. Pl. ½ to 1 foot.

13 *L.* inci'sum (Willd. spec. 3. p. 89.) lower leaves orbicular; floral leaves broad-ovate, all deeply toothed, or lobed; the uppermost leaves approximate, exceeding the flowers; tube of corolla straight, furnished with a ring of hairs inside at the base: throat dilated: galea oblong, entire: lateral lobes appendiculate by a short linear tooth. ☉. H. Native of Europe, especially of the North, in corn-fields; France, Germany, Sweden; Britain, in many places. Smith, engl. bot. t. 1933. Rchb. icon. bot. eur. 3. p. 21. t. 223. *L.* hybridum, Vill. fl. dauph. 1. p. 251. *L.* dissèctum, With. brit. pl. p. 527. *L.* urticæfòlium, Weihe, ex Rchb. fl. germ. exc. p. 321. *L.* Westphaliànum, Weihe, ex Rchb. l. c. *L.* Coesfeldiæ, Weihe, ex Rchb. l. c. *L.* purpùreum, β, Huds. angl. p. 255.—Pet. brit. t. 83. f. 3. Leaves cut, as in *L. bífidum*. Flowers similar to those of *L. purpùreum*. Whorls sometimes all approximate, and sometimes the lower ones are remote.

Cut-leaved Archangel. Fl. May, Sept. Britain. Pl. ½ to 1 foot.

Sect. III. Lamiotypus (so named because the species contained in this section are the type of the genus.) Benth. lab. p. 513. Lamiotypus, Dumort, florul. belg. p. 45. Tube of corolla transversely annulate inside, contracted under the ring, and dilated above it, rather ventricose, and somewhat recurvedly drawn out; throat a little dilated. Anthers hairy outside.

14 *L.* moscha'tum (Mill. dict. no. 4.) leaves ovate, cordate, nearly glabrous; calycine teeth long, lanceolate-subulate; tube of corolla ample, short, furnished with a pilose ring inside; throat very wide: galea longer than the tube; lateral lobes bluntly acuminated, scarcely appendiculate. ☉. H. Native of the Levant. Leaves blotched with white, and in dry weather have a musky scent, but in wet weather are fetid. Corollas white; galea villous.

Musky-scented Archangel. Fl. April, July. Clt. 1730. Pl. ½ foot.

15 *L.* calve'num (D'Urv. pl. arch. in mem. soc. Lin. par. p. 323.) stem erectish, branched, quite glabrous, fistular; leaves cordate, wrinkled, woolly, pubescent: the upper ones also subpetiolate; calyxes smooth, reticulated, about equal in height to the corollas; calycine teeth very long, arched, subulate, scarcely ciliated; flowers crowded, sessile; whorls numerous: lower ones remote. ☉. H. Native of the Grecian Islands. Corolla villous outside, white.

Large-calyxed Archangel. Pl. ½ to 1 foot.

16 *L.* petiola'tum (Royle, ex Benth. in Hook. bot. misc. 3. p. 381. lab. p. 513.) leaves ovate-lanceolate, acuminated, scarcely cordate at the base; calycine teeth long-subulace; tube of corolla ample, furnished with a pilose ring inside: throat scarcely dilated; galea elongated: lateral lobes mutic, or with a short setaceous appendage: lip very short. ♃. ? H. Native of the Himalaya, plentiful, Royle; Kamaon, Wall. Allied to *L. vulgàtum*, but the leaves and corollas are different. Hairs of stem reflexed. Lower leaves petiolate: floral ones sessile, coarsely and somewhat doubly serrated, green and hispid on both surfaces. Whorls usually many-flowered. Corolla white; galea villous outside.

Petiolate-leaved Archangel. Pl. ascending.

17 *L.* vulga'tum (Benth. lab. p. 514.) leaves ovate, cordate, or truncate at the base, wrinkled, usually villous; calycine teeth long-subulate, glabrous or villous; tube of corolla ample, furnished with a ring of hairs inside: throat dilated a little: galea oblong: lateral lobes appendiculate by a long subulate tooth. ♃. H. Native of Europe, North of Africa, and Middle Asia, in shady mountain places, &c.; in some parts of Scotland. This is a very variable plant, but is readily distinguished from others by the form of the corolla. Leaves petiolate, crenated, doubly toothed, or a little cut, usually green, but often lined and blotched with white, more or less wrinkled, and villous. Whorls 10-20-flowered.

Var. α, *rùbrum* (Benth. lab. p. 514.) corollas purple or red; leaves green or blotched with white. ♃. H. This is more common in the southern regions of Europe than in the northern. *L.* maculàtum, Lin. spec. p. 809. Rchb. icon. bot. eur. 3. p. 12. t. 215. Sibth. et Smith, fl. græc. 6. p. 46. t. 556. with spotted leaves. Smith, engl. bot. t. 2550. with spotless leaves. *L.* rugòsum, Ait. hort. kew. 2. p. 296. Rchb. icon. bot. eur. 3. p. 14. t. 217. but not of Sibth. et Smith, nor Guss. nor Tenore. *L.* rùbrum, Blackw. t. 183. Wallr. sched. crit. p. 300. *L.* mutábile, Dumort, florul. belg. p. 45. ? *L.* hirsùtum, Lam. dict. 3. p. 410. with spotless leaves. *L.* stoloníferum, Lap. abr. pyr. p. 383. with spotless leaves, and many large flowers. *L.* grandiflòrum, Pourr. act. acad. tolos. 3. p. 322. *L.* lævigàtum, Lin. spec. p. 808. Rchb. icon. bot. eur. 3. p. 14. t. 216. but not of all authors—(this is a more glabrous variety.) *L.* melis-

sæfòlium. Mill. dict. no. 5.?—Sabb. hort. rom. 3. t. 34.—Bocc. muss. t. 23.—Colum. ecphr. 1. p. 190, t. 192.

Var. β, *álbum* (Benth. lab. p. 514.) flowers white; leaves spotless, villous. ♃. H. More common in the northern regions of Europe than the southern. L. álbum, Lin. spec. p. 809. Hook. fl. lond. 2. icone. Smith, engl. bot. t. 768. Curt. lond. 2. p. 45. t. 115. Fl. dan. 594. Mart. fl. rust. t. 25.—Riv. mon. t. 62. f. 1. L. níveum, Hort. L. capitàtum, Smith, in Rees' cycl. vol. 20. L. foliòsum, Crantz, stirp. austr. p. 258. This is certainly a distinct species from *L. maculàtum*; the roots of this creep like couch under ground, while the root of *L. maculàtum* is composed of fibres. Linnæus says that the leaves are eaten as a pot-herb in spring. The plant was formerly considered medicinal.

Common Archangel, or Dead-Nettle. Fl. April, Sept. Britain. Pl. 1 to 2 feet.

18 L. mólle (Ait. hort. kew. 2. p. 297.) lower leaves ovate: superior ones ovate-lanceolate, acute, truncate at the base, very rarely cordate; calycine teeth long-subulate; tube of corolla ample, furnished with a hairy ring inside, subrecurved: throat a little dilated: galea oblong: lateral lobes appendiculate by a subulate tooth; anthers hairy. ♃. H. Native country unknown, but common in gardens. L. parietariæfòlium, Benth. lab. p. 739. L. parietariæfòlio, Mor. hloes. 278. Very nearly allied to *L. vulgàtum*; but the lower leaves are rarely cordate: the upper ones much narrower, and often quite entire; and the corollas are smaller, and white.

Soft Archangel. Fl. April, June. Clt. 1683. Pl. ½ to 1 foot.

19 L. tomentòsum (Willd. spec. 3. p. 90.) leaves ovate, cordate, wrinkled, very villous; calycine teeth subulate, plumosely ciliated; tube of corolla ample, furnished with a ring of hairs inside: throat dilated a little: galea oblong: lateral lobes appendiculate by a long subulate tooth. ♃.? H. Native of the South-east of Europe, and Middle Asia; as of the South of Italy, Armenia, Caucasus. L. Colúmnæ, Tenore, ind. sem. hort. nap. 1827. syll. fl. nap. p. 286. Hardly differing from *L. vulgàtum*; except in the smaller, more villous leaves, and in the very villous calycine teeth. Flowers white.

Tomentose Archangel. Fl. May, July. Clt.? Pl. ½ to 1 foot.

Sect. IV. Galéobdolon (from γαλη, *gale*, a weasel; and βδολος, *bdolos*, fetid smell; in allusion to the fetid smell of *L. Galeóbdolon*.) Benth. lab. p. 515. Tube of corolla obliquely annulate inside, contracted under the ring, but dilated and rather ventricose above the ring, somewhat recurvedly stretched out: throat a little dilated: galea oblong, narrowed a long way at the base. Anthers glabrous.

20 L. rubéscens (Sibth. in herb. Banks, ex Benth. lab. p. 515.) leaves ovate, truncate or subcordate at the base: superior leaves acuminated, all wrinkled and villous; corolla reddish purple: galea elongated, entire: lateral lobes angular, having the angle mutic, or with a setaceous appendage. ♃. H. Native of Sicily and Naples. L. rugòsum, Sibth. et Smith, fl. græc. 6. p. 45. t. 555. Guss. fl. sic. prod. 2. p. 94. Tenore, fl. nap. 2. p. 19.? but not of Ait. This species differs from *L. flexuòsum*, in the corollas being one half larger, more villous, and purplish red; and in the leaves being more villous; and the bracteas are usually broader.

Pubescent Dead-Nettle. Pl. ascending.

21 L. flexuòsum (Tenore, fl. nap. 2. p. 19. t. 52. syll. p. 287.) leaves ovate, acuminated, truncate, or subcordate at the base, nearly glabrous, or scarcely villous; corolla white: galea elongated, entire: lateral lobes angular, having the angle mutic, or furnished with a setaceous point. ♃. H. Native of the region of the Mediterranean; as of France, Sicily, Naples, and Barbary. Reich. icon. bot. cur. 8. p. 3. t. 706. L. Petitianum, Guy, ined. Stems procumbent, often rooting at the base; branches ascending. Leaves coarsely and doubly toothed, green, or marked by a white line. Whorls 6-20-flowered.

Flexuous Dead-Nettle. Fl. April, July. Clt. 1824. Pl. ascending.

22 L. Galeóbdolon (Crantz, austr. p. 262. Benth. lab. p. 516.) leaves ovate, acuminated, truncate or subcordate at the base, nearly glabrous, or pilose; corolla yellow: galea elongated, entire: lateral lobes oblong, mutic, or with a very short appendage, hardly shorter than the lip. ♃. H. Native of the North of Europe, in shady places, woods, and under hedges; plentiful in some parts of Britain. Galeópsis Galeóbdolon, Lin. spec. 810. Pollíchia Galeóbdolon, Roth, fl. germ. 1. p. 254. Leonúrus Galeóbdolon, Scop. carn. no. 705. Galeóbdolon lúteum, Huds. angl. p. 258. Hook. fl. lond. 2. icone. Smith, engl. bot. t. 787. Galeóbdolon Galeópsis, Reich. cat. p. 436. Curt. fl. lond. 4. t. 40. Cardiaca sylvática, Lam. fl. fr. 2. p. 384. Pollíchia vulgáris et montána, Pers. ann. bot. 14. p. 39. Galeóbdolon vulgáre, Pers. euch. 2. p. 122.—Riv. mon. irr. t. 20. f. 2.—Mor. hist. sect. 11. t. 11. f. 5, 6. Herb nearly glabrous, but sometimes, especially on the lower leaves and stems, beset with long hairs. Whorls numerous, 6-15-flowered. Leaves deeply toothed. Corolla yellow: middle segment of the lower lip tawny, marked with 3 lines, the whole lower lip beautifully spotted with tawny or deep orange dots.

Galeobdolon, or Yellow-flowered Dead-Nettle. Fl. May, July. Britain. Pl. 1 to 1½ foot.

Doubtful species.

23 L. hírtum (Poir. suppl. p. 296.) leaves ovate-cordate, pubescently hairy, rather hoary; stem and calyxes very hairy; corolla small, nearly glabrous. ♃.? H. Native country unknown, but cultivated in Parisian gardens. Flowers of *L. álbum*, but much smaller. Stems hairy. Leaves soft, with nearly regular, obtuse crenatures, canescent: lower ones on long petioles. Whorls few-flowered. Calycine teeth 5, very short. Corolla white.

Hairy Archangel. Pl. ascending.

24 L. micrán'thum (Weinm. in syll. pl. soc. ratisb. 1. p. 68.) lower leaves petiolate: upper ones sessile, cordate-ovate, obtuse, serrated; whorls 6-flowered. ☺. H. Native of Brazil. Leaves beset in all parts with reflexed or spreading hairs. Calycine teeth equal, ciliated, terminated by a bristle. Corolla small, pale red, about equal in length to the calycine teeth; galea entire. Perhaps *L. purpùreum* or *Stáchys arvénsis*.

Small-flowered Archangel. Pl. 1 foot.

Cult. None of the species are worth cultivating for ornament, except *L. Orvàla* and *L. vulgàtum*, var. *maculàtum*. They are of the most easy culture, and will grow in any soil or situation, even under the drip of trees. The herbaceous perennial kinds are increased by division. The seeds of annual kinds only require to be sown in the open ground in spring.

LXXVII. LAGOCHILUS (from λαγος, *lagos*, a hare; and χειλος, *cheilos*, a lip; in reference to the bifid lower lip, like that of a hare's.) Bunge, mon. gen. molucc. ined. Benth. lab. p. 640.

Lin. syst. *Didynàmia, Gymnospérmia*. Calyx tubularly campanulate, somewhat 5-nerved, with an equal or oblique

mouth: teeth 5, nearly equal, of the superior ones are the longest, rather spinose at top. Corolla having the tube a little exserted, annulate inside, and the limb bilabiate; upper lip oblong, bifid at apex; lower lip erectish, with short, erect, acute, lateral lobes, and a spreading, broadly bifid middle lobe. Stamens 4, ascending: lower ones the longest. Filaments naked at the base; anthers approximate by pairs, 2-celled: cells parallel or diverging, and with the margins of the valvules ciliated. Style about equally bifid at apex: lobes subulate, stigmatiferous at apex. Achenia dry, triquetrous, with acute angles, and a truncate apex.—Herbs? quite glabrous, stiff. Leaves deeply lobed: lobes somewhat spinescent. Whorls axillary, few-flowered. Bracteas subulate, rather spinose.

1 L. diacanthophyl'lus (Benth. lab. p. 641.) leaves tripartite, cut; calyxes erectish, with oblong, mucronulate teeth, which are longer than the tube. ♃. F. Native of the desert of Bucharia, Pallas. Molucélla diacanthophýlla, Pall. nov. act. petrop. 10. p. 380. t. 11. Molucélla grandiflòra, Steph. in Willd. spec. 3. p. 131. Stems numerous, erect, rising from a perennial base. Lobes of lower leaves broad, short, obtuse, mutic, those of the superior ones narrow, ending each in a spiny mucrone; middle lobe of floral leaves sometimes tridentate. Whorls 2-flowered.? Corolla villous, pale red.

Two-spined-leaved Lagochilus. Pl. ⅓ foot.

2 L. Bu'ngei (Benth. lab. p. 641.) leaves petiolate, 3-5-parted, cut: calyx elongated, incurved, with lanceolate, spinose teeth, which are one half shorter than the tube. ♃. F. Native of Siberia, among rocks in Soongaria, at the Irtish, Bunge. L. diacanthophýlla, Bunge, mon. moluce. ined. exclusive of the syn. of Pallas. Stems woody at the base, ascending. Leaves an inch long, cuneated at the base, with spiny or mutic lobes. Corolla pale red, almost 1½ inch long. Whorls remote.

Bunge's Lagochilus. Pl. 1 foot.

3 L. ilicifòlius (Bunge, mon. moluce. ined. ex Benth. lab. p. 641.) leaves sessile, cuneiform, deeply 3-5-toothed at apex; calyxes short, erectish, with oblong, very shortly mucronulate teeth. ♃. F. Native of Mongholia, in stony saltish places, Bunge.—A dwarf, stiff herb, or under-shrub. Stem rather villous under the axils, the rest glabrous. Whorls few-flowered. Corolla 7-8 lines long, pilose outside.

Holly-leaved Lagochilus. Shrub ⅓ foot.

Cult. For culture and propagation see *Làmium*, p. 819.

LXXVIII. LEONURUS (from λεων, *leon*, a lion; and *ουρα*, *oura*, a tail; lion's tail.) Lin. gen. no. 722. Schreb. gen. no. 977. Juss. gen. p. 114. Benth. lab. p. 517.—Cardiaca, Tourn. inst. t. 87.—Cardiaca, Chaitùrus, et Panzèria, Mœnch. meth.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx 5-nerved, turbinate, nearly equal, with a truncate mouth, and 5 teeth, which are subulate, and rather spiny at apex, and at length spreading. Corolla with an inclosed, rarely exserted tube, which is naked, or obliquely annulate inside, and a bilabiate limb: superior lip oblong, quite entire, sometimes flattish, with a narrowed base, and sometimes arched; lower lip spreading, trifid, the lateral lobes oblong, and the middle lobe obcordate. Stamens 4, ascending, didynamous: lower 2 the longest; anthers approximate by pairs, 2-celled: cells parallel, transverse, rarely diverging, with naked valvules. Style about equally bifid at top; lobes subulate, rarely short, and obtuse, stigmatiferous at top. Achenia dry, smooth, triquetrous, truncate at apex, with acute angles.—Erect herbs. Leaves generally deeply lobed: lower ones roundish: floral ones narrower, all exceeding the flowers much. Whorls dense, axillary, distinct. Bracteas subulate. The section *Cardiaca* comes very near to the section *Galeòbdolon* of *Làmium*, and the section *Chaitùrus* to the genus *Marrùbium*, ex Benth.

Sect. 1. Cardi'aca (the Latin name of motherwort, from *cardia*, the heart; in allusion to its supposed efficacy in the cure of cardialgia.) Benth. lab. p. 518. Cardiaca, Mœnch, meth. p. 401. Tube of corolla obliquely annulate inside, rather ventricose above the ring; upper lip flattish, narrowed at the base: lower lip spreading, with the middle lobe entire.

1 L. pubes'cens (Benth. in Wall. pl. asiat. rar. 1. p. 68. lab. p. 518.) finely pubescent; leaves all ovate, acuminated, rather deeply toothed; corolla about 3 times as long as the calyx. ♃. or ♂. H. Native of the mountains of Kumaon, Wall.; Choor and Kunaour, Royle. Leaves more toothed than lobed. Whorls 20-30-flowered, remote. Corollas larger than those of *L. Cardiaca*.

Pubescent Motherwort. Pl.?

2 L. Royle'anus (Benth. l. c.) stem erect, finely tomentose; leaves ovate, acuminated, deeply serrated, or 3-5-lobed, villous above, and clothed with hoary tomentum beneath, as well as the calyxes. ♃. or ♂. H. Native of Mount Choor, Royle. Stem branched, with pilose axils. Whorls many-flowered; lower ones remote: upper ones spicate.

Royle's Motherwort. Pl.?

3 L. Cardi'aca (Lin. spec. p. 817.) pubescent; lower cauline leaves palmatifid: superior leaves ovate, lobate: floral leaves oblong, subtrifid, narrowed a long way at the base: lobes all ovate or lanceolate; calyxes glabrous or villous. ♃. or ♂. H. Native throughout Europe and Middle Asia, on banks or under hedges, in a gravelly or calcareous soil. In several places both in Scotland and England, in like situations. Smith, engl. bot. t. 286. Fl. dan. t. 727. L. campéstris, Andrz. ex Besser, pl. exs. with the segments of the leaves a little narrower. L. Illýricus, Hort. Cardiaca vulgàris, Mœnch, meth. p. 401. Cardiaca trilobàta, Lam. fl. fr. 2. p. 388.—Blackw. t. 171.—Mor. hist. sect. 11. t. 9. f. 13. Stems branched at the base. Whorls 6-15-flowered, distant. Corolla villous outside, pale red or white, and striped with purple veins. The herb is bitter and tonic, with no very pleasant, but pungent smell. It was formerly used in Cardialgia, whence its old name; but it has now become wholly obsolete, except, perhaps, among cow-leeches and farriers. Bees are fond of the flowers. In German, Motherwort is called *Herzgewaus* or *Herzkraut*. In Swedish, *Bonassla*. In French, *Agripaine, Cardiaque, La Cardiale*. In Italian, Spanish, and Portuguese, *Agripalma, Cardiaca*, &c.

Var. β, villòsus (Benth. lab. p. 518.) leaves more wrinkled, and are, as well as the stems, villous; calyxes rather villous. ♃. or ♂. L. villòsus, Desf. cat. hort. par. p. 73. D'Urv. enum. pl. arch. in mem. soc. Lin. par. p. 325. L. condensàtus, Horn. hort. hafn. L. lùcerus, Lindl. hort. trans. 6. p. 296. L. canéscens, Dumort, florul. belg. p. 46. L. neglèctus, Schrauck, in syll. pl. soc. ratisb. 2. p. 61. Corollas red or purple.

Var. γ, crispus (Benth. lab. p. 519.) margins of leaves undulately curled, and lacerately toothed. ♂. H. L. crispus, Murr. comm. gœtt. 8. t. 4. Cardiaca crispa, Mœnch, meth. p. 401.—Sabb. hort. rom. 3. t. 43. Mill. dict. ed. 7th. Corollas pale red or white.

Cardiac or Common Motherwort. Fl. July, Aug. Britain. Pl. 2 to 4 feet.

4 L. glaucescens (Bunge, in Led. fl. alt. 2. p. 409.) canescent from glaucescent pubescence above; cauline leaves palmately parted, cut, with oblong-lanceolate lobes; floral leaves subtrifid, the segments and upper leaves lanceolate-linear, almost quite entire; calyxes clothed with hoary pubescence. ♂. H.

Native of the Altaia, plentiful. Ledeb. fl. ross. atl. ill. t. 179. Habit of *L. Sibíricus*, with the flowers of *L. Cardiaca*. Leaves ample, deeply toothed; floral leaves much narrower, and more deeply cut than in *L. Cardiaca*.

Glaucescent Motherwort. Pl.

5 L. Tatáricus (Lin. spec. p. 818.) glabrous or pubescent at top; cauline leaves palmately parted, cut; floral leaves subtrifid: lobes of all, as well as the upper leaves, lanceolate-linear or linear; calyxes glabrous or villous. ♃. H. Native of Tartary, Lin.; Siberia, about the Kolyvan, Patrin; Altaia, frequent, Ledeb. Rchb. icon. bot. eur. 4. p. 31. t. 338. L. Altàicus, Spreng. syst. 2. p. 738. L. multífidus, Desf. hort. par.—Mill. fig. 53. t. 80. Nearly allied to *L. glaucéscens*, but more slender, more humble, and the leaves more finely cut, and the flowers smaller.

Tartarian Motherwort. Fl. Aug. Oct. Clt. 1756. Pl. 2 to 3 feet.

Sect. II. Chaitu'rus (from χαιτη, *chaite*, a head of hair, and ουρα, *oura*, a tail; in reference to the close whorls of flowers.) Benth. lab. p. 520. Chaitùrus, Mœnch. meth. p. 401. Tube of corolla straight, naked inside: upper lip a little arched: lower lip erectish, with nearly equal lobes, the middle lobe almost entire. Stamens scarcely longer than the tube; cells of anthers diverging. Flowers minute.

6 L. marrubia'strum (Lin. spec. 817.) branches elongated, pubescent; leaves oblong-ovate, somewhat deeply toothed, narrowed at both ends; calyxes nearly glabrous; corollas shorter than the calycine teeth. ☉. H. Native of Europe, especially in the East, and Asiatic Russia, among bushes, and in waste places; as of France, Germany, Piedmont, Hungary, Caucasus, Siberia. Jacq. fl. austr. 5. p. 3. t. 405. Chaitùrus leonuroides, Willd. fl. berol. p. 201. Chaitùrus marrubiástrum, Ehrh. Cardiaca marrubiástrum, Schreb.—Bocc. mus. 2. t. 98. Leaves petiolate, 1 to 1½ inch long, glabrous and green above, pale and canescent beneath, and tomentosely pubescent. Whorls dense, many-flowered, numerous, distant. Calycine teeth subulate, spiny, diverging. Corollas small, white, or pale red, smoothish.

Horehound-like Motherwort. Fl. June, Aug. Clt. 1710. Pl. 1 to 3 feet.

Sect. III. Panze'ria (named after G. Wolf. Fr. Panzer, of Nuremberg, author of several botanical works.) Benth. lab. p. 520. Panzèria, Mœnch. meth. p. 402. Tube of corolla straight, naked inside. Upper lip arched; lower lip straightish, or with the middle lobe spreading a little, obcordate or bifid. Stamens exserted from the tube.

7 L. Sibi'ricus (Lin. spec. p. 818.) erect, tall, glabrous or finely pubescent; leaves pinnately or palmately parted, a little cut; upper floral leaves almost quite entire; calyxes glabrous or clothed with fine tomentum. ♃. H. Native of Asia, Africa, and America, as of India, China, and Japan, Timor, Senegambia, Cuba, Demerara, St. Thomas, Trinidad, Brazil, &c. Rchb. icon. bot. eur. 4. p. 30. t. 337. Smith, exot. bot. 2. p. 67. t. 94. Sweet, fl. gard. 3. t. 204. L. Tatáricus, Burm. fl. ind. 127. but not of Lin. L. occidentàlis, Hortul. L. heterophýllus, Sweet, brit. fl. gard. 2. t. 197. L. occidentàlis, Colla, in mem. acad. taur. vol. 33. p. 154. L. altíssimus, Bunge, nov. gen. et spec. chin. not. ined. L. multífidus, Desf. Panzèria multífida, Mœnch. meth. suppl. p. 137. Panzèria tripartìta, Mœnch. meth. p. 402.? Stáchys Artemisiæ, Lour. coch. p. 368.—Amm. ruth. no 60. t. 8.? Branches usually canescent, at length glabrous and green. Leaves cut to the middle of the limb; cauline leaves usually tripartite; all green and glabrous above, but pale beneath, and pubescent while young. Lower whorls remote; upper ones approximate. Corollas red.

Siberian Motherwort. Fl. June, Aug. Clt. 1759. Pl. 2 to 6 feet.

8 L. lana'tus (Spreng. syst. 2. p. 738.) plant humble, clothed with white wool or villi; leaves all palmate-parted or palmatifid; corolla elongated. ♃. or ♂. H. Native of Siberia, in dry, sterile places, between the river Kan and Jebegan; and at the rivers Katunga and Tschuja, and near Slimon, Ledeb.; Dahuria, Patrin. Rchb. icon. bot. eur. 8. p. 15. t. 736. Ballòta lanàta, Lin. spec. 816. Panzèria lanàta, Pers. ench. 2. p. 126. Panzèria tomentòsa, Mœnch. meth. 402.—Gmel. sib. 3. t. 54. Stems rising from a thick rather woody base. Whorls dense, many-flowered, approximate. Corolla more than an inch long, yellowish.

Woolly Motherwort. Fl. June, Aug. Clt. 1752. Pl. 1 to 2 feet.

† *Species not sufficiently known.*

9 L. Java'nicus (Blum. bijdr. p. 828.) leaves ovate-oblong, unequally toothed; calyxes strigosely pubescent; calycine teeth acuminated, spreading; upper lip of corolla concave, emarginate: middle segment of the lower lip roundish, crenulated: lateral ones acutish. ♃. H. Native of the west of Java, in shady mountain places.

Java Motherwort. Pl.?

10 L. oblongifòlius (Blum. bijdr. p. 828.) leaves oblong, acuminated, unequally denticulated; calyxes very pilose; calycine teeth subulate; middle segment of the lower lip of the corolla roundish, crenulated: lateral ones acute. ♄.? H. Native of Java, on the Salak mountains, on the banks of the river Tjapus.

Oblong-leaved Motherwort. Pl.?

Cult. None of the species are very ornamental; and being generally biennial plants, the seeds of them only require to be sown in the open ground. *L. lanàta* should be grown in a dry sandy soil, or on rockwork.

LXXIX. ANISO'MELES (from ανισος, *anisos*, unequal, and μελος, *melos*, a member; in reference to the anthers of the longer stamens being dimidiate or halved.) R. Br. prod. p. 503. Benth. lab. p. 701. A'juga species, Roxb. Népeta and Ballòta species, Lin.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate, tubular, erectish, 5-toothed. Corolla having the tube equalling the calyx, and furnished with a pilose ring inside, and a bilabiate limb; upper lip erect, oblong, entire; lower lip larger, spreading: lateral lobes ovate, obtuse, the middle lobe emarginately sub-bifid. Stamens 4, ascending, exserted, the lower 2 the longest; anthers approximating by pairs, those of the longer stamens dimidiate, and those of the shorter ones 2-celled: the cells parallel and transverse. Style almost equally bifid at top. Achenia dry, smooth.—Herbs and sub-shrubs, with the habit of *Stáchys*, sect. *Erióstachys*. Whorls sometimes densely many-flowered, racemose; sometimes very loose; constantly composed of cymes on long peduncles; sometimes axillary and few-flowered. Flowers purplish.

1 A. moschà'ta (R. Br. prod. p. 503.) leaves elliptic, and arc, as well as the stem, clothed with cinereous pubescence; whorls few-flowered; calyx greyish-green, glanduliferous. ♄. S. Native of tropical New Holland. Corollas red or purplish.

Musky Anisomeles. Fl. July, Aug. Clt. 1824. Shrub 2 to 3 feet.

2 A. inodòra (R. Br. prod. p. 503.) leaves elliptic, nearly glabrous, dotted beneath; whorls remote; calyxes green, glanduliferous. ♄.? S. Native of tropical New Holland.

Scentless Anisomeles. Shrub.

3 **A. Heyne'na** (Benth. in Wall. pl. rar. asiat. 1. p. 59. lab. p. 702.) glabrous or finely pubescent; leaves remote, oblong-lanceolate, narrowed at the base; cymes of flowers on long peduncles, secund, few-flowered; calycine teeth lanceolate, acute. ♄. ? S. Native of the Indian Peninsula, Heyne; Island of Salcette, on the higher mountains, in shady woods, at the temple of Kennerg, Jacquemont. Leaves serrately crenated, smaller and thinner than the rest, pale green, and usually finely pubescent.

Heyne's Anisomeles. Shrub, ?

4 **A. salviefòlia** (R. Br. prod. p. 503. ? Benth. lab. p. 702.) villous; leaves oblong-elliptic or lanceolate; whorls dense, many-flowered; calycine teeth short, broad-lanceolate, acute. ♄. ? S. Native of tropical New Holland; Island of Timor. Very nearly allied to *A. intermèdia*, and *A. ovàta*, var. *mollissima*, but differs in the smaller stature, slenderer branches, smaller calyxes, and in the teeth being 4 times shorter than the tube.

Sage-leaved Anisomeles. Shrub. ?

5 **A. ova'ta** (R. Br. in Ait. hort. kew. ed. 2. vol. 2. p. 364.) hairy, rarely almost glabrous; leaves ovate, acuminated or roundish or truncately subcordate; whorls dense, many-flowered; calycine teeth lanceolate, acute. ☉. ? S. Native of the hotter parts of Asia, in waste and humid places in most parts. Jacq. fil. ecl. 1. t. 86. Hook. bot. misc. 2. p. 358. t. 19. *A. disticha*, Heyne, ex Roth. nov. spec. p. 254. Népeta Amboinica, Lin. suppl. p. 278. Ballòta disticha, Lin. mant. 83. Ajuga disticha, Roxb. fl. ind. 3. p. 2. Népeta disticha, Blume, bijdr. p. 828. Marrùbium Indicum, Burm. fl. ind. p. 127. et thes. zeyl. t. 71. Monárda Zeylánica, Burm. fl. ind. p. 12. Ballòta Mauritiàna, Pers. ench. 2. p. 126.—Rheed. mal. 10. p. 175. t. 88. Leaves obtuse, broadly crenated. Whorls 10-40-flowered, secund, or nearly equal; lower ones distant; upper ones interruptedly spicate. Corollas purple; lower lip of a deeper colour.

Ovate-leaved Anisomeles. Fl. July, Aug. Clt. 1823. Pl. 2 to 3 feet.

6 **A. ca'nicans** (Benth. in Wall. pl. rar. asiat. 1. p. 59. lab. p. 703.) canescent from pubescence; leaves ovate-oblong or lanceolate, narrowed at the base; whorls many-flowered, rather loose; calycine teeth lanceolate, acute. ♄. ? S. Native of the Birman Empire, on the banks of the Irrawaldi, near Yenangbuen, Wallich. Habit of *A. Malabárica*, but the leaves are a little broader, pubescent on both surfaces, as well as the stems and calyxes. Cymes usually elongated as in *A. Malabárica*, but the flowers are fewer. Calyx elongated, having the teeth as in *A. ovàta*.

Whitish Anisomeles. Shrub. ?

7 **A. interme'dia** (Wight, mss. ex Benth. lab. p. 703.) clothed with tomentose pubescence or subvillous; leaves ovate-lanceolate, cuneated at the base; whorls many-flowered, dense, or the cymes are at length ample and elongated; bracteas subulate; calyx hairy, having the teeth lanceolate at the base, and subulate at apex, very soft. ♄. ? S. Native of the Indian Peninsula, on the mountains of Madura; and of Ceylon, at Peradenia. Habit intermediate, between *A. ovàta*, and *A. Malabárica*, but is more nearly allied to the latter, from which it differs in the broader less tomentose leaves, and broader calycine teeth.

Intermediate Anisomeles. Shrub.

8 **A. Malaba'rica** (R. Br. in. bot. mag. t. 2071.) tomentosely villous; leaves oblong-lanceolate, narrowed at the base; whorls many-flowered, dense, or the cymes are ample, and at length elongated; floral leaves, bracteas, and subulate calycine teeth, very soft. ♄. S. Native of the hotter parts of Asia, in humid places by the sides of rivulets; as of the Indian Peninsula, Burman Empire, Mauritius, Penang, Java, Malabar, &c. Hook. journ. bot. 1. p. 225. t. 127. Népeta Malabárica, Lin. mant. 566. Ajuga fruticòsa, Roxb. fl. ind. 3. p. 1. Stàchys Malabárica, Sieb. fl. maur. exc.—Rheed. mal. 10. p. 155. t. 83.? Branches canescent from short tomentum. Leaves 2-4 inches long, obtuse, serrately crenated in the upper part, quite entire at the base. Whorls distant, disposed in simple racemes. Corolla rose-coloured or purplish: throat of corolla and filaments pilose. Odour of *Stàchys sylvática*.

Malabar Anisomeles. Fl. July, Aug. Clt. 1817. Shrub 2 to 5 feet.

Cult. The species are of the most easy culture and propagation. A light rich soil answers them well; and cuttings strike root readily in the same kind of soil.

LXXX. GALEOPSIS (from γαλη, *gale*, a weasel; and οψις, *opsis*, resemblance; the mouth of the corolla gaping like that of an animal.) Lin. gen. no. 717. Schreb. gen. no. 972. Juss. gen. p. 114. Benth. lab. p. 523. Tetràhit. Dill. gen. 3-4. Mœnch. meth.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubularly campanulate, somewhat 5-nerved, with a nearly equal mouth and 5 nearly equal teeth, or the superior teeth are the longest, somewhat spinescent at apex. Corolla with an exserted tube, which is naked inside, a dilated throat, and a bilabiate limb; upper lip ovate, entire, arched; lower lip spreading, trifid; the lateral lobes ovate, and the middle lobe obcordate or somewhat bifid; palate furnished with an elevated tooth above, at the recess of the lobes. Stamens 4, ascending, the lower two the longest; anthers 2-celled: cells opposite, transversely and bivalvately dehiscent; inner valve roundish, with ciliated edges; outer one larger and naked. Style about equally bifid at top; lobes subulate, stigmatiferous at apex.—Annual divaricately branched erect herbs, rarely decumbent at the base. Floral leaves almost similar to the cauline leaves. Whorls numerous, many-flowered, distinct. Flowers red or cream-coloured, or variegated with both these colours. This genus is readily distinguished from all other labiate genera in the structure of the anthers.

1 **G. ochroleu'ca** (Lam. dict. 2. p. 600.) stem pubescent; leaves oblong or oblong-lanceolate, clothed with soft villi on both surfaces; calyx clothed with glandular villi. ☉. H. Native of Middle Europe; as of Britain, France, and Germany, in sandy corn-fields; in England, as in Cambridgeshire, Nottinghamshire, Yorkshire, Lancashire, and about Bangor in Wales. Relhb. icon. bot. eur. 1. p. 40. t. 46. *G. villòsa*, Smith, fl. brit. 2. p. 629. engl. bot. t. 2353. *G. grandiflòra*, Gmel. syst. p. 205. *G. prostràta*, Vill. dauph. 2. p. 388. *G. dùbia*, Leers herb. no. 453. Tetràhit longiflòrum, Mœnch, meth. p. 395. *G. ségetum*, Relhb. ex Steud. nom. p. 351. *G. Ládanum*, *majus* Krok. fl. siles. no. 932. Stems often decumbent at the base. The whole plant generally clothed with glandular hairs. Corollas large, cream-coloured.

Cream-coloured flowered Hemp Nettle. Fl. July, Aug. Britain. Pl. 1 foot.

2 **G. La'danum** (Lin. spec. p. 810.) stem glabrous or pubescent; leaves oblong-lanceolate, clothed with short tomentose pubescence on both surfaces; calyxes clothed with adpressed pubescence and glandless pili. ☉. H. Native throughout Europe, from Sweden and Scotland to Spain, Italy, South of Russia and the Caucasus; a common weed in corn fields, plentiful in Britain, Smith, engl. bot. t. 884. *G. canéscens*, Sebulres, obs. p. 108. ? *G. angustifòlia*, Ehrh. Tetràhit Ládanum, Mœnch, meth. 394. —Petiv. brit. t. 33. f. 11.—Mor. hist. 3. p. 386. sect. 11. t. 12. f. 18. Plant erect. Branches purplish. Leaves remotely serrate-crenated. Whorls few at the tops of the branches, 6-10-flowered. Corolla red, having the tube and throat generally spotted with yellow: sometimes not above half again as long as the calyx, and sometimes 2 or 3 times as long, pubescent outside.

Var. β, parviflòra, (Benth. lab. p. 523.) corolla about half again as long as the calyx. ☉. H. G. parviflòra, Lam. dict. 2. p. 606. G. intermèdia, Vill. fl. dauph. 2. p. 387. t. 9. Rchb. icon. bot. eur. 1. p. 40. t. 46. G. latifòlia, Hoffm. fl. germ. 4-8. ex D. C. fl. fr. 3. p. 544.

Var. γ, spinòsa (Benth. lab. p. 523.) calycine teeth longer and spinose. ☉. H. G. angustifòlia, Hoffm. fl. germ. 4-8. ex D. C. fl. fr. 3. p. 543.

Ladanum Hemp Nettle. Fl. July, Sept. Britain. Pl. 1 foot.

3 G. Tetra'hit (Lin. spec. p. 810.) stem usually hairy, from stiff bristles or pili, and tumid at the nodi; leaves ovate, and are, as well as the calyxes, glabrous or hairy. ☉. H. Native throughout Europe and Middle Asia, by way-sides, in coppice-woods; in corn-fields and on their margins; plentiful in some parts of Britain. Tetràhit nodòsum, Mœnch, meth. p. 395. Leaves 1-3 inches long, pilose. Whorls 6-30-flowered, distinct, or the upper ones approximate. Corolla sometimes shorter than the calycine teeth; sometimes 4 times as long, purplish, yellowish, or spotted with both colours.

Var. α, parviflòra, (Benth. lab. p. 524.) corolla 2-3 times as long as the calyx. ☉. H. G. Tetràhit, Curt. fl. lond. 5. t. 191. Rchb. icon. bot. eur. 9. p. 28. t. 877. Smith, engl. bot. t. 207. G. bifida, Boenning. ex Lej. fl. belg. p. 241. Rchb. fl. germ. exc. p. 323. G. acuminàta, Rchb. fl. germ. exc. p. 323.—Riv. mon. irr. t. 31.—Petiv. herb. brit. t. 33. f. 8.—Mor. hist. t. 12. f. 13. Corolla purple or white, with a spot on the lower lip, variegated with purple and yellow.

Var. β, pubéscens (Benth. lab. p. 524.) stems scarcely hairy. ☉. H. G. pubéscens, Besser. prim. fl. gal. 2. p. 27. Rchb. icon. bot. eur. 1. p. 40. and 41. t. 47-48. G. Walteriàna, Schlecht. fl. berol.

Var. γ, grandiflòra (Benth. lab. p. 524.) corollas 3-4 times as long as the calyxes. ☉. H. G. versicolor, Lin. spec. p. 810. Curt. fl. lond. 6. t. 38. Rchb. icon. bot. eur. 1. p. 47. t. 57. G. cannàbina, Poll. pal. no. 560. Fl. dan. 929. Willd. spec. 3. p. 393. G. speciòsa, Mill. dict. no. 3. Corolla cream-coloured; lower lip spotted with purple.

Tetrahit or Common Hemp Nettle. Fl. July, Aug. Britain. Pl. 1 to 3 feet.

Cult. All the species are common weeds in corn-fields; and are therefore only cultivated in botanical gardens.

LXXXI. STA'CHYS (from *σταχυς, stachys*, a spike, in reference to the spiked inflorescence.) Benth. lab. p. 525.—Stáchys and Betónica, Lin. and other authors.—Zietènia, Gleditsch, Pers. and other authors.—Eriòstomum, Tetrahitum and Trixàgo, Hoffm. et Link.

Linn. syst. *Didynàmia, Gymnospérmia.* Calyx tubularly campanulate, 5 or 10-nerved, with an equal or oblique 5-toothed mouth; teeth equal, or the superior ones are larger, or the 3 superior ones are combined into an upper lip. Corolla with an equal, inclosed or exserted tube, furnished with a transverse ring of hairs inside or naked, often incurved above; throat not dilated; limb bilabiate; upper lip erect or spreading a little, usually arched a little, entire or scarcely emarginate, rarely elongated and flattish, emarginately bifid; lower lip usually longer, spreading, and 3-lobed; the middle segment large, entire, or emarginate. Stamens 4, ascending, exserted; lower 2 the longest; filaments naked; anthers approximate, 2-celled: cells distinct, parallel, diverging or divaricate. Style about equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia dry, obtuse, not truncate.—Herbs or subshrubs. Whorls 2 or many-flowered, usually disposed in terminal, nearly simple racemes.

Sect. 1. Alopecu'ros (from *αλωπηξ, alopex*, a fox, and *ουρα, oura*, a tail; resemblance in spikes of flowers.) Benth. lab. p. 531.—Betónica species, Lin. and other authors. A perennial villous green herb. Whorls fasciculately many-flowered, approximating into somewhat interrupted spikes. Outer bracteas about equal in length to the calyxes. Corollas yellowish; tube inclosed. Cells of anthers parallel.

1 S. alopecu'ros (Benth. lab. p. 531.) plant ascending, villous; leaves petiolate, broad-ovate, obtuse, crenated, broad-cordate at the base: lower floral leaves sessile, similar to the upper ones, but broader: upper ones and bracteas broad-ovate, acute; corolla one half longer than the calyx, which is amply campanulate. 4. H. Native of South and Middle Europe, on the mountains; as of the Pyrenees, Cevennes, Switzerland, Austria, Provence, Piedmont, Naples, Mount Parnassus. Betónica alopecùros, Lin. spec. p. 811. Jacq. fl. austr. 1. p. 50. t. 78. Rchb. icon. bot. eur. 8. 4b t. 719. Betónica lùtea, Mill. dict. no. 7. Sideritis alopecùros, Scop. carn. no. 711. t. 28. Spikes an inch in diameter. Whorls 20-30-flowered. Corollas cream-coloured, downy outside.

Fox-tail-spiked Betony. Fl. July. Clt. 1759. Pl. 1 to 1½ foot.

Sect. II. Betónica (betonic is the Celtic name of common betony.) Benth. lab. p. 532. Betónica species of Lin. and other authors. Pilose, pubescent, or villous perennial herbs. Whorls fasciculately many-flowered, approximating into subinterrupted spikes. Outer bracteas equalling the calyxes. Corollas purplish, rarely cream-coloured; tube usually exserted; cells of anthers subparallel.

2 S. densiflòra (Benth. lab. p. 532.) erect, hairy; leaves petiolate, ovate-oblong, obtuse, crenated, cordate at the base: lower floral leaves cordate-ovate, on short petioles: superior ones bractea-formed, and are, as well as the bracteas, ovate-lanceolate, mucronate, equalling the calyxes; whorls approximating into a dense oblong spike: the lower whorls remote; corolla twice as long as the calyx. 4. H. Native of the South of Europe in subalpine places; as of Spain, Pyrenees, Switzerland, Appennines, Naples, Hungary, Caucasus. Betónica Monnièri, Osb. p. 146. Gouan, ill. p. 36. Betónica hirsùta, Lin. mant. 248. Murr. comm. gœtt. 1779. vol. 2. p. 13. t. 3. Rchb. icon. bot. eur. 8-5. t. 714. Betónica Dánica, Mill. dict. no. 2. Betónica incàna, Ait. hort. kew. 2. p. 293. Sims. bot. mag. 2125. Rchb. icon. bot. eur. 8. p. 5. t. 713.—Barrel. icon. t. 340. Stems nearly simple. Leaves 2-3 inches long, and 1 to 1½ broad. Spikes thick, dense. Corollas villous outside, purplish, tube exannulate inside. Calycine teeth spinose: superior ones rather the largest.

Dense-flowered Betony. Fl. June, July. Clt. 1710. Pl. 1½ foot.

3 S. Betónica (Benth. lab. p. 532.) erect, rather pilose; lower leaves on long petioles, ovate-oblong, obtuse, crenated, cordate at the base: superior leaves remote, and are, as well as the lower floral leaves, sessile, oblong-lanceolate, acute, toothed: uppermost ones linear, quite entire, equalling the calyxes; whorls many-flowered, all approximate into an oblong subinterrupted spike, or the lower whorls are distinct: bracteas ovate, mucronate, equalling the calyxes; corolla twice as long as the calyx. 4. H. Native throughout Europe and Russian Asia, in woods, heaths, and pastures, among bushes; plentiful in Britain, in like situations. Betónica officinàlis, Lin. spec. p. 810. Hook. fl. lond. vol. 2. with a figure. Smith, engl. bot. t. 1113. Fl. dan. 726. Rchb. icon. bot. eur. 8. p. 4. t. 710. Betónica hirta, Leyss. Rchb. icon. bot. eur. 8. p. 4. t. 711. Betónica legítima, Link, handb. p. 476. Betónica stricta, Ait. hort. kew. 2. p.

299. Rchb. icon. bot. eur. 8. p. 5. t. 712. Betónica alpìna, Mill. dict. no. 3. Betónica foliòsa, Presl. fl. sic. 37.? Betónica affìnis, Wender. in bot. zeit. 1826. 1. p. 353. Betónica serótina, Host, fl. austr. vol. 2. Betónica divúlsa, Tenore, syll. fl. nap. append. p. 641.?—Sabb. hort. rom. t. 82.—Riv. mon. irr. t. 28. —Mor. hist. sect. 11. t. 5. f. 1.—Petiv. herb. brit. t. 32. f. 6. Very like *S. densiflòra*, but differs in the more slender stems, longer petioles, remote smaller leaves, the more starved spike, &c. Corolla purple or white. Betony was formerly much used in medicine, but it is discarded from present practice. When fresh it intoxicates. The leaves and flowers, according to Lewis, have a herbaceous, roughish, and somewhat bitterish taste, with a weak aromatic flavour. An infusion of them or light decoction may be drunk as tea. The roots are bitter and very nauseous; in small doses they act as an emetic and aperient. The plant dyes wool of a fine dark yellow colour.

Var. β, màjor (Benth. lab. p. 532.) spike elongated and thicker, and the habit more like that of *S. densiflòra*, but the superior leaves are lanceolate, not ovate. ♃. H. This is the garden variety.

Betony, Common. Fl. July, Sept. Britain. Pl. 1 to 1½ foot.

4 S. LONGIFÒLIA (Benth. lab. p. 533.) erect, villous; leaves petiolate, oblong-lanceolate, obtuse, crenated, deeply cordate at the base: lower floral leaves similar to the rest, sessile: upper floral ones bractea-formed, and are, as well as the bracteas, ovate-lanceolate, acuminated, shorter than the calyxes; whorls many-flowered: lower ones remote: upper ones approximate into a cylindrical spike; corolla twice as long as the calyx, which is tubular. ♃. H. Native of Caucasus. Betónica orientàlis, *Lin. spec. p. 811. Lam. ill. t. 507. f. 2.?* Leaves 4-6 inches long, and ½ but scarcely 1 inch broad, deeply and hastately cordate at the base. Spike loosish, ½ foot long, interrupted at the base. Corollas reddish, purple; tube exannulate inside.

Long-leaved Betony. Fl. June, July. Clt. 1737. Pl. 1 to 2 feet.

5 S. GRANDIFLÒRA (Benth. lab. p. 533.) erect, villous; leaves petiolate, broad-ovate, obtuse, crenated, broadly cordate at the base: floral leaves sessile, stem-clasping, almost similar to the rest, gradually becoming smaller as they ascend, till the upper ones become almost bractea-formed; whorls many-flowered, distinct: the lower ones remote; bracteas ovate-lanceolate, acute, longer than the calyxes; corolla about 3 times as long as the calyx, which is tubularly campanulate: throat dilated. ♃. H. Native of Siberia, at the river Terek; also of Caucasus. Betónica grandiflòra, Willd. spec. 3. p. 96. Curt. bot. mag. t. 700. Rchb. icon. bot. eur. 8. p. 6. t. 715. Betónica orientàlis, Thuil. fl. par. p. 293. but not of Lin. Whorls 10-20-flowered. Corolla violaceous, 12-14 lines long, glabrous; tube exannulate inside.

Great-flowered Betony. Fl. June, July. Clt. 1803. Pl. 1 foot.

6 S. BICOLOR (Benth. lab. p. 533.) ascending, villous; leaves petiolate, oblong-lanceolate, deeply crenated, wrinkled above and hairy, but clothed with white wool beneath: lower floral leaves similar to the rest, sessile: upper floral leaves bractea-formed, lanceolate, equalling the calyxes; whorls many-flowered, rather distinct, few; corolla more than twice as long as the calyx, which is tubularly campanulate: throat dilated. ♃. H. Native of Eastern Caucasus, in stony places. Betónica nívea, Stev. in mem. soc. nat. car. mosq. 3. p. 266. Betónica macroùra, Otto.? This is a very elegant species, of the size, and with the flowers of *S. grandiflòra*. Leaves form of those of *S. hirsùta*, green above. Calyx woolly. Corollas large.

Var. α, rósea; flowers rose-coloured. ♃. H.

Var. β, ochroleùca; flowers cream-coloured. ♃. H.

Two-coloured-leaved Betony. Fl. June, July. Clt. 1820. Pl. 1 to 1½ foot.

SECT. II. ERIÓSTACHYS (from *eprov, erion*, wool, and *σταχυς, stachys*, a spike; spikes woolly.) Benth. lab. p. 534. *Eriostachys* Benth. lab. p. 534. Rchb. fl. germ. exc. p. 319. Perennial or biennial herbs, clothed with soft villi or wool. Whorls many-flowered. Outer bracteas alone equalling the calyxes or hardly shorter than them.

7 S. HERBA'CEA (All. ped. 1. p. 51. t. 84. f. 1.) erect, woolly from very long hairs; leaves petiolate, oblong, obtuse, crenated, subcordate at the base: floral leaves very broadly ovate, quite entire, and broadly cordate at the base, scarcely exceeding the calyxes; whorls many-flowered, distinct; bracteas ovate or oblong: outer ones equalling the calyxes; calyx woolly, with ovate, very acute subspinose teeth. ♃. H. Native of Europe, in the region of the Mediterranean, in dry uncultivated places; as of Spain, Eastern Pyrenees, France about Rhodes, Provence, Piedmont, Italy, Sicily, &c. Sideritis Heráclea, Col. ecphr. 1. t. 131. ex Allion. S. intermèdia, Tenore, fl. nap. p. 84. ex D. C. but not of Ait. S. barbàta, Lapeyr. abr. p. 536. S. phlomoides, Willd. enum. suppl. p. 41. Betónica Heráclea, Lin. syst. 535. mant. p. 83. Stems many, from a thick perennial base. Cauline leaves 2-5 inches long, and hardly 1 inch broad. Racemes simple. Corolla twice as long as the calyx, purple, form of that of *S. Germánica*.

Var. β, lútea (Benth. lab. p. 534.) flowers yellow. ♃. H. Native of Croatia, Dalmatia, and near Constantinople. S. obliqua, Waldst. et Kit. hung. 2. p. 142. t. 134. S. Crética, Forsk. fl. const. p. 28. but not of Lin. S. orientàlis, Vahl. symb. 2. p. 64. Sibth. et Smith, fl. græc. 6. p. 48. t. 134. This only differs from the species in the colour of the flowers.

Heraclean Hedge Nettle. Fl. June, July. Clt. 1816. Pl. 1 foot.

8 S. MOLLI'SSIMA (Willd. hort. berol. 60. t. 60.) humble, erect, clothed with soft villi; leaves petiolate, broad-ovate, crenated, cordate at the base, wrinkled, greenish on both surfaces, very villous; whorls many-flowered; bracteas linear, equalling the calyxes; calyx campanulate, villous, with acute, rather spinose teeth; corolla pubescent outside, half again as long as the calyx. ♃. H. Native of Spain, and of the Island of Corfu. Leaves like those of *S. alpìna*, but smaller. Corollas pale purple. ?

Very soft Hedge Nettle. Fl. July, Aug. Clt. 1806. Pl. ½ to ¾ foot.

9 S. PO'MILA (Russ. nat. hist. alep. 2. p. 255. t. 10.) perennial or suffruticose, humble; leaves almost radical, petiolate, ovate, obtuse, cordate at the base, wrinkled, clothed with hoary tomentum on both surfaces; whorls few, many-flowered; outer bracteas about equal in length to the calyxes; calyx nearly glabrous, with lanceolate-subulate teeth, which are about equal in length to the tube. ♃. or ♄. F. Native of Syria, near Aleppo, Russell. Stems rising from a short woody base. Radical leaves almost like those of *Sálvia pomífera*. Floriferous branches 2-4 inches high, bearing 2-4 whorls. Floral leaves roundish, wrinkled. Whorls 15-20-flowered.

Dwarf Hedge Nettle. Pl. ¼ to ½ foot.

10 S. SWAINSÒNII (Benth. lab. p. 535.) herbaceous, ? pilosely woolly, procumbent at the base, much branched; leaves petiolate, ovate, obtuse, crenated, rounded at the base, wrinkled, very soft; whorls 2-10-flowered; bracteas one half shorter than the calyxes, rarely minute; calyx campanulate, villous, with lanceolate, very acute, rather spinose teeth; corolla twice as long as the calyx. ♃.? H. Native of Greece, on Mount Parnassus, Swainson; Ithaca, P. B. Webb. Prásium hirsútum, Poir. dict. 5. p. 611. This species is allied to sect. *Zietènia*. Leaves about ½ an inch long. Racemes dense. Corolla villous outside. Ring of tube rather oblique.

Swainson's Hedge Nettle. Pl. ½ foot.

11 S. Zuccarini (Benth. lab. p. 535.) herbaceous, silky and woolly from adpressed pili; branches elongated, erect, a little branched; leaves few, linear, quite entire; whorls 2-flowered; bracteas shorter than the calyxes; calyx tubularly campanulate, with spinose teeth, which exceed the tube of the corolla. ♃.? H. Native of Greece, Zuccarini. Branches almost naked. Leaves scarcely an inch long, acutish: floral leaves small, sessile, lanceolate. Calyxes sessile.

Zuccarini's Woundwort. Pl. 2 to 3 feet.

12 S. lanàta (Jacq. icon. rar. 1. p. 11. t. 107.) clothed with dense silky wool; leaves oblong-elliptic, narrowed at both ends, scarcely crenulated, wrinkled: floral leaves smaller: upper floral leaves shorter than the whorls; whorls many-flowered, the uppermost ones approximating into a spike; bracteas linear-lanceolate, about equal in length to the calyxes; calyx incurved, with scarcely unequal acute mutic teeth which are woolly inside; corolla woolly outside, with an inclosed tube. ♃. H. Native of Tauria, in dry exposed fields, plentiful, and throughout Caucasus. Eriòstomum lanàtum, Hoffm. nachtr. 1. p. 60. Leaves thick. Whorls above, 30-flowered. Corollas purple, smaller than in *S. Germánica*.

Woolly Woundwort. Fl. June, Sept. Clt. 1782. Pl. 1 to 1½ foot.

13 S. lusítica (Milt. diet. no. 8.) erect, clothed with hoary tomentum; leaves nearly sessile or on short petioles, oblong-lanceolate, narrow, obtuse, crenulated, narrowed at the base, rarely subcordate, wrinkled: floral leaves ovate-lanceolate, quite entire, rather longer than the whorls; whorls many-flowered, distinct; upper ones approximate; bracteas linear-lanceolate, equalling the calyxes; calyx a little incurved, with acute spinose teeth, which are densely woolly inside; corolla woolly outside, with an inclosed tube. ♃. H. Native of Europe, in the region of the Mediterranean; as of Italy, Etruria, and near Parma. S. salviæfòlia, Tenore, fl. nap. 2. p. 29. t. 53. syll. p. 291. Eriòstomum salviæfòlium, Presl. fl. sic. p. 37. This species differs from *S. Germánica* in the more humble stature, narrower leaves, which are rarely cordate at the base, and more tomentose than woolly. Corollas purplish.

Var. β, púngens (Benth. lab. p. 537.) plant more humble; leaves fewer; whorls few, spicate at the tops of the stems. ♃. H. Native of Dalmatia, at Zara; Syria, near Aleppo. S. púngens, Russel, nat. hist. alep. S. salviæfòlia, Vis. pl. dalm. Sideritis hirsùta, Sieb. pl. exsic. exs.

Italian Woundwort. Fl. June, July. Clt.? Pl. 1 to 1½ foot.

14 S. Germánica (Lin. spec. 812.) herbaceous, tall, clothed with loose white wool; cauline leaves petiolate, ovate or ovate-lanceolate, obtuse, usually cordate at the base, crenated; lower floral leaves sessile, half stem-clasping, crenated, the uppermost ones lanceolate, acute, and quite entire, rather longer than the whorls; whorls many-flowered, distinct, racemose: upper whorls approximate; bracteas linear-lanceolate, equalling the calyxes; calyx a little incurved, with acute, rather spinose teeth, woolly inside, upper teeth the largest; corolla woolly outside, with an inclosed tube. ♃. H. Native of Europe, Middle Asia, and North Africa, in dry, arid, and stony places; in several parts of England, but hardly indigenous. Jacq. fl. austr. 4. p. 10. t. 319. Smith, engl. bot. t. 829. Bot. reg. t. 1259. Rchb. icon. bot. eur. 10. p. 18. t. 950. Oed. fl. dan. t. 684. S. lanàta, Crantz, austr. 267, but not of Jacq. Eriòstomum Germánicum, Hoffm. et Link, fl. port. S. tomentòsa, Gat. fl. mont. p. 107. S. Crética, Lin. syst. 812.? Sibth. et Smith, fl. græc. 6. p. 47. t. 558. Walth. hort. p. 108. t. 19. S. spectábilis, Choisy, in D. C. pl. rar. hort. gen. 1. p. 27. S. dasyántha, Rafin. prec. des. decouv. p. 39. S. biémnis, Roth, Rchb. icon. bot. eur. 10. p. 17. t. 949. S. polystàchya, Tenore. fl. nap. 2. p. 23. t. 53. syll. p. 297. Eriòstomum polystàchyum, Presl. fl. sic. p. 37. Eriòstomum Lusitánicum, Hoffm. et Link, fl. port. S. Lusitánica, Steud. nom. p. 806. S. Pannónica, Lang. pl. exs. S. argéntea, Tausch, in bot. zeit. 1831. 1. p. 217. S. álba, Mill. diet. no. 4.? S. heterophýlla, Mœnch. ex Steud. nom. p. 806. S. cinèrea, S. elongàta, S. excélsa, S. intermèdia, S. orientàlis, S. Sibírica, S. verbascifòlia, &c. Hortul. S. montàna, Riv. mon. irr. t. 27. f. 1.—Barrel. icon. t. 207. This species is very variable in wooliness and size of flowers. Whorls 15-20-flowered. Corollas reddish purple.

German Woundwort or Hedge Nettle. Fl. July. Britain. Pl. 1 to 4 feet.

15 S. floccòsa (Benth. lab. p. 799.) herbaceous; stem tall, clothed with dense floccose wool; cauline leaves petiolate, ovate-lanceolate, obtuse, crenated, cordate at the base, clothed with soft villi above, and dense white floccose wool beneath; lower floral leaves crenulated; superior ones lanceolate, quite entire, pungent, rather shorter than the calyxes; whorls many-flowered, distinct, racemose: upper ones approximate; bracteas lanceolate, equalling the calyxes; calyx a little incurved, with acute pungent teeth, which are rather woolly inside, the upper teeth the largest; tube of corolla inclosed. ♃. H. Native of the North of India, on the mountains near Hirpur, Jacquemont. This species differs from its nearest allies, *S. Germánica* and *S. lanàta*, in the leaves being deeply cordate at the base, and in the wool of the stem and lower surfaces of the leaves being dense and floccose, not long and silky.

Floccose Woundwort. Pl. 1 to 3 feet.

16 S. alpìna (Lin. spec. p. 812.) herbaceous, tall; stem erect, pilose, rather woolly; leaves petiolate, ovate, serrately crenated, cordate at the base, green on both surfaces, villous: floral leaves narrower, gradually becoming smaller as they ascend, acute, serrated; whorls all remote, many-flowered; bracteas linear, about equal in length to the calyxes; calyx rather pilose, with lanceolate-ovate acute spinose teeth; corolla woolly outside, about twice as long as the calyx. ♃. H. Native of the mountainous parts of Europe; as of the Pyrenees, France, Switzerland, Upper Italy, Germany, &c. Lapeyr. fl. pyr. 1. p. 14. t. 8. Eriòstomum alpìnum, Hoffm. et Link, fl. port.—Sabb. hort. rom. 3. t. 41. This plant varies much in gardens, but is at all times readily distinguished from *S. Germánica* in the leaves being green on both surfaces, in the whorls being fewer and more remote, and in the raceme being much less woolly. Corollas, like those of *S. Germánica*, obscure purple, or reddish brown.

Var. β, intermèdia (Benth. lab. p. 537.) larger; leaves more wrinkled, rather woolly beneath. ♃. H. Native of Caucasus and Siberia. S. intermèdia, Ait. hort. kew. 2. p. 209. S. Crética, Lin. spec. p. 812. from the description. S. orientàlis, Lin. spec. p. 813. S. Sibírica, Link, enum. 2. p. 109. Sweet, fl. gard. t. 100. S. curviflòra, Tausch, in bot. zeit. 1831. 1. p. 216. S. urticæfòlia, Tausch, l. c. S. fúsca, Mœnch.?

Alpine Woundwort. Fl. July, Aug. Clt. 1597. Pl. 1 to 3 feet.

17 S. serìfera (Wall. pl. rar. asiat. 1. p. 64. Benth. lab. p. 557.) herbaceous, tall; stem erect, very pilose; leaves petiolate, ovate or ovate-oblong, bluntish, crenated, cordate at the base, villous on both surfaces, green above, pale or hoary beneath, clothed with silky wool while young; whorls all distant, 10-15-flowered; bracteas linear, about equal in length to the calyxes; calyx woolly, with ovate-lanceolate very acute spinose teeth. ♃. H. Native of Central Asia, on the mountains; Caucasus, on the Talusch mountains, in woods; Persia, on the mountains of Gilan; Nipaul, Kamaoon, and Himalaya. S. Pérsica, Gmel. jun. ex Meyer, verz. pflanz. p. 94. Hardly distinct from *S. alpìna*, unless in being more villous, and in there being fewer flowers in

each whorl. Racemes many-flowered, woolly from long loose hairs. Leaves white from wool beneath, or green on both surfaces.

Silky Woundwort. Pl. 1 to 2 feet.?

18 S. SETI'FERA (Meyer, verz. pflanz. p. 94.) herbaceous, tall; stem erect, pilose, rather woolly; leaves on short petioles, oblong or oblong-lanceolate, rounded at the base: floral leaves gradually smaller as they ascend, all green on both surfaces, wrinkled, clothed with soft villi, aristately mucronate at apex; whorls many-flowered, distant; bracteas lanceolate, awned; calyx villous, with lanceolate, acute, spinose teeth; corolla downy outside, exceeding the calyx a little. ♃. H. Native of Caucasus, on the Talusch mountains, in rather humid places near Swant. Allied to *S. sericea*, but differs in the leaves being nearly sessile, narrow, awned, and in the corollas being more glabrous.

Bristle-bearing Woundwort. Pl. 1 to 2 feet.?

19 S. VESTI'TA (Benth. lab. p. 538.) herbaceous, erect, clothed with soft white villi; leaves nearly sessile, ovate-lanceolate, obtuse, crenulated, cordate at the base, thick, wrinkled, densely clothed with white wool beneath: floral leaves lanceolate, acute, reflexed: upper ones scarcely exceeding the calyxes; whorls about 10-flowered, all distant; bracteas linear, one-half shorter than the calyxes; calyx villous, with lanceolate-acute rather spinose teeth; corolla pubescent outside, about twice as long as the calyx. ♃.? H. Native of Nipaul. Nearly allied to *S. oblongifólia*, but differs from it in the thick woolly leaves and shorter bracteas. Leaves 1 to 1½ inch long, green above. Tube of corolla scarcely exserted.

Clothed Woundwort. Pl. 1 to 1½ foot.

20 S. MELISSÆFÓLIA (Benth. lab. p. 538.) herbaceous; branches divaricate, pubescent from soft hairs; leaves petiolate, broad-ovate, obtuse, crenated, wrinkled, green on both surfaces, nearly glabrous or pubescent: upper floral leaves shorter than the calyxes; whorls about 10-flowered, rather remote, or the upper ones are approximate; bracteas linear, one half shorter than the calyxes; calyx ovate-campanulate, pubescent, with acute, but not spinose teeth; corolla pubescent outside, about twice as long as the calyx. ♃.? H. Native of Nipaul. Allied to *S. splèndens*, but more glabrous, and the flowers fewer, and about half the size. Leaves 1½ to 2 inches long, and about 1 inch broad, thin. Racemes branched a little. Corolla purplish: tube slender, incurved.

Balm-leaved Woundwort. Pl.

21 S. SPLE'NDENS (Wall. pl. rar. asiat. 1. p. 64.) herbaceous, tall; stem erect, pilose; leaves petiolate, ovate, serrately crenated, cordate at the base, wrinkled, villous, green on both surfaces: floral leaves similar to the rest, sessile, gradually becoming smaller as they ascend; whorls about 10-flowered, remote; bracteas linear, shorter than the calyxes; calyx pubescent, with bluntish mutic unequal teeth; corolla more than twice as long as the calyx: tube exserted, incurved. ♃.? H. Native of Gosaing-than, on the mountains, Wall; mountains of Mussooree, and throughout the Himalaya range, Royle. Allied to *S. alpina*, but less villous; flowers fewer in the whorls, and the bracteas shorter.

Shining Woundwort. Pl. tall.

Sect. III. CALO'STACHYS (from καλος, *kalos*, beautiful; and σταχυς, *stachys*, a spike; in reference to the beauty of the flowers.) Benth. lab. p. 539.—Perennial glabrous or villous herbs. Stems often furnished with obverse pili or prickles on the angles. Whorls about 6-flowered. Bracteas minute. Calycine teeth very acute or rather spinescent. Corolla scarlet or purple, with a much exserted tube. Cells of anthers diverging or divaricate.

22 S. COCCI'NEA (Jacq. hort. schœnbr. 3. p. 18. t. 284.) herbaceous, erect, clothed with soft villi; leaves petiolate, ovate-lanceolate, bluntish, crenated, cordate at the base; racemes elongated; whorls 6-flowered, all distant; bracteas almost wanting; corolla pubescent, about 3 times as long as the tube. ♃. G. Native of Mexico. Curt. bot. mag. t. 666. Andr. bot. rep. t. 810. Leaves 2 inches long: floral leaves sessile, with submucronate crenatures; upper ones longer than the calyxes, ending in spinose mucrones. Corolla beautiful scarlet, pubescent, an inch long.

Scarlet-flowered Hedge Nettle. Fl. June, Aug. Clt. 1798. Pl. 2 to 3 feet.

23 S. CILIA'TA (Dougl. mss. ex Benth. lab. p. 539.) herbaceous, erect, nearly glabrous; angles of stems obversely ciliated; leaves petiolate, ovate, shortly acuminated, crenated, cordate at the base, glabrous or rather hispid from a few hairs above; whorls 6-flowered, upper ones approximate; bracteas almost absent; corolla almost glabrous, 3 or 4 times longer than the calyx. ♃. H. Native of North-west America, along the banks of the Columbia, Douglas and Scouler. Leaves 2-3 inches long; petioles ciliated. Corolla smoothish, purple, nearly an inch long.

Ciliated-stemmed Hedge Nettle. Pl. 3 to 4 feet.

24 S. THUNBE'RGII (Benth. lab. p. 540.) herbaceous, erect?; angles of stem beset with obverse prickles; leaves petiolate, ovate, acuminated, crenated, cordate at the base, coriaceous, prickly on the nerves beneath, glabrous on both surfaces or hispid from long hairs; whorls 6-flowered, distant; bracteas almost wanting; corolla more than twice as long as the calyx, which is quite glabrous. ♃. G. Native of the Cape of Good Hope. Galeópsis hispida, Thunb. prod. fl. cap. p. 96. Habit of *S. boraginoides*. Stems procumbent or erect. Corolla glabrous, red, similar to those of *S. ciliata*.

Thunberg's Hedge Nettle. Pl. procumbent.?

25 S. BORAGINOI'DES (Schiede et Deppe, in Linnæa, 5. p. 100.) herbaceous, erect; angles of stem beset with obverse prickles; leaves petiolate, ovate, acute, crenated, cordate at the base, green on both surfaces, hairy and prickly on the nerves beneath; whorls 6-flowered, distant; bracteas almost wanting; calyx pilosely pubescent; corolla 4 times as long as the tube. ♃.? G. Native of Mexico, in shady places; on Mount Maculteper, and towards San Andres. Habit of *S. ciliata*. Leaves 1-2 inches long. Corollas and calyxes form and size of those of *S. coccinea*.

Borago-like Hedge Nettle. Pl. 2 to 3 feet.

26 S. CHAMISSÒNIS (Benth. in Linnæa, 6. p. 80.) herbaceous, erect; angles of stem obversely ciliated; leaves petiolate, ovate, obtuse, crenated, cordate at the base, clothed with velvety wool on both surfaces; whorls 6-flowered, distant; bracteas almost wanting; corolla villous outside, 3 times as long as the calyx. ♃.? H. Native of California, Chamisso. Allied to *S. ciliata*, but differs from it in the leaves, and very villous corollas, and in the calyxes being longer and hispidly pilose.

Chamisso's Hedge Nettle. Pl. 2 to 3 feet.?

27 S. RIEDE'RI (Cham. in Linnæa, 6. p. 570.) erect, simple; angles of stem obversely ciliated; leaves on short petioles, ovate-oblong: floral leaves ovate, subcordate, nearly sessile, all acute, serrately crenated, with scabrous margins; whorls 6-flowered: flowers sessile; calyx hispid, with the nerves prickly; corolla 3 times longer than the calyx. ♃.? H. Native of Kamtschatka, Rieder. Lower leaves 2 to 2½ inches long: middle cauline leaves 4-5 inches long. Corollas red. Habit and hispidity of *S. boraginoides*.

Rieder's Hedge Nettle. Pl. 2½ feet.

28 S. HIRSU'TA (H. B. et Kunth, nov. gen. amer. p. 341.) stems ascending, hispid; leaves petiolate, ovate-oblong, acute, cordate, hairy on both surfaces, crenated; whorls about 6-flow-

ered, distant; tube of corolla twice as long as the calyx. ♃.? G. Native of Mexico, in bushy places on the mountains between Actopan and Totonilco. Leaves nearly an inch long; petioles hispid. Calyx pilose, with subulately acuminated segments. Corolla scarlet, downy outside.

Hairy Hedge Nettle. Pl. ½ foot.

Sect. IV. Stachyotýpus (from *στυχυς, stachys*, a spike; and *τυπος, typos*, type; because this section is supposed to be the representative type of the genus; or in other words the true species of the genus.) Benth. lab. p. 541. Stachyotypus, Dumort, florul. belg. p. 45.—Campanistrum and Eriostachys species, Rchb. fl. germ. exc. p. 318.—Trixágo et Stachys, Hoffm. et Link, fl. port.—Annual or perennial, pilosely hispid or glabrous, rarely woolly herbs. Whorls usually about 6-flowered, rarely 2-4 or 10-15-flowered. Bracteas minute. Calycine segments usually subspinescent. Corolla purplish, red, or rosy-white, never cream-coloured; tube inclosed, or very shortly exserted.

§ 1. Genuína (this section is supposed to contain the genuine or true species of the genus.) Benth. lab. p. 541. *Stems tall, erect, having the angles usually ciliated with long spreading or obverse pili, rarely glabrous. Leaves ovate or oblong-lanceolate, rarely amply ovate. Whorls* 6-10-*flowered. Corollas rather large; tube sometimes exserted.*

29 S. Mexicána (Benth. lab. p. 541.) herbaceous, erect, tall; stems hairy from stiff pili; leaves ample, petiolate, ovate-oblong, crenated, cordate at the base, hispid on both surfaces: floral leaves sessile, exceeding the flowers; whorls 6-8-flowered, distant; calyx campanulate, hispid, with lanceolate acute rather spinose teeth; corolla nearly glabrous, twice as long as the calyx; tube exserted. ♃. H. Native of New Spain, Moçino et Sessé. Allied to *S. sylvática*, but the leaves are on shorter petioles, narrower and longer. Corolla larger, and the tube more ample; upper lip emarginate.

Mexican Hedge Nettle. Pl. tall.

30 S. sylvática (Lin. spec. p. 811.) herbaceous, erect, hispid; leaves on long petioles, ovate, acuminated, serrated, cordate at the base; floral leaves bractea-formed, scarcely longer than the calyxes; whorls about 6-8-flowered, distant; calyx campanulate, hispid, with lanceolate acute rather spinose teeth; corolla nearly glabrous, twice as long as the calyx, with an exserted tube. ♃. H. Native of Europe and Middle Asia, in shady places and woods; from Sweden to Spain and Italy; also of Tauria and Caucasus; in Britain frequent in hedges and other shady places. Smith, engl. bot. t. 416. Curt. lond. 3. t. 34. S. Canariénsis, Jacq. icon. rar. 1. p. 11. t. 108.—Sabb. hort. rom. 3. t. 38.—Riv. mon. irr. t. 26. f. 2. Roots creeping, but not extensively. Herb branched, hispid from long spreading hairs. Leaves large, coarsely and acutely toothed, green. Corolla purple, marbled about the orifice, 6 lines long, with a pilose ring near the base of the tube inside. The herb is pungent, with a fetid smell, approaching to that of black horehound. Being one of those plants which powerfully affect the nerves it might prove no contemptible stimulant if judiciously used, ex Smith. The herb will dye yellow.

Wild Hedge Nettle. Fl. July, Aug. Britain. Pl. 2 to 3 feet.

31 S. palústris (Lin. spec. p. 811.) herbaceous, erect; stems pubescent or beset with retrograde hairs; leaves nearly sessile, oblong, or ovate-lanceolate, serrately crenated, rounded at the base or cordate, wrinkled, hispid, or the lower ones are nearly glabrous; whorls 6 to 10-flowered, distinct, the upper ones subapproximate; calyx campanulate, hispid, with lanceolate acute rather spinose teeth; corolla twice as long as the calyx. ♃. H. Native throughout Europe, as well as of Asia and North America, in humid places; plentiful in Britain in marshes, on the banks of rivers, in watery places, by road-sides, and in corn-fields, especially if they are moist. Smith, engl. bot. t. 1675. Hook. fl. lond. vol. 2. icone. Curt. lond. 3. t. 35. S. ségetum, Hagen ex Rchb. fl. germ. exc. 319. S. affinis, Bunge, enum. pl. chin. bot.—Riv. mon. t. 26. f. 1.—Blackw. herb. t. 273.—Petiv. herb. brit. t. 33. f. 9. Angles of stem ciliated with spreading hairs, the rest pubescent. Leaves 2-3 and sometimes 4-6 inches long, pubescent or hispid on both surfaces; lower ones sometimes glabrous. Corollas pale purple; lower lip variegated; tube about equal in length to the calyx. It behoves many farmers to know this plant, says Mr. Curtis, as a very noxious plant in many corn-fields, increasing extensively by the roots, and also by seed. Linnæus says that swine are fond of the roots.

Var. β, *angustifólia* (Benth. lab. p. 542.) flowers smaller; calyxes rather mutie. ♃. H.

Var. γ, *hýbrida* (Benth. lab. p. 542.) leaves on long petioles; corolla subexserted. ♃. H. Native of Britain in moist places. S. ambígua, Smith, engl. bot. t. 2089. Rchb. icon. bot. eur. 3. p. 20. t. 222. Plant 1-2 feet high.

Marsh Hedge Nettle, or Clown's All-Heal. Fl. July, Aug. Britain. Pl. 2 to 4 feet.

32 S. Baicalénsis (Fisch. ex Benth. lab. p. 543.) erect; stem beset with retrograde stiff hairs; leaves nearly sessile, oblong-linear, acutish, serrated, rounded at the base, hispid: floral leaves scarcely longer than the calyxes; whorls 6-flowered; lower ones remote: upper ones approximate into a dense thick oblong spike; calyx campanulate, hispid, with lanceolate very acute rather spinose teeth; corolla twice as long as the calyx. ♃. H. Native of Dahuria, Fischer; Eastern Siberia, Pallas. S. angustifólia, Pall. herb. Stems nearly simple, with the sides glabrous, and the angles pilose. Leaves 2 inches long. Spikes densely hispid. Corollas like those of *S. palústris*.

Baical Hedge Nettle. Pl. 1 to 1½ foot.

33 S. áspera (Michx. fl. bor. amer. 2. p. 6.? Benth. lab. p. 543.) erect; stem retrorsely hispid, rarely naked; leaves on short petioles, ovate-oblong or ovate-lanceolate, acute, serrated, rounded at the base, glabrous, or furnished with a few stiff hairs above: floral leaves lanceolate, acute, longer than the calyxes; whorls 6-10-flowered, distant; calyx tubularly campanulate, glabrous, ciliated, with lanceolate acute subspinose divaricate teeth; corolla about twice as long as the calyx. ♃.? H. Native of North America, in pastures by river-sides; from Canada to Carolina. S. arvénsis, Walt. fl. car. p. 162, but not of Lin. S. hispida, Pursh, fl. amer. sept. 2. p. 407. Habit of *S. palústris*. Stems glabrous on the sides, but having the angles, nerves of leaves, and petioles beset with retrograde stiff hairs. Leaves 3-4 inches long and 1½ broad. Corollas violaceous, glabrous, with a pilose ring inside.

Var. β *glabráta* (Benth. lab. p. 543.) angles of stem almost naked, or altogether glabrous. ♃. H. Native of Carolina and of China in the province of Tokeen, Reeves. *S. áspera*, Nutt. gen. amer. 2. p. 30.?

Rough Hedge Nettle. Fl. July, Aug. Clt. 1821. Pl. 2 to 3 feet.

34 S. hyssopifólia (Michx. fl. bor. amer. 2. p. 4.? Benth. lab. p. 543.) plant ascending, quite glabrous, or the stems are beset with retrograde hairs on the angles; leaves nearly sessile, oblong-lanceolate, acutish, subserrated, narrowed a little at the base: floral leaves very acute, rather longer than the calyxes; whorls about 6-flowered, distinct, approximate into short racemes; calyx broadly campanulate, quite glabrous, with lanceolate very acute subspinose divaricate teeth; corolla glabrous, 2-3

times longer than the calyx. ♃. H. Native of North America, in humid meadows near Saint Louis, Drummond; Carolina, Walter. S. tenuifòlia, Willd. spec. p. 100.? S. palústris, Walt. fl. car. p. 162, but not of Lin. Stems procumbent at the base; branches ascending. Leaves 1-2 inches long, quite glabrous. Corolla violaceous; tube shortly exserted, with a pilose ring inside.

Hyssop-leaved Hedge Nettle. Pl. 1 to 1½ foot.

35 S. Chinénsis (Bunge, pl. chin. hor. in mem. soc. peterb. vol. 2. p. 241.) tall, erect, nearly glabrous; angles of stem obversely pilose; leaves nearly sessile, oblong-lanceolate, subserrated, hispid above and glabrous beneath; whorls few, 6-flowered; bracteas minute; calyx elongated, campanulate, pilose, with lanceolate very acute rather spinose teeth; corolla hardly twice as long as the calyx. ♃. H. Native of the North of China, Bunge. Allied to *S. palústris*, *S. áspera*, *S. hyssopifòlia*. Leaves 3-4 inches long. Corolla red, pilose outside, with a pilose ring inside.

China Hedge Nettle. Pl. 2 to 3 feet.?

§ 2. Rudera'lES (from *ruderalis*, of or belonging to rubbish; the species are generally found in waste places.) Benth. lab. p. 544. *Herbs usually perennial, erect, or ascending, rarely procumbent, hispid, villous or woolly, rarely glabrous. Whorls 6, rarely with so many as 10 flowers. Corolla rather large, with the lower lip half an inch long; having the tube always inclosed.*

36 S. albicau'lis (Lindl. in bot. reg. t. 1558.) erect, clothed with white wool at the base and viscid pubescence above; lower leaves petiolate: upper ones sessile, all lanceolate and coarsely toothed, roundly cuneated at the base or narrowed: floral leaves shorter than the calyxes; whorls 6-flowered, remote; calyx ovate-campanulate, clothed with viscid pubescence: teeth broad-lanceolate, acute, rather spinose; corolla glabrous, twice as long as the calyx. ♃. G. Native of the Andes of Chili, Macrae; in the Pampas about Buenos Ayres, Gillies. Leaves remote, 1-3 inches long. Corolla red, glabrous; tube a little exserted, furnished with a pilose ring inside.

White-stemmed Hedge Nettle. Fl. July, Aug. Clt. 1827. Pl. 2 to 3 feet.

37 S. oblongifòlia (Benth. in Wall. pl. rar. asiat. 1. p. 64. lab. p. 545.) erect or ascending, pubescent or villous; leaves on short petioles, oblong-lanceolate, acutish, serrated, subcordate at the base, villous: floral leaves longer than the calyxes; whorls about 6-flowered, distant; calyx tubularly campanulate, pubescent, with lanceolate very acute scarcely spinulose teeth; corolla one half longer than the calyx. ♃. G. Native of the mountains of Silhet. Leaves 1-2 inches long, densely villous or woolly beneath. Corolla violaceous, pubescent outside.

Oblong-leaved Hedge Nettle. Pl.?

38 S. ajugoi'des (Benth. in Linnæa. 6. p. 80. lab. 545.) erect, very hairy; leaves petiolate, oblong, obtuse, crenated, rounded at the base or cuneated, wrinkled: floral leaves conforming to the others; whorls few, 6-flowered, remote; calyx ovate-campanulate, hispid, with ovate acute rather spinose teeth; corolla glabrous, twice as long as the calyx. ♃. H. Native of California, Chamisso. Herb almost simple, and sometimes branched at the base. Leaves 1-2 inches long. Corollas like those of *S. Macræ'i*.

Ajuga-like Hedge Nettle. Pl. ¼ to ¾ foot.

39 S. sideritoi'des (Gill. mss. ex Benth. lab. p. 740.) perennial, ascending, clothed with silky pili; leaves oblong-lanceolate, serrated, narrowed a long way at the base, wrinkled, clothed with soft silky villi: floral leaves ovate-lanceolate: upper ones shorter than the calyxes; whorls 6-flowered, remote; calyx campanulate, hispid, with lanceolate-acute rather spinose teeth; corolla rather pilose, scarcely twice as long as the calyx. ♃. G. Native of Chili, on the Andes about Mendoza, Gillies. Habit of *S. arenària*, but the tube of the corolla is exannulate inside. Perhaps only a villous variety of *S. grandidentàta*.

Sideritis-like Hedge Nettle. Pl.?

40 S. grandidenta'ta (Lindl. in bot. reg. t. 1080.) perennial, erect, pilosely pubescent, hispid above; leaves petiolate, oblong-lanceolate, coarsely toothed, all roundly cuneated at the base or narrowed: upper floral leaves shorter than the calyxes; whorls 6-flowered, remote; calyx ovate-campanulate, hispid, with lanceolate-acute rather spinose teeth; corolla glabrous, twice as long as the calyx. ♃. G. Native of Chili, at Valparaiso, Macrae. Form of leaves and inflorescence that of *S. albicaúlis*. Corollas red or purple.

Large-toothed-leaved Hedge Nettle. Fl. July, Aug. Clt. 1827. Pl. 1 to 3 feet.

41 S. Macræ'i (Benth. lab. 6. p. 78. lab. p. 545.) erect or ascending, pilosely hispid; leaves petiolate, ovate or ovate-lanceolate, obtuse, crenated: lower ones cordate at the base: upper ones roundly cuneated at the base: upper floral leaves sessile, shorter than the calyxes; whorls 6-flowered, remote; calyx ovate-campanulate, hispid, with lanceolate-acute rather spinose teeth; corolla glabrous, twice as long as the calyx. ♃.? G. Native of Chili, at Valparaiso, and of California. Hook. et Arn. in Beech. voy. pt. bot. p. 155, but not of Benth. Very nearly allied to the preceding. Corolla violaceous.

Macrae's Hedge Nettle. Pl. ½ to 1 foot.?

42 S. Bridge'sii (Benth. lab. p. 546.) erect, clothed with soft white villi or wool; leaves petiolate, ovate, obtuse, crenated, subcordate at the base, wrinkled: floral leaves sessile: upper ones rather shorter than the calyxes; whorls 6-flowered, remote; calyx ovate-campanulate, clothed with very soft villi, with mutic teeth; corolla twice as long as the calyx. ♃.? G. Native of the South of Chili, Bridges. Allied to the preceding, but the leaves are smaller, thicker, and the whole plant is canescent from soft wool, not villous from stiff hairs.

Bridges's Hedge Nettle. Pl.?

43 S. Gillie'sii (Benth. lab. p. 740.) ascending, villous; leaves petiolate, obtuse, crenated, cordate at the base: lower ones rounded, nearly glabrous: superior ones ovate, pubescent; floral leaves ovate, quite entire, shorter than the calyxes, villous: racemes hispid from stiff villi; whorls 6-flowered, distant; calyx ovate-campanulate, hispid, with ovate-lanceolate acute rather spinose teeth; corolla glabrous, thrice as long as the calyx, with an exserted tube. ♃.? G. Native of the Andes of Chili, near Mendoza. Intermediate between *S. Macræ'i* and *S. circinnàta*; differing from the first in the short stiff stems, broad leaves, and larger corollas; and from the last in the stems and leaves being less hispid, leaves less crenated, and in the tube of the corolla being exserted.

Gillies's Hedge Nettle. Pl.?

44 S. circinna'ta (Lher. stirp. 1. p. 51. t. 26.) procumbent, hispid; floriferous branches erect; leaves petiolate, roundish, obtuse, crenated, broadly cordate at the base: floral leaves smaller: upper ones ovate, quite entire, rather shorter than the calyxes; whorls 6-flowered, distinct: lower ones remote; calyx campanulate, hispid, with ovate acute rather spinose teeth; corolla pubescent, scarcely twice as long as the calyx. ♃. H. Native of the South of Spain and North of Africa; Gibraltar; on the lead-hills of Tunis, Vahl.; Mount Atlas, in the fissures of rocks, Desf. S. velutina, Willd. enum. suppl. p. 41. S. latifòlia, Ait. hort. kew. 2. p. 303. Sterile branches procumbent, creeping a little. Corolla 7-8 lines long, pale or dark purple or white.

Circinnate-leaved Hedge Nettle. Fl. June, July. Clt. 1777. Pl. 1 to 2 feet.

45 S. nepetæfòlia (Desf. cat. hort. par. p. 58. Benth. lab. p. 546.) ascending, canescent; leaves petiolate, ovate, obtuse, crenated, cordate at the base, wrinkled; whorls distant, 6-flowered; calyx tubular, canescent, with lanceolate acute rather spinose teeth; corollas pubescent, half again as long as the calyxes. ♃.? H. Native of Spain, Pavon. Plant canescent from short tomentum. Leaves from ½ to 1 inch long, almost like those of *Népeta Mussìni*. Corolla purple; tube equalling the calyx. Habit different from other species of the genus.

Catmint-leaved Hedge Nettle. Fl. June, Aug. Clt. 1805. Pl. 1 to 2 feet.

46 S. Arà'bica (Horn. hort. hafn. p. 554.) erect, divaricately branched; branches glabrous or beset with spreading hairs; leaves petiolate, ovate-lanceolate, acutish, serrately crenated, rounded at the base or cuneated, glabrous or pubescent; floral leaves sessile, ovate, acute, cordate at the base; whorls 6-flowered, remote; calyx large, campanulate, pilose, with ovate acute rather spinose teeth; corolla pubescent, one half longer than the calyx. ⊙.? H. Native of Arabia. This species is distinguished from all others in the large calyx, which is 6-8 lines long. Corolla violaceous; tube shorter than the calyx.

Arabian Hedge Nettle. Fl. June, Aug. Clt. 1819. Pl. 1 foot.

47 S. bullà'ta (Benth. lab. p. 547.) erect, villous; leaves on short petioles, broad-ovate, coarsely crenated, bullately wrinkled, rather canescent beneath, hispidly villous on both surfaces; floral leaves shorter than the calyxes; whorls 6-flowered; calyx turbinately campanulate, hispid, with ovate acute rather pungent teeth; corolla about twice as long as the calyx. ♃.? H. Native of California, Beechey. *S. coccínea*, Hook. et Arn. in Beech. voy. pt. bot. p. 156. but not of Jacq. Leaves 1½ to 2 inches long; floral leaves sessile. Whorls approximate. Corolla pubescent; tube equalling the calyx, furnished with a ring of hairs inside.

Blistered-leaved Hedge Nettle. Pl.?

48 S. brachià'ta (Bojer, mss. ex Benth. lab. p. 547.) procumbent? clothed with fine tomentose pubescence; leaves sessile, oblong-lanceolate, bluntish, toothed, roundish at the base, wrinkled; whorls about 6-flowered, remote; calyx ovate-campanulate, pubescent, with ovate very acute rather spinose teeth; corollas small, downy outside, about twice as long as the calyx. ♃. S. Native of Madagascar, Lyall. Stems rather woody. Leaves 1 to 1½ inches long. Corolla almost like that of *S. Grahámii*, scarcely 3 lines long.

Armed Hedge Nettle. Pl. procumbent.

49 ? S. ca'ndida (Benth. lab. p. 547.) procumbent? clothed with white wool; leaves nearly sessile, oblong-lanceolate, coarsely toothed, or crenated, narrowed at the base; floral leaves rather shorter than the calyxes; whorls 6-flowered, remote; calyx ovate, campanulate, woolly, with lanceolate very acute rather spinose teeth; corolla woolly outside, one half longer than the calyx. ♃.? F. Native of the Levant, ex Horr. par.; Macedonia, ex Herb. Lamb. The whole plant clothed with dirty white wool. Leaves half, or hardly an inch long.

White Hedge Nettle. Pl. procumbent.

50 S. incrèta (Burch. cat. geogr. no. 3794.) procumbent, glabrous; leaves nearly sessile, oblong-lanceolate, cordate at the base; whorls about 6-flowered; calyxes glabrous, with rather spinose teeth; corollas twice as long as the calyx. ♃.? G. Native of the Cape of Good Hope. Habit of *S. Æthiópica*, but larger. Leaves about an inch long, with crenulated edges.

Trailing Hedge Nettle. Pl. trailing.

§ 8. Olica'nthæ (from ὀλιγος, *oligos*, few; and ανθος, *anthos*, a flower; in reference to the few-flowered whorls.) Benth. lab. p. 548. *Annual, rarely perennial, weak herbs, which are procumbent at the base. Whorls 2-4, rarely 6-flowered.*

51 S. Æthiópica (Lin. mant. p. 82.) villous, procumbent; leaves petiolate, rigid, ovate-deltoid, crenated, deeply and broadly cordate at the base; floral leaves narrowed at the base, rather shorter than the calyxes; whorls 2-4 flowered, racemose; calyx campanulate, hispid, with equal, acute, rather spinose teeth; corolla twice as long as the calyx. ♃. G. Native of the Cape of Good Hope. Jacq. obs. 4. p. 2. t. 77. Lher. stirp. nov. 2. t. 27. Lower leaves ½ an inch long; superior ones smaller: floral ones quite entire. Corolla purple.? This species varies much in hairiness and size of flowers.

Æthiopian Hedge Nettle. Fl. April, June. Clt. 1770. Pl. procumbent.

52 S. subse'ssilis (Burch. cat. geogr. no. 4326.) decumbent; stems nearly glabrous; leaves nearly sessile, ovate, almost quite entire, deeply cordate, pilosely hispid on the margins and nerves; floral leaves nearly glabrous, shorter than the calyxes; whorls 2-flowered, racemose; calyx campanulate, hispid, with equal lanceolate very acute subspinose teeth; corolla nearly glabrous, with the tube rather exserted. ♃.? G. Native of the Cape of Good Hope, and Algoa Bay. Leaves scarcely 2 lines long. Corolla twice as long as the calyx.

Almost-sessile-leaved Hedge Nettle. Pl. procumbent.

53 S. Lya'lli (Benth. lab. p. 548.) annual, diffuse, hispid; leaves petiolate, small, orbicular, rounded at the base, or cordate, wrinkled; floral leaves similar to the rest; whorls 2-flowered; calyx campanulate, with an oblique mouth, and lanceolate, acute teeth, the upper teeth the longest; corolla one half longer than the calyx. ⊙. S. Native of Madagascar. A small plant, with the habit of *Verónica agréstis*. Calyxes secund, subreflexed. Corollas rosy-white, form of those of *S. Córsica*, but much smaller.

Lyall's Hedge Nettle. Pl. diffuse.

54 S. rotundifòlia (Moç. et Sessé, mss. ex Benth. lab. p. 548.) annual, ascending; leaves petiolate, ovate-rounded, crenated, cordate at the base; floral ones similar to the rest; whorls axillary, 2-flowered; calyx campanulate, very pilose, with nearly equal lanceolate acute scarcely spinescent teeth; corolla 3 times as long as the calyx; tube shortly exserted; lower lip large. ⊙. S. Native of New Spain. Allied to *S. Córsica*. Stems nearly simple, villous. Flowers nearly sessile. Corollas almost like those of *S. Córsica*, but larger.

Round-leaved Hedge Nettle. Pl. ½ foot.

55 S. Córsica (Pers. ench. 2. p. 30.) procumbent, pilose; leaves petiolate, ovate, very blunt, broadly crenated, rounded at the base, or subcordate; floral leaves smaller: upper ones shorter than the calyxes; whorls 2-4-flowered, remote; calyx campanulate, hispid, with nearly equal lanceolate acute rather spinescent teeth; corolla more than twice as long as the calyx: tube a little exserted: lower lip large. ♃.? H. Native of Corsica and Sardinia, in corn-fields. Rchb. icon. bot. eur. 7. p. 24. t. 646. Clechòma grandiflòra, D. C. fl. fr. 3. p. 538. Herb diffuse. Corolla downy outside, 7-8 lines long, rosy-white or pink, large for the size of the plant.

Corsican Hedge Nettle. Fl. July, Aug. Clt. 1823. Pl. ½ to ½ foot.

56 S. serràta (Burch. cat. geogr. no. 5155.) annual, decumbent, pilose; leaves petiolate, broad-ovate, acutish, broadly cordate at the base; upper floral leaves sessile, shorter than the calyxes; whorls about 4-flowered; calyx tubularly campanulate, hispid, with nearly equal lanceolate acute rather spinose teeth; corolla twice as long as the calyx. ⊙. H. Native of

the Cape of Good Hope. Nearly allied to *S. arvénsis*; but the corollas are twice the size; the leaves broader and more acute, and the flowers fewer.

Serrulated-leaved Hedge Nettle. Pl. decumbent.

57 S. marrubiifòlia (Viv. fl. cors. app. 2. ex Benth. lab. p. 740.) annual, erectish, pilose; leaves petiolate, broad-ovate, obtuse, crenated, broadly cordate at the base; upper floral leaves sessile, shorter than the calyxes; whorls 6-flowered; calyx tubularly campanulate, pilose, with lanceolate acute teeth, the upper teeth the largest; corolla twice as long as the calyx: tube inclosed, equalling the calyx; lips nearly equal. ☉. H. Native of Barbary, Corsica, Naples. S. arvénsis purpùrea, Poir. dict. 7. p. 373. S. Poirètii, Tenore, syll. fl. nap. app. p. 538. Habit of *S. arvénsis*; but the calyxes are broadly campanulate, oblique, and the corollas are much larger. Leaves very like those of a species of *Marrùbium*.

Horehound-leaved Hedge Nettle. Pl. ½ foot.?

§ 4. Agre'stes (from *agrestis*, wild.) *Weak annual herbs. Whorls* 6, *rarely* 10-15-*flowered.*

58 S. eria'ntha (Benth. lab. p. 549.) annual, prostrate, rather creeping; leaves petiolate, ovate-oblong, obtuse, crenated, truncate at the base, or rounded, rather villous; upper floral leaves sessile, scarcely longer than the calyxes; whorls 6-flowered; calyx campanulate, clothed with soft rufous villi, with short acutish mutic teeth; corolla exceeding the calyx a little. ☉. H. Native of Mexico, Moçino et Sessé. Allied to *S. arvénsis*, and the leaves very like those of *S. Grahàmi*, but differs from both in habit and calyxes. Leaves 6-9 lines long, rather rufescent beneath. Corollas like those of *S. arvénsis*.

Woolly-flowered Hedge Nettle. Pl. prostrate.

59 S. arve'nsis (Lin. spec. p. 814.) annual, decumbent, pilose; leaves petiolate, ovate, obtuse, crenated, cordate at the base; floral leaves narrower: upper ones cuneated at the base, sessile, rather shorter than the calyxes; whorls 4-6-flowered, distant; calyx tubularly campanulate, hispid, with nearly equal lanceolate acute scarcely spinose teeth; corolla scarcely exceeding the calyx, with an inclosed tube and short lips. ☉. H. Native throughout Europe, North of Africa, and Middle Asia, in corn-fields; also of South America, but probably imported from Europe; plentiful in some parts of Britain, in corn-fields, in gravelly or calcareous soil. Smith, engl. bot. t. 1154. Hook. fl. lond. vol. 2. icone. Oed. fl. dan. t. 587. Rchb. icon. bot. eur. 10. p. 24. t. 967. Curt. fl. lond. 4. t. 41. Sabb. hort. rom. 3. t. 51. Glechòma marrubiástrum, Vill. dauph. 2. p. 371. Cardiaca arvénsis, Lam. fl. fr. 2. p. 383. Trixàgo arvénsis, Hoffm. et Link, fl. port. Trixàgo cordifòlia, Mœnch, meth. p. 398. Trixàgo coloràta, Presl, fl. sic. p. 37. Stàchys Brasiliénsis, Hortul.—Riv. mon. t. 27. f. 2. Glechòma arvénsis, Lin. spec. ed. 1st. p. 578. Plant erectish or decumbent. Leaves ½ to 1 inch long. Corolla pilose outside, pale purple: tube shorter than the calyx, with a ring of hairs inside near the base.

Corn-field Hedge Nettle. Fl. July, Aug. Britain. Pl. ¼ to ½ foot.

60 S. agra'ria (Schiede et Deppe, in Linnæa, 5. p. 100.) annual, erectish, pilose; leaves petiolate, oval, obtuse, crenated, cordate at the base; floral leaves narrower, all longer than the calyxes; whorls about 6-flowered, distant; calyx campanulate, pubescent, with nearly equal very acute rather spinose teeth; corolla hardly exceeding the calyx. ☉. H. Native of Mexico, near Jalapa; and Texas, at Rio Brazos. Flowers smaller than those of *S. arvénsis*. Corolla pale violet.

Field Hedge Nettle. Pl. ¼ foot.?

61 S. trunca'ta (Kunze, in pl. Poppig, mss. ex Benth. lab. p. 550.) annual, erect, pubescent; leaves petiolate, ovate, obtuse, crenated, rounded at the base; floral leaves acute, cuneated at the base, longer than the whorls; whorls 4-6-flowered, distant; calyx broad-campanulate, with equal broad-ovate very acute rather spinose teeth, which are much shorter than the tube; corolla scarcely exceeding the calyx, with an inclosed tube, and very short lips. ☉. H. Native of Chili, near Valparaiso. Habit of *S. arvénsis*, but more erect and less pilose. Corollas red, glabrous.

Truncate-flowered Hedge Nettle. Pl. ½ foot.?

62 S. Peruvia'na (Domb. in herb. Smith, ex Benth. lab. p. 551.) annual, decumbent; branches pilose; leaves petiolate, ovate-rounded, obtuse, crenated, cordate at the base, glabrous or pilose; floral leaves sessile, exceeding the calyxes; whorls about 6-flowered, distant; calyx broadly campanulate, hispid: teeth shorter than the tube, broad, acute, rather spinose; corolla scarcely exceeding the calyx, having the upper lip very short, and the lower lip 3 times as long as the upper. ☉. H. Native of Peru, in boggy places near Lima. Larger than *S. arvénsis*. Leaves broader, and more glabrous. Calyx larger. Corolla twice as long, with an inclosed tube.

Peruvian Hedge Nettle. Pl. decumbent.

63 S. Kee'lii (Benth. lab. p. 551.) annual? erect, villous; leaves petiolate, ovate, crenated, cordate at the base, pilose: superior ones oblong; floral leaves cuneated, narrow, reflexed, hardly longer than the calyxes; racemes elongated; whorls 6-flowered; fructiferous calyx campanulate, spreading; teeth acute, spinescent, rather shorter than the tube; corollas twice as long as the calyx; upper lip short; lower lip 3 times as long as the upper lip. ☉. H. Native of Mexico, near Tlalpuxahua, Keerl. Habit of *S. Grahàmii*, but more pilose, &c.

Keerl's Hedge Nettle. Pl. ½ to 1 foot.?

64 S. Graha'mii (Benth. lab. p. 551.) herbaceous, procumbent? pilosely pubescent; leaves petiolate, ovate-oblong, obtuse, crenated, subcordate at the base, rather hispid, or at length glabrous; whorls 10-15-flowered, remote; calyx globosely campanulate, nearly glabrous: teeth ovate, acute, rather spinose; corolla small, glabrous, about twice as long as the calyx. ☉. H. Native of Mexico, near Tlalpuxahua, G. J. Graham. Corollas 3 lines long, almost like those of *S. arvénsis*.

Graham's Hedge Nettle. Pl. procumbent.

65 S. Drummóndi (Benth. lab. p. 551.) annual, erect, pilosely hispid; leaves petiolate, oval, obtuse, broadly cordate at the base, or rounded; floral leaves lanceolate: upper ones rather shorter than the calyxes; whorls 6-flowered; calyx campanulate: teeth linear, or lanceolate-subulate, equalling the tube; corolla twice as long as the calyx: upper lip short; lower one 3 times as long as the upper. ☉. H. Native of Texas, at Rio Brazos, Drummond. Habit of *S. agrària*.

Drummond's Hedge Nettle. Pl. 1 to 2 feet.

66 S. Bogote'nsis (H. B. et Kunth, nov. gen. amer. 2. p. 309.) erect, pilose; leaves petiolate, ovate, rounded at apex, obsoletely cordate at the base, crenated, rather canescent beneath; whorls 4-6-flowered; calyx turbinately campanulate, 5-cleft, with ovate-oblong mucronate nearly equal teeth; corolla exceeding the calyx: upper lip entire, shorter than the lower one. ☉. H. Native near Santa Fe de Bogota. Leaves an inch long, and 9 lines broad. Corolla violaceous. This appears only to differ from *S. Drummóndi*, in the form of the calyx, and more villous leaves, which are canescent beneath.

Bogota Hedge Nettle. Pl. 1 foot.?

67 S. de'nsus (H. B. et Kunth, l. c.) erect, puberulous; leaves petiolate, ovate, obtuse, deeply cordate, crenated, nearly glabrous, with the veins and margins hairy; whorls about 10-flowered; calyx turbinately campanulate, with lanceolate aristately subulate nearly equal teeth; corolla with the tube a

little longer than the calyx: upper lip bifid; lower lip 3 times as long as the upper lip. ☉.? H. Native of Quito, between Cachapamba and Chillo. Leaves 10-11 lines long, and 7 lines broad, paler beneath. Corolla pale violet. Allied to *S. arvénsis*.

Weak Hedge Nettle. Pl.?

68 S. ELLI'PTICA (H. B. et Kunth, l. c. p. 308.) erect, hairy; leaves petiolate, elliptic, rounded at apex, cordate at the base, crenated; whorls 6-flowered; calyx turbinately campanulate, with ovate acuminately mucronate unequal teeth; corolla twice as long as the calyx: upper lip entire, rather concave. ☉.? H. Native of Quito, near Tumbamba and Chillo. Leaves ½ an inch long, and 4 lines broad. Whorls approximate. Corolla rose-coloured, downy outside, middle segment of lower lip marked by two purple spots at the base.

Elliptic-leaved Hedge Nettle. Pl. 1 foot.

Sect. V. OLI'SIA (meaning unknown to us.) Benth. lab. p. 553.—Olìsia species, Dumort, florul. belg.—Tetrahitum and Stàchys species, Hoffm. et Link, fl. port.—Herbs, annual or perennial, glabrous, pubescent, or pilose, but never woolly. Leaves ovate. Whorls about 6-flowered. Bracteas minute. Calyxes usually spinescent, sometimes bilabiate. Corollas cream-coloured.

69 S. HI'RTA (Lin. spec. p. 813.) erect or ascending, branched, pilosely hairy; leaves petiolate, ovate, crenated, truncately cordate at the base; floral leaves sessile, roundly cuneated at the base: upper ones ovate, acute, quite entire; whorls 6-flowered, distant, or the upper ones are approximate; calyx campanulate, pilose, with lanceolate-subulate very acute spinescent teeth; corolla pubescent outside, scarcely a half again as long as the calyx, with an inclosed tube, and an emarginately bifid upper lip. ☉. H. Native of the South-west of Europe, and the North of Africa, in dry stony places near the sea; as of Spain, Portugal, Italy, Tunis; as well as of the Canary Islands. All. ped. 1. p. 31. t. 2. f. 3. bad. Sideritis oeymástrum, Gouan, hort. monsp. p. 278. Galeópsis hirsùta, Lin. spec. ed. 1st. p. 580. Tetrahitum hirtum, Hoffm. et Link, fl. port. Stàchys divaricàta, Viv. fl. cors. append. 2. Stàchys inscripta, Rchb. icon. bot. exot. 1. p. 28. t. 40.—Lob. icon. 519.? Galeópsis Hispánica, Mill. ex Steud. nom. p. 351. Leaves ½ to 1½ inch long. Plant pale green. Corollas cream-coloured.

Hairy Hedge Nettle. Fl. June, Aug. Clt. 1725. Pl. ¼ to ½ foot.

70 S. A'NNUA (Lin. spec. p. 813.) annual, erect, nearly glabrous, or pubescent at top; leaves petiolate, ovate, bluntish, crenated, rounded at the base, or cuneated; floral leaves lanceolate, longer than the calyxes, acute, almost quite entire; whorls about 6-flowered, distinct: upper whorls approximate; calyx tubularly campanulate, villous, a little incurved, with lanceolate very acute rather spinose teeth; corollas pubescent, about twice as long as the calyx. ☉. H. Native of Europe, in corn-fields, and by way sides; as of France, Germany, Italy, Caucasus, &c. Jacq. fl. austr. 4. p. 31. t. 360. Betónica ánnua, Lin. spec. ed. 1st. p. 573. Mœnch, meth. p. 396. Stàchys nervòsa, Gat. fl. mont. p. 107. Stàchys Betónica, Crantz, stirp. austr. p. 265.—Riv. mon. irr. t. 69. Plant branched. Cauline leaves glabrous, 1½ inch long, and 8-10 lines broad; upper floral leaves smaller, pubescent. Corollas yellow, or cream-coloured.

Annual Hedge Nettle. Fl. July, Aug. Clt. 1713. Pl. ½ to 1 foot.

71 S. PUBE'SCENS (Tenor. fl. nap. prod. p. 34.) perennial, ascending, almost glabrous, but pubescent above; leaves petiolate, ovate, obtuse, crenated, cuneated at the base; floral leaves ovate, longer than the calyxes, acutish, nearly entire; whorls about 6-flowered, distant; calyx tubularly campanulate, villous, a little incurved, with lanceolate very acute rather spinose teeth; corolla pubescent, about twice as long as the calyx. ♃. H. Native of Europe, in the region of the Mediterranean, in dry fields; as of Spain, Lucania, Dalmatia. S. decúmbens, Willd. enum. suppl. p. 41.? S. Balbísii, Link, enum. 2. p. 110. S. frágilis, Vis. pl. rar. dalm. ex Rchb. fl. germ. p. 319.? Calycine teeth equalling the tube of the corolla. Corolla yellowish, or cream-coloured, sometimes spotted with red in the throat.

Pubescent Hedge Nettle. Fl. May, July. Clt. 1816. Pl. ½ to 1 foot.

72 S. MARI'TIMA (Lin. mant. p. 82.) perennial, tomentosely hairy, ascending; leaves on short petioles, oblong-lanceolate, obtuse, narrowed at the base, rather wrinkled; floral leaves sessile, ovate, obtuse: upper ones rather shorter than the calyxes; whorls about 6-flowered: lower ones distant: superior ones approximating into a spike; calyx tubularly campanulate, villous, with lanceolate acute mutic teeth; corolla pubescent, about a half again as long as the calyx. ♃. H. Native in the region of the Mediterranean, in sandy places by the sea side; as near Valentia, Montpelier, Nice, &c. Jacq. hort. vind. 1. p. 29. t. 70. Rchb. icon. bot. cur. 5. p. 51. t. 484. S. betonicæfòlia, Pers. ench. 2. p. 124.? but not of Desf.—Dill. elth. 50. t. 42. f. 50.—Bocc. mus. 2. p. 164. t. 127. Stems numerous. Leaves about an inch long, wrinkled and tomentose. Corolla pale yellow or cream-coloured, the lower lip spotted with purple at the base.

Sea-side Hedge Nettle. Fl. July. Clt. 1714. Pl. ½ to 1½ foot.

73 S. SPINULÒSA (Sibth. et Smith, fl. græc. prod. 1. p. 410.) annual?; angles of branches hispid; leaves petiolate, broad-ovate; lower leaves cordate at the base; floral leaves sessile, ovate-lanceolate; whorls 6-10-flowered, distinct; bracteas minute; calyx ample, campanulate, with broad acute rather spinose equal teeth, which are about equal in length to the corolla; upper lip of corolla very large. ☉.? H. Native of Dalmatia, Istria, Candia, Corfu, about Constantinople, &c. Galeópsis orientàlis, Mill. Plant erect or ascending. Angles of stems ciliated with obverse hairs. Leaves crenated, 1-2 inches long, green, pilose. Corollas pale yellow, like those of *S. menthæfòlia*, but a little longer.

Spinulose Hedge Nettle. Fl. July, Aug. Clt.? Pl. 1 to 1½ foot.

74? S. MENTHÆFÒLIA (Vis. pl. rar. dalm. in bot. zeit. 1829. erglb. p. 14. Benth. lab. p. 555.) plant ascending or erect, hairy; leaves on short petioles, oblong-ovate, serrated, rounded at the base, or subcordate; floral leaves sessile, acute, hardly exceeding the calyxes; whorls 6-10-flowered: superior ones approximate; calyx amply campanulate, bilabiate, with broad, very acute, submutic teeth; lower lip of corolla very large. ♃.? H. Native of Dalmatia. S. grandiflòra, Host, fl. austr. 2. p. 169. Leaves 2 to 3 inches long, hispid. Lower whorls distant. Corolla cream-coloured. This differs from the other species of this section in the bilabiate calyx.

Mint-leaved Hedge Nettle. Pl.?

Sect. VI. CHAMÆSIDERI'TIS (from χαμαι, *chamai*, on the ground; and Σιδηριτις, *Sideritis*; in reference to the smallness of the species.) Rchb. fl. germ. exc. p. 318. Benth. lab. p. 556. Perennial, glabrous, or pilose herbs, never woolly. Leaves oblong, lanceolate, or linear. Whorls 2-6-flowered. Bracteas minute, subspinescent. Corolla cream-coloured or purple.

75 S. SUBCRENA'TA (Vis. pl. rar. dalm. in bot. zeit. 1829.

1 erglb. p. 15.) ascending, pilosely pubescent; leaves nearly sessile, oblong-lanceolate, obtuse, scarcely crenated, narrowed, and quite entire at the base; floral leaves ovate-lanceolate, acute: upper ones shorter than the calyxes; whorls densely 6-10-flowered, distant; calyx tubularly campanulate, rather pilose, with ovate very acute rather spinose nearly equal teeth; corolla nearly glabrous, twice as long as the tube of the calyx. ♃. H. Native of Dalmatia, on hills. S. récta, β. Bertol. amœm. ital. p. 378. Allied to *S. récta*, but differs in the leaves being narrower, more entire. Corolla yellow, ?

Subcrenated-leaved Hedge Nettle. Pl. 1 to 2 feet.

76 S. succ'ta (Lin. mant. p. 82.) erect or ascending, pilosely hairy; leaves on short petioles, oblong-ovate or lanceolate, obtuse, crenated, rounded or narrowed at the base, wrinkled, hairy; floral leaves sessile, acute: upper ones shorter than the calyxes; whorls about 10-flowered, distant; calyx ovate-campanulate, hairy, with ovate very acute rather spinose equal teeth; corolla glabrous, twice as long as the calyx. ♃. H. Native of Europe, especially in the south, in dry places and by way sides; as of Spain, Germany, Italy, South of Russia, Tauria, Caucasus, Candia, &c. Jacq. fl. austr. 4. p. 31. t. 359. Sideritis hirsùta, Gouan, fl. monsp. p. 85. Betónica hirta, Gouan, hort. monsp. p. 276. Betónica decúmbens, Mœnch, meth. p. 396. Tetràhit herbariòrum, Ger. fl. gallopr. p. 272. S. Betónica, Crantz, stirp. austr. p. 264. S. bufònia, Thuill. fl. par. 1. p. 295. S. procúmbens, Lam. fl. fr. 2. p. 385. S. Sideritis, Vill. fl. dauph. 2. p. 375. S. sylvéstris, Forsk. fl. const. p. 28. S. ánnua, Smith, prod. fl. græc. 1. p. 410. but not of Lin. S. glutinòsa, Smith, prod. fl. græc. 1. p. 409. but not of Lin. S. decúmbens, Rchb. fl. germ. p. 318. but scarcely of Willd.—Riv. mon. irr. t. 70. Leaves 1 to 1½ inch long, very variable in breadth and hairiness. Corolla pale yellow or cream-coloured, with a purplish throat.

Upright Hedge Nettle. Fl. June, Aug. Clt. 1683. Pl. 1 to 1½ foot.

77 S. arena'ria (Vahl, symb. 2. p. 64.) decumbent, canescent from pubescence; leaves nearly sessile, oblong-linear or lanceolate, acute, subserrated, narrow a long way at the base, and quite entire; floral leaves smaller: upper ones shorter than the calyxes; whorls loosely 6-10-flowered, remote; calyx tubularly campanulate, pilose, with lanceolate very acute rather spinose teeth, the upper tooth rather the broadest; corolla pubescent outside, twice as long as the calyx. ♃. H. Native of the region of the Mediterranean; as of Tunis, Sicily, Naples, about Trebezond, Iberia, &c., in dry, rugged, exposed places. Sims, bot. mag. t. 1959. Desf. fl. atl. 2. p. 21. t. 126.? S. Ibérica, Bieb. fl. cauc. 2. p. 51. Rchb. icon. bot. exot. 1. p. 43. t. 58. S. prostràta, Lag. cat. hort. madr. S. diffùsa, Schw. S. scordifòlia, Willd. enum. 2. p. 616. S. purpùrea, Poir. dict. suppl. 2. p. 616. S. congésta, D'Urv. enum. pl. arch. in mem. soc. Lin. par. p. 324. S. rùbra, Donn, hort. cantab. Branches more or less canescent from long soft hairs, as well as the leaves. Leaves 1 to 1½ inch long: upper floral ones quite entire. Corolla purplish, pilose outside.

Sand Hedge Nettle. Fl. July. Clt. 1804. Pl. 1 foot.

78 S. angustifòlia (Bieb. fl. cauc. 2. p. 51.) glabrous; branches twiggy, diffuse; leaves linear, quite entire, serrated, or the lower ones are pinnatifid; racemes elongated; whorls remote, 2-flowered; calyx tubularly campanulate, glabrous, with nearly equal very acute rather spinose teeth; corolla pubescent outside, with a shortly exserted tube. ♃. H. Native of the South of Tauria, in woods, among stones at Femirdschi, and near Cherson. Sweet, fl. gard. 2. t. 180. S. tenuifòlia, Pall. ex Link, enum. 2. p. 109. Rchb. icon. bot. exot. 1. p. 20. t. 28. but not of Willd. S. récta, D'Urv. enum. pl. arch. ? but not of Lin. Corollas purplish.

Narrow-leaved Hedge Nettle. Fl. June, Aug. Clt. 1823. Pl. 1 to 3 feet.

Sect. VII. Amble'ia (meaning unknown to us.) Benth. lab. p. 558. Shrubs or under-shrubs, usually tomentose, rarely glabrous, but never pilose. Whorls 2-6-flowered, rarely so much as 10-flowered. Bracteas small, or few. Calyx tomentose or woolly, with soft mutic teeth.

79 S. hyssopoi'des (Burch. cat. georg. no. 2653.) suffruticose ?; branches elongated, loosely sub-tomentose; leaves linear or oblong, quite entire, or denticulated at apex, narrowed a long way at the base, glabrous on both surfaces, or scarcely tomentose; upper floral leaves shorter than the calyxes; whorls 2-flowered; calyx clothed with hoary tomentum, with broad lanceolate mutic teeth; corolla about twice as long as the calyx, green: floral ones gradually broader and shorter. Calyx clothed with very thin tomentum. Corolla silky outside.

Hyssop-like Hedge Nettle. Shrub.

80 S. cæru'lea (Burch. cat. geogr. no. 1775. ex Benth. lab. p. 558.) suffruticose ? quite glabrous; branches elongated, loosely tomentose; leaves linear or oblong, quite entire, or somewhat denticulated at apex, narrowed a long way at the base, glabrous, or scarcely tomentose; upper floral leaves shorter than the calyxes; whorls 2-flowered; calyx clothed with hoary tomentum: teeth broad-lanceolate, mutic; corolla about twice as long as the calyx. ♄. G. Native of South Africa. Leaves 2-4 inches long, greenish or tomentose. Flowers few, remote. Corolla silky outside.

Blue-flowered Hedge Nettle. Shrub.

81 S. spatula'ta (Burch. cat. geogr. no. 1788. ex Benth. lab. p. 559.) suffruticose, clothed with hoary tomentum; leaves linear-spatulate, quite entire; superior floral leaves scarcely exceeding the calyxes; whorls 2-flowered; bracteas small; calyx tubularly campanulate, with broad-lanceolate teeth, which are equal in length to the tube of the corolla. ♄. G. Native of South Africa. Very nearly allied to *S. lineàris*; but differs in the form of the leaves, subracemose flowers, small upper leaves, and inclosed tube of corolla, &c.

Spatulate-leaved Hedge Nettle. Shrub.

82 S. linea'ris (Burch. cat. geogr. no. 2717. ex Benth. lab. p. 559.) suffruticose, clothed with hoary tomentum; leaves linear, sessile, quite entire; floral leaves exceeding the flowers; whorls about 2-flowered; bracteas minute; calyx tubularly campanulate, with lanceolate acute mutic teeth, shorter than the tube of the corolla. ♄. G. Native of South Africa. Densely clothed with floccose tomentum. Leaves 1 inch long. Corolla about twice as long as the calyx, silky outside.

Linear-leaved Hedge Nettle. Shrub.

83 S. rosmarinifòlia (Benth. lab. p. 559.) suffruticose, clothed with hoary tomentum; leaves nearly sessile, oblong-linear, quite entire, rounded as the base, tomentose on both surfaces, and white beneath; whorls about 6-flowered, distant; bracteas subulate, shorter than the calyxes; calyx campanulate, clothed with hoary tomentum; teeth lanceolate, acute, mutic; corolla scarcely exceeding the calycine teeth, tomentose outside. ♄. G. Native of the Cape of Good Hope. S. hyssopifòlia, Vahl, herb. but not of Michx. Sideritis pállida, Thunb. prod. fl. cap. 95. Leaves similar to those of Lavender or Hyssop, about an inch long, acutish. Upper whorls sometimes approximate.

Rosemary-leaved Hedge Nettle. Shrub humble.

84 S. ruòsa (Ait. hort. kew. 2. p. 303.) suffruticose, clothed with hoary tomentum; leaves sessile, oblong-linear or lanceolate, narrowed a long way at the base, quite entire, wrinkled; whorls 6-10-flowered, distant; bracteas subulate: outer ones

about equal in length to the calyxes; calyx campanulate, with lanceolate subulate acute mutic teeth; corolla about twice as long as the calyx. ♄. G. Native of the Cape of Good Hope. Jacq. icon. rar. 3. p. 7. t. 499. Corollas pale yellow.?

Wrinkled-leaved Hedge Nettle. Fl. July, Aug. Clt. 1774. Shrub 1 to 2 feet.

85 S. DENTICULA'TA (Burch. cat. geogr. no. 1369. ex Benth. lab. p. 560.) suffruticose; branches clothed with hoary tomentum; leaves petiolate, obovate or oblong, obtuse, crenated, undulately curled, much wrinkled, clothed with sub-floccose tomentum beneath; whorls 2-flowered; bracteas small, subulate; calyx tubularly campanulate, loosely tomentose, with ovate-lanceolate acute mutic teeth; corolla scarcely twice as long as the calyx. ♄. G. Native of South Africa. Branches and leaves almost like those of *Marrùbium vulgàre*. Leaves ½ to ¾ of an inch long: floral leaves about twice as long as the calyx. Corolla silky outside.

Denticulated-leaved Hedge Nettle. Shrub.

86 S. CUNEA'TA (Banks, herb. mss. ex Benth. lab. p. 560.) suffruticose, clothed with tomentose wool; leaves petiolate, obovate-cuneated, roundish, obtuse, crenated, undulately curled, much wrinkled, clothed with sub-floccose tomentum on both surfaces; whorls 2-flowered; bracteas small, subulate; calyx campanulate, densely tomentose, with ovate-lanceolate acutish mutic teeth; corolla exceeding the calyx a little. ♄. G. Native of the Cape of Good Hope, Masson. Branches and leaves like those of *Marrùbium Alýssum*. Leaves hardly ½ an inch long: floral ones exceeding the calyxes. Whorls approximate at the tops of the branches. Corolla small, silky outside.

Wedge-leaved Hedge Nettle. Shrub.

87 S. PAUCIFLÒRA (Benth. lab. p. 560.) suffruticose, clothed with floccose wool; leaves nearly sessile, oblong-lanceolate, obtuse, quite entire, narrowed at the base, wrinkled; whorls 2-flowered, rarely 4-flowered, distant; calyx tubularly campanulate, with lanceolate acute mutic teeth; corolla exceeding the calyx a little. ♄. G. Native of Egypt, near Mount Sinai, N. Bové. S. orientàlis. Forsk. fl. ægypt. p. 68. but not of Lin. S. Palæstina, Vahl, symb. 2. p. 64. but not of Lin. S. affinis, Fres. mus. senkenb. p. 91. Stems shrubby at the base, branched. Lower leaves 1 to 1½ inch long; floral leaves usually shorter than the calyxes. Corollas small, silky outside. Tomentum white or yellowish.

Few-flowered Hedge Nettle. Fl.? Clt. 1834.? Shrub ½ to 1½ foot.

88 S. NI'VEA (Labill. pl. syr. dec. 8. p. 5. t. 3.) suffruticose, clothed with tomentose wool; leaves nearly sessile, oblong, obtuse, quite entire, narrowed at the base, thick; whorls 2-4-flowered, few, distant; calyx tubularly campanulate, white, with ovate obtuse mutic teeth; corolla a half again as long as the calyx, pubescent outside. ♄. G. Native of Syria, near Damascus. Tomentum white, floccose. Leaves 1½ inch long. Calycine teeth equalling the tube of the corolla.

Snowy Hedge Nettle. Shrub ½ to 1 foot.

89 S. BURCHE'LII (Benth. lab. p. 561.) suffruticose, clothed with floccose tomentum; leaves nearly sessile, oblong or oblong-lanceolate, serrately crenated, narrowed at the base, wrinkled; whorls 6-10-flowered, distinct; bracteas very minute; calyx tubularly campanulate, with lanceolate obtuse mutic spreading teeth: upper teeth the largest. ♄. G. Native of the Cape of Good Hope. Phlòmis micrántha, Burch. cat. geogr. no. 1672. trav. 310. Sideritis rugòsa, Thunb. prod. p. 95. Habit of *Marrùbium peregrinum*. Lower leaves 2-3 inches long; floral leaves whiter. Corolla small.

Burchell's Hedge Nettle. Shrub.

90 S. *Ægyptiaca* (Pers. ench. 2. p. 124.) hoary; flowers spicate; leaves ovate, wrinkled; bracteas broadly ovate, acuminated; calyx campanulate, smooth. ♄. G. Native of Egypt. This differs from *S. Palæstina* in the calyx and dense spike.

Egyptian Hedge Nettle. Shrub.

91 S. PALÆSTI'NA (Lin. spec. p. 1674.) suffruticose, canescent, tomentose; leaves sessile, oblong-lanceolate, obtuse, or aristately mucronate, quite entire, narrowed a little at the base, stem-clasping, wrinkled; whorls about 6-flowered, at length remote, or the upper ones are approximate; calyx tubularly campanulate, clothed with hoary tomentum: teeth obtuse, mutic; corolla scarcely twice as long as the calyx. ♄. G. Native of Palestine, on the mountains between Gaza and Jerusalem. S. lanàta, Mœnch, p. 397. but not of Jacq.—Barr. icon. t. 979.?—Boec. mus. 2. t. 109—112.? Leaves 1-2 inches long, whitest beneath. Corolla white or purple, clothed with silky pubescence outside.

Palestine Hedge Nettle. Fl. July, Aug. Clt. 1820. Shrub.

92 S. NU'TANS (Benth. lab. p. 561.) suffruticose, pubescent; leaves sessile, ovate, obtuse, crenated, narrowed at the base, wrinkled, villous above, and clothed with white wool beneath; whorls 2-6-flowered; flowers pedicellate, densely clothed with white wool, reflexed in the fructiferous state: teeth lanceolate, obtuse, mutic; corolla exceeding the calyx a little, pubescent outside. ♄. G. Native of the Cape of Good Hope, Dahl. This differs from *S. Lamárckii*, in the broader leaves, which are green above, and clothed with long white pili beneath, not clothed with white wool, &c.

Nutant-flowered Hedge Nettle. Shrub.

93 S. LAMA'RCKII (Benth. lab. p. 562.) suffruticose, clothed with woolly tomentum; leaves nearly sessile, oblong, obtuse, crenated, narrowly rounded at the base, thick, much wrinkled; whorls about 6-flowered, few, distant; calyx tubular, densely clothed with white wool: teeth ovate, obtuse, mutic; corolla exceeding the calyx a little, clothed with white tomentum outside. ♄. G. Native of the Cape of Good Hope. S. rugòsa, Lam. ill. t. 509. f. 3. but not of Ait. Sideritis decúmbens, Thunb. prod. p. 95. Habit of *Marrùbium*. Branches at length nearly glabrous. Leaves 6-12 lines long. Corollas yellow.?

Lamarck's Hedge Nettle. Shrub.

94 S. JURA'NA (Burch. cat. geogr. no. 1233. ex Benth. lab. p. 562.) suffruticose, clothed with rather floccose tomentum; leaves nearly sessile, oblong-lanceolate, subcrenated at top, wrinkled; whorls 6-10-flowered, distant; calyx woolly, with broad-lanceolate acute mutic teeth; corolla twice as long as the calyx. ♄. G. Native of South Africa. Leaves 1 to 1½ inch long, the tomentum rather velvety above, and canescent beneath. Corolla clothed with silky villi outside.

Coupled Hedge Nettle. Shrub 1 to 2 feet.

95 S. INFLA'TA (Benth. lab. p. 562.) suffruticose; branches clothed with white tomentum; leaves nearly sessile, oblong, obtuse, quite entire, a little wrinkled, clothed with white tomentum beneath; whorls about 6-flowered, distant; bracteas linear, short; flowers sessile; calyx inflately campanulate, with ovate bluntish mutic teeth; corolla one half longer than the calyx. ♄. G. Native of the North of Africa, and probably of Egypt; in Persia, between Kermancha and Amadan, Olivier. Leaves scarcely an inch long. Corolla silky outside. Tomentum floccose.

Inflated-calyxed Hedge Nettle. Shrub.

96 S. INTEGRIFÒLIA (Vahl, herb. ex Benth. lab. p. 562.) suffruticose; branches tomentosely woolly; leaves nearly sessile, oblong, bluntish, quite entire, or with a few crenatures at apex, narrowed at the base, green; whorls 6-10-flowered, distinct; bracteas linear, shorter than the calyxes; calyx ovate-tubular, sessile, densely clothed with wool, having linear obtuse mutic teeth; corolla one half longer than the calyx. ♄. G. Native of the Cape of Good Hope. Betónica Heraclèa, Lin. mant. p.

83. Phlòmis parvifòlia, Burch. cat. geogr. no. 1232. trav. p. 225. Sideritis, Thunb. prod. p. 95. Leaves ½ an inch long, beset with rather stellate wool while young, but the adult ones are nearly glabrous; floral leaves longer, and more densely tomentose. Corolla pubescent.

Entire-leaved Hedge Nettle. Shrub.

Sect. VIII. Zietè'nia (probably so named after some obscure botanist.) Benth. lab. p. 562. Zietènia and Stachys species of authors. Under-shrubs, woolly from white soft hairs, rarely glabrous. Bracteas small or few. Whorls 2-6-flowered. Calyxes woolly or glabrous, with subulate usually spinose teeth.

97 S. lavandulæfòlia (Vahl, symb. 1. p. 42.) suffruticose, pilose; cauline leaves petiolate, oblong-lanceolate, quite entire, narrowed at both ends; floral leaves sessile, ovate-lanceolate; whorls 2-6-flowered: teeth of calyx linear, mutic, longer than the tube, exceeding the corolla. ♄. H. Native of Caucasus, in dry stony places. Zietènia orientàlis, Gled. act. berol. 1766. p. 3. Sideritis calycántha, Bieb. fl. cauc. 3. p. 393. Rchb. icon. bot. eur. 1. p. 17. t. 15.—A humble, spreading, procumbent, canescent shrub. Sterile branches erect, leafy. Leaves bluntish. Corolla purple, shorter than the calycine teeth.

Lavender-leaved Hedge Nettle. Fl. July, Aug. Clt. 1820. Shrub procumbent.

98 S. mucrona'ta (Sieb. pl. cret. exs. ex Benth. lab. p. 563.) suffruticose, much branched, woolly from long loose hairs; leaves petiolate, oblong, crenated, wrinkled; whorls 2-4-flowered; calyx campanulate, with long, rather spinose teeth, which exceed the corolla. ♄. H. Native of Candia. Leaves 1 inch long: floral ones sessile. Whorls distinct. Limb of corolla very villous.

Mucronate Hedge Nettle. Shrub ½ foot.

99 S. spinòsa (Lin. syst. 3. p. 58.) suffruticose, hoary from silky adpressed hairs, much branched; branches spinescent at apex; leaves sessile, linear, quite entire; whorls 2-flowered; calyx campanulate, with lanceolate spinose teeth, which are equal in length to the corolla. ♄. H. Native of Candia. This differs from *S. glutinòsa*, in the leaves, branches, and calyxes being clothed with silky wool; in the branches being spinescent, and in the larger corollas.—Park. theatr. 476. t. 48. f. 6.—Mor. hist. 3. p. 382. sect. 11. t. 10. f. 9.

Spinose-branched Hedge Nettle. Fl. July. Clt. 1640. Shrub 1 foot.?

100 S. glutinòsa (Lin. spec. p. 813.) suffruticose, glabrous, much branched; leaves oblong-linear, acute, almost quite entire, narrowed at the base; whorls about 2-flowered; calyx campanulate, glabrous, with equal ovate very acute rather spinose teeth; corolla clothed with silky pubescence outside: tube about equal in length to the calycine teeth. ♄. H. Native of Corsica, on hills; and of Candia, &c.—Mor. hist. 3. p. 389. sect. 11. t. 4. f. 17.? Leaves of the spinescent branches an inch long, on short petioles, furnished with a few scattered hairs, the rest glabrous: superior ones sessile. Flowers on short pedicels. Corolla almost white.

Clammy Hedge Nettle. Fl. June, July. Clt. 1729. Shrub 1 foot.

101 S. fruticulòsa (Bieb. fl. cauc. 2. p. 51.) suffruticose, divaricately branched at the base; branches rather pilose; leaves sessile, oblong-lanceolate, or linear, subdenticulated, green on both surfaces, glabrous: floral ones conforming to the others; whorls 2-flowered; calycine teeth lanceolate, very acute, somewhat spinose, rather shorter than the tube; corolla about twice as long as the calyx. ♄. H. Native of Eastern Caucasus and Iberia, in stony places of mountains. Leaves ½ to 1 inch long, with remote short toothlets. Corolla pale purple.

Fruticulose Hedge Nettle. Fl. June, Aug. Clt. 1818. Shrub 1 foot.?

† *Species not sufficiently known.*

102 S. betonicæfòlia (Desf. cor. in ann. mus. 10. p. 304. t. 25.) villous; leaves cordate, crenated; whorls about 6-flowered; calyxes mutic. ☉. H. Native of Candia, Tournefort. Stem erect, branched. Leaves petiolate, wrinkled, obtuse, crenated, very like those of *Betònica officinàlis*. Whorls distinct, 2-flowered; floral leaves ovate, a little longer than the calyxes. Corolla large, white. Perhaps the same as *S. spinulòsa*.

Betony-leaved Hedge Nettle. Fl. June, July. Clt. 1818. Pl. 2 feet.

103 S. scordioi'des (Poir. dict. 7. p. 373.) suffruticose; leaves lanceolate-linear, almost entire: floral ones spiny-toothed; calycine teeth straight, subulate, spinose. ♄. H. Native of the North of Africa. Branches numerous, divaricate, stiff, villous. Floral leaves sessile, half stem-clasping, all glabrous. Whorls interrupted, terminal, 6-9-flowered. Corolla yellowish, a little longer than the calyx: upper lip flattish, emarginate; lobes of lower lip roundish, unequal, subcrenulated. Perhaps a species of *Sideritis*.

Scordium-like Hedge Nettle. Shrub humble.

104 S. Oly'mpica (Poir. suppl. 5. p. 226.) villous; stem simple, straight, stoloniferous; leaves elliptic, sharply serrated, ciliated with wool; cauline leaves distant, spreading at the top of straight petioles; spike dense, woolly. ♃.? H. Native of Mount Olympus, Toscan. Allied to *S. nivea*. Stem woolly. Leaves an inch long, obtuse at both ends, whitish-green above, and woolly beneath. Whorls dense. Teeth of calyx spinose. Corolla pale yellow, villous outside.

Olympic Hedge Nettle. Pl. 1 foot.

105 S. Tournefórtii (Poir. suppl. 5. p. 227.) leaves cordate-ovate, subcrenated, obtuse; petioles connate at the base; whorls many-flowered; corolla large, villous outside: tube length of calyx; stem tomentose. ♃.? H. Native of Candia, near Canea, Tournefort. S. Crética latifòlia, Tourn. inst. p. 186. itin. 1. p. 33. t. 1. This is a beautiful species, with large rose-coloured flowers. Leaves wrinkled, whitish-green, finely crenulated, 2-3 inches long, and an inch broad. Corolla with a whitish tube and a rose-coloured lip.

Tournefort's Hedge Nettle. Pl. 2 feet.

106 S. pilòsa (Nutt. journ. acad. nat. sc. phil. 7. p. 48.) hairy from pili; leaves nearly sessile, oblong-ovate, acute, serrated; calyx very pilose, with elongated teeth; whorls about 6-flowered. ♃.? H. Native of North America, in the valleys of the Rocky Mountains. Plant humble, robust. Leaves soft beneath. Flowers rather large, purplish.

Pilose Hedge Nettle. Pl. humble.

† † *Doubtful species.*

107 S. decu'mbens (Pers. ench. 2. p. 123.) whorls many-flowered, approximate; bracteas filiform; leaves cordate, toothed; stem decumbent, villous. ♃.? H. Native country unknown. Habit of *S. circinnàta*. Corolla yellowish. Stem branched.

Decumbent Hedge Nettle. Pl. decumbent.

108 S. venòsa (Pers. l. c.) lower leaves spatulate, obtuse, crenated, petiolate, veined with red; cauline leaves sub-rhomboid; stem very villous; calyx smooth. ♃.? H. Native country unknown.

Veiny-leaved Hedge Nettle. Pl.

109 S. betæfòlia (Pers. l. c. p. 124.) leaves petiolate, cor-

date, deeply crenated; spike compact, villous. ♃.? H. Native country unknown.

Beet-leaved Hedge Nettle. Pl.

110 S. barbi'gera (Viv. fl. cors. append. 2. p. 4.) hairy; stem ascending; leaves cordate-elliptic, crenulated; floral leaves ovate, acute, equalling the calyxes; bracteas ovate-linear; whorls 6-10-flowered; calyxes regular, spinulose; corolla woolly outside; middle segment of the beard obovate, acute: lateral segments linear, obtuse, and twice as long as the middle lobe. ♃.? H. Native of Corsica. This differs from *S. lavandulæfolia*, in habit, shape, and length of the floral leaves, corolla, &c.

Beard-bearing Hedge Nettle. Pl.

111 S. barbuntifo'lia (Viv. fl. cors. app. l. c.) hairy from spreading piti; stem brachiate; leaves cordate, roundish-ovate, crenated; floral leaves ovate and elliptic, spinulose at apex; whorls 6-flowered; corolla purple; lateral lobes of lower lip short, the middle lobe and upper lip emarginate. ♃.? H. Native of Corsica.

Horehound-leaved Hedge Nettle. Pl.

112 S. Valenti'na (Lag. nov. gen. et spec. p. 18.) leaves oblong-lanceolate, subcordate, hairy; whorls 6-7-flowered: upper ones sterile. ♃.? H. Native of Spain, on hills in the province of Valentia, near Enguera.

Valentia Hedge Nettle. Pl.

113 S. stenophy'lla (Spreng. syst. 2. p. 794.) suffruticose, rather hairy; branches twiggy; leaves linear, 3-nerved: lower ones sub-lanceolate, unidentate on both sides; whorls leafy; calyxes pungent. ♄. H. Native of the South of Spain. Sideritis linearifolia, Lam.?

Narrow-leaved Hedge Nettle. Fl. July, Aug. Clt. 1823. Shrub 1 foot.

114 S. glauck'scens (Mussin. ex Spreng. syst. 2. p. 726.) stem erect, villous; leaves cordate, acuminated, serrated, hairy on both surfaces: whorls leafless, spicate; segments of calyx divaricate, pungent. ♃.? H. Native of Caucasus.

Glaucescent Hedge Nettle. Pl.

115 S. biflo'ra (Hook. et Arn. in Beech. voy. pt. bot. p. 155.) Nothing is hardly known of this plant.

Two-flowered Hedge Nettle. Pl.

Cult. Very few of the species are worth cultivating for ornament, most of them having a weedy appearance. They will all grow in any common garden soil; the herbaceous perennial species are readily increased by dividing at the root in spring or autumn. The seeds of annual kinds only require to be sown in spring, in the open border. Some of the smaller species, as *S. Córsica*, do well in pots among other alpine plants. The hardy shrubby species, as *S. lavandulæfolia*, are well fitted for decorating rockwork; these are readily increased by cuttings, under a hand-glass, or by seeds. The greenhouse species require the treatment of other greenhouse plants.

LXXXII. SPHA'CELE (*from σφακος, sphakos*, sage; similarity.) Benth. in bot. reg. under no. 1289. lab. p. 567.—Phytóxys, Molina.—Sideritis species, H. B. et Kunth, nov. gen. amer. 2. p. 307.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, usually widened in the fructiferous state, irregularly somewhat 10-nerved, and reticulately veined, with an equal mouth, which is naked inside, deeply 5-toothed: teeth nearly equal, or scarcely somewhat dejected into two lips. Corolla with an ample, inclosed, or exserted tube, which is furnished with a pilose ring inside at the base: limb short, scarcely bilabiate; lobes broad-roundish, erectly spreading: upper ones sub-bifid: lateral ones entire: lower one larger, and emarginate. Stamens 4, ascending, nearly equal, or didynamous: lower ones the longest; filaments glabrous, naked; anthers sub-approximate, 2-celled: cells linear, distinct, diverging. Style somewhat equally bifid at top: lobes subulate, stigmatiferous at apex. Achenia dry, smooth.—Sub-shrubs or shrubs. Leaves bullately wrinkled, often canescent beneath; floral ones bractea-formed, rarely nearly similar to the cauline leaves. Whorls 2-6-flowered. Racemes simple or branched, terminal. This genus is allied to *Stáchys*, with the leaves of *Sálvia*.

1 S. salviæfo'lia (Benth. lab. p. 567.) shrubby; leaves oblong-lanceolate, rounded at the base, bullate above, and canescent beneath, as well as the branches; whorls many-flowered, secund, crowded into a terminal, rather branched, spike-formed raceme; corolla rather shorter than the calyx. ♄. G. Native of South America. Sideritis salviæfolia, H. B. et Kunth, nov. gen. 2. p. 307. Leaves 2-4 inches long. Whorls 6-10-flowered. Corolla whitish-blue, equalling the calyx. Calyx hispid, with lanceolate, subulate teeth. Bracteas very minute.

Sage-leaved Sphacele. Shrub.

2 S. bulla'ta (Benth. lab. p. 568.) shrubby; branches and under sides of leaves clothed with hoary tomentum, glabrous above, and rugosely blistered, oblong, obtuse, cordate, crenulated; flowers about 5-6 in a whorl, crowded into a dense spike; bracteas ovate, bidentate at apex; calycine teeth acuminately subulate; tube of corolla exceeding the calyx a little. ♄. S. Native of New Granada, on the Andes between Pasto and Peindela. Sideritis bullàta, H. B. et Kunth, nov. gen. amer. 2. p. 306. Shrub much branched, strong-scented. Leaves 2 inches long. Corollas white.

Blistered-leaved Sphacele. Shrub.

3 S. panicula'ta (Benth. lab. p. 568.) suffruticose; branches clothed with hairy tomentum; leaves oblong, sagittately cordate, acute, crenately toothed, rugosely blistered above, and glabrous, but clothed with fine hoary pubescence beneath; spikes panicled; whorls 6-flowered, approximate; bracteas ovate, and are, as well as the calycine teeth, acute. ♄. S. Native of Quito, on the mountains near Tarqui. Sideritis paniculàta, H. B. et Kunth, nov. gen. 2. p. 307. Shrub strong-scented. Leaves 3 inches long, and 16 lines broad. Calyx hispid. Corollas white, similar to those of *S. bullàta*.

Panicled Sphacele. Shrub 3 to 4 feet.

4 S. calyci'na (Benth. lab. p. 568.) suffruticose?; branches clothed with soft villi; leaves petiolate, ovate-oblong, rounded at the base, a little wrinkled, villous; racemes nearly simple, secund; whorls 2-flowered, remote; calyx ample, very villous; corolla ample, exceeding the calyx a little. ♄. F. Native of California, Douglas. Leaves 2-3 inches long, irregularly toothed. Calycine teeth broad-ovate, acute. Corolla white. Upper floral leaves sessile, bractea-formed, lanceolate, quite entire.

Large-calyxed Sphacele. Shrub.?

5 S. tomentòsa (Benth. lab. p. 569.) suffruticose, prostrate; branches ascending, tomentosely villous; leaves small, oblong, roundly subdilated at the base, wrinkled, tomentose on both surfaces; racemes loose, secund; whorls 2-flowered; corolla scarcely exceeding the calyx. ♄. G. Native of Peru, at Chuculin, Dombey. Leaves ⅓ inch long, irregularly and deeply crenated. Upper floral leaves sessile. Corolla inflated a little, pale.

Tomentose Sphacele. Shrub prostrate.

6 S. campanula'ta (Benth. in bot. reg. under no. 1289. lab. p. 569.) shrubby; branches divaricate; leaves small, oblong-lanceolate, narrowed at the base, bullately wrinkled above, and green, but clothed with hoary tomentum beneath; racemes loose, secund; whorls 2-flowered; corollas ample, about twice as long as the calyx. ♄. G. Native of Chili, near Valparaiso and Conception. Rosmarinus Chilénsis, Molina, hist. nat. chil. p. 13.? Dracocéphalum chamædryoides, Balb. misc. p. 29.

Algue Laguen, Feuill. chil. 3. t. 1. Phytóxys acidíssima, Molina ex Spreng. syst. 2. p. 716. Branchlets tomentosely pubescent. Leaves on short petioles, ½ to 1 inch long. Corollas pale blue.

Campanulate-calyxed Sphacele. Fl. July. Clt. 1795. Shrub 2 to 3 feet.

7 S. subrasta'ta (Benth. l. c.) shrubby; branches tomentose; leaves oblong-lanceolate, truncately subhastate at the base, green, and bullately wrinkled above, but clothed with white tomentum beneath; racemes loose, nearly simple; whorls many-flowered; corolla about twice as long as the calyx. ♄. G. Native of Chili, near Valparaiso. Leaves scarcely an inch long, obtuse, crenulated. Whorls 4-6-flowered. Calycine teeth linear-subulate. Corolla blue. Stamens a little exserted.

Subhastate-leaved Sphacele. Shrub.

8 S. Lindle'yi (Benth. l. c. lab. p. 570.) shrubby; branches clothed with floccose wool; leaves ovate, cordate at the base, bullately wrinkled, clothed with white wool beneath; racemes simple, dense; whorls many-flowered; corolla twice as long as the calyx. ♄. G. Native of Chili, near Valparaiso. Hook. bot. mag. t. 2993. Stáchys Sálviæ, Lindl. in bot. reg. t. 1226. Leaves 1½ to 3 inches long. Corollas purplish-violet, more than an inch long, pubescent outside.

Lindley's Sphacele. Fl. Aug. Clt. 1825. Shrub 3 to 4 feet.

9 S. lamiifòlia (Benth. lab. p. 570.) shrubby; branches clothed with rufous tomentum; leaves on short petioles, ovate, cordate at the base, villous, wrinkled, of nearly the same colour on both surfaces; racemes loose, a little branched; whorls many-flowered; corolla much exserted. ♄. G. Native of Peru, Dombey. Leaves obtuse, crenated, glandular beneath: floral ones sessile. Whorls 4-6-flowered. Calyx sub-bilabiate, with setaceously acuminated teeth. Corolla scarlet, almost 1½ inch long.

Dead Nettle-leaved Sphacele. Shrub.

10 S. speciòsa (St. Hil. mss. ex Benth. lab. p. 570.) shrubby; branches clothed with rufous tomentum; leaves petiolate, ovate, or oblong-lanceolate, truncately subcordate at the base, bullately much wrinkled above, and rather woolly beneath, but at length nearly glabrous; racemes loose, paniculately branched; whorls 2-flowered; corolla much exserted. ♄. G. Native of Brazil, in shady rocky places on Serra do Papagaio, in the province of Minas Geraes. Leaves doubly crenulated: floral leaves small, bractea-formed, acuminated, nearly entire. Corolla reddish-violet, more than an inch long.

Showy Sphacele. Shrub 3 to 5 feet.

Cult. The species are free growers, and flowerers. Any light rich earth will answer them; and cuttings readily strike root, with a hand-glass placed over them.

LXXXIII. LEPECHI'NIA (named after John Lepechin, a Russian botanist.) Willd. hort. berol. 1. p. 21. t. 21. Benth. lab. p. 415.—Horminum species, Ortega.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx inflately campanulate, reticulately veined, truncate at apex, sub-bilabiate; upper lip bidentate; lower lip tridentate: teeth all awned; throat naked inside. Corolla equal in length to the calyx; tube naked inside; limb bilabiate; upper lip erect, flattish, emarginate; lower lip trifid, with flat, entire, rather spreading lobes. Stamens 4, didynamous, ascending: lower 2 the longest; anthers approximate: cells rather parallel. Style glabrous, almost equally bifid at apex. Achenia dry, smooth, black.—Herbs. Whorls many-flowered, remote, or spicate.

1 L. spica'ta (Willd. hort. berol. 1. p. 21. t. 21.) stem erect; whorls crowded into a terminal spike; fructiferous calyx closed. ♃. F. Native of Mexico, near Arlo and Santa Rosa de la Sierra; and near Xalapa. Bot. reg. t. 1992. Horminum cauléscens, Orteg. dec. p. 68. Ulrícia pyramidáta, Jacq. ex Steud. nom. p. 413. Stem rather hairy. Leaves nearly sessile, 2-6-inches long, ovate, obtuse, crenulated, cuneated at the base, wrinkled, pubescent, green on both surfaces; floral leaves under the spike similar to the others, but smaller; those in the spike bractea-formed, equalling the calyxes. Spikes oblong or sub-globose 1 to 1½ inch long. Calyx pubescent. Corolla small, yellow.

Spike-flowered Lepechínia. Fl. July, Aug. Clt. 1800. Pl. 1 to 1½ foot.

2 L. procu'mbens (Benth. lab. p. 415.) stems procumbent; whorls secund, remote; fructiferous calyx spreading. ♃. F. Native of Mexico, Karwinski. Branches nearly simple, villous. Leaves petiolate; lower ones ovate: superior ones oblong; all obtuse, crenated, sub-cordate at the base; lower floral leaves almost similar to the others, sessile: the upper ones small and bractea-formed. Whorls 6-10-flowered. Corolla like *L. spicata*, but a little longer.

Procumbent Lepechínia. Pl. procumbent.

Cult. The species of *Lepechínia* should be grown in pots in a rich open earth, or one composed of equal parts of peat sand and loam. They require the protection of a frame or greenhouse in winter, and are readily increased by division and seeds, and even by cuttings.

LXXXIV. CRANIO'TOME (from κρανεον, *kranéon*, a helmet; and τομη, *tome*, a section; probably in reference to the short galea or helmet.) Reichb. icon. bot. exot. 1. p. 39. Benth. lab. p. 704.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx ovate, somewhat globose after florescence, equal, 5-toothed; throat contracted, villous inside. Corolla with an exserted tube, and a bilabiate limb: the upper lip very short and concave, entire; the lower lip longer, spreading, and trifid; the lateral segments short. Stamens 4, ascending, didynamous, shorter than the corolla: lower ones longest. Anthers 2-celled; cells at length divariente. Style about equally bifid at top. Stigmas minute. Achenia dry, smooth.

1 C. versi'color (Reichb. l. c. t. 54.) ♃. H. Native of Nipaul, Kamaon, and Silhet, &c. Népeta versícolor, Trev. in nov. act. acad. nat. cur. 13. p. 183. Anisómeles Nepalénsis, Spreng. syst. 2. p. 706. Ajuga furcàta, Link, enum. 2. p. 99. Herb erect, branched. Branches pilose. Leaves petiolate, ovate, acuminated, crenated, cordate at the base, hispid from pili on both surfaces. Uppermost floral leaves bractea-formed. Cymes loose, many-flowered, pedunculate, racemose. Racemes slender, panicled. Flowers minute, elegantly variegated with white, red, and purple. Calyx pubescent. Fl. July, Aug. Clt. 1824. Pl. 4 to 6 feet.?

Party-coloured-flowered Craniotome.

Cult. For culture and propagation see *Lepechínia*, above.

LXXXV. SIDERI'TIS (of Pliny, and Σιδηριτις of Dioscorides; from σιδηρος, *sideros*, iron; so named on account of its fancied property of healing flesh wounds.) Tourn. inst. t. 90. Lin. gen. no. 712. Schreb. gen. no. 966. Juss. gen. p. 113. Benth. lab. p. 570.—Hesiódia, Burgsdórffia, and Marrubiástrum, Mœnch.—Empedóclea, Rafin.—Naviculària, Fabr.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx tubular, 5-10-nerved: teeth erect, rather spinose, sometimes equal, and sometimes the upper one is very broad, or the 3 upper ones are almost joined into an upper lip. Corolla with an inclosed tube,

which is naked or annulate inside, and a bilabiate limb; upper lip erect, flattish, entire, or emarginately bifid; lower lip spreading, trifid, the middle lobe the broadest, and usually emarginate. Stamens 4, didynamous, inclosed; the upper 2 very short, bearing 2-celled anthers: the cells divaricate; the 2 lower ones longer, bearing dimidiate or difformed empty anthers, rarely conforming to the superior anthers. Style inclosed, bifid at top; upper lobe terete, truncate, stigmatiferous at top: lower lobe dilated, clasping the superior one at the base, stigmatiferous on the top and edges. Achenia dry, obtuse at apex, not truncate.—Herbs, shrubs, and under-shrubs. Whorls 6, or many-flowered, axillary, racemose or spicate. Floral leaves sometimes almost similar to the cauline leaves: upper ones minute, sometimes bractea-formed, dilated, and clasping the flowers, with quite entire or spiny-toothed margins. Corollas small, usually yellowish.

Sect. I. Marrubia'strum (from *Marrubium*, horehound; and *astrum*, an affixed signification, like: plants with the habit of *Marrúbium*.) Mœnch, meth. 391. Benth. lab. p. 573. Shrubs clothed with soft wool, generally white. Floral leaves green, quite entire or crenated, nearly similar to the lower cauline ones, but much smaller; uppermost ones minute.

1 S. Massonia'na (Benth. lab. p. 573.) clothed with white dense adpressed wool; leaves oblong, subcordate at the base, thick, clothed with white wool on both surfaces or only beneath; racemes paniced; whorls few-flowered. ♄. G. Native of Madeira, Masson. Allied to *S. Crética*, but the leaves are narrower and scarcely crenated, and the upper surfaces of the leaves less woolly. Whorls 4-10-flowered, interruptedly racemose. Corollas yellow. ?

Masson's Ironwort. Shrub.

2 S. ca'nescens (Ait. hort. kew. 2. p. 289.) clothed with adpressed dense white wool; leaves ovate, crenated, a little truncate at the base, cordate, thick, clothed with adpressed wool on both surfaces, white beneath; racemes simple; whorls few-flowered. ♄. G. Native of Teneriffe. S. Crética, Lin. spec. p. 801.—Comm. hort. 2. p. 197. t. 99. Habit of *S. Canariénsis*, but the wool is white. Leaves 1-2 inches long. Whorls usually 10-flowered; lower ones distant. Corolla yellow, scarcely exceeding the calyx, pale yellow, or dirty white.

Whitened Ironwort. Fl. April, July. Clt. 1714. Shrub 2 to 3 feet. ?

3 S. macrosta'chyos (Poir. suppl. 2. p. 381.) clothed with dense white adpressed wool; leaves ovate, subcordate at the base, green above, and very white beneath; whorls many-flowered, imbricated into a thick very dense spike. ♄. G. Native of the Canary Islands, Poiret, Masson. Corollas exceeding the calyx a little. Upper surfaces of leaves nearly glabrous.

Long-spiked Ironwort. Shrub.

4 S. Canarie'nsis (Lin. spec. p. 573.) clothed with villous wool; leaves ovate, crenated, cordate at the base, thick, wrinkled, veiny beneath, and clothed with velvety wool on both surfaces; racemes simple; whorls many-flowered, distinct. ♄. G. Native of the Canary Islands. Jacq. hort. vind. 3. p. 18. t. 30. Marrubiástrum tomentósum, Mœnch, meth. p. 391.—Pluk. phyt. t. 322. f. 4. Plant clothed with rather floccose yellowish white dense wool. Leaves 2-4 inches long. Whorls dense, 20-30-flowered. Corolla yellowish, scarcely exceeding the calyx. Style often 4-5 cleft, and the ovarium 8-10 parted, in the gardens.

Canary Island Ironwort. Fl. May, Aug. Clt. 1697. Shrub 3-6 feet.

Sect. II. Empedóclea (the name of an ancient philosopher.) Benth. lab. p. 574.—Empedóclea, Rafin. Caratt. ex Guss. Small shrubs or perennial herbs, woolly at the base. Floral leaves quite entire, clasping the sessile flowers.

5 S. Syri'aca (Lin. spec. p. 801.) suffruticose, clothed with white wool; leaves thick, oblong-lanceolate, narrowed at the base: lower ones crenulated: floral leaves cordate at the base, quite entire, equalling the calyxes. ♄. F. Native of Candia and Palestine. Rchb. icon. bot. exot. 1. p. 42. t. 57. Sibth. et Smith, fl. græc. 6. p. 41. t. 550.—Sabb. hort. rom. 3. t. 40. The whole plant is clothed with white wool. Whorls 6-10-flowered. Corolla twice as long as the calyx, yellow, clothed with silky villi outside.

Syrian Ironwort. Fl. June, Sept. Clt. 1597. Shrub 1 to 1½ foot.

6 S. Tau'rica (Bieb. fl. cauc. 2. p. 43.) suffruticose, clothed with white wool; leaves thick, oblong-lanceolate, or spatulate, narrowed at the base: lower ones crenulated, clothed with dense white wool on both surfaces: floral leaves very broadly cordate, acuminated, quite entire, reticulately veined, clothed with loose wool, greenish; calycine teeth lanceolate, mutic. ♄. H. Native of Tauria, on calcareous mountains. Bieb. cent. pl. rar. ross. 1. t. 39. Rchb. icon. bot. eur. 4. p. 61. t. 384. S. Syriaca, Pall. ind. taur. but not of Lin. S. incàna, Habliz, taur. p. 148, but not of Lin. Nearly allied to *S. Syriaca*. Corollas yellow.

Taurian Ironwort. Fl. June, Sept. Clt. 1822. Shrub 1 to 1½ foot.

7 S. Sicula (Ucria, ex Guss. prod. fl. sic. 2. p. 85.) suffruticose, clothed with white wool; leaves thick, oblong-spatulate, narrowed at the base: lower leaves crenulated, woolly on both surfaces: floral ones very broadly cordate, acuminated, quite entire, reticulately veined, clothed with loose wool, green, about twice as long as the calyxes; calycine teeth lanceolate-subulate, very acute, rather spinescent. ♄. F. Native of the South of Europe; as of Spain, Italy, Sicily. S. Brùtia, Tenore, fl. nap. 2. p. 16. Empedóclea montàna, Rafin. Caratt. p. 78. S. decúmbens, Mœnch, meth. p. 390. ? Naviculària Heistèri, Fabric. Very nearly allied to *S. Syriaca*. Corollas yellow.

Sicilian Ironwort. Shrub 1½ to 2 feet.

8 S. Libanótica (Labill. icon. pl. syr. rar. 4. p. 13. t. 8.) suffruticose; branches simple, glabrous; leaves obovate-oblong, serrated, tomentose; whorls distant; bracteas ovate, acuminated, reticulately veined; calycine segments mucronate. ♄. F. Native of Mount Lebanon. Floral leaves sessile. Whorls 4-8-flowered. Bracteas length of calyxes. Calyx pilose. Corolla pale yellow, pilose, the tube length of calyx.

Lebanon Ironwort. Shrub 1 to 1½ foot.

9 S. pu'llulans (Vent. hort. cels. t. 98.) suffruticose; stem rather woolly at the base, green and pubescent above, divaricately branched; leaves ovate-lanceolate, half stem-clasping, stiff, reticulately veined, green on both surfaces, pubescent or canescent from loose wool: floral leaves broadly cordate, acuminated, twice as long as the flowers; calyx green, with subulate spinose teeth. ♄. F. Native of Syria, on mountains near Jerusalem and Nazareth, Boué. Leaves 2-3 inches long; floral ones 1 to 1½ inch long. Whorls 6-10-flowered. Corolla pubescent outside. Perhaps only a variety of *S. Libanótica*.

Sprouting Ironwort. Shrub.

10 S. du'ra (Benth. lab. p. 576.) suffruticose; stem clothed with white wool; leaves sessile, half stem-clasping, lanceolate, acute, quite entire, stiff, rather woolly from hoary villi on both surfaces: floral leaves broad-cordate, equalling the calyxes, quite entire, acuminated; calyx clothed with soft villi, with soft mutic teeth. ♄. F. Native country unknown. Habit of *S. Syriaca*, but the form of the leaves is different, the whole plant is less woolly, and the whorls more numerous and more remote. Whorls about 6-flowered. Floral leaves very concave.

Hard Ironwort. Shrub.

11 S. PERFOLIA'TA (Lin. spec. p. 802.) suffruticose, hardly woolly at the base; stem pilose, green; leaves half stem-clasping, ovate-oblong or lanceolate, greenish on both surfaces, and furnished with soft villi, rather veiny: floral leaves very broadly cordate, acuminated, reticulately veined, green on both surfaces, twice as long as the leaves; calyx green, pilose, with lanceolate-subulate very acute scarcely spinose teeth. ♄. F. Native of the South of Europe; as of Spain, Sicily, and the Levant. Leaves 1½ to 2 inches long, quite entire or few-toothed, often connate at the base; floral leaves very much dilated, boat-shaped at the base. Corolla yellow, hardly exceeding the calycine teeth.

Perfoliate-leaved Ironwort. Fl. Aug. Nov. Clt. 1731. Shrub 1 to 1½ foot.

12 S. DI'STANS (Willd. spec. 3. p. 66.) suffruticose, hoary; leaves lanceolate, quite entire, acute; whorls distant; floral leaves cordate, acuminated, mucronate, reticulated, nerved. ♄. F. Native of the Levant. Very nearly allied to *S. Taûrica*, from which it differs in the acute, less tomentose, quite entire, leaves, very remote whorls, and glabrous, mucronate bracteas, &c. Tube of corolla longer than the calyx; middle lobe of lower lip obtuse, not emarginate as in *S. Taûrica*.

Distant-whorled Ironwort. Shrub ½ to 1 foot.

13 S. RUGO'SA (Poir. suppl. 2. p. 383.) suffruticose; leaves ovate-lanceolate, obtuse, wrinkled, a little toothed, clothed with hoary tomentum; whorls distant; floral leaves entire, and are, as well as the calyxes acuminated and tomentosely pilose at apex; branches strict. ♄. F. Native of Syria, Labillardière. *S. rytidea*, Spreng. syst. 3. p. 644. Stems slender. Leaves distant, about an inch long. Calyxes longer than the floral leaves; teeth spinose. Corollas yellow.?

Wrinkled Ironwort. Shrub ½ to 1 foot.

14 S. ÆGYPTI'ACA (Pers. ench. 2. p. 117.) leaves ovate, serrated, hoary, the veins beneath rather prominent; stem terete, clothed with white tomentum; whorls clasped by the floral leaves. ♄.? F. Native of Egypt. Stem tall.

Egyptian Ironwort. Shrub tall.

SECT. III. EUSIDERI'TIS (from *ευ*, *eu*, well, and *Sideritis*; so named from this section being supposed to contain the true or legitimate species of the genus.) Benth. lab. p. 577. Small shrubs, villous or rather woolly from soft hairs or pili; rarely nearly glabrous. Floral leaves bractea-formed, sessile, very broadly cordate, clasping the flowers, reticulately veined, with spiny-toothed margins. Teeth of calyx equal, spiny. Corolla exceeding the calycine teeth a little. The species of this section are closely allied to each other.

15 S. GRANDIFLO'RA (Salzm. pl. tang. exs. ex Benth. lab. p. 577.) suffruticose; stem loosely woolly; leaves oblong, obtuse, crenated, narrowed a long way at the base, clothed with soft villi; floral leaves very broad, exceeding the flowers, clothed with soft villi, bluntly acuminated at top, somewhat spinosely denticulated on the margins at the base. ♄. F. Native on hills about Tangiers. Leaves green on both surfaces. Corollas pale yellow, size of those of *Stachys récta*; tube annulate inside.

Great-flowered Ironwort. Shrub 1 to 1½ foot.

16 S. OVA'TA (Cav. icon. 1. p. 36. t. 48.) suffruticose,? green, glabrous or subvillous; leaves oblong-ovate, obtuse, subserrated: floral leaves very broad, exceeding the flowers, glabrous or with villous margins, few-veined, with spiny-toothed margins; whorls approximate, spicate. ♄. F. Native of Spain. Leaves 1 to 1½ inch long. Whorls 6-flowered. Corolla cream-coloured; middle segment of the lower lip crenated.

Ovate-leaved Ironwort. Shrub.

17 S. SPINO'SA (Lam. dict. 2. p. 169.) suffruticose, clothed with soft villi, greenish; leaves oblong-lanceolate, mucronate, with serrated subspinose margins: floral leaves broad, acuminated, exceeding the flowers, with spiny-toothed edges, all clothed with silky villi; whorls approximate, spicate. ♄. P. Native of Spain and Barbary. *S. serràta*, Lag. nov. gen. et spec. p. 18. Stems branched at the base. Corollas pale yellow.

Spinose Ironwort. Fl. June, Sept. Clt.? Shrub 1 to 1½ foot.

18 S. ILICIFO'LIA (Willd. enum. p. 606.) suffruticose, nearly glabrous; leaves oblong-lanceolate, with spinosely serrated edges, a little cut: floral leaves broad, acuminated, exceeding the flowers, with spiny-toothed margins, all nearly glabrous; whorls all remote. ♄. F. Native of the Levant and Spain. Leaves 1-2 inches long. Corollas small. Whorls many-flowered, dense. Lower leaves petiolate; upper ones sessile.

Holly-leaved Ironwort. Fl. June, Sept. Clt.? Shrub 1 to 1½ foot.

19 S. SCORDIOI'DES (Lin. spec. p. 803.) suffruticose; branches decumbent, ascending or erectish, usually loosely villous, rarely glabrous; leaves ovate, oblong or oblong-linear, narrowed at the base, deeply toothed, mutic or rarely almost entire, pilosely woolly or glabrous: floral leaves very broad, equalling the calyxes or hardly longer, with spiny-toothed margins; whorls rather villous, rarely glabrous, interruptedly or densely spicate. ♄. H. Native of Europe, in the region of the Mediterranean; as of Spain, South of France, Piedmont, South of Switzerland. —Barr. icon. 343.—Lob. icon. 528. Very variable in stature and form of leaves. Corollas pale yellow.

Var. α, grandiflòra (Benth. lab. p. 578.) branches erectish, stiff; leaves oblong, green, villous, deeply toothed; whorls large, subinterruptedly spicate. ♄. H. Native among rocks in the Eastern Pyrenees, near Bagnols, and of Spain. *S. subspinòsa*, Cav. icon. rar. 3. p. 5. t. 209. *S. spinòsa*, Bench. cat. pl. pyr. p. 121. but not of Lin.

Var. β, communis (Benth. lab. p. 578.) branches erectish or ascending; leaves obovate-oblong, deeply toothed, villous, canescent while young; whorls very spinose, interruptedly spicate. ♄. H. Native of the South of France and Spain in dry, arid places.

Var. γ, elongàta (Benth. lab. p. 578.) branches elongated, ascending or erect; leaves oblong or oblong-lanceolate, deeply toothed, nearly glabrous, green; whorls interruptedly rarely densely spicate. ♄. F. Common in gardens; and probably a native of Spain. *S. hyssopifòlia*, of many authors. *S. fœtida*, Poir. dict. suppl. 2. p. 382. *S. hirta*, Roth, catal. 1. p. 67. *S. hirsùta*, Brot. fl. lus. 1. p. 161. *S. fruticulòsa*, Pourr. act. tol. 3. p. 328.

Var. δ, alpìna (Benth. lab. p. 578.) branches short, decumbent; leaves oblong-ovate, few-toothed, clothed with hoary villi or at length glabrous; whorls densely or subinterruptedly spicate. ♄. H. Native of the higher Pyrenees and Piedmont. *S. alpina*, Vill. fl. dauph. 2. p. 373. *S. Pyrenàica*, Poir. suppl. 2. p. 383. *S. crenàta*, Lapeyr. hist. abr. pl. pyr. p. 331.

Var. ε, glabràta (Benth. lab. p. 578.) branches ascending; leaves oblong-ovate, few-toothed or quite entire, nearly glabrous; whorls densely or subinterruptedly spicate. ♄. H. Native along with var. δ. *S. hyssopifòlia*, of many authors.

Var. ζ, angustifòlia, (Benth. lab. p. 578.) leaves oblong-linear, nearly glabrous. ♄. H. Native of the Eastern Pyrenees. *S. hyssopifòlia*, Lin. spec. 803. Schkuhr, handb. 2. t. 158.—Barrel. icon. t. 171.

Var. η, incàna, (Benth. cat. pyr. 121. lab. p. 578.) leaves oblong-linear, clothed with hoary villi. ♄. H. Native of the Eastern Pyrenees. *S. Pyrenàica*, Endress. pl. exs. un. fcin. Wurtemb.

Scordium-like Ironwort. Fl. Aug. Nov. Clt. 1597. Shrub ½ to 1 foot.

20 S. leuca'ntha (Cav. icon. 4. p. 2. t. 304.) suffruticose; branches erect, strict, tomentose; leaves linear, a little toothed, nearly glabrous, fascicled in the axils; spikes interrupted, slender, nearly glabrous: floral leaves very broad, equalling the calyxes, with spiny-toothed margins. ½. F. Native of Spain, in calcareous places, on the mountains. Corollas white or pale yellow.

White-flowered Ironwort. Fl. July, Aug. Clt. 1823. Shrub 1 foot.

21 S. pu'ngens (Benth. lab. p. 579.) suffruticose; branches erect, strict, pubescent; leaves linear, very acute, pungent, quite entire, glabrous; spikes dense, tetragonal: floral leaves very broad, about twice as long as the calyxes, with deep spiny-toothed margins. ½. F. Native of Spain. Spikes almost as in *S. serràta*, and the habit is that of *S. fœ'tens;* but the floral leaves are different. Leaves an inch long; lower ones hardly pungent.

Pungent Ironwort. Shrub.

22 S. arbore'scens (Salzm. pl. exs. ex Benth. lab. p. 579.) suffruticose; branches erect, somewhat bifariously woolly: leaves oblong-lanceolate, deeply toothed, glabrous: floral leaves very broad, equalling the calyxes, reticulately veined, rather woolly, with subspinosely toothed margins; whorls many-flowered, hairy, distinct, approximate, subspicate. ½. F. Native of Gibraltar, Broussonet and Salzmann. Leaves nearly sessile, scarcely an inch long. Whorls 6-10-flowered, globose. Bracteas orbicular. Corollas pale yellow.

Arborescent Ironwort. Shrub 4 to 5 feet.

23 S. Cavanille'sii (Lag. nov. gen. et spec. p. 18.) rather hoary; leaves lanceolate, dentately serrated; spike elongated; whorls distinct; bracteas cordately orbicular, spiny-toothed. ½. F. Native of Spain, in mountainous places about Madrid and Old Castile. S. scordioides, Cav. icon. 4. p. 2. t. 303, but not of Lin. ex Lag. Stems and under surfaces of leaves tomentose, more or less hoary. Corollas yellow.

Cavanilles's Ironwort. Shrub ½ to 1 foot.

24 S. hirsu'ta (Lin. spec. p. 803.) suffruticose; branches decumbent, very hairy; leaves oblong-ovate or cuneated, deeply toothed, narrowed at the base, hairy: floral leaves very broad, equalling the calyxes, with subspinosely toothed margins; whorls globose, very hairy, all remote. ½. F. Native of Spain, France, Provence, Piedmont. Cav. icon. 4. p. 1. t. 302. S. scordioides, var. lanàta et latifòlia, Benth. cat. pyr. p. 121. S. tomentòsa, Pourr. act. acad. tol. 3. p. 328. S. Hispánica, Mill. dict. no. 7.—Sabb. hort. 3. t. 58. Whorls usually more than 10-flowered, an inch distant. Floral leaves scarcely spinose. Corollas pale yellow.

Hairy Ironwort. Fl. June, July. Clt. 1731. Shrub decumbent.

25 S. chamædryfòlia (Cav. icon. 4. p. 1. t. 301.) suffruticose; branches ascending, rather villous; leaves oblong or cuneated, deeply toothed, narrowed at the base, rather villous: floral leaves very broad, equalling the calyxes, with subspinosely toothed margins; whorls almost glabrous or villous, all remote. ½. F. Native of Spain. Hardly differing from *S. hirsùta*, unless in being more glabrous. Whorls usually smaller, and the floral leaves larger. Corollas yellow.

Germander-leaved Ironwort. Fl. June, Aug. Clt. 1816. Shrub 1 foot.

26 S. angustifòlia (Lam. dict. 2. p. 168.) suffruticose; branches ascending or erectish, strict, tomentosely pubescent; leaves oblong-linear, quite entire, rarely few-toothed, narrowed at the base: floral leaves very broad, equalling the calyxes, with spiny-toothed margins; whorls rather villous, all distant. ½. F. Native of Spain, in the region of the Mediterranean, and North of Africa, in sandy places near Mascar. S. incàna, Cav. icon. rar. 2. p. 69. t. 186. S. angustifòlia, Lam. dict. 2. p. 168. Lag. nov. gen. et spec. p. 18. S. lincarifòlia, Lag. nov. gen. et spec. p. 18.? Allied to *S. scordioides*, var. *angustifòlia* and *S. incàna*. Leaves always sessile. Corollas yellow.

Narrow-leaved Ironwort. Fl. July, Aug. Clt. 1820. Shb. 1 ft.

27 S. tragorifo'lium (Lag. nov. gen. et spec. p. 18.) suffruticose; branches ascending or erectish, tomentosely woolly; leaves oblong-linear, obtuse, quite entire, narrowed at the base, rather woolly; floral leaves very broad, equalling the calyxes, spiny-toothed; whorls rather villous, interruptedly spicate. ½. F. Native of Spain, in the kingdoms of Murcia and Valentia. S. suffruticòsa, Mill. dict. no. 4.? Calyxes glabrous or villous, not woolly. Corollas yellow.

Goat-marjoram Ironwort. Shrub 1 foot.?

28 S. inca'na (Lin. spec. p. 802.) suffruticose; branches clothed with white wool or tomentum; leaves oblong-linear, obtuse, quite entire, clothed with white wool on both surfaces, especially while young: floral leaves very broad, somewhat palmatifid, shorter than the calyxes, rather spinose; whorls distant; calyxes clothed with white wool. ½. F. Native of Spain. S. virgàta, Desf. fl. atl. 2. p. 15. t. 126.—Boec. mus. 2. p. 77. t. 67. f. 2.? Habit of *Lavándula spica*. Leaves ½ to 1½ inch long. Whorls about 6-flowered. Corollas yellow.

Hoary Ironwort. Fl. July, Aug. Clt. 1752. Shrub 1 to 2 feet.

29 S. sera'ea (Pers. ench. 2. p. 118. Benth. lab. p. 741.) suffruticose, clothed with white wool; leaves oblong-linear or spatulate, obtuse, quite entire, densely clothed with white wool on both surfaces: floral leaves subpalmatifid, shorter than the calyxes, subspinose; whorls distant; calyx clothed with white wool. ½. F. Native of Spain. Nearly allied to *S. incana*, but the wool is much more dense, and the floral leaves shorter, and scarcely toothed.

Silky Ironwort. Shrub.

30 S. glau'ca (Cav. icon. 2. p. 68. t. 185.) suffruticose, glabrous, glaucescent; leaves oblong-linear, obtuse, quite entire: floral leaves broad, obtuse, quite entire or a little toothed, rather shorter than the calyxes; whorls distant; calyxes glabrous, with obtuse teeth. ½. F. Native of Spain, on the mountains. Habit of *S. incàna*, but differs from it in being glabrous and glaucescent, &c. Corollas pale rose-coloured.

Glaucous Ironwort. Shrub.

31 S. fœ'tens (Lag. nov. gen. et spec. p. 18.) suffruticose; leaves linear, glabrous, acute; spikes dense; fructiferous calyx with a bearded throat. ½. F. Native of Spain. Stem and branches twiggy, rush-formed, glabrous. Peduncles villous. Spikes cylindrical, 1½ to 5 inches long; whorls 12-24-flowered. Corolla white, length of calyx.

Stinking Ironwort. Shrub 2 to 3 feet.

32 S. lasia'ntha (Pers. ench. 2. p. 117.) leaves ovate, with spinulose teeth; whorls very villous. ½. H. Native of Spain. S. Hispanica fœtidissima, flore purpurascente, et coma canescente, Tourn. inst. p. 192.

Woolly-flowered Ironwort. Shrub.

33 S. crispa'ta (Willd. enum. p. 606. in a note.) hairy; leaves oblong-cuneated, toothed, undulated, tomentose beneath; bracteas orbicular, spiny-toothed; whorls distant. ½.? F. Native of Gibraltar. Leaves small, undulated.

Curled-leaved Ironwort. Fl. June, Sept. Clt. 1816. Shrub 1½ foot.

Sect. IV. Hesiònia (probably from Hesiodus, the name of an ancient poet.) Benth. lab. p. 582. Hesiòdia, Burgsdórffia and Marrubiástrum species, Mœnch, meth. Greenish annual herbs, rather woolly from soft pili. Floral leaves almost similar to the cauline ones, but smaller, a little toothed; teeth mutic. Teeth of calyx sometimes all nearly equal, the 3 upper ones somewhat connected at the base, obscurely bilabiate; sometimes the upper tooth is very large, with the lower ones all narrow, and about equal. Corolla usually shorter than the calycine teeth.

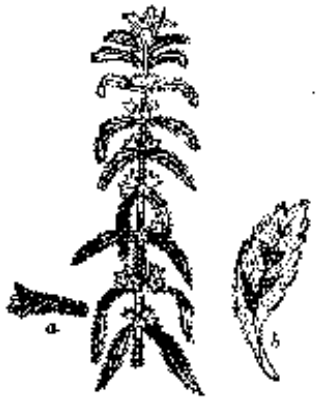
34. S. LANA'TA (Lin. spec. p. 804.) annual, clothed with soft wool-like hairs; leaves ovate, rounded at the base: floral leaves ovate, crenulated; calyx woolly, greenish, sub-bilabiate, with lanceolate-subulate acuminately subspinose teeth, the upper tooth twice the size of the lower ones. ⊙. H. Native of the region of the Mediterranean, as of Candia, Leri, Syria, &c. S. élegans, Murr. nov. comm. gott. 1778. t. 4. S. nigricans, Pers. ench. 2. p. 117. Lam. dict. 2. p. 167. Marrubiástrum élegans, Mœnch, meth. p. 391. Habit of *Stáchys ánnua*. Plant densely pilose. Leaves 1 to 1½ inch long. Corolla yellowish at the base; lips black at apex.

Woolly Ironwort. Fl. July. Clt. 1787. Pl. ½ to 1 foot.

35 S. PURPU'REA (H. F. Talbot, fl. corf. ined. ex Benth. lab. p. 712.) annual, very villous, green; leaves oblong-ovate: lower floral leaves toothed: upper ones ovate-lanceolate, acute, almost quite entire; calyx pilose, with aristately mucronate teeth, the upper tooth very large, ovate, the lower ones lanceolate-subulate; galea of corolla oblong, purplish. ⊙. H. Native of the islands, Corfu and Zante, Talbot. Sideritis Cretica, maxima, Ocimi Valentini facie, Tourn. This differs from *S. Romàna* in being more densely beset with long hairs, and particularly in the purple, not yellow, corollas; and the galea is longer and much narrower.

Purple-flowered Ironwort. Pl. ½ foot.

36 S. ROMA'NA (Lin. spec. p. 802.) annual, clothed with soft rather woolly pili, green; leaves oblong-ovate: floral leaves ovate-lanceolate, toothed; calyx nearly glabrous, with aristately mucronate teeth, the upper tooth large and ovate, and the lower teeth lanceolate-subulate. ⊙. H. Native of the region of the Mediterranean, in cultivated and waste places; as of Spain, France, Italy, Sicily, Grecian Islands, Syria, &c. Cav. icon. 2. p. 69. t. 187. Sibth. et Smith, fl. græc. 6. p. 43. t. 552. S. spatulàta, Lam. fl. fr. 2. p. 377. Burgsdórffia rígida, Mœnch, meth. p. 392. Burgsdórffia, Hoffm. et Link, fl. port. Stems branched at the base, ascending, clothed with long soft villi like the rest of the plant. Whorls 6-flowered, distant. Corolla yellowish.



Roman Ironwort. Fl. June, Aug. Clt. 1740. Pl. ½ foot.

37 S. APPROXIMA'TA (Gasp. in Guss. prod. fl. sic. suppl. p. 191.) bractless, very villous; leaves oblong, crenately toothed, tapering into the petioles: floral leaves equalling the calyxes; whorls all approximate into elongated spikes; teeth of calyx spinose, pungent: upper tooth ovate. ⊙ H. Native of Sicily, near Seceiara, in maritime pastures, Gasparini. Habit of *S. Romàna*.

Approximate-flowered Ironwort. Pl. ½ foot. ?

38 S. MONTA'NA (Lin. spec. p. 802.) annual, ascending; stem hairy; leaves oblong-lanceolate, narrowed at the base; floral leaves awned, a little toothed; calyx green, nearly glabrous, sub-bilabiate; teeth all ovate, aristately mucronate, at length spreading. ⊙. H. Native of the South of Europe and Middle Asia, in cultivated fields; as of the South of France, Italy, Sicily, Dalmatia, Syria, Tauria, Caucasus, Altaia, &c. Jacq. fl. austr. 5. p. 16. t. 434. Hesiòdia bicolor, Mœnch, meth. 392. Hesiòdia montàna, Dumort, fl. belg. p. 44.—Colum. ecphr. 1. p. 198. t. 196. Habit of *S. Romàna*, but taller, the whorls more numerous, the calycine teeth all nearly equal; the 3 superior teeth less deeply cut than the lower ones. Corollas yellow, with a ferruginous margin; upper lip entire, rather concave (fig. 83.)

FIG. 83.

Mountain Ironwort. Fl. July, Aug. Clt. 1752. Pl. ½ to 1 foot.

39 S. REMÒTA (D'Urv. enum. pl. arch. in mem. soc. Lin. par. p. 322.) annual; branches elongated, divaricate, rather villous or woolly; leaves oblong-lanceolate, narrowed at the base: floral leaves obtuse, mutic, a little toothed; calyx clothed with loose wool, sub-bilabiate: teeth all ovate-lanceolate, aristately mucronate, at length spreading. ⊙. H. Native of the Grecian Islands and Syria. S. lanàta, Hochst. et Steud. pl. exs. but not of Lin. S. montàna, Sibth. et Smith, fl. græc. 6. p. 42. t. 551, but not of Lin. Very nearly allied to *S. montàna*, but the habit is stronger, and the calyxes are clothed with white loose wool, not with long pili as in it.

Remote Ironwort. Pl. ½ to 1 foot.

† *Species not sufficiently known.*

40 S. TOMENTÒSA (Ucria, pl. ad Lin. Opus. add. no. 15. ex Guss. prod. fl. sic. suppl. 192.) leaves ovate-lanceolate, toothed, hoary; flowers verticillately spicate; spikes leafy. ⊙.? H. Native of Sicily.

Tomentose Ironwort. Pl. ?

41 S. RÒSEA (Desf. cor. Tourn. in ann. mus. 10. p. 302. t. 24.) villous; leaves ovate-oblong, obtuse, sessile, crenated; flowers twin, axillary; calyxes mutic. ⊙.? H. Native of Egypt. Plant canescent from adpressed tomentum, with the habit and leaves of *Teúcrium Scórdium*. Leaves 6-10 lines long, and 4-5 broad. Flowers nearly sessile. Corolla pale red; tube equalling the calyx; upper lip arched, entire.

Rose-coloured-flowered Ironwort. Pl. ¾ to 1 foot.

† † *Doubtful species.*

42 S. CILIA'TA (Thunb. fl. jap. 245.) leaves ovate, serrated; bracteas ciliated. 4.? H. Native of Japan, Thunb. Plant villous. Leaves petiolate, dotted above, hardly an inch long. Spikes terminal, lanceolate, erect. Bracteas nearly orbicular, acuminated, nerved, ciliated, imbricated.

Ciliated Ironwort. Pl. 1 to 1½ foot.

43 S. PARVIFÒLIA (Lam. ill. t. 505. f. 2.) This can hardly be enumerated as a species.

44 S. PROSTRA'TA (Zucc. ex Steud. nom. p. 776.)

45 S. TRICHIFÒLIA (Juss. ex Steud. nom. p. 776.)

Cult. All the shrubby species are well fitted for decorating rockwork; they prefer a dry chalky or gravelly soil, and are readily increased by cuttings, seeds, or by division. Those species belonging to the first section being natives of the Canary Islands are properly greenhouse plants. The seeds of annual kinds only require to be sown in the open ground in Spring in dry light soil.

LXXXVI. MARRU'BIUM (of Pliny, from the Hebrew *marrob*, a bitter juice, the species being extremely bitter.) Tourn. inst. t. 91. Lin. gen. no. 791. Schreb. gen. no. 976. Juss. gen. p. 114. Benth. lab. p. 585. Lagópsis, Bunge.

LIN. SYST. *Didynàmia, Gymnospérmia.* Calyx tubular, 5-10-nerved, equal; teeth 5-10, acute, rather spinose, nearly equal, erect or often spreading at maturity. Corolla with an inclosed tube, which is naked inside or somewhat annulated, and a bilabiate limb; upper lip erect, flattish or concave, entire or shortly bifid; lower lip spreading, trifid, the middle lobe the broadest, and usually emarginate. Stamens 4, didynamous, the lower ones the longest, inclosed within the tube of the corolla; anthers 2-celled: cells divaricate, sub-confluent, all nearly similar. Style bifid at

top; lobes short, obtuse, stigmatiferous at apex. Achenia dry, obtuse, not truncate at apex.—Perennial, usually tomentose or woolly herbs. Leaves wrinkled, rarely cordate at the base, usually cut; floral leaves similar, exceeding the flowers. Whorls axillary, usually many rarely few-flowered. Bracteas subulate, exceeding the calyxes, rarely very short, and almost wanting.

Sect. I. Lagópsis (from λαγος, *lagos*, a hare; and οψις, *opsis*, resemblance; application not evident.) Benth. lab. p. 586. Lagópsis, Bunge, mon. gen. molucc. Teeth of calyx 5. Tube of corolla exannulate; upper lip quite entire. Leaves roundish, palmatifid.

1 M. incísum (Benth. lab. p. 586.) leaves roundish, subpalmately-lobed, cut, greenish on both surfaces; bracteas setaceous; calyx glabrous or scarcely tomentose, with 5 setaceous teeth; upper lip of corolla oblong, entire. ♃. H. Native of Siberia, Dauria, and China, near Pekin. Leonúrus supínus, Willd. spec. 3. p. 116. Plant ascending, pubescent. Whorls 6-10-flowered. Corollas whitish, villous outside.

Cut-leaved Horehound. Pl. ½ to ½ foot.

2 M. erióstachyum (Benth. lab. p. 586.) leaves roundish, palmately lobed, cut, green on both surfaces; bracteas stiff, subulate; calyx densely woolly, with 5 subulate spinescent teeth; upper lip of corolla short, entire. ♃. H. Native of Siberia. Leonúrus erióstachys, Turcz. mss. Lagópsis víridis, Bunge, mon. gen. molucc. ined. Plant ascending, pubescent, but the tops of the stems are woolly. Leaves 5-7-parted; lobes cut. Whorls about 10-flowered. Corollas like those of *M. lanàta*.

Woolly-spiked Horehound. Pl. ½ foot.

3 M. lanátum (Benth. lab. p. 587.) leaves roundish, deeply lobed, clothed with white wool on both surfaces; bracteas setaceous; calyx densely woolly, with 5 subulate subspinescent teeth; upper lip of corolla short, entire. ♃. H. Native of Altaia, in exposed stony places at the river Tschuja. Moluccélla marrubiástrum, Steph. in mem. soc. mosc. 2. p. 8. Ledeb. fl. ross. alt. ill. t. 150. Lagópsis incàna, Bunge, mon. gen. molucc. ined. Stems numerous, decumbent, rising from a thick base, ascending at top. Whorls approximate into oblong, woolly spikes. Corolla blackish brown, villous outside.

Woolly horehound. Pl. decumbent.

Sect. II. Marrúbium (see genus for derivation.) Benth. lab. p. 587. Teeth of calyx 5-10. Tube of corolla subannulate inside; upper lip emarginate or bifid. Leaves roundish or ovate, crenated, rarely cut.

4 M. Alyssum (Lin. spec. p. 815.) leaves roundish, cuneated at the base, deeply crenated or lobed, clothed with soft white villi on both surfaces; bracteas almost wanting; calyx woolly, with 5 stiff spreading teeth; upper lip of corolla short, emarginately bifid. ♃. H. Native of the region of the Mediterranean; as of Spain, Sardinia, Apulia, Egypt, &c. M. plicátum, Forsk. fl. ægypt. arab. p. 213.—Mor. hist. 3. p. 377. sect. 11. t. 10. f. 12. Stems thick, ascending, woolly. Whorls distant, 10-15-flowered. Corollas minute, dark purple.

Alyssum or Plaited-leaved Horehound. Fl. July, Aug. Clt. 1597. Pl. ½ to 1 foot.

5 M. Persícum (Meyer, verz. pflanz. p. 95.) leaves orbicular, crenated, clothed with white wool on both surfaces; bracteas almost wanting; calyx woolly, with 5 stiff spreading teeth; upper lip of corolla oblong. ♃. H. Native of Persia, in dry stony places on the Talusch mountains near Swant. Habit, leaves, and inflorescence nearly of *M. vulgàre*, but is clothed with white wool in all parts. Flowers more numerous in the whorls than in *M. Alyssum*. Corolla a little larger.

Persian Horehound. Pl. ½ to 1 foot.

6 M. cærulescens (Desf. cat. hort. par. ed. 3. p. 395.) stems tall, clothed with white wool; leaves ovate, crenated at apex, scarcely wrinkled, green above, canescent beneath; outer bracteas shorter than the calyxes; calyx clothed with white wool, with 5 subulate straight spreading teeth; galea of corolla oblong, bifid at apex. ♃. H. Native of Persia. Leaves form of those of *M. Astracánicum*, clothed with white tomentum or wool beneath while young, but almost glabrous in the adult state. Corollas blue.

Bluish-flowered Horehound. Pl. 2 to 3 feet.

7 M. catariæfólium (Desr. in Lam. dict. 3. p. 717.) stems clothed with hoary tomentum; leaves ovate, crenated, a little wrinkled, pubescent, canescent beneath; outer bracteas shorter than the calyxes; calyx clothed with hoary tomentum, with 5 short stiff spreading recurved teeth; galea oblong, bifid at apex. ♃. H. Native of Cappadocia. Nearly allied to *M. Astracánicum*, but more erect, more branched, and clothed with hoary tomentum, never woolly nor villous. Whorls more numerous and smaller, as well as the flowers. Corollas white.

Cat-mint-leaved Horehound. Fl. July, Aug. Clt. 1819. Pl. 1 to 2 feet.

8 M. Astracánicum (Jacq. icon. rar. 1. p. 11. t. 109.) stems loosely villous, rather woolly; leaves ovate, crenated at top, bullately wrinkled, green and villous on both surfaces, or scarcely canescent beneath; outer bracteas shorter than the calyxes; calyx pubescent, with 5 short acute straight or subrecurved teeth; galea of corolla oblong, bifid at apex. ♃. H. Native of the Levant; Persia, on the higher Talusch mountains; and Cashmere, but not about Astracan. Rchb. icon. bot. eur. 3. p. 61. t. 270. Intermediate between *M. candidissimum* and *M. leonuroides*. Lower parts of stems and lower leaves clothed with long soft hairs. Whorls dense, many-flowered. Corolla blue or white.

Astracan Horehound. Fl. July, Aug. Clt. 1816. Pl. 1½ to 2 feet.

9 M. leonuroídes (Desr. in Lam. dict. 3. p. 715.) stems rather woolly; leaves ovate or roundish, coarsely and deeply crenated, clothed with soft pubescence, canescent beneath or on both surfaces; outer bracteas scarcely shorter than the calyxes; calyx clothed with white wool, with 5 subulate recurvedly spreading teeth; galea of corolla oblong, bifid at apex. ♃. H. Native of Caucasus and near Astracan. Rchb. icon. bot. eur. 3. p. 84. t. 299. M. Astracánicum, Bieb. fl. taur. 2. p. 52.? and of many other authors. M. affine, Horn. hort. hafn. p. 556. Lower leaves roundish; superior ones ovate. Whorls size of those of *M. vulgàre*. Corollas blueish purple.

Leonurus-like Horehound. Fl. July, Sept. Clt. 1819. Pl. 1 to 2 feet.

10 M. plumósum (Meyer, verz. pflanz. p. 96.) leaves roundish, deeply lobed, clothed with short villi on both surfaces, rather canescent; calyx clothed with soft villi, with 5 teeth, which are, as well as the bracteas subulate and plumose; galea of corolla bifid at apex. ♃. H. Native of Caucasus. Whorls distant, many-flowered, nearly an inch in diameter. Corolla scarcely longer than the calycine teeth.

Feathery-bractead Horehound. Pl. ascending.

11 M. velutínum (Sibth. et Smith, fl. græc. 6. p. 49. t. 561.) branches elongated, tomentose, woolly at the base; leaves orbicular, crenated, subcuneated at the base, clothed with velvety villi on both surfaces; whorls ample, many-flowered; calyx clothed with tomentose pubescence, with 5 teeth, which are subulate, stiff, straight, or at length spreading, as well as the bracteas; galea of corolla oblong, bifid. ♃. H. Native of Mount Parnassus. Allied to *M. candidissimum*, but differs in the colour of the whole plant, and in the form of the leaves. Corollas white.?

Velvety Horehound. Pl. 1½ foot.

12 M. candidi'ssimum (Lin. spec. p. 816.) branches elongated, a little branched, clothed with white wool; leaves ovate, crenated, clothed with soft white villi or white wool; whorls large, many-flowered; calyx clothed with white villi or wool, usually with 5 subulate stiff spreading teeth; galea of corolla oblong, bifid at apex. ♃. H. Native of the South of Europe; as of Spain, South of France, Italy, Dalmatia, Carinthia, Persia, &c. M. peregrinum, Rchb. icon. bot. eur. 4. p. 10. t. 312, but not of Lin. M. catariæfòlium, Rchb. icon. bot. eur. 4. p. 10. t. 313, but not of Desr. M. setàceum, Desr. in Lam. dict. 3. p. 717.? M. incànum, Desr. in Lam. dict. 3. p. 716. M. uncinàtum, Horn. hort. hafn. p. 968.? M. flexuòsum, Mœnch, meth. p. 399.? M. oloratissimum, Pourr. ex Steud. nom. bot. p. 510.—Dill. elth. 218. t. 174. f. 214. Stems procumbent at the base and ascending at apex. Whorls remote, 20-50-flowered. Corollas whitish.

Very white Horehound. Fl. July, Sept. Clt. 1732. Pl. 1 to 2 feet.

13 M. supi'num (Lin. spec. p. 816.) branches clothed with white wool; leaves ovate-roundish, clothed with soft villi, greenish, or clothed with white wool beneath, crenated, bullately wrinkled; whorls many-flowered; calyx villous, with 5-10-subulate stiff, erect, or at length spreading teeth; galea of corolla oblong, bifid at apex. ♃. H. Native of the South of Europe.?—Bocc. mus. 2. p. 78. t. 69.—Barrel. icon. 685.? Intermediate between *M. candidissimum* and *M. vulgàre*, having the flowers of the first and the leaves of the latter. Perhaps a garden hybrid.

Trailing Horehound. Fl. Aug. Sept. Clt. 1714. Pl. trailing.

14 M. peregri'num (Lin. spec. p. 815.) dwarf, divaricately branched; leaves oblong, clothed with hoary tomentum; whorls few-flowered; calyx tomentose, with 5 lanceolate-subulate erect or scarcely spreading teeth; galea of corolla oblong, bifid. ♃. H. Native of Europe and Middle Asia; as of Germany, Austria, Transylvania, Grecian Islands, Syria, Tauria, &c. Jacq. austr. t. 160. M. Créticum, Mill. dict. no. 3. Rchb. icon. bot. eur. 3. p. 74. t. 288. M. paucifòrum, Wallr. sched. crit. p. 295. M. angustifòlium, Mœnch, ex Steud. nom. p. 510.—Dill. elth. 219. t. 174. f. 215.—Mor. hist. t. 9. f. 8. Plant clothed with short, hoary tomentum. Whorls 4-6 rarely 10-flowered. Corollas whitish.

Foreign Horehound. Fl. July, Sept. Clt. 1640. Pl. 1 to 1½ foot.

15 M. Pannónicum (Clus. ex Rchb. fl. germ. exc. p. 325.) branches divaricately branched; leaves ovate or oblong, clothed with hoary tomentum or soft villi; floral leaves all twice as long as the flowers; whorls many-flowered, all distant; calyx clothed with hoary tomentum, with 6-10 subulate teeth which at length spread; galea of corolla oblong, bifid at apex. ♃. H. Native of Germany, near Halle, Hungary, Moravia, Austria, and Transylvania. M. paniculàtum, Desr. in Lam. dict. 3. p. 716.? Rchb. icon. bot. eur. 3. p. 86. t. 300. M. peregrinum, Spreng. fl. hal. t. 6. but not of Lin. M. remòtum, Kit. in Schultes, austr. fl. 2. p. 161. M. rùbrum, Roth, nov. spec. p. 259. Whorls distant, 12-15-flowered. Corolla of *M. peregrinum*. Allied to *M. peregrinum* and *M. vulgàre*.

Pannonian Horehound. Pl. 1 to 1½ foot.

16 M. radia'tum (Delile, mss. ex Benth. lab. p. 591.) branches divaricate, a little branched, clothed with hoary tomentum; leaves ovate or oblong, clothed with hoary tomentum or soft villi: upper floral leaves scarcely exceeding the calyxes; whorls many-flowered, rather loose: upper ones approximate; calyx small, tomentose, with 6-10 elongated subulate straight stellately spreading subspinescent teeth. ♃. H. Native of the region of the Mediterranean. Allied to *M. Pannónicum*, but the leaves and calyxes are smaller, &c.

Radiate-calyxed Horehound. Pl. 1 to 1½ foot.?

17 M. cunea'tum (Russ. nat. hist. alepp. 2. p. 255.) stem clothed with white tomentum at the base and pubescence at top; leaves ovate-cuneated, much wrinkled, green above and canescent beneath: floral leaves small, scarcely exceeding the calyxes; calyx small, tomentose, with 10 short somewhat recurved spreading mutic teeth. ♃. H. Native of Syria, near Aleppo, and between Bagdad and Kermancha. Stems more slender than in other species. Whorls numerous, lower ones remote, upper ones approximate. Corollas small, white.

Cuneate-leaved Horehound. Pl. 1 foot.

18 M. vulga're (Lin. spec. p. 816.) branches clothed with white wool; leaves ovate or roundish, clothed with soft villi, greenish or clothed with white wool beneath, crenated; whorls many-flowered; calyx clothed with woolly villi: teeth 10, recurvedly spreading; galea of corolla oblong, bifid at apex. ♃. H. Native throughout Europe and Middle Asia, among rubbish and by way-sides; plentiful in some parts of Britain, but probably not indigenous. Woodv. med. bot. 265. t. 97. Smith, engl. bot. t. 410.—Subb. hort. rom. 3. t. 59. Fl. dan. 1030. M. lanàtum, H. B. et Kunth, nov. gen. amer. 2. p. 310. M. Germánicum, Schranck ex Steud. nom. p. 510. Stems ascending, rarely decumbent. Whorls distant, 20-50-flowered. Corollas small, white. This, the common horehound, has a strong penetrating smell, not altogether unpleasant. It was a favourite medicine in obstructions of the viscera. In large doses it proves aperient. Bees much frequent the flowers.

Var. β, lanàtum (Benth. lab. p. 591.) leaves densely clothed with white wool. ♃. H. Native of Naples. M. Apulum, Tenore, fl. nap. t. 154. syll. p. 292.

Common Horehound. Fl. June, Sept. Britain. Pt. 1½ to 2 feet.

† *Species not sufficiently known.*

19 M. circinna'tum (Desr. in Lam. dict. 3. p. 717.) leaves circinnate, crenated, much wrinkled; calycine teeth subulate, erect, villous. ♃. H. Native of the Levant. Stems tomentose. Leaves clothed with shining soft tomentum. Flowers white. Calyx tubular, tomentose. Tube of corolla exceeding the tube of the calyx; upper lip deeply bifid.

Circinnate-leaved Horehound. Pl. ?

20 M. parvifòrum (Fisch. et Meyer, ind. sem. hort. petrop. 1835. p. 33.) leaves pubescent, wrinkled, ovate-oblong, crenated, clothed with white tomentum beneath, as well as the base of the erect branched stems; bracteas setaceous, equalling the calyxes; calycine teeth 10, setaceous, mucronate, straight, spreading much, rather shorter than the tube; corolla scarcely exceeding the calyx. ♃. H. Native of Caucasus, on the Talusch mountains. M. peregrinum, Meyer, verz. pflanz. no. 820. This differs from *M. peregrinum* of Lin. in not being silky, and in the calycine teeth being 10. Corolla white; galea bifid.

Small-flowered Horehound. Pl. 1 to 1½ foot.

21 M. propi'nquum (Fisch. et Meyer, l. c.) clothed with petiocanescent villi; stem branched, erectish; leaves wrinkled, middle ones obovate: upper ones cuneated; bracteas setaceous, rather late, coarsely crenated: lower leaves almost orbicular; shorter than the calyxes; calycine teeth villous, setaceous, mucronate, spreading much, straight, not half so long as the tube; tube of corolla exserted; galea short. ♃. H. Native of Caucasus, on the Talusch mountains. Allied to *M. leonuroides*. Flowers violaceous.

Allied Horehound. Pl. 1 to 2 feet.?

Cult. All the species of *Marrùbium* grow freely in any common garden soil, and are readily increased by division and by seed.

LXXXVII. BALLOTA (*βαλλωτη, ballote*, the Greek name

of *Ballòta nigra*, or Black Horehound, which is derived from βαλλω, *ballo*, to emit; rejected by cattle on account of the offensive smell.) Benth. lab. p. 592. Ballòta and Marrùbium, species of Lin. and other authors. Beringèria, Necker. Pseudodictámnus, Tourn. and Mœnch.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx somewhat funnel shaped; tube 10-nerved; teeth 5-10, dilated at the base or combined into an orbicular spreading limb. Corolla having the tube a little inclosed, with a transverse pilose ring inside, and a bilabiate limb; upper lip erect, oblong or subconcave, emarginate at apex; lower lip spreading, trifid, middle lobe emarginate. Stamens 4, ascending, didynamous; lower ones the longest; anthers exserted from the tube of the corolla, approximating by pairs, 2-celled: cells at length divaricate, and nearly distinct. Style bifid at apex, with subulate lobes, which are stigmatiferous at apex. Achenia dry, obtuse at apex, not truncate.—Perennial, hairy, woolly, or tomentose herbs. Leaves wrinkled, usually cordate at the base, entire or crenated, never cut; floral ones almost similar. Whorls axillary, many rarely few-flowered. Bracteas numerous, oblong, subulate, spine-formed, but sometimes very short.

Sect. I. Beringe'ria (probably named after some botanist of the name of Beringer, of whom we know nothing.) Benth. lab. p. 594. Bracteas oblong or subulate, soft. Limb of calyx 6-20-toothed or crenated.

1 B. Africa'na (Benth. lab. p. 594.) hairy; leaves orbicular, irregularly crenated, green on both surfaces; limb of calyx spreading, orbicular, dilated, with about 10 short setaceous teeth; galea of corolla ovate; stamens scarcely exserted from the tube. ♃. G. Native of the Cape of Good Hope. Marrùbium Africànum, Lin. spec. p. 816. Pseudodictámnus emarginàtus, Mœnch, ex Steud. Marrùbium crispum, Lin. spec. 1674. Marrùbium Thouìni, Schultes, ex syll. pl. suc. ratisb. 2. p. 23.—Comm. hort. 2. p. 179. t. 90. Whorls globose, many-flowered, distant. Corollas nearly glabrous, white or purple.?

African Stinking Horehound. Fl. July, Sept. Clt. 1710. Pl. 1 foot.

2 B. pseudodicta'mnus (Benth. lab. p. 594.) clothed with white wool; leaves orbicular, quite entire or obscurely crenated, thick, woolly; limb of calyx spreading, dilated, woolly, with 5-10 crenatures. ♄. F. Native of Candia. Marrùbium pseudodictámnus, Lin. spec. 817. Sibth. et Smith, fl. græc. 6. p. 50. t. 562. Lam. ill. t. 508. f. 2. Beringèria pseudodictámnus, Necker, Link, handb. 478.—Sabb. hort. rom. 3. t. 47.—Park. theatr. 28. f. 2. Whorls dense, many-flowered, distant. Corollas white, spotted with red.

Bastard Dittany of Crete. Fl. July, Aug. Clt. 1596. Shrub 1 to 2 feet.

3 B. undula'ta (Benth. lab. p. 595.) hairy; leaves orbicular, crenated, villous on both surfaces, rugosely curled; limb of calyx spreading, orbicular, rather shorter than the tube, thick, villous, with an undulately curled 10-20 crenated margin: crenatures mutic. ♃. H. Native of Arabia, in the desert of Sinai, N. Bové. Marrùbium umbellàtum, Fres. pl. ægypt. in mus. senk. p. 92. Some of the hairs glanduliferous. Whorls many-flowered, less dense than those of *B. pseudodictámnus*.

Undulated-calyxed Stinking Horehound. Pl. ?

4 B. acetabulòsa (Benth. lab. p. 595.) hairy or somewhat woolly; leaves orbicular, crenated, villous above, and clothed with white wool beneath; limb of calyx spreading, with a 20-crenated margin: crenatures mutic. ♃. or ♄. F. Native of the Grecian islands and Syria. Marrùbium acetabulòsum, Lin. spec. p. 817. Marrùbium pseudodictámnus, Steud. et Hochst. pl. exs. un. itin. but not of Lin. Beringèria acetabulòsa, Necker, Link, handb. p. 478. Marrùbium suffruticòsum, Mill. dict. no. 9.—Park. theatr. 28. f. 3.?—Barrel. icon. t. 129. Calyx woolly or villous at the base. Corolla small, pale purple; galea scarcely emarginate.

Saucer-leaved Stinking Horehound. Fl. June, Aug. Clt. 1676. Pl. 2 feet.

5 B. molli'ssima (Benth. lab. p. 595.) stems clothed with white wool; leaves broad-ovate, obtuse, canescent or white on both surfaces, floccosely woolly beneath; limb of calyx spreading, about equal in length to the tube, villously tomentose, with a shortly 10-toothed margin: teeth broad, acute, scarcely mucronate. ♄. F. Native of Spain.? Marrùbium Hispánicum, Lin. herb, but scarcely of his spec. pl. 816. but not of other authors. Marrùbium cinèreum. M. scrophulariæfòlium Hortul. —Herm. par. 201.?—Bocc. mus. 2. p. 167. t. 122.? Leaves more broad than long, regularly crenated, very soft. Whorls dense, many-flowered. Bracteas spatulate. Corolla whitish. Perhaps only a variety of *B. hirsùta*.

Very soft Stinking Horehound. Fl. July, Aug. Clt. 1714. Pl. 1 foot.

6 B. hirsu'ta (Benth. lab. p. 595.) hairy or somewhat woolly; leaves orbicular, crenated, hairy above, green on both surfaces, or clothed with white wool beneath; limb of calyx spreading, about equal to the tube, hairy, with a shortly 10-toothed margin: teeth broad acute or mucronate. ♃. F. Native of the North of Africa, near Mogodor. Marrùbium hirsùtum, Willd. spec. 3. p. 113.? Marrùbium crispum, Desr. in Lam. dict. 3. p. 719.? and of many other authors, but not of Lin. Habit and leaves of *B. acetabulòsa*, but differs in the limb of the calyx being 10 not 20-toothed, smaller, and in the plant being more hairy. Corollas pale purple.?

Var. β, hispida (Benth. lab. p. 596.) greener and more hairy. ♃. H. Native of Spain.

Hairy Stinking Horehound. Fl. June, Aug. Clt.? Pl. 1½ foot?

7 B. microphy'lla (Benth. lab. p. 596.) tomentose; leaves subcordately ovate, finely crenulated; calyx funnel-shaped: limb spreading, with 10 acute unequal teeth; bracteas spatulate, acute. ♃.? F. Native of the Levant. Marrùbium microphýllum, Desr. in Lam. dict. 3. p. 720. Leaves nearly sessile, soft, thick, 7-9 lines long, and 4 lines broad. Whorls numerous, many-flowered.

Small-leaved Stinking Horehound. Pl.

8 B. rugòsa (Benth. lab. p. 596.) stem pubescent, rather woolly; leaves ovate, obtuse, crenated, wrinkled, clothed with hoary tomentum on both surfaces; whorls few-flowered; limb of calyx short, spreading a little, with 10 short mucronulate teeth. ♃. F. Native of the Levant. Marrùbium rugòsum, Desf. l. Desf. cat. hort. par. ed. 3. p. 396. Marrùbium humile, Desf. l. c.? Leaves scarcely ½ an inch long, usually clothed with white wool beneath. Whorls 4-6 rarely 10-flowered. Corolla of *B. acetabulòsa*, but more glabrous.

Wrinkled-leaved Stinking Horehound. Pl. humble.

9 B. orli'gica (Benth. lab. p. 596.) stems clothed with hoary pubescence; leaves ovate, crenated, wrinkled, canescent above, and clothed with white wool beneath; whorls few-flowered; limb of calyx short, unequally dilated, with 10 mucronate teeth. ♃. F. Native of Syria, on mountains about Aleppo and Antioch, P. Russell. Marrùbium rugòsum, var. Russell, herb. All parts as in *B. saxátilis*, but twice the size.

Oblique-calyxed Stinking Horehound. Shrub. ?

10 B. saxa'tilis (Sieb. pl. exs. ex Benth. lab. p. 596.) hairy; leaves ovate or orbicular, crenated, thick, wrinkled, green on both surfaces or white beneath, hairy on both surfaces; whorls few-flowered; limb of calyx short, spreading a little, with 10 mucronate teeth. ♄. F. Native of Syria, near Aleppo and of Palestine. Marrùbium rugòsum, Russel, nat. hist. alep. 2. p.

255. Moluccélla microphýlla, Delile, fragm. fl. arab. petr. 10. f. 2. Stems woody at the base. Branches divaricate or procumbent. Corollas smaller than in *B. rugòsa*.

Rock Stinking Horehound. Shrub procumbent.

11 B. Russellia'na (Benth. lab. p. 597.) stems scarcely pubescent; leaves ovate, obtuse, quite entire, wrinkled, green above, and white beneath; whorls few-flowered; limb of calyx short, spreading a little, with 6-10 acute or shortly mucronate teeth. ♄.? F. Native of Syria, Near Aleppo, Russell. Allied to *B. saxátilis*, but the leaves are all quite entire, and the branches less hairy. Leaves hardly half an inch long, cordate at the base, pubescent above.

Russell's Stinking Horehound. Shrub.

12 B. Hispa'nicum (Benth. lab. p. 597.) hairy; leaves ovate-cordate: upper ones usually acute, or all are obtuse, rarely rounded, hairy on both surfaces, green or canescent beneath; limb of calyx short, spreading a little, with 10 setaceously mucronate teeth. ♃.? U. Native of Spain, Sicily, and South of Italy. Marrùbium Hispánicum, Lin. spec. 816. Marrùbium rupéstre, Biv. manip. 2. t. 1. Marrùbium scrophulariæfòlium, Lag. Pseudodictámnus acútus, Mœnch, meth. p. 399. Marrùbium saxátile, Rafn.—Bocc. mus. 2. p. 167. t. 122.—Barrel. icon. t. 797.—Herm. par. t. 201. Leaves usually 2 inches long, exactly cordate, crenated. Whorls 20-50-flowered, dense. Bracteas and calyxes very hairy. Corollas like those of *B. acetabulòsa*.

Spanish Stinking Horehound. Fl. July, Aug. Clt. 1714. Pl. 2 feet.

Sect. II. Ballòta (see genus for derivation.) Benth. lab. p. 597. Bracteas linear-subulate, soft. Limb of calyx 5-toothed.

13 B. nigra (Lin. spec. 814.) hairy or glabrous; leaves ovate, truncate at the base, green on both surfaces, more or less hairy; limb of calyx erectish: teeth dilated at the base and subulately mucronate at the apex. ♃. H. Native throughout the whole of Europe, in waste places, in hedges, and by waysides; also of Tauria and Caucasus; plentiful in Britain. Rchb. icon. bot. eur. 8. p. 30. t. 1773. Smith, engl. bot. t. 46. B. álba, Lin. spec. 814. B. fœ'tida, Lam. fl. fr. 2. p. 281. Rchb. icon. bot. eur. 8. p. 30. t. 775. B. vulgàris, Link. B. boreàlis, Schweigg. Rchb. icon. bot. eur. 8. p. 30. t. 776. B. ruderàlis, Spreng. fl. hal. p. 101. B. sèpium, Paulet, in Pers. ench. 2. p. 125. B. rùbra, Schrad. Marrùbium nigrum, Ger. emac. 701. f. 1. Crantz, stirp. austr. p. 272. Marrubiástrum, Riv. mon. irr. t. 65.—Sabb. hort. rom. 3. t. 35.—Blackw. 136.—Mor. hist. 3. p. 377. sect. 11. t. 9. f. 14. Stems, leaves, and calyxes green, sometimes nearly glabrous, but usually pubescent, rarely hairy. Whorls many-flowered, rather loose, the lower cymes on short peduncles. Limb of calyx very variable in form. In the species the stems are brown, and corollas purple; but in that variety called *B. álba* the whole plant is pale green, and the corollas white. The plant is recommended in hysterical cases. In Gotland it is an universal remedy in disorders incident to cattle.

Black or Common Stinking Horehound. Fl. July, Sept. Britain. Pl. 2 to 3 feet.

14 B. urticæfòlia (Ostm. ex Rchb. icon. bot. eur. 8. p. 30. t. 774.) slender; leaves ovate, sharply and deeply serrated; teeth of calyx erect, linear-setaceous, equalling the tube. ♃. H. Native of Bohemia and Saxony, in waste places and on walls. Plant slender, green, less pubescent than *B. nigra*. Leaves exactly of *Urtica úrens*, the first ones cordate, ex Rchb. fl. germ. exc. p. 325. Perhaps only a variety of *B. nigra*.

Nettle-leaved Stinking Horehound. Pl. 3 to 4 feet.

Sect. III. Acanthofra'sium (from *ακανθος, acanthos*, a spine; and *πρασιον, prasion*, one of the Greek names of Horehound; so called in allusion to the subulate spine-formed bracteas.) Benth. lab. p. 598. Bracteas subulate, stiff, spine-formed. Limb of calyx 5-10-toothed.

15 B. Pe'rsica (Benth. lab. p. 598.) leaves cuneiform, toothed; bracteas spine-formed; limb of calyx membranous, dilated, shortly 5-10-toothed. ♄. G. Native of Persia. Moluccélla Pérsica, Burm. fl. ind. p. 128. t. 38. f. 2. Branches simple, glabrous, whitish, with a single spine at each joint. Serratures of leaves spiny. Calyx regular, 5 cleft; segments obovate, scarious, with 3 mucrones. Corolla flattish, glabrous.

Persian Stinking Horehound. Shrub.

16 B. limba'ta (Benth. lab. p. 748.) canescent; leaves oblong, quite entire, cuneated at the base; bracteas spine-formed; limb of calyx unequally and membranaceously dilated, somewhat 5-toothed. ♄. G. Native of the North East of India, on the mountains, in gravelly places near Pindaden Khan. Shrub much branched, younger branches villous. Leaves ½ to 1 inch long. Whorls distant, 6-flowered. Calyx very villous; limb with 5 angles, and as many teeth between the angles.

Limbate-calyxed Stinking Horehound. Shrub 2 feet.

17 B. spinòsa (Link, handb. p. 475.) leaves ovate, quite entire or deeply toothed, green on both surfaces; whorls few-flowered; bracteas spine-formed, straight; calyxes hairy; limb erectish, with 5-10 teeth, which are dilated at the base, subulate, and subspinose; galea of corolla very hairy. ♄. F. Native of Piedmont and Provence. Moluccélla frutéscens, Lin. spec. p. 821. Beringèria frutéscens, Rchb. fl. germ. exc. p. 325. Shrub branched; branches villous. Leaves scarcely an inch long. Whorls about 6-flowered, distant.

Spinose Stinking Horehound. Shrub 1 foot.

18 B. integrifòlia (Benth. lab. p. 599.) shrubby, pubescent; leaves ovate, quite entire, rarely with a few crenatures, green on both surfaces; bracteas spine-formed, spreadingly reflexed; limb of calyx dilated, spreading a little, 5-toothed; galea of corolla nearly glabrous. ♄. F. Native of the island of Cyprus. Moluccélla frutéscens, Sibth. et Smith, fl. græc. 6. p. 568. Habit of *B. spinòsa*, but the branches are longer, and the leaves usually entire, the spines stronger and usually recurved. Corolla white, lined with purple.

Entire-leaved Stinking Horehound. Shrub 1 to 2 feet.

19 B. Forska'hlei (Benth. lab. p. 599.) leaves ovate, serrated; calyx campanulate, pubescent, with 5 subulate unequal unarmed teeth; whorls remote, 10-12-flowered, involucra quadrifid, with setaceous segments. ♄. F. Native of Arabia Felix. Phlòmis álba, Forsk. fl. aegypt. p. 107. Corolla white; upper lip hairy. Habit of *B. spinòsa*.

Forskahl's Stinking Horehound. Shrub.

† *Doubtful species.*

20 B. orienta'lis (Presl. del. prag. p. 80.) stem branched; villous; leaves cordate-roundish, toothed, wrinkled, clothed with hoary tomentum beneath; bracteas linear; calyx stiff, with 10 spinose teeth; galea of corolla arched, crenulated. ♃. H. Native of Asia Minor. Marrùbium orientàle, Spreng. syst.

Eastern Stinking Horehound. Pl.

21 B. pilòsa (Lour. coch. p. 364.) leaves ovate, crenated, tomentose; whorls pilose; calyx 10-toothed. ♃. H. Native of Cochinchina. Stem pilose, branched. Corolla white. Teeth of calyx reflexed. Upper lip of corolla entire, arched. Perhaps a species of *Leúcas*.

Pilose Stinking Horehound. Pl.?

22 B. discolor (Desf. ex Steud. nom. p. 90.) and 23. B. parvifòlia (Desf. l. c.) Nothing is known of these two plants but the names.

Cult. See *Marrùbium* for the culture of the perennial herbaceous kinds; and *Lasiócorys* for that of the shrubby species.

LXXXVIII. LASIO'CORYS (from λασιος, *lasios*, wool; and κορυς, *korys*, a helmet; in reference to the outside of the galea of the corolla being very hairy.) Benth. lab. p. 600.—Leùcas species, R. Br.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx subcampanulate, equal, 10-nerved; teeth 5, ovate, rarely furnished with minute teeth in the sinuses. Corolla with an inclosed tube, which is annulate inside, and a bilabiate limb; upper lip entire, concave, erect, very hairy outside; lower lip spreading, scarcely longer, trifid; the middle segment hardly broader than the lateral ones, emarginate. Stamens 4, didynamous: lower 2 the longest, ascending; filaments naked at the base; anthers approximating by pairs under the upper lip, 2-celled: cells divaricate. Lobes of style subulate: lower one the shortest, and sometimes very short, stigmatiferous towards the apex. Achenia dry, triquetrous, obtuse at top.—Branched shrubs. Leaves entire or toothed.

1 L. Cape'nsis (Benth. lab. p. 600.) leaves almost quite entire; whorls 2-4-flowered; calycine teeth one half shorter than the tube. ♄. G. Native of the Cape of Good Hope. Young branches clothed with white tomentum: adult ones canescent, or nearly glabrous. Leaves fasciculate, nearly sessile, oblong or cuneiform, obtuse, canescent from tomentum, as well as the calyxes, &c. Corolla whitish. Upper lobe of style usually very short.

Cape Lasiocorys. Shrub.

2 L. Abyssi'nica (Benth. lab. p. 600.) leaves toothed at apex; whorls 6-10-flowered; calycine teeth subulately acuminated, about equal in length to the tube. ♄. G. Native of Abyssinia. Leùcas quinquedentàta, R. Br. append. to Salt. abyss. Habit of *L. integrifòlia*. Branches pubescent. Leaves longer and greener. Calyx scarcely tomentose. Upper lobe of style one half shorter than the lower one.

Abyssinian Lasiocorys. Shrub.

Cult. A light rich soil will suit the species of this genus; and cuttings will strike root readily in the same kind of earth, with a hand-glass placed over them; but if seeds ripen, this will be unnecessary.

LXXXIX. ROYLEA (named in honour of John Forbes Royle, M.D. surgeon in the East India Company's Service; late superintendent of the botanic garden at Saharumpur; now Professor of Materia Medica in King's College, London; author of "Illustrations of Indian Botany, &c.") Wall. pl. rar. asiat. 1. p. 57. t. 74. Benth. lab p. 601.—Ballòta species, D. Don, prod. fl. nep. p. 111.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular at the base, 10-nerved; limb 5-cleft; segments erect, oblong, membranaceous, reticulately veined, equal. Corolla shorter than the calyx; tube inclosed, annulate inside; limb bilabiate; upper lip erect, entire, arched: lower lip spreading, trifid, having the middle lobe entire. Stamens 4, didynamous, ascending under the upper lip: lower 2 the longest; anthers approximate by pairs, 2-celled: cells divaricate, at length sub-confluent. Style almost equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia dry, obtuse at apex.—Allied to *Ballòta* and *Otostègia*, from which it differs only in the calyx.

1 R. e'legans (Wall. l. c.) ♄. G. Native of Sirmore and Deyra Dhoon, Wall.; Hurdwar and Sirinaghur, Hardwick; Himalaya, Royle. Phlòmis calycina, Roxb. fl. ind. 3. p. 11. Ballòta cinèrea, D. Don, prod. fl. nep. p. 111.—A much branched, erect shrub. Branches cinereous from tomentum. Leaves numerous, petiolate, ovate, acute, subcordate, coarsely and bluntly serrated, 1 to 1½ inches long, pilose on both surfaces, green above and hoary beneath; floral leaves conforming to the others, but gradually smaller. Whorls 6-10-flowered; cymes on short peduncles. Calyxes tomentosely pubescent. Corollas from white to pale red, or rose-coloured.

Elegant Royléa. Fl. July, Aug. Clt. 1824. Shrub 2 to 3 feet.

Cult. For culture and propagation see *Lasiócorys*, above.

XC. OTOSTE'GIA (from ους ωτος, *ous otos*, an ear; and στεγος, *stegos*, a covering; in reference to the lips of the calyx being prolonged.) Benth. lab. p. 601.—Phlòmis species, Vahl. —Molucélla species, R. Br.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular at the base, 10-nerved; limb sub-bilabiately and membranaceously prolonged: upper lip short, entire, or triangular: lower lip large, ovate, obtuse. Corolla with an inclosed tube, which is annulate inside, and a bilabiate limb; upper lip oblong, concave, entire, erect, very hairy outside: lower lip spreading, trifid: middle lobe broader, emarginate. Stamens 4, ascending, didynamous, the lower ones the longest; filaments naked at the base; anthers approximate by pairs under the superior lip, 2-celled: cells divaricate. Style somewhat equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia dry, obtuse at apex.—Shrubs. Whorls loosely many-flowered. Corollas white.? This genus differs from *Röylea*, *Ballòta*, and *Leùcas*, in the calyx; and from the latter genus in the divisions of the style.

1 O. integrifo'lia (Benth. lab. p. 602.) leaves oblong, quite entire, clothed with rather silky tomentum on both surfaces; upper lip of calyx ovate, entire. ♄. G. Native of Abyssinia, Salt. Molucélla integrifòlia, R. Br. Append. to Salt's Abyssinia. Shrub clothed with silky tomentum or pubescence. Leaves narrowed at the base and blunt at apex, canescent on both surfaces as in *Atriplex Hálimus*; young leaves fascicled, with 3 short straight spines in each axil. Whorls numerous, disposed in a terminal raceme.

Entire-leaved Otostegia. Shrub.

2 O. scariòsa (Benth. lab. p. 602.) leaves ovate, toothed, wrinkled, green on both surfaces; upper lip of calyx ovate, entire. ♄. G. Native of Arabia Felix, Forsk; Abyssinia, Salt. Molucélla scariòsa, R. Br. append. to Salt's Abyss. Clinopòdium fruticòsum, Forsk. fl. ægypt. p. 107. Phlòmis moluccoides, Vahl. symb. 1. p. 42. t. 14. Habit of *Röylea*. Branches pubescent. Leaves an inch long, roundly truncated at the base, green above and pubescent beneath. Whorls few; cymes on short peduncles. Bracteas canescent, pubescent. Calyx villous.

Scarious Otostegia. Shrub.

3 O. repa'nda (Benth. lab. p. 602.) leaves ovate, toothed, wrinkled, clothed with hoary tomentum beneath; upper lip of calyx short, triangular. ♄. G. Native of Abyssinia, Salt. Molucélla repánda, R. Br. Append. to Salt's Abyss. Allied to *O. scariòsa*, but differs in the branches and leaves being villous, and in the calyxes being more villous, and in the form of the upper lip of the corolla.

Repand-leaved Otostegia. Shrub.

Cult. For culture and propagation, see *Lasiócorys*, above.

XCI. LEU'CAS (from λευκος, *leucos*, white; in allusion to the downy whiteness of the flowers.) R. Br. prod. p. 504. Benth. lab. p. 602.—Phlòmis species, Lin.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular or tubularly campanulate, striated, straight or incurved at apex;

mouth equal or drawn out obliquely above or beneath, 8-10-toothed. Corolla with an inclosed tube, which is annulate, or naked inside, and a bilabiate limb; upper lip concave, erect, entire, rarely emarginate, very hairy outside; lower lip longer, spreading, trifid, the middle segment the largest. Stamens 4, didynamous, ascending, the lower ones the longest; filaments naked at the base; anthers approximate by pairs under the upper lip, sub-bilocular: cells divaricate, confluent. Upper lobe of style very short, lower one subulate and stigmaciferous towards the apex. Achenia dry, triquetrous, obtuse at apex.—Herbs or under shrubs. Leaves quite entire or usually toothed; floral ones nearly similar. Whorls sometimes few-flowered and sometimes densely many-flowered. Corollas usually white, rarely purplish.—Scarcely differing from *Ballòta*, except in the unequally lobed stigma, but the calyx, corolla, and the general habit mark it out as a good genus.

Sect. I. Hemi'stoma (from ἡμι, *hemi*, half, and στομα, *stoma*, a mouth; the lower side of the calyx is alone drawn out.) Benth. lab. p. 605. Hemistoma, Ehrenb. Calyx tubular, with an oblique mouth; lower side drawn out, cleft above. Whorls globose, many-flowered. Bracteas numerous, equalling the calyxes.

1 L. Indica (R. Br. prod. p. 504.) herbaceous; stems and under sides of leaves clothed with silky tomentum; whorls many-flowered, globose; calyx rather villous, membranaceous, having the 3 lower teeth short and setaceous, the upper ones having disappeared. ☉. S. Native of Madagascar. Phlòmis Indica, Lin. spec. 820. Leaves broad-ovate, acutish, coarsely and serrately crenated. Corollas exceeding the calyx a little, densely clothed with white hairs or villi.

Indian Leucas. Fl. July, Aug. Clt. 1789. Pl. 1 foot.

2 L. urticæfòlia (R. Br. prod. p. 504.) herbaceous, clothed with fine canescent tomentum; whorls many-flowered, globose; calyx rather villous, membranaceous, with 8-10 very short setaceous teeth. ☉. S. Native of the East Indies, Abyssinia, and Arabia. Phlòmis urticæfòlia, Vahl, symb. 3. p. 76. Leucas affinis, R. Br. in append. to Salt, abyss. Hemistoma ovàta, Ehrenb. mss. Habit and inflorescence of *L. Indica*. Stems decumbent or ascending at the base. Leaves broad, ovate, coarsely and serrately crenated. Corollas white.

Nettle-leaved Leucas. Fl. July, Sept. Clt. 1810. Pl. ½ to 1 foot.

Sect. II. Loxo'stoma (from λοξος, *loxos*, oblique; and στομα, *stoma*, a mouth; mouth of calyx oblique.) Benth. lab. p. 606. Calyx tubular, with an oblique mouth, the lower side more drawn out than the upper, and hardly cleft above. Whorls few-flowered. Bracteas minute.

3 L. glabra'ta (R. Br. prod. p. 504.) herbaceous, glabrous; whorls 2-4-flowered, secund; calyx glabrous, with 10 subulate teeth. ☉. S. Native of Delagoa Bay, and Arabia Felix. Phlòmis glabràta, Vahl, symb. 1. p. 42. Plant often purplish. Stems elongated, decumbent. Leaves ovate or oblong, few-toothed. Corolla purplish.

Glabrous Leucas. Pl. decumbent.

Sect. III. Physoca'lyx (from φυσα, *physa*, a bladder; and καλυξ, *calyx*, a calyx; calyx inflated.) Benth. lab. p. 744. Calyx inflated, with a contracted equal mouth. Whorls 6-10-flowered. Bracteas minute.

4 L. infla'ta (Benth. lab. p. 744.) shrubby; leaves sessile, orbicular, subcordate at the base, hairy on both surfaces, and green; whorls subspicate; calyx with 10 short erect teeth: throat nearly naked inside. ♄. G. Native of Arabia, in the desert of Suez, N. Bove.

Inflated-calyxed Leucas. Shrub.

Sect. IV. Ortholeu'cas (from ορθος, *orthos*, straight; and *Leucas*; in reference to the equal mouth of the calyx.) Benth. lab. p. 606. Ortholeucas, Benth. in Wall. pl. rar. asiat. 1. p. 61. Whorls rather loose, usually few-flowered. Bracteas minute or few, setaceous, rarely almost equalling the calyxes. Calyx tubular or sub-campanulate, striated, with an equal or scarcely oblique mouth, a nearly naked throat, and 10 erect, subulate, or very short setaceous teeth.

5 L. Chine'nsis (R. Br. prod. p. 504.) suffruticose? branches clothed with silky tomentum; leaves broad-ovate, coarsely toothed, wrinkled, villous, white beneath; whorls few-flowered; calyx funnel-shaped, tomentose, with an equal acutely 10-toothed limb. ♄. G. Native of China and the Indian peninsula. Phlòmis Chinénsis, Retz, obs. 2. p. 19. Habit of *L. montàna* and *L. lanàta*. Whorls 6-10-flowered. Corollas white.

China Leucas. Fl. June, Oct. Clt. 1820. Shrub procumbent.

6 L. monta'na (Spreng. syst. 2. p. 742.) perennial or suffruticose; branches clothed with silky tomentum; leaves ovate, serrately crenated, wrinkled, green above and pubescently hairy, but clothed with white wool beneath; whorls many-flowered; calyx clothed with silky villi, with an equal mouth, and very short setaceous erect teeth. ♄.? S. Native of India, near Madras. Phlòmis montàna, Roth, nov. spec. p. 263. Branches ascending, rising from a woody base. Leaves roundly truncate, or broadly cordate at the base. Whorls 15-20-flowered. Corollas white; tube annulate inside.

Mountain Leucas. Shrub ascending.

7 L. ova'ta (Benth. in Wall. pl. rar. asiat. 1. p. 61. lab. p. 607.) perennial or suffruticose; branches clothed with silky tomentum; leaves ovate, obscurely crenated, wrinkled, green and pubescently hairy above, but clothed with white wool beneath; whorls many-flowered; calyx pubescent, with an equal mouth, and very short setaceous straight teeth. ♄.? S. Native of Ava, on the banks of the Irawaddi. Allied to *L. montàna*; but the leaves are larger and blunter, scarcely broadly crenated, or almost quite entire.

Ovate-leaved Leucas. Shrub 2 feet.

8 L. lana'ta (Benth. l. c.) perennial or suffruticose; branches clothed with white wool; leaves ovate, sub-crenated, thick, wrinkled, clothed with very soft white wool on both surfaces; whorls many-flowered; calyx clothed with white wool, with an equal truncate mouth, and very short setaceous erect teeth. ♄.? G. Native of the East Indies, in the valleys of the provinces of Kamaon, Sirmore, and Deyra Dhoon, Wall. and Royle. Marrùbium mollissimum, D. Don, prod. fl. nep. p. 112. Allied to *L. montàna*; but the plant is clothed with white wool; the leaves narrower, and less deeply crenated. Corollas white.

Woolly Leucas. Pl. 1 to 1½ foot.

9 L. molli'ssima (Wall. pl. rar. asiat. 1. p. 62.) perennial or suffruticose; branches tetragonal, clothed with adpressed tomentose villi; leaves ovate, crenated, wrinkled, clothed with soft villi, pale or canescent beneath; whorls many-flowered; calyx pubescent, with an equal mouth, and very short setaceous erect teeth. ♄.? S. Native of the East Indies, in the valleys of Nipaul, and on the Pundua mountains; also of China, Sir G. Staunton. Habit of *L. montàna*, but usually taller, and more branched. Leaves ½ to 1 inch, roundly truncate or broadly cordate at the base. Whorls 10-30-flowered. Corollas white? or usually purplish; tube annulate inside.

Very-soft Leucas. Shrub 1 to 2 feet. ?

10 L. HAMILTONIA'NA (Benth. l. c.) perennial; branches clothed with adpressed tomentose villi; leaves ovate, serrately crenated, wrinkled, clothed with soft villi, canescent or rufescent beneath; whorls few-flowered; calyx pubescent, a little incurved, with an oblique mouth, and very short setaceous erect teeth. ♃. S. Native of the East Indies, at Monghyr, Hamilton. Differs from *L. mollissima*, in the larger more acute leaves, and few-flowered whorls, and in the calyx.

Hamilton's Leucas. Pl. 1 to 1½ foot.

11 L. TE'RES (Benth. l. c.) perennial or suffruticose; branches tomentose, terete; leaves ovate, subcrenated, green and pubescent above, and canescent beneath, hardly wrinkled; whorls 6-10-flowered; calyx pubescent, with an equal mouth and very short setaceous erect teeth. ♄. ? S. Native of the Birman Empire, on the banks of the Irawaddi. Allied to *L. mollissima*; but differs in the branches being terete; in the leaves being smaller, and flowers fewer; in the whorls being smaller, &c.

Terete-stemmed Leucas. Pl.

12 L. STRIGÒSA (Benth. l. c.) herbaceous; branches tetragonal, clothed with adpressed pubescence; leaves oblong-lanceolate, scarcely serrated, green and strigosely hairy above, but clothed with rufous canescent adpressed tomentum beneath; whorls few-flowered; calyx pubescent, with an equal mouth, and very short teeth. ☉. S. Native of the East Indies, near Prome, Wall. Branches ascending. Leaves nearly sessile. Whorls remote, 2-6-flowered, rarely about 10-flowered. Flowers of *L. pilòsa*.

Strigose Leucas. Pl. ascending.

13 L. ANGULA'RIS (Benth. l. c.) herbaceous, procumbent; branches acutely tetragonal; angles ciliated, subalate; leaves on short petioles, ovate, crenated, wrinkled, strigosely hispid on both surfaces; whorls few-flowered; calyx tubularly campanulate, villous, with an equal mouth and setaceous teeth. ☉. ? S. Native of Ceylon, Macrae. Allied to *L. strigòsa* and *L. pilòsa*, but differs in the form of the leaves, and especially in the calyxes.

Angular-stemmed Leucas. Pl. procumbent.

14 L. PILÒSA (Benth. l. c.) perennial, erect; branches pilosely pubescent; leaves ovate, serrately crenated, green on both surfaces, pilose or canescently pubescent beneath; whorls many-flowered; calyx pubescent, with an equal mouth, and very short setaceously erect teeth. ♃. S. Native of Bengal, and the banks of the Irawaddi. Phlòmis pilòsa, Roxb. fl. ind. 3. p. 12.? Corollas white or pale purple. Whorls 2-20-flowered.

Var. β, pubéscens (Benth. l. c.) leaves canescent from pubescence beneath. ♃. S. Native of Deyra Dhoun, Royle; Rajemahl, Wall.

Pilose Leucas. Pl. 1½ foot.

15 L. DECEMDENTA'TA (Smith, in Rees' cycl. Benth. lab. p. 600.) annual? pubescent; leaves ovate, crenated, clothed with fine tomentum, green on both surfaces, or sub-canescent beneath; whorls many-flowered: lower ones or all are shorter than the petioles; calyx pubescent, striated, with an equal mouth, and short setaceous teeth. ☉.? S. Native of the Islands of the Pacific; as of Timor, Otaheite, Corollines, Malden, &c. Stàchys decemdentàta, Forst. prod. no. 526. Phlòmis decemdentàta, Willd. spec. 3. p. 124. Leucas stachyoides, Spreng. syst. 2. p. 749. Floral leaves ½ an inch long, twice as long as the flowers. Allied to *L. mollissima*.

Ten-toothed Leucas. Pl. 1 to 1½ foot. ?

16 L. PLA'CIDA (R. Br. prod. 505.) annual, nearly glabrous; leaves ovate, crenated, membranaceous, green on both surfaces, and nearly glabrous; whorls many-flowered, shorter than the petioles; calyx nearly glabrous, with an equal mouth, and setaceous teeth. ☉. S. Native of tropical New Holland, Moluccas, banks of the Irawaddi. Phlòmis Moluccàna, Roxb. fl. ind. 3. p. 11. Leucas melissæfòlia, Benth. in Wall. pl. rar. asiat. 1. p. 62. L. parvifòra, Benth. in Wall. l. c. Hardly distinct from *L. decemdentàta*, except in the smoothness, and thinner blunter leaves. Corollas white.

Placid Leucas. Fl. July, Sept. Cit. 1833. Pl. 1 to 2 feet.

17 L. REPETIFÒLIA (Benth. l. c.) herbaceous? clothed with fine pubescence; leaves numerous, petiolate, ovate-roundish, crenated, green on both surfaces, or scarcely canescent; whorls few-flowered; calyx tubularly campanulate, nearly glabrous, with an equal mouth, and short acute teeth. ☉.? S. Native of the Indian peninsula. Leaves an inch long, obtuse, truncate or subcordate at the base, pubescent on both surfaces.

Catmint-leaved Leucas. Pl.?

18 L. LONGIFÒLIA (Benth. lab. p. 744.) stem herbaceous, erect, villous; leaves linear, almost quite entire, nearly glabrous; whorls 6-10-flowered; calyx turbinately tubular, with an equal mouth, and very short setaceous teeth. ☉.? S. Native of the North-east of India, at Pounah, Jacquemont. Allied to *L. hyssopifòlia*.

Long-leaved Leucas. Pl. erect.

19 L. ANGUSTIFÒLIA (Wall. pl. asiat. rar. 1. p. 62. Benth. lab. p. 610.) herbaceous, diffuse; leaves oblong-lanceolate or linear, narrowed at the base, nearly glabrous; whorls 6-20-flowered; calyx tubular, with an equal mouth, and very short setaceous erect teeth. ☉.? S. Native of Nipaul. Habit of *L. procúmbens*; but differs in the much longer leaves, which are narrowed at both ends; and in the flowers being more numerous; in the whorls, &c.

Narrow-leaved Leucas. Pl. diffuse.

20 L. PROCU'MBENS (Desf. mem. mus. par. 11. p. 7. t. 3. f. 2.) herbaceous, diffuse; leaves ovate-lanceolate, subserrated, nearly glabrous; whorls 2-6-flowered; calyx tubular, with an equal mouth, and lanceolate-subulate erect teeth. ♃. S. Native of the East Indies, Bengal, Ceylon, Peninsula, Bundelgund, &c. Phlòmis biflòra, Roxb. fl. ind. 2. p. 12. and of many other authors, but not of Vahl. Népeta Indica, Burm. fl. ind. p. 126. The whole plant nearly glabrous. Stems rising from a thick perennial base. Corollas as in *L. biflòra*.

Procumbent Leucas. Pl. procumbent.

21 L. BIFLÒRA (R. Br. prod. p. 504.) herbaceous, diffuse; leaves ovate, coarsely toothed, pubescent on both surfaces; whorls 2-flowered; calyx tubular, with an equal mouth, and subulate teeth. ☉.? S. Native of the peninsula of India and Ceylon. Phlòmis biflòra, Vahl, symb. 3. p. 77.—Burm. thes. zeyl. p. 140. t. 69. f. 1. Leaves pale beneath, ½ an inch long. Corolla white; tube obscurely annulate inside.

Two-flowered Leucas. Fl. July, Sept. Cit. 1819. Pl. diffuse.

22 L. PUBE'SCENS (Benth. lab. p. 610.) herbaceous; branches clothed with fine pubescence; leaves ovate, crenated, truncate at the base, thin, green on both surfaces, or pale and pubescent beneath; whorls densely many-flowered; bracteas subulate, shorter than the calyxes; calyx tubular, with an equal mouth, and straight subulate teeth. ☉.? S. Native of the peninsula of India. L. marrubioides, β, glàbrior, Benth. in Wall. pl. asiat. rar. 1. p. 61. This differs from *L. marrubioides*, in the leaves and calyxes being finely pubescent, not clothed with white wool, &c.

Pubescent Leucas. Pl.

23 L. MARRUBIOI'DES (Desf. mem. mus. par. 11. p. 6. t. 3. f. 1.) herbaceous; branches clothed with woolly pubescence; leaves broad-ovate, crenated, subcordate at the base, wrinkled, hispid above, but clothed with white wool beneath; whorls densely many-flowered; bracteas subulate, about equal in length to the calyxes; calyx tubular, with an equal mouth, and straight

subulate teeth. ⊙.? S. Native of the Indian peninsula and Ceylon. Stems procumbent at the base. Whorls above 30-flowered. Corollas white.

Horehound-like Leucas. Pl. procumbent.

24 *L.* Java'sica (Benth. lab. p. 611.) stem branched, scandent; branches obversely pilose on the angles; leaves ovate, bluntly serrated, scutish at the base, and quite entire, pubescent on both surfaces; whorls 6-10-flowered; calyx oblong, pubescent, 10-toothed: teeth subulate, the alternate ones shorter. ⊙.? S. Native of Java, among bushes on the banks of rivers. Phlòmis Chinénsis, Blum. bijdr. p. 829. but not of Retz.

Var. β; leaves smaller, clothed with soft pubescence on both surfaces. ⊙.? S. Native of Java, on declivities between Mount Burangrang and Tankuwan Paku.

Java Leucas. Pl. climbing.

Sect. V. A'strodon (from ἀστηρ, *aster*, a star; and ὀδους ὀδοντος, *odous odontos*, a tooth; in allusion to the teeth of the calyx spreading in a stellate manner.) Benth. lab. p. 611. A'strodon, Benth. in Wall. pl. asiat. rar. 1. p. 61. Calyx tubular, with an equal mouth, and a usually very villous throat, and 10 teeth, which usually spread in a stellate manner at the time of maturity. Whorls usually globose, many-flowered, solitary or few, the upper ones sometimes capitate. Bracteas scarcely shorter than the calyxes.

25 *L.* suffruticòsa (Benth. lab. p. 611.) branches clothed with rufous villi, leafy at the base; leaves sessile, oblong-lanceolate, linear, quite entire, green and hispid above, and clothed with white tomentum beneath; bracteas subulate; calyx clothed with rufous villi, with a truncate villous mouth, and very short rather spreading teeth. ♄. S. Native of the Indian peninsula, on the Nielgherry mountains. Stems numerous, rising from a woody base. Leaves 8-10 lines long. Whorls about 10-flowered. Corollas as in *L. ternifòlia*; tube exannulate inside.

Suffruticose Leucas. Shrub ½ to 1 foot.

26 *L.* rosmarinifòlia (Benth. l. c.) suffruticose; branches clothed with adpressed villi; leaves sessile, linear, quite entire, scabrous from hairs above, but clothed with white tomentum beneath; bracteas lanceolate-linear; calyx villous, with a truncate villous mouth, and very short rather spreading teeth. ♄. S. Native of the Indian peninsula, Wight. Allied to the preceding, but the hairs are hardly rufescent. Leaves an inch long, much narrower. Bracteas broader, very acute, equalling the calyxes.

Rosmary-leaved Leucas. Shrub dwarf.

27 *L.* helianthemifòlia (Desf. mem. mus. par. 11. p. 2. t. 1.) stems shrubby at the base; branches clothed with silky subrufescent wool; leaves opposite, sessile, oblong-elliptic or lanceolate, quite entire, silky on both surfaces, but greener above, and very white beneath; bracteas linear, shorter than the calyxes; calyx clothed with silky villi, with a truncate villous mouth, and very short rather spreading teeth. ♄. S. Native of the Indian peninsula, on the Nielgherry mountains, Leschenault and Wight. Differs from *L. ternifòlia*, in the leaves being opposite, shorter, less white; and in the branches being usually rufescent.

Sun-rose-leaved Leucas. Shrub dwarf.

28 *L.* ternifòlia (Desf. mem. mus. par. 11. p. 4. t. 1. f. 2.) stem shrubby at the base; branches densely tomentose; leaves 3 in a whorl, sessile, oblong-lanceolate, quite entire, silky on both surfaces, very white beneath; bracteas linear; calyx clothed with silky wool, with a truncate villous mouth, and very short, rather spreading teeth. ♄. S. Native of the Indian peninsula, on the Nielgherry mountains. Branches clothed with dense white or rufescent wool. Leaves 1 to 1½ inch long. Whorls 10-20-flowered. Galea of corolla densely clothed with white hairs; tube exannulate inside.

Tern-leaved Leucas. Shrub dwarf.

29 *L.* lanceæfòlia (Desf. mem. mus. 11. p. 5. t. 2. f. 2.) stem erect, clothed with rufous tomentum; leaves oblong-lanceolate, almost quite entire, green and pubescent above, but canescent and clothed with tomentose pubescence beneath; bracteas equalling the calyxes; calyx clothed with rufous villi, with a truncate pubescent mouth, very short teeth, which are, as well as the bracteas, stiffly mucronulate. ♃. S. Native of the Indian peninsula, on the Nielgherry mountains. Leaves 3-4 inches long. Galea of corolla densely clothed with white villi; tube finely pubescent inside, but exannulate.

Lance-leaved Leucas. Pl. 7 to 8 feet.

30 *L.* stelligèra (Wall. pl. rar. asiat. 1. p. 61. Benth. lab. p. 613.) herbaceous, erect, pubescent and sub-canescent; leaves oblong-lanceolate, bluntly serrated, glabrous or finely pubescent; calyx tomentose, with a truncate mouth, which is villous inside; teeth 10, and are, as well as the bracteas, subulate, soft, spreading, revolute at top. ⊙.? S. Native of the East Indies, at Aurungabad, Wall. Habit of *L. linifòlia*. Leaves 2-3 inches long. Whorls usually solitary, or 2-3 approximate at the tops of the branches. Corolla white; tube annulate inside.

Star-bearing Leucas. Pl. 1½ foot.

31 *L.* lamiifòlia (Desf. mem. mus. 11. p. 4. t. 2. f. 1.) herbaceous, clothed with rufous villi; leaves cordate-ovate, clothed with rufous villi above, and hoary tomentum beneath; bracteas lanceolate-linear, equalling the calyxes; calyx silky, with a truncate equal mouth, which is villous inside, and subulate teeth, which at length spread in a stellate manner. ⊙.? S. Native of the Indian peninsula, on the Nielgherry mountains. Leaves crenated, 2 to 2½ inches long. Whorls few, towards the tops of the branches, densely many-flowered. Flowers like those of *L. lanceæfòlia*.

Dead Nettle-leaved Leucas. Pl. 2 feet.

32 *L.* hirta (Spreng. syst. 2. p. 743.? Benth. lab. p. 613.) suffruticose?; branches clothed with rufescent villi; leaves ovate or oblong, sub-crenated, green and hairy on both surfaces; bracteas equalling the calyxes; calyx villous, with a truncate very villous mouth, and 10 short subulate stellately spreading mutic teeth. ♄.? S. Native of the peninsula of India, Heyne. Phlòmis hirta, Heyne, and perhaps of Roth, nov. spec. pl. p. 264.? Leucas helianthemifòlia, Benth. in Wall. pl. asiat. rar. 1. p. 61. but not of Desf. Plant divaricately branched. Leaves scarcely an inch long. Whorls usually solitary, on the tops of the branches. Galea of corolla densely clothed with white hairs.

Hairy Leucas. Shrub ½ foot.

33 *L.* vesti'ta (Benth. in Wall. pl. rar. asiat. 1. p. 61. lab. p. 613.) herbaceous, erect; stem clothed with rufescent hairs; leaves ovate-oblong, crenated, hairy, green, or scarcely canescent beneath; bracteas linear, ciliately hairy; calyx hairy, with a truncate nearly equal mouth, which is very hairy inside, and hardly equal subulate teeth, which spread in a stellate manner. ⊙.? S. Native of the peninsula of India, on the Madura mountains; and of Silhet. Stem more robust than in *L. ciliata*. Tube of corolla annulate inside.

Clothed Leucas. Pl. 2 to 3 feet.?

34 *L.* cilia'ta (Benth. l. c.) herbaceous, erect, clothed with adpressed pubescence; leaves ovate-lanceolate or oblong, serrately crenated, green on both surfaces; bracteas linear, ciliately hairy; calyx tubular, with a truncate equal mouth, which is rather pilose inside or naked, with elongated subulate hairy stellately spreading teeth. ⊙.? S. Native of Nipaul. Leaves

2-3 inches long. Whorls few, distant, towards the tops of the branches. Corollas as in *L. Zeylánica*; tube annulate inside.

Ciliated Leucas. Pl. 1 to 2 feet.

Sect. VI. Plagióstoma (from πλαγιος, *plagios*, transverse; and στομα, *stoma*, a mouth; in reference to the oblique mouth of the calyx.) Benth. lab. p. 614. Plagióstoma, Benth. in Wall. pl. rar. asiat. 1. p. 60. Calyx turbinate or tubular, with an oblique mouth, which is drawn out above. Whorls usually globose, many-flowered, solitary or few: upper ones sometimes capitate. Bracteas equal to, or a little shorter than the calyxes.

35 L. strícta (Benth. l. c.) herbaceous, erect, strict, pubescently hairy; leaves oblong-lanceolate or linear, almost quite entire; whorls many-flowered, solitary, terminal; bracteas subulate, hairy; calyx hairy, sub-striated, with an oblique mouth, and subulate striated teeth, which spread at length in a stellate manner. ☉.? S. Native of the Indian peninsula. Leaves remote, 1 to 1½ inch long. Whorls 1-2 together, forming a head, 15-30-flowered. Corollas as in *L. Zeylánica*.

Strict Leucas. Pl.?

36 L. Zeylá'nica (R. Br. prod. p. 504.) herbaceous, erect, pubescently hairy; leaves oblong-lanceolate or linear, quite entire, or few-crenate; whorls dense, many-flowered, dimidiate or nearly equal; bracteas linear, hairy; calyx glabrous at the base, almost veinless, striated at top, a little incurved, with an oblique mouth, and short teeth, the upper teeth the largest. ☉. S. Native of Ceylon; also of Pegu, near Rangoon. Phlòmis Zeylánica, Lin. spec. p. 820. but not of Roxb. Leonûrus marrubiástrum, Burm. fl. ind. 127. but not of Lin.—Rumph. amb. 6. p. 39. t. 16. f. 1. Leaves distant, green. Whorls 10-20-flowered, 1 or 2 together at the tops of the branches. Corollas white.

Ceylon Leucas. Fl. June, Oct. Clt. 1777. Pl. 1 foot.

37 L. dimidiá'ta (Benth. lab. p. 615.) herbaceous, diffuse, pubescently hairy; leaves oblong or linear, quite entire; whorls few-flowered, dimidiate, remote; bracteas linear, hairy; calyx glabrous at the base, almost veinless, striated at top, hairy, a little incurved, with an oblique mouth, and short hardly unequal teeth. ☉. S. Native of the Indian peninsula. L. dimidiàta, Benth. in Wall. pl. rar. asiat. but not of Roth. Leaves nearly sessile, remote, ⅓ an inch long. Whorls remote, secund, 4-12-flowered. Very nearly allied to *L. áspera*.

Diffuse Leucas. Pl. 1 to 1½ foot, diffuse.

38 L. hyssopifólia (Benth. l. c.) herbaceous, perennial, many-stemmed, ascending, hairy; leaves oblong-linear, quite entire; whorls dense, nearly equal; bracteas linear, scarcely pilose; calyx glabrous, almost veinless, or scarcely striated at apex, rather hairy, with an oblique truncate mouth, and minute setaceous hairy teeth. ♃. S. Native of Nipaul and Kamaon, Wall.; Deyra Dhoon, Royle. Stems numerous, rising from a thick woody base, ascending. Leaves 1 to 1½ inch long. Whorls 10-20-flowered, distant. Calyx shortly 10-toothed. Corollas white.

Hyssop-leaved Leucas. Pl. ½ to 1 foot.

39 L. á'spera (Spreng. syst. 2. p. 743.) herbaceous, pubescently hairy; leaves oblong or linear, sub-crenated, green; whorls dense, equal; bracteas oblong-linear, or subulate, hairy; calyx glabrous at the base, almost veinless, striated at top, and a little incurved, with an oblique mouth, and short, scarcely unequal teeth. ☉. S. Native of the Himalaya, along the river Jumna, even to Allahabad, Royle; Indian peninsula, Wight; Mauritius, Bourbon, Java, and the Philippines, &c. Phlòmis áspera, Willd. enum. 2. p. 631. Phlòmis Plukenètii, Roth, nov. pl. spec. 261.? Leûcas Plukenètii, Spreng. syst. 2. p. 743.? Phlòmis esculénta, Roxb. fl. ind. 3. p. 10. Phlòmis cephalótis, var. Blum. bijdr. p. 830.? Tumba, Rheed. mal. 10. p. 181. t. 91.? Stems hispid, or tomentosely pubescent, rarely glabrous. Leaves entire or few-toothed. Whorls usually 10-20-flowered. Corollas white; tube annulate inside.

Var. β, Wightiana (Benth. lab. p. 616.) whorls small, numerous, approximate. ☉. S. L. Wightiàna, Benth. in Wall. pl. rar. asiat. 1. p. 60.

Rough Leucas. Fl. July, Aug. Clt. 1818. Pl. 1 to 3 feet.

40 L. nu'tans (Spreng. syst. 2. p. 743.) herbaceous, pubescent; leaves ovate-oblong, crenated a little, green; whorls many-flowered, distant; bracteas oblong or lanceolate; calyx pubescent, striated, much elongated in the fructiferous state, incurved, nutant, with an oblique mouth, and short, linear, scarcely unequal teeth. ☉.? S. Native of the Indian peninsula; and near Segain, and on the banks of the Irawaddi. Leaves broader than in *L. áspera*, with the crenatures fewer and more obscure. Corollas small.

Nodding-calyxed Leucas. Pl.?

41 L. dimidia'ta (Spreng. syst. 2. p. 743. Benth. lab. p. 616. but not of Benth. in Wall. pl. rar. asiat.) herbaceous, pubescently hairy; leaves ovate-oblong, subcrenated, green; whorls many-flowered, usually solitary, terminal; bracteas linear-subulate, hairy; calyx glabrous at the base, almost veinless, striated at top, incurvedly reflexed, with an oblique mouth, and short scarcely unequal teeth. ☉.? S. Native of the Burman Empire, on the banks of the Irawaddi. Nearly allied to *L. nútans*, but differs in the shorter calyxes, minute bracteas, solitary whorls; and with the habit and leaves of *L. Zeylánica*.

Dimidiate Leucas. Pl.?

42 L. cephalótes (Spreng. syst. 2. p. 743.) herbaceous, pubescently hairy; leaves ovate or oblong, subserrated, green; whorls usually solitary, large, globose, densely many-flowered; bracteas ovate-lanceolate, acute, imbricated; calyx striated at top, rather villous, with an oblique mouth, and short, scarcely unequal teeth. ☉. S. Native of the East Indies, common; Nipaul, Bengal, and the Peninsula. L. capitàta, Desf. mem. mus. 11. p. 8. t. 4. Phlòmis cephalótes, Roth, nov. pl. spec. 262. Leaves 2-4 inches long. Whorls terminal. Corollas white; lower lip large, obcordate.

Headed Leucas. Fl. July, Sept. Clt. 1818. Pl. 1 foot.

43 L. Martinice'nsis (R. Br. prod. p. 617.) herbaceous, pubescent, scarcely canescent; whorls distant, large, globose, many-flowered; bracteas lanceolate-subulate; calyx membranous, incurved, with an oblique mouth, which is drawn out above, and with about 10 subulate teeth, the upper tooth very long. ☉. S. Native of the tropics in both hemispheres; as of the East Indies, Madagascar, west coast of Africa, West Indies, Brazil, &c. Clinopódium Martinicénsis, Jacq. amer. p. 173. t. 177. f. 75. Phlòmis Martinicénsis, Swartz, prod. fl. ind. occ. p. 88. Phlòmis Caribæ'a, Jacq. icon. rar. 1. p. 11. t. 110. Leonûrus parvifòrus, Mœnch, meth. p. 401. Phlòmis móllis, Schum. pl. guin. 263. Leaves ovate, crenated, rounded at the base, but more often cuneated: upper ones lanceolate. Bracteas subspinescent. Corollas small, white; tube exannulate inside.

Martinico Leucas. Fl. July, Sept. Clt. 1781. Pl. 1 to 2 feet.

44 L. linifo'lia (Spreng. syst. 2. p. 743.) herbaceous, erect, clothed with fine canescent pubescence or tomentum; leaves oblong-linear, quite entire, or remotely serrated; whorls dense, nearly equal, many-flowered; bracteas linear, canescent; calyx canescent or glabrous, almost veinless, elongated above, with a very oblique mouth, the lower teeth very short, and the upper tooth very large. ☉. S. Native of the East Indies, Bengal, and the Peninsula, very common; Madagascar, Mauritius,

Bourbon, Moluccas, Philippines, &c. Phlòmis linifòlia, Roth, nov. spec. pl. p. 260. Phlomis Zeylánica, Roxb. fl. ind. 3. p. 9. Lin. syst. 150. Jacq. icon. rar. 1. p. 11. t. 111. but not of Lin. spec. L. lavandulæfòlia, Smith, in Rees' cycl. vol. 2. Leonùrus Indicus, Burm. fl. ind. p. 127. Herba admiratiònis, Rumph. amb. 6. p. 39. t. 16. f. 1. Leaves 2-3 inches long. Whorls distinct, 2-4 towards the tops of the branches. Corollas like those of *L. Zeylánica*, white.

Flax-leaved Leucas. Fl. July, Sept. Clt. 1816. Pl. 1 to 1½ foot.

Cult. Most of the species of *Leùcas*, being annual, the seed should be reared on a hot-bed early in spring; and when the plants are about 1 inch in height, they should be planted into separate small pots, and afterwards shifted from size to size of pots, as they increase in size; and in the summer they may be placed in the greenhouse, where they will flower and seed freely, if plenty of air be given through the day. The suffruticose species should be treated like other stove plants, and they will be readily increased by cuttings or seeds.

XCII. LEONO'TIS (from λεων, *leon*, a lion; and ους ωτος, *ous otos*, an ear; lion's ear; fanciful likeness in the corollas.) R. Br. prod. p. 504. Benth. lab. p. 618.—Phlòmis species of Lin. and other authors.

Lin. syst. *Didynamia, Gymnospérmia.* Calyx ovate-tubular, 10-nerved, incurved at apex, with an oblique sub-10-toothed mouth; the upper tooth the largest. Corolla having the tube usually exserted, naked, or incompletely annulate inside, and a bilabiate limb; upper lip concave, erect, elongated, entire: lower lip short, spreading, trifid, the middle segment hardly larger than the lateral ones. Stamens 4, ascending, didynamous, the lower 2 the longest; filaments naked at the base; anthers approximating by pairs under the lower lip, 2-celled: cells divaricate, acute. Upper lobe of style very short. Achenia dry, obtuse at apex.—Herbs or sub-shrubs. Whorls many-flowered, usually very dense. Bracteas numerous, linear-subulate. Corollas showy, scarlet or yellowish.

1 L. nepetæfòlia (R. Br. prod. p. 504.) herbaceous; leaves ovate, crenated; teeth of calyx all spiny: upper one large; corollas scarlet, scarcely twice as long as the calyx. ☉. S. Native of Asia and Africa, within the tropics; West Indies, and Brazil, in moist places. Ker. bot. reg. 4. t. 281. Phlòmis nepetæfòlia, Lin. spec. 820. Leonùrus globòsus, Mœnch, meth. 400. Leonùrus nepetæfòlius, Mill. dict. no. 2.—Herm. lugdb. 115. t. 117.? Stem pubescent or tomentose. Leaves 2-4 inches long, obtuse, rarely acutish, truncate or subcordate at the base, green on both surfaces, clothed with hoary tomentum beneath or glabrous. Whorls few, distant. Corolla villous, scarlet.

Cat-mint-leaved Lion's-Ear. Fl. Sept. Oct. Clt. 1778. Pl. 2 to 7 feet.

2 L. pa'llida (Benth. lab. p. 619.) herbaceous; leaves ovate, acute, bluntly serrated; calycine teeth all spinose: upper one large, ovate; corollas yellowish, scarcely exceeding the calyxes. ☉. S. Native of Guinea. Phlòmis pállida, Schum. pl. guin. p. 262. Phlòmis Africàna, Beauv. fl. d'ow. 2. p. 82. t. 111. Very nearly allied to *L. nepetæfòlia*; but differs in the leaves being more acute, on shorter petioles, and especially in the corollas being smaller, and yellowish.

Pale-flowered Lion's-Ear. Pl. 2 to 4 feet.

3 L. ova'ta (Spreng. syst. 2. p. 744.) herbaceous; leaves ovate, deeply crenated; calycine teeth all spinose; upper tooth large, ovate; corolla about 3 times as long as the calyx. ☉.? S. Native of South Africa, without the tropic, Burchell. Phlòmis Leonòtis, Lin. mant. p. 83. Mill. fig. t. 162. f. 1. Stems tomentosely pubescent. Leaves scarcely an inch long, broadly truncate or subcordate at the base, pubescent above, and tomentosely pubescent beneath. Whorls size of those of *L. nepetæfòlia*. Corollas orange-coloured, size of those of *L. Leonùrus*.

Ovate-leaved Lion's-Ear. Fl. June, July. Clt. 1713. Pl. 2 to 7 feet.

4 L. interme'dia (Lindl. bot. reg. 10. t. 1850.) herbaceous or suffruticose; leaves ovate-lanceolate, deeply toothed; whorls very dense, globose; calyx villous, with mutic teeth; corolla about 3 times as long as the calyx. ♄.? or ♃.? Native of Algoa Bay. Habit of *L. ovàta*; but the leaves are 2 or 3 times as long, bluntly acuminated, and the tomentum on the lower surfaces of the leaves, as well as on the petioles and branches, is more dense. Corollas orange-coloured, a little shorter than those of *L. Leonùrus*.

Intermediate Lion's-Ear. Fl. Sept. Oct. Clt. 1822. Shrub? 3 to 4 feet.

5 L. parvifo'lia (Benth. lab. p. 619.) shrubby; leaves ovate, wrinkled, and arc, as well as the branches, canescent; upper tooth of calyx ovate, spinescent: lower ones all very short and mutic; corolla about 3 times as long as the calyx. ♄. G. Native of the Cape of Good Hope, Masson. This species differs from *L. ovàta*, in the leaves being smaller, more wrinkled, canescent, and in the form of the mouth of the calyx. Stems woody and humble. Corollas of *L. Leonùrus*.

Small-leaved Lion's-Ear. Shrub humble.

6 Leonu'rus (R. Br. prod. p. 504.) shrubby; leaves oblong-lanceolate, bluntly serrated; whorls rather loose; calyx clothed with fine pubescent tomentum, with mutic teeth; corolla more than 3 times as long as the calyx. ♄. G. Native of the Cape of Good Hope. Phlòmis Leonùrus, Lin. spec. p. 820. Curt. bot. mag. t. 478. Leonùrus grandiflòrus, Mœnch, meth. 400.—Leonùrus Africànus, Mill. dict. no. 1.—Knor. del. 2. t. 50.—Sabb. hort. rom. 3. t. 44.—Breyn. cent. 171. t. 86.—Seba, mus. 1. p. 22. t. 14. f. 1. Branches tomentose. Leaves 2 inches long, obtuse, tomentose beneath and pubescent above. Whorls distant or approximate. Corollas 2 inches long, scarlet, villous.

Lion's-tail Lion's-Ear. Fl. Oct. Dec. Clt. 1712. Shrub 5 to 6 feet.

Cult. The species are all very showy when in blossom. Any light rich earth will suit them; and young cuttings of the shrubby kinds strike root readily in sand, with a hand-glass over them. The annual kinds should be treated in the manner recommended for the species of *Leùcas*, see above.

XCIII. PHLO'MIS (φλομος, of Dioscorides; from φλοξ, *phlox*, φλογος, *phlogos*, a flame; the down of some species was used formerly as wicks.) R. Br. prod. p. 504. Benth. lab. p. 620.—Phlòmis species of Lin. and other authors. Phlomidòpsis, Link, handb. p. 379.—Phlomoìdes, Mœnch, meth. p. 403.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular, 5 or 10-striped, usually plicate, with an equal, truncate, or tridentate mouth. Corolla with an inclosed or scarcely exserted tube, usually annulate inside, and a bilabiate limb; upper lip galeate, keeled, compressed, broad, entire or emarginate, incumbent or erectish: lower lip spreading, trifid. Stamens 4, ascending, didynamous; the lower 2 the longest; upper filaments adnate, usually drawn out into an appendage at the base: lower ones naked; anthers approximate by pairs under the galea, somewhat 2-celled: cells divaricate, obtuse, confluent. Superior lobe of style very short, the lower lobe subulate, stigmatiferous at apex. Achenia dry, triquetrous, obtuse at apex, rarely trun-

cate, glabrous or pubescent at apex.—Herbs, under-shrubs, and shrubs; in the first section clothed with floccose wool, and in the second section green. Leaves wrinkled. Whorls many-flowered, axillary, propped by bracteas, rarely naked. Corollas in the first section yellow or purple; but in the second section purple or white.

Sect. I. Euphlo'mis (from *eu*, *eu*, well; and *phlomis*; so called because this section is supposed to contain the true species of the genus.) Benth. lab. p. 622. Galea of corolla large, incumbent, tomentose, rarely villous, shortly somewhat bearded inside and along the margins; lateral segments of the lower lip small, furnished each with a lanceolate, or ovate, truncate, small appendage; the middle lobe large, very broad, rounded, emarginate, or somewhat 2-lobed.

§ 1. Lychni'tis (from λυχνος, *lychnos*, a lamp; down used for making wicks.) Benth. lab. p. 623. *Plant suffruticose. Floral leaves broadly dilated at the base, clasping the flowers.*

1 P. lychni'tis (Lin. spec. p. 819.) suffruticose, clothed with hoary tomentum; leaves sessile, oblong-linear, narrowed at both ends, stem-clasping, wrinkled; floral leaves very broad at the base; bracteas subulate, and are, as well as the calyxes, clothed with silky pili, with short subulate teeth. ♄. H. Native of Europe, in the region of the Mediterranean, in dry places; as of Spain, South of France, North of Italy.? Sims. bot. mag. 998. Mill. fig. 203.—Lob. icon. 558.—Barrel. icon. 1321. Stems numerous, simple, rising from a woody base. Cauline leaves 2-3 inches long, and scarcely 4 lines broad, green or canescent above, very veiny, and clothed with white tomentum beneath. Corolla yellow, twice as long as the calyx. The dry leaves of this sort are used for wicks; hence its specific name, and its Spanish one of *Candelera*.

Link Phlomis. Fl. June, Aug. Clt. 1658. Shrub 2 feet.

§ 2. Gymnophlòmis (from γυμνος, *gymnos*, naked; and φλομος, *phlomos*, the Greek name of Mullein; so called from the whorls being almost destitute of bracteas.) Benth. lab. p. 623. *Perennial herbs or undershrubs. Floral leaves narrowed at the base. Whorls few-flowered. Bracteas few, loose or wanting. Calycine teeth soft, mutic.*

2 P. Bauguei'ri (Desf. mem. mus. 11. p. 9. t. 5.) perennial or suffruticose, very white from floccose tomentum; leaves ovate-oblong, roundly cuneated at the base, densely woolly; whorls about 6-flowered; bracteas linear, loose; calyx very pilose, with lanceolate soft plumose teeth, which exceed the corolla. ♃. F. Native of Persia, near Kermanchan. Stems almost simple. Leaves 2-3 inches long, acutish, a little crenated, and a little wrinkled. Whorls approximate. Corollas deep red, a little smaller than those of *P. lychnitis*. Superior filaments thickened at the base, scarcely appendiculate.

Bruguier's Phlomis. Pl. 1 to 1½ foot.

3 P. crini'ta (Cav. icon. rar. 3. p. 25. t. 247.) perennial or suffruticose, clothed with very white floccose wool; leaves ovate-oblong, roundedly truncate at the base, the radical leaves subcordate, very thick, densely woolly on both surfaces; floral leaves narrowly rounded at the base; whorls 6-10-flowered; bracteas linear, loose; calyx very pilose, with linear plumose mutic teeth, which are shorter than the corolla. ♃. F. Native of Spain. Stems rising from a woody base. Radical leaves 2-3 inches long, almost quite entire. Whorls disposed in a panicle. Corolla like those of *P. lychnitis*, yellow or pale orange.

Long-haired Phlomis. Fl. June, Aug. Clt. 1820. Pl. 1 to 1½ foot.

4 P. purpu'rea (Desf. fl. atl. 2. p. 25. t. 127.) perennial or suffruticose, woolly; leaves ovate-oblong, rounded at the base, clothed with sub-floccose tomentum on both surfaces; whorls 4-6-flowered; bracteas linear, loose; calyx pilose, with linear soft acute mutic teeth. ♃. F. Native of Algiers, near Mayance. Lower leaves petiolate: upper ones sessile, scarcely crenated. Corollas size of those of *P. herba-venti*, purple, villously tomentose outside; upper lip bipartite.?

Two-lobed-lipped Phlomis. Pl. 2 to 3 feet.

5 P. orienta'lis (Mill. dict. no. 9.) perennial or suffruticose, clothed with floccose wool; leaves ovate: lower ones cordate at the base, much wrinkled, villous or woolly on both surfaces; floral leaves narrowed at the base; whorls 6-10-flowered; calyx elongated, pilose, with linear, soft, acute, plumose teeth. ♃. F. Native of Syria, near Aleppo, and about Smyrna. Habit of *P. Nissòlii*, but the calyx is very different. Corollas pale brown or yellow.

Eastern Phlomis. Fl. July, Aug. Clt.? Pl. 1 to 2 feet.

6 P. Olivie'ri (Benth. lab. p. 624.) shrubby, woolly; leaves petiolate, ovate, narrowed at the base: lower ones cordate, wrinkled, densely clothed with wool in the young state; whorls few-flowered; bracteas short, linear; calyx hispidly woolly, with lanceolate-linear obtuse teeth. ♄. F. Native of Persia, between Bagdad and Kermanchan, and between Kermanchan and Armadan. Bracteas as in *P. Armeniaca*, but more hispid; but the calyxes are less pilose, and the stems more simple than in *P. orientàlis*.

Olivier's Phlomis. Shrub.

7 P. Armeni'aca (Willd. spec. 3. p. 119.) perennial, clothed with floccose wool; radical leaves on long petioles, cordate-oblong, obtuse, crenated; cauline leaves lanceolate, attenuated at the base; whorls 6-flowered; bracteas loose, subulate, mucronulate; calyx clothed with tomentose wool, contracted at the apex in the fructiferous state, with subulate mucronate straight teeth. ♃. F. Native of Armenia; and of Caucasus, in dry stony places among the Talusch mountains, near Perimbal and Swant. D. Don, in Sweet, fl. gard. n. s. 4. t. 364. P. orientàlis, angusto et lineare folio, flore luteo, Tourn. cor. p. 10. Stems simple. Leaves obscurely crenated. Whorls distinct, usually 6-flowered. Corollas yellow, similar to those of *P. lychnitis*, twice the length of the calyx, clothed with stellate pubescence outside.

Armenian Phlomis. Fl. June, July. Clt. 1834. Pl. ½ to 1 foot.

8 P. Nissòlii (Lin. spec. p. 819.) perennial or suffruticose, densely clothed with sub-floccose wool; leaves petiolate, ovate-oblong, deeply cordate at the base, much wrinkled; whorls few-flowered; bracteas very short; calyx densely woolly, with ovate acuminated soft mutic teeth. ♃. F. Native of Syria, near Smyrna and Aleppo. Mill. fig. 204. Stems rising from a woody base. Lower leaves petiolate, 4-5 inches long, crenulated. Whorls distant. Corolla yellow, similar to that of *P. lychnitis*; but the upper lip is a little acuminated, and the middle lobe of the lower lip more deeply emarginate.

Nissole's Phlomis. Fl. June, July. Clt. 1757. Pl. 1 to 1½ foot.

§ 3. Dendrophlòmis (from δενδρον, *dendron*, a tree; and φλομος, *phlomos*, the Greek name of Mullein; in allusion to the species being woody). Benth. lab. p. 625. *Shrubs, rarely sub-shrubs. Whorls dense. Bracteas adpressed, numerous, about equal in length to the calyxes. Calyxes usually truncate, mucronate.*

9 P. purpu'rea (Lin. spec. p. 818.) shrubby; branches

clothed with floccose tomentum; leaves oblong, obtuse, crenated, truncate or subcordate at the base, greenish above, and clothed with white tomentum beneath; bracteas oblong-lanceolate, and are, as well as the calyxes, clothed with white tomentum; calycine segments lanceolate, softly acuminated. ♄. H. Native of Spain, near Malaga. Smith, spicil. 6. t. 7. P. ferruginea, Mill. dict. no. 12. P. salviæfòlia, Jacq. hort. schœnbr. 3. p. 58. t. 359. Floral leaves ovate-lanceolate, much longer than the whorls. Corollas reddish-purple; upper lip tomentosely villous outside. Appendages of upper filaments subulate.

Purple-flowered Phlomis. Fl. June, Aug. Clt. 1661. Shrub 2 to 3 feet.

10 P. Ita'lica (Smith, spicil. 1. t. 6.) shrubby, clothed with floccose tomentum; leaves oblong-lanceolate, obtuse, truncate at the base, wrinkled; whorls dense; bracteas linear, obtuse, adpressed, about equalling the calyxes, clothed with floccose tomentum; calyx truncate, with very short obtuse mutic teeth. ♄. H. Native of Spain, Italy, and Balearic Islands. P. rotundifòlia, Mill. dict. no. 18. fig. 202. Wool subferruginous or white. Leaves all petiolate, 2-3 inches long, velvety on the upper surface, a little crenated. Corollas purple. Upper filaments thickened a little under the insertion. This differs from *P. purpùrea* in the calyxes and bracteas.

Italian Phlomis. Fl. June, Aug. Clt. 1661. Shrub 1 to 2 feet.

11 P. ellípticа (Benth. lab. p. 626.) shrubby, clothed with subfloccose tomentum; leaves ovate-elliptic, truncate at the base, much wrinkled, clothed with floccose tomentum beneath, or on both surfaces: whorls dense, many-flowered; bracteas lanceolate, linear, bluntish, stiff, clothed with floccose wool; calyx truncate, with linear stiff pungent teeth. ♄. F. Native of Persia. Branches at length glabrous towards the tops. Leaves an inch long, at length naked above, but clothed with floccose tomentum on both surfaces while young. Whorls about 10-flowered. Corolla purplish.

Elliptic-leaved Phlomis. Shrub.

12 P. lana'ta (Willd. enum. suppl. p. 41.) shrubby; branches divaricate, clothed with subfloccose wool; leaves small, ovate-roundish, very blunt, roundly cuneated at the base, much wrinkled, green above, and clothed with white wool beneath; bracteas ovate-lanceolate, obtuse, shorter than the calyxes, and are, as well as them, clothed with white wool; calycine teeth very short, obtuse, or stiffly mucronulate. ♄. H. Native of Calabria and Candia. P. parvifòlia, Presl. del. prag. p. 86. P. microphýlla, Sieb. in bot. zeit. 1823. 2. p. 598. Shrub divaricately much branched. Branches clothed with rusty wool. Whorls solitary on the branches, or twin and remote, 6-8-flowered. Corolla yellow; upper lip clothed with velvety tomentum.

Woolly Phlomis. Fl. June, July. Clt. 1696. Shrub 1 to 2 feet.

13 P. angustifòlia (Mill. dict. no. 2.) shrubby; branches clothed with floccose tomentum; leaves ovate or oblong, obtuse, truncate at the base, much wrinkled, canescent above, and clothed with white tomentum beneath; bracteas lanceolate, clothed with soft white tomentum, mutic; calyx clothed with white tomentum; calycine teeth truncate, mucronate, very short and stiff. ♄. F. Native among rocks in the desert of Sinai, Bove; and in the Grecian Archipelago. P. flavéscens, Mill. dict. no. 10. This species differs from *P. purpùrea*, in the stem being taller; in the calyxes being truncate, &c. Corolla cream-coloured, size of those of *P. purpùrea*.

Narrow-leaved Phlomis. Fl. June, Aug. Clt. 1596. Shrub.

14 P. fruticòsa (Lin. spec. p. 818.) shrubby; branches clothed with floccose tomentum; leaves ovate or oblong, roundly cuneated at the base, wrinkled, green above, and clothed with white tomentum beneath; whorls densely many-flowered; bracteas broad-ovate or ovate-lanceolate, acute, greenish, ciliated, villous; calyx villous, with truncate teeth, which end each in a subrecurved, or spreading, subulate, stiff acumen. ♄. H. Native of the region of the Mediterranean, in dry exposed places of mountains; as of Sicily, Abruzzo, Greece, Levant, &c. Sims, bot. mag. 1843. Sibth. et Smith, fl. græc. 6. p. 51. t. 568. P. ferruginea, Hortul. but not of Tenore nor Mill. P. latifòlia, Mill. dict. no 3.—Sabb. hort. rom. 3. t. 15. Shrub branched. Tomentum of branches usually yellowish. Leaves 2-3 inches long, quite entire, or more or less crenated, villous above. Whorls solitary or twin at the tops of the branches, 20-30-flowered. Corollas yellow or dusky yellow, showy. Appendages of upper filaments recurved.

Shrubby Phlomis, or Jerusalem Sage. Fl. June, July. Clt. 1596. Shrub 2 to 4 feet.

15 P. ferrugi'nea (Tenore, fl. nap. 2. p. 36. t. 57.) shrubby; branches clothed with loose floccose tomentum; leaves oblong-lanceolate, obtuse, crenulated, cordate at the base, much wrinkled, villous and green above, but clothed with loose floccose tomentum beneath; bracteas lanceolate, hispid; calyx villous, with a long-haired throat, and short stiff subulate teeth. ♄. H. Native of Lucania and Japygia, Tenore. Branches clothed with rusty purple loose wool. Leaves 2-3 inches long, green above, and canescent beneath. Whorls 18-20-flowered. Corollas yellow, densely tomentose outside. Appendages of upper filaments short, acute.

Var. β, Crética (Benth. lab. p. 627.) leaves lanately villous, canescent; bracteas linear-subulate. ♄. H. Native of Candia. P. Crética, Presl. del. prag. P. fruticòsa, Sieb. pl. cret. exs.

Rusty Phlomis. Fl. June, July. Clt. 1823. Shrub 2 to 3 feet.

16 P. visco'sa (Poir. dict. 5. p. 271.) shrubby; branches scarcely tomentose; leaves petiolate, ovate, obtuse, crenated, truncate or subcordate at the base, green above, and scarcely tomentose beneath; whorls many-flowered; bracteas lanceolate-linear, ciliated; calyx hispid, with truncate, subulately acuminated, stiff, rather spreading teeth, 2 of the teeth longer than the rest. ♄. H. Native of the Levant. P. virens, D. C. cat. hort. monsp. p. 182. Nearly allied to *P. ferruginea*; but the leaves are broader, greenish, and scarcely wrinkled; and the calyx is distinct. Leaves form of those of *P. fruticòsa*, rather villous above. Whorls about 10-flowered. Corollas yellow. villous outside.

Clammy Phlomis. Fl. June, July. Clt.? Shrub 2 to 3 feet.?

§ 4. Oxyphlòmis (from ὄξυς, *oxys*, sharp; and φλόμος, *phlomos*, the Greek name of Mullein; in reference to the very acute, stiff, sub-pungent bracteas.) Benth. lab. p. 628. *Herbs or under-shrubs. Whorls usually many-flowered, rarely so few as 6-flowered. Bracteas very acute, with stiff, rather pungent tops.*

17 P. glaucо'sa (D. Don, in bot. reg. t. 1300.) subfruticose; branches clothed with white floccose wool; leaves ovate-oblong, cordate at the base, greenish above, and much wrinkled, and clothed with floccose wool beneath; whorls densely many-flowered; bracteas linear, clothed with white wool, and are, as well as the calycine teeth, subulate, stiff, glabrous, and hooked at apex. ♄. F. Native of Egypt. Leaves with the auricles closed at the base, covered with canescent villi above. Whorls few, distant, large, 20-30-flowered. Corollas yellow, size of those of *P. Sàmia*.

Floccose Phlomis. Fl. July, Oct. Clt. 1828. Shrub 2 feet.

18 P. bi'color (Benth. lab. p. 629.) corolla deep yellow outside; lower lip purplish above; bracteas entire; calyxes mucro-

uate; mucrones blackish, glabrous, hooked. ♄. H. Native of Lybia, in the mountains of Cyrenaica Viviani. P. Sàmia, Sims, bot. mag. t. 1891. S. Sàmia, β, bicolor, Viv. fl. lib. spec. 30. t. 15. f. 2. Habit almost of *P. fruticòsa*. Bracteas not joined at the base, as in *P. Sàmia*. Calyxes and bracteas hairy, not woolly as represented in Viviani's figure.

Two-coloured-flowered Phlomis. Fl. June, July. Clt. 1714. Pl. 2 to 3 feet.

19 P. Russellia'na (Lag. mss. Benth. lab. p. 629.) herbaceous; branches tall, almost simple; radical leaves very ample, ovate, deeply cordate at the base, and are, as well as the cauline leaves, wrinkled, green above, and canescent from tomentum beneath; whorls large, many-flowered; bracteas linear, very acute, and are, as well as the calyxes, green and pubescent; calyx truncate, with long stiff subulate spreading teeth. ♃. H. Native of Syria, near Aleppo. P. hérba-vénti, var. Russ. nat. hist. alep. 2. p. 269. t. 16. P. lunarifòlia, β, Russelliàna, Sims, bot. mag. 2542. Branches clothed with loose white tomentum. Leaves 6-8 inches long. Whorls 40-50-flowered. Corollas yellow or brownish? tomentose outside. Appendages of superior filaments subulate.

Russell's Phlomis. Fl. June, July. Clt. 1821. Pl. 3 to 5 feet.

20 P. lunariifo'lia (Sibth. et Smith, prod. fl. græc. p. 414.) stems herbaceous, tall, pubescent; leaves ovate, wrinkled above, canescently tomentose beneath; whorls many-flowered; bracteas broad-lanceolate or oblong, acute, subciliated, and are, as well as the calyxes, green; calyx truncate at apex, rather membranous, with subulate stiff pungent teeth. ♃. H. Native of the Peloponnesus, in various places; and on Mount Athos. Bracteas 3 times as broad as those of *P. Russelliàna*. Corollas yellow.

Honesty-leaved Phlomis. Fl. June, July. Clt. 1818. Pl. 3 to 4 feet.

21 P. Sa'mia (Lin. spec. 819.) stems herbaceous, tall, pubescent; leaves ovate, wrinkled above, and clothed with canescent tomentum beneath; whorls many-flowered; bracteas linear, very acute, pungent, and are, as well as the calyxes, green and pubescent; calyx elongated, plicate, with lanceolate-subulate stiff pungent teeth. ♃. H. Native of Eubœa, Samos, Ceramania, &c. Vent. choix. t. 4. Sibth. et Smith, fl. græc. 6. p. 52. t. 564. Allied to *P. Russelliàna*; but the stems are less tomentose, the whorls sometimes 10-15-flowered. Calyx 9-10 lines long, pubescent and clammy. Corollas purple. "Leaves ovate-cordate, crenated," ex Desf.

Samos Phlomis. Fl. June, July. Clt. 1714. Pl. 2 to 3 feet.

22 P. ri'gida (Labill. icon. pl. syr. rar. 3. p. 15. t. 10.) herbaceous; leaves oblong-lanceolate, wrinkled, clothed with subfloccose tomentum, having the nerves and petioles pilose; whorls many-flowered; bracteas subulate, stiff, pungent; calyx hairy, with subulate stiff teeth. ♃. H. Native of Syria, near Damascus, in sandy places. Stems woolly from short hairs, intermixed with long hairs. Leaves obtuse, crenulated, cordate at the base, but the cauline ones are roundly cuneated at the base. Corollas yellow, almost like those of *P. Lychnitis*. Filaments not appendiculate, ex Labill.

Stiff Phlomis. Pl. 2 feet.

23 P. Cashmeria'na (Royle, ex Benth. in Hook. bot. misc. 3. p. 382, lab. p. 630.) herbaceous, erect: stem densely clothed with floccose tomentum; leaves ovate-lanceolate, obtuse, crenated towards the apex, broadly rounded at the base, wrinkled, pubescent or villous above, and clothed with dense white tomentum beneath; bracteas subulate, ciliated, longer than the calyxes; calyx clothed with floccose wool, with subulate stiff spreading teeth. ♃. H. Native in the valley of Cashmere, Royle. Corollas larger than in *P. hérba-vénti* and *P. púngens*, to which species it comes nearest. Galea densely villous.

Cashmere Phlomis. Pl. 1 to 1½ foot.?

24 P. herba-ve'nti (Lin. spec. 819.) herbaceous, erect, divaricately much branched; branches beset with long hairs; leaves oblong-lanceolate, crenated, rounded at the base, coriaceous, green on both surfaces, or canescent beneath, always shining and rather scabrous above; bracteas subulate, ciliated, longer than the calyxes; calyx hairy, with subulate stiff rather spreading teeth. ♃. H. Native of the region of the Mediterranean, in dry places; as of Spain, Sicily, Italy, Tauria. Sims, bot. mag. t. 2449. Sibth. et Smith, fl. græc. t. 564.—Sabb. hort. rom. 3. t. 17. Branches green or purplish. Leaves often 6-8 inches long: floral ones sessile, all much exceeding the whorls. Whorls 10-20-flowered. Corollas purplish-violet, tomentose outside. Appendages of upper filaments acute, sub-recurved. In autumn, after the substance of the leaves has decayed, the veins remain perfect, showing the complete skeletons of them; hence the specific name. We believe this is also the case in *P. púngens*.

Var. β, tomentòsa (Benth. lab. p. 631.) leaves tomentose beneath.

Wind-herb Phlomis. Fl. July, Sept. Clt. 1596. Pl. 1 to 1½ foot.

25 P. pu'ngens (Willd. spec. 3. p. 121.) herbaceous, divaricately branched; branches clothed with hoary tomentum; leaves on short petioles, ovate-lanceolate, quite entire or serrated, rounded at the base, shining and green above, and rather scabrous, but clothed with hoary tomentum beneath; bracteas subulate, ciliated, rather longer than the calyxes; calyx hairy, with subulate stiff rather spreading teeth. ♃. H. Native of the south-east of Europe, and west of Asia, in dry mountain places; as of Galicia, Greece, Tauria, Caucasus, Persia, &c. Sweet, fl. gard. n. s. t. 38. Nearly allied to *P. hérba-vénti*; but is distinguished from it in the tomentosely pubescent, not pilose, stem; in its narrower, quite entire, or serrated, not crenated, leaves, which are constantly tomentose beneath; and the whorls are more numerous, usually 6-10-flowered, &c. Corolla purplish-violet.

Pungent Phlomis. Fl. July. Clt. 1820. Pl. 1½ to 2 feet.

Sect. II. Phlomidópsis (from φλόμος, *phlomos*, the Greek name of Mullien; and ὄψις, *opsis*, resemblance; so called because it has been considered a distinct genus allied to *Phlomis* by some authors.) Benth. lab. p. 631. *Phlomidópsis*, *Link*, handb. p. 179. Phlomoides, *Mœnch*, meth. p. 403. Galea of corolla erectish, pilose, bearded inside and on the margins with long pili; middle lobe of lower lip hardly larger than the lateral ones.—Green, hairy, or pilose herbs, rarely rather woolly. Whorls dense. Bracteas adpressed. Corollas purple or white.

26 P. brevifo'lia (Benth. in Wall. pl. rar. 1. p. 62.) herbaceous, erect, nearly glabrous; leaves petiolate, broad-ovate, acuminated, crenated, truncate or subcordate at the base, rather hispid above, and glabrous beneath; bracteas linear, and are, as well as the calyxes, nearly glabrous; galea of corolla pubescent, erect. ♃. H. Native of Nipaul, on Gossainsthan, Wall. Leaves all petiolate. Whorls 15-20-flowered. Calyx truncate, with very short emarginate or acuminated teeth. Filaments scarcely drawn out at the base. Corolla hardly a half again as long as the calyx, white.?

Short-flowered Phlomis. Pl.

27 P. macrophy'lla (Wall. pl. rar. asiat. 1. p. 62. Benth. lab. p. 631.) herbaceous, tall, nearly glabrous. Leaves on long petioles, very ample, basisately cordate; floral leaves ovate, narrowed at the base; bracteas subulate, and are, as well as the

calyxes, a little ciliated; galea of corolla erect, very pilose inside. ♃. H. Native along with the preceding. Herb many feet high, branched. Allied to *P. tuberòsa*. Branches furnished with short reflexed rufescent pili at top. Petioles ciliated with long rufous hairs. Leaves 6 inches long, hispid above, and tomentose beneath. Whorls numerous, remote, 30-40-flowered. Corollas white.

Long-leaved Phlomis. Pl. 3 to 6 feet.

28 P. TUBEROSA (Lin. spec. p. 819.) herbaceous, tall, nearly glabrous; leaves ample, ovate, obtuse, crenated, deeply cordate at the base: floral leaves oblong-lanceolate; bracteas subulate, and are, as well as the calyxes, subciliated; galea of corolla erectish, very pilose inside. ♃. H. Native of the East of Europe and Middle Asia, in exposed fields; as of Bohemia, Moravia, Austria, Hungary, Podolia, South of Russia, Siberia, Tauria, Caucasus, &c. Sims. bot. mag. t. 1555. Hall. comm. gratt. 1751. t. 11. Phlomoides tuberòsa, Moench, meth. p. 404. Phlomidòpsis tuberòsus, Link, handb. p. 480. Root tuberous in this, and probably in many other species of the present section. Branches and stems purplish. Lower leaves ½ foot long; floral ones 2-3 inches long, usually hastately dilated at the base or a little cut, all green and glabrous. Whorls remote, 30-40-flowered. Corollas purple; galea crenulated. Appendages of upper filaments recurved. Several varieties of this species occur in the gardens.

Tuberous-rooted Phlomis. Fl. June, July. Clt. 1759. Pl. 3 to 5 feet. 6

29 P. AGRARIA (Bunge, in Ledeb. fl. alt. 3. p. 411.) stem herbaceous, simple or a little branched, hispid; lower leaves on long petioles, hastately cordate; upper floral leaves shorter than the calyxes; bracteas subulate, and are, as well as the calyxes ciliated and tomentosely pubescent; galea of corolla erect, very pilose inside. ♃. H. Native of Altaia, in cultivated fields near Semipalatinsk. Led. fl. ross. ait ill. t. 364. Stems many, generally simple. Leaves deeply toothed, pubescent, green above, and subcanescent beneath; floral leaves sessile. Whorls about 10-flowered. Corollas purplish, almost similar to those of *P. tuberòsa*. Appendages of upper filaments long, subulate.

Field Phlomis. Fl. June, Aug. Clt. 1830. Pl. 1½ to 3 foot.

30 P. ALPINA (Pall. in act. petrop. 1779. 2. p. 265. t. 13.) stems herbaceous, simple, hispid; radical leaves very ample, deeply cordate; cauline leaves ovate-lanceolate: upper floral ones linear-lanceolate, elongated, quite entire, soft; bracteas subulate, and are, as well as the calyxes, hairy; galea of corolla very pilose, erect. ♃. H. Native of the Altaian mountains, in subalpine shady places. Stems numerous, green. Radical leaves 8 inches long and 6 broad, rather hispid on both surfaces. Whorls 20-30-flowered. Corollas purple, similar to those of *P. tuberòsa*.

Alpine Phlomis. Fl. June, Sept. Clt. 1802. Pl. 1 to 1½ foot.

31 P. BRACTEOSA (Royle, ex Benth. in Hook. bot. misc. 3. p. 383. lab. p. 633.) herbaceous, tall, erect, a little branched; stems obversely villous; leaves petiolate, ovate, obtuse, coarsely crenated, broadly cordate at the base, wrinkled, clothed with adpressed pili above and pale short tomentum beneath: floral leaves almost similar to the rest; bracteas oblong; outer ones large, foliaceous; calycine teeth truncate, subulate, acuminated at top; galea of corolla very pilose. ♃. F. Native of the Himalaya, on Mount Choor, and at Kidarkonta, Royle; Simla, Countess of Dalhousie. Outer bracteas almost similar to the leaves, an inch long; sometimes oblong, quite entire, all green like the leaves. Filaments exappendiculate. Root probably tuberous.

Bracteate Phlomis. Pl. 1 to 1½ foot.

32 P. LAMIIFOLIA (Royle, ex Benth. in Hook. bot. misc. 3. p. 383. lab. p. 633.) herbaceous, humble, simple; stems obversely villous; leaves petiolate, broad-ovate, crenated, deeply cordate at the base, wrinkled, villous on both surfaces, pale beneath: floral leaves oblong-lanceolate; bracteas lanceolate or subulate, ciliated, equalling the calyxes; calyx nearly glabrous, with truncate subulately acuminated teeth; galea of corolla villous. ♃. F. Native of Cashmere, on Mount Choor, and in Mussooree, Royle; and the mountains of Kamaon, Wall. P. latifòlia, Royle, ex Benth. in Hook. bot. misc. 3. p. 383. Upper floral leaves scarcely exceeding the flowers. Whorls 15-20-flowered. Corollas like those of *P. tuberòsa*. Filaments exappendiculate. Root probably tuberous.

Archangel-leaved Phlomis. Pl. ½ to 1 foot.

33 P. SIMPLEX (Royle, ex Benth. in Hook. bot. misc. 3. p. 382. lab. p. 634.) herbaceous, humble, erect, nearly simple; stem obversely pilose; leaves petiolate, broad-ovate, obtuse, crenated, cordate at the base, wrinkled, green on both surfaces, villous: floral leaves nearly sessile, oblong, narrowed at both ends; bracteas linear, ciliated, equalling the calyxes; calyx membranous, rather coloured, ciliated at apex, with truncate subulately acuminated teeth; galea of corolla very pilose. ♃. F. Native of Cashmere, on the mountains of Kamaon, and at Peer Punjale, Royle. This species differs from *P. lamiifòlia* in the leaves being narrower, more villous, in the corollas being larger, and in the tube being exserted.

Simple Phlomis. Pl. ½ to 1 foot.?

34 P. CORDATA (Royle, ex Benth. l. c.) herbaceous, humble, erect, nearly simple; stem obversely pilose; leaves on long petioles, ovate-roundish, obtuse, crenated, cordate at the base, wrinkled, densely clothed with silky villi on both surfaces: floral leaves oblong-lanceolate; bracteas linear, subulate, rather shorter than the calyxes, villous; calyx rather villous, with roundish subulately acuminated teeth; galea of corolla very pilose. ♃. F. Native of Cashmere, on the mountains of Kamaon, Royle. This differs from the two preceding species in the leaves being densely clothed with soft silky villi on both surfaces, but is perhaps only a variety of one of them.

Cordate-leaved Phlomis. Pl. ½ to 1 foot.?

35 P. RUCOSA (Benth. in Wall. pl. rar. 1. p. 69. lab. p. 634.) suffruticose, erect, simple, rather fleshy, finely tomentose; leaves on long petioles, ovate-oblong, acute, serrated, narrowed or rounded at the base; whorls much shorter than the petioles: bracteas subulate, and are, as well as the calyxes glabrous; calycine teeth lanceolate-subulate; corollas nearly glabrous. ♄. S. Native of Silhet, among the mountains. Different in habit from the other species of this section, but it is allied in characters to *P. breviflòra*. Leaves all petiolate, green, rather fleshy, nearly glabrous, 4-6 inches long. Corollas yellowish, ex Wall. similar to those of *P. breviflòra*. Stamens a little exserted. Filaments all naked at the base.

Wrinkled-leaved Phlomis. Shrub.

N.B. P. condensàta, Mart. ex. Steud. nom. and P. scariòsa, Presl. ex Steud. nom. are only known by name.

Cult. All the species of *Phlomis* prefer a light dry soil, in which even the more tender kinds will endure our winters. The shrubby kinds are readily increased by young cuttings in spring; and the herbaceous perennial species by division and seeds. Those marked frame should be protected in winter from frosts. Being all ornamental, they are worth cultivating in every collection.

XCIV. NOTOCHÆTE (from *νωτος, notos*, the back; and *χαιτη, chaite*, a bristle or beard; in reference to the nerves of the calyx being drawn out into stiff hooked bristles under the apex of the calyx.) Benth. in Wall. pl. rar. 1. p. 68. lab. p. 635.

LIN. SYST. *Didynàmia, Gymnospérmia*. Calyx tubular, equal,

membranaceous at apex, shortly 5-toothed, 5-nerved; nerves drawn out into subulate, stiff, uncinately revolute awns under the top of the calyx. Corolla with an inclosed, exannulate tube; upper lip galeate, very pilose; lower lip spreading, somewhat equally trifid. Stamens 4, ascending, didynamous; lower 2 the longest. Filaments naked at the base; anthers approximate by pairs, 2-celled; cells at length divaricate. Lobes of style short, equal. Achenia dry, truncate at apex, naked. This genus is allied to section *A. Phlomidópsis* of *Phlòmis*, and particularly to *Phlòmis breviflòra*, but differs in the structure of the calyx and that of the anthers.

1 N. ramòsa (Benth. l. c.) ♃.? F. Native of Nipaul, Wall. Stems herbaceous, branched, erect, pubescent. Leaves on long petioles, 3-5 inches long, ovate, acuminated, serrately crenated, obliquely and roundly cuneated at the base, nerved, green on both surfaces and nearly glabrous, but tomentose beneath while young. Whorls remote, globose, densely many-flowered, much shorter than the petioles. Bracteas subulate, stiff, revolute, exceeding the corolla. Corollas small, purplish.

Hooked-calyxed Notochaite. Pl. 2 feet.

Cult. For culture and propagation, see *Phlòmis*, p. 854.

XCV. EREMO'STACHYS (from *ερημος, eremos*, deserted; and *σταχυς, stachys*, a spike; in reference to the species being inhabitants of desert places, and from the flowers growing in verticillate spikes.) Bunge, in Ledeb. fl. alt. 2. p. 414. Benth. lab. p. 636.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx amply tubular, subcampanulate or funnel-shaped, with 5 spinose or mucrone-formed teeth; limb large and membranaceous. Corolla with an inclosed tube, which is annulate or naked inside, and a gaping bilabiate limb; upper lip elongated, galeate, somewhat compressed, attenuated at the base, pubescent outside, and bearded inside and on the margins; lower lip spreading, trifid, the lobes all rounded, but the middle one is the broadest. Stamens 4, ascending, didynamous, the lower 2 the longest. Superior filaments thickened into an obtuse or fringed appendage at the base; anthers approximate by pairs, 2-celled: cells divaricate. Style bifid at top; lobes subulate, equal, or the upper one is scarcely a half shorter than the lower. Achenia dry, densely pilose at apex.—Rather branched herbs. Radical leaves larger than the cauline ones, entire or dissected. Whorls many-flowered, usually approximate at the tops of stem or branches. Bracteas adpressed. Corollas usually yellow or cream-coloured, rarely purple.

1 E. laciniàta (Bunge, in Led. fl. alt. 2. p. 416.) leaves pinnate; leaflets oblong-lanceolate or linear, deeply pinnatifid; calyx amply tubular, campanulate, hardly dilated at apex. ♃. H. Native of the Levant, Eastern Caucasus, and Siberia, Persia, &c. Phlòmis laciniàta, Lin. spec. 819. Sweet fl. gard. 1. t. 24. Stems nearly simple. Radical leaves ½ foot long: floral leaves scarcely exceeding the calyxes. Petioles, stems, and nerves of leaves clothed with loose wool. Whorls 10-20-flowered, upper ones approximate. Calycine teeth spinosely mucronate. Corollas purplish; tube annulate. Appendages of upper filaments obtuse, nearly entire. Lobes of style unequal.

Jagged-leaved Eremostachys. Fl. July. Clt. 1731. Pl. 1 to 1½ foot.

2 E. superbà (Royle, ex Benth. in Hook. bot. misc. 3. p. 281. lab. p. 637.) radical leaves large, pinnate; leaflets 2-3 pairs: lower ones petiolulate: outer one very long; all broad and coarsely crenate-lobed, green on both surfaces: floral leaves ovate, acute, almost quite entire; calyx amply tubular, scarcely dilated at apex. ♃. H. Native of the East Indies, at Kheere Pass, and Deyra Dhoon, Royle. Royle, ill. pl. himal. t. 74. Radical leaves 1½ foot long, the ultimate leaflet 10 inches long; petioles and petiolates villous; but the limb is almost glabrous. Stems woolly towards the top. Whorls 6-flowered, disposed in dense racemes. Calycine teeth ending in spiny mucrones. Corollas almost as in *E. laciniàta*, but yellow; tube exannulate. Appendages of upper filaments obtuse, scarcely fringed. Lobes of style equal.

Superb Eremostachys. Pl. 1 to 2 feet.

3 E. phlomoi'des (Bunge, in Ledeb. fl. alt. 1. p. 414. fl. ross. alt. ill. t. 122.) leaves ovate, toothed; calyx tubular, scarcely dilated at apex, with spreading spinose teeth. ♃. H. Native of Altaia, in saltish places, adjacent to the Arkaul and Dolenkara mountains. Stems branched, hairy from long soft white pili, as well as calyxes and bracteas. Radical leaves petiolate, obtuse; and floral leaves sessile, acute, spiny-toothed, narrowed at the base. Whorls 6-flowered, distinct. Bracteas subulate, spinose. Corolla pale yellow, one half smaller than in *E. laciniàta*. Appendages of upper filaments short, fringed.

Phlomis-like Eremostachys. Pl. 1 foot.

4 E. tuberòsa (Bunge, in Ledeb. fl. alt. 2. p. 415.) leaves ovate, toothed; calyx glabrous, tubular at the base, with a membranaceous rather spreading limb, which is shorter than the tube, and ending in 5 spinose teeth. ♃. H. Native of Siberia, at Lake Inderio. Molucélla tuberòsa, Pall. itin. 3. append. no. 101. t. 1. Leaves clothed with loose wool, and the petioles with dense wool, the rest of the plant glabrous; radical leaves petiolate; cauline ones sessile. Whorls 6-flowered, rather distant. Corolla cream-coloured, about twice as long as the calyx. Appendages of upper filaments, shortly fringed.

Tuberous-rooted Eremostachys. Pl. ½ to 1 foot.

5 E. molucelloi'des (Bunge, in Ledeb. fl. alt. 2. p. 416.) leaves ovate, toothed; base of calyx tubular, pubescent, and with the limb large and membranaceously dilated, furnished with 5 short mucrones. ♃. H. Native of the Kirghisean Steppe, in dry sandy places. Ledeb. fl. ross. alt. ill. t. 437. Phlòmis lanigera, Sievers in Pall. beytr. 7. ex Bunge. Root thick, tuberous. Stems usually almost simple, clothed with white wool at the knees and base, the rest with spreading white hairs. Radical leaves wrinkled, rather hispid above, and clothed with villous wool beneath. Whorls 6-flowered. Corolla cream-coloured, like that of *E. tuberòsa*. Genitals and achenia like those of *E. tuberòsa*.

Molucella-like Eremostachys. Pl. 1 to 2 feet.

Cult. For culture and propagation, see *Phlòmis*, p. 854.

XCVI. ERIOPHYTON (from *εριον, erion*, wool; and *φυτον, phyton*, a plant; in allusion to the plant, which is clothed with long white wool.) Benth. in Wall. pl. rar. asiat. 1. p. 63. lab. p. 638.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx membranous, amply campanulate, equal, 5-toothed. Corolla with an inclosed tube and a bilabiate limb; upper lip large, galeate, compressed, incumbent; lower lip small, trifid, with rounded lobes. Stamens 4, ascending, didynamous, the lower ones the longest; superior filaments appendiculately thickened at the base; anthers approximate by pairs, 2-celled: cells divaricate. Style about equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia dry, naked. This genus is nearly allied to *Eremóstachys*, but differs in the form of the calyx and corolla, as well as in habit, which is nearly that of *Phlòmis*.

1 E. Wallichia'num (Benth. in Wall. l. c.) ♃. F. Native of Nipaul, on Gosainsthun. Wall. Stems rising from a tuberous root, ? simple. Lower leaves small; superior and floral ones rhomboid or orbicular, subcuneated at base, sessile, crenated, very soft. Whorls 6-flowered. Calycine teeth rather

spiny at top. Corollas yellow; galea large, orbicular. The upper parts of the stems, leaves, calyxes, and galea of corolla clothed with very long loose white wool.

Wallich's Eriophytum. Pl.

Cult. For culture and propagation, see *Phlòmis*, p. 854.

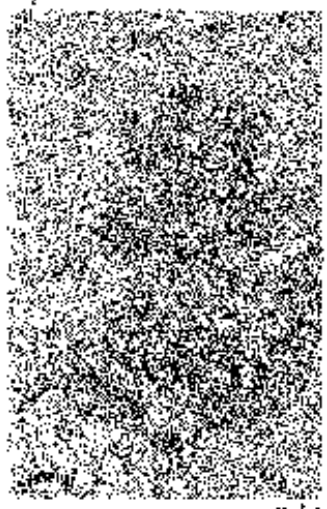
XCVII. MOLUCE'LLA (a dim. from Molucca Islands, of which one of the species was supposed to be a native.) Lin. gen. no. 724. Schreb. gen. 979. Gærtn. fruct. 1. p. 320. t. 66. Juss. gen. p. 115. Benth. lab. p. 639.—Molùcca, Tourn. Mœnch.—Chasmònia, Presl.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx obliquely campanulate at the base, striated; limb ample, dilated, reticulately veined, with 5-10 mucrones or spines. Corolla with an inclosed tube, which is obliquely annulate inside; limb bilabiate; upper lip erect, entire or emarginately bifid; lateral lobes of lower lip erectish; middle lobe spreading broad, obcordate. Stamens 4, didynamous, ascending, lower ones the longest; filaments naked at the base; anthers laterally pedicellate at the tops of the filaments, 2 celled: cells almost distinct, divaricate. Style about equally bifid at apex; stigmas nearly terminal. Achenia dry, acutely triquetrous, truncate at apex.—Annual quite glabrous herbs. Leaves petiolate, deeply crenated or cut; floral leaves similar to the cauline ones. Whorls axillary, many-flowered. Bracteas subulate, spinose.

1 M. læ'vis (Lin. spec. 821.) limb of calyx large, membranaceous, subpentagonal, with 5 very short mucrones or teeth. ☉. H. Native of Syria and Palestine. Sibth. et Smith, fl. græc. 6. p. 53. t. 566. Sims, bot. mag. t. 1852. Molùcca læ'vis. Riv. mon. t. 64. Mœnch, meth. p. 404.—Sabb. hort. rom. 3. t. 45. Plant quite glabrous in every part, smooth. Stem a little branched, floriferous almost from the base. Leaves on long petioles, roundish, coarsely crenated, rounded or cuneated at the base. Whorls usually 6-flowered, distant. Corolla white, shorter than the limb of the calyx, furnished with an almost complete membranaceous not pilose ring inside the throat.

Smooth Molucca Balm. Fl. July, Aug. Clt. 1570. Pl. 1 to 1½ foot.

2 M. spinòsa (Lin. spec. 821.) limb of calyx short, coriaceous, sub-bilabiate, with 8 spines. ☉. H. Native of the region of the Mediterranean; as of Sicily, Naples, Palestine, Mount Parnassus, &c. Sibth. et Smith, fl. græc. 6. p. 54. t. 567. Lam. ill. t. 510.—Sabb. hort. rom. 3. t. 46. Chasmònia incisa, Presl. fl. sic. 37. Bot. reg. 1244. M. armàta, Sieb. pl. exs. Molùcca spinòsa, Mœnch, meth. p. 404. Habit of *M. læ'vis*, but more rigid. Leaves smaller, with mucronulate teeth. Inflorescence and bracteas like those of *M. læ'vis*. Corolla exceeding the calyx a little, furnished with a pilose ring inside, cream-coloured.



Spiny Molucca Balm. Fl. July, Aug. Clt. 1596. Pl. 1½ to 2 feet.

Cult. The seeds of these plants should be reared on a hot-bed early in autumn or spring; and when the plants are of sufficient size they should be planted in separate pots, and kept under glass, until the middle of May, when they may be planted out of doors in any warm dry situation, where they will flower and seed freely; for if the seeds are sown out in the open ground in spring, the plants in this case come into flower so late that they seldom, if ever, ripen seed.

XCVIII. HOLMSKIO'LDIA (named in memory of Theodore Holmskiold; author of Coriphæi clavarias Ramarius complectentes, 1 vol. fol.: Copenhagen, 1790, and other works.) Retz, obs. 6. p. 31. Benth. lab. p. 642. Hastingia, Smith, exot. bot. 2. t. 80.—Platùnium, Juss. ann. mus. 7. p. 76.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx with a very short tube and a large subrotately campanulate, membranaceous, veiny, almost entire limb. Corolla with an elongated, incurved tube, which is naked inside, a subdilated throat, and a sub-bilabiate limb; upper lip bifid, with erectly spreading segments; lateral segments of the lower lip small, reflexed; middle one ovate, spreading. Stamens 4, ascending, didynamous, lower ones the longest and exserted; upper filaments dilated a little at the base; anthers 2-celled: cells parallel. Style nearly entire, or the upper lobe is very short, stigmatiferous at apex. Ovarium bipartite, with deeply bifid, scarcely bipartite lobes. Achenia rugose, rather fleshy.? Shrub with the habit of *Verbenàceæ*. Allied to *Molucélla* by the calyx; and to *Melissíneæ* in the corolla; and to the tribes *Prasièæ* and *Ajugoìdeæ*.

1 H. sanguínea (Retz. l. c.) ♄. S. Native of Hindostan and Silhet, &c. Hastingia coccínea, Smith, l. c. Platùnium rùbrum, Juss. l. c. Shrub with divaricate, tetragonal, glabrous, often tubercled branches. Leaves petiolate, ovate, acuminated, hardly toothed, somewhat truncate at the base, 2-4 inches long, glabrous, green on both surfaces. Racemules axillary, scarcely longer than the petioles, constantly composed of a few 2-4-flowered whorls. Calyx red or blood coloured. Corolla red. Genitals exserted. (fig. 87.)

Bloody-calyxed Holmskioldia. Fl.? Clt. 1796. Shrub.

Cult. Any light rich earth, or a mixture of equal parts of loam, sand, and peat, will suit this shrub; and young cuttings will be readily rooted in the same kind of soil in heat, with a hand-glass placed over them.

XCIX. HYMENOCRA'TER (from ὑμὴν, *hymen*, a membrane; and κρατὴρ, *krater*, a cup; in allusion to the large membranous calyx.) Fisch. et Meyer, ind. sem. hort. petrop. 1835. p. 39.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx with a short 13-nerved tube, and a large membranous spreading 5-cleft limb; lobes ovate. Corolla with an exserted tube and a sub-bilabiate limb; upper lip bipartite; lower lip tripartite, having the middle segment large and emarginate. Stamens inclosed, didynamous, ascending under the upper lip: cells of anthers divaricate. Stigma bilabiate. Achenia dry, subovate, glabrous, tubercled. This genus comes near to *Róylea* and *Holmskiòldia*, but differs from the first in the quinquefid limb of the calyx, bipartite upper lip of corolla, as well as in the divaricate cells of anthers; and from the latter in the spreading limb of calyx, exserted corolla, bipartite upper lip and tubercled achenia; and from *Molucélla* in the form of the corolla.

1 H. bituminòsus (Fisch. et Meyer, l. c.) ♄. F. Native of the North of Persia, on arid hills. A humble glabrous shrub, having leaves much like those of *Népeta Pannónica*, viscid, and smelling of bitumen. Cymes axillary, 5-7-flowered, crowded. Throat of calyx closed by villi. Corollas violaceous, painted with white lines. Achenia black.

Bituminous Hymenocrater. Shrub humble.

Cult. For culture and propagation, see *Phlòmis*, p. 854.

C. ACHYROSPE'RMUM (from ἄχυρον, *achyron*, chaff; and σπέρμα, *sperma*, a seed; so called because the achenia are

crowned by a paleaceous arillus.) Blum. bijdr. p. 840. Benth. lab. p. 643.

Lin. syst. *Didynámia, Gymnospérmia.* Calyx larger than the corolla, sub-bilabiate; upper lip erect, trifid; lower one a little shorter, spreading, bifid. Corolla longer than the calyx, tubular; limb bilabiate; upper lip short, erect, emarginate; lower lip semitrifid, the middle lobe large and concave. Stamens 4, nearly equal, ascending; anthers 1-celled. Achenia 4, inclosed in the permanent calyx, crowned by a paleaceous aril above. —Herbs with opposite toothed leaves, which are clothed with soft pubescence. Flowers verticillately spicate, terminal.

1 A. densiflórum (Blum. bijdr. p. 841.) spike cylindrical, dense-flowered; bracteas many-flowered; leaves obovate-oblong, acute, quite entire at the base. ♃.? S. Native of Java, on the edges of rivulets about Linga Jattie in the province of Cheribon.

Dense-flowered Achyrospermum. Pl. ½ to 1 foot.

2 A. rhlomoídes (Blum. bijdr. 841.) spike loose; bracteas 1-flowered, biglandular at the base inside; leaves obovate, obtuse, quite entire at the base. ♃.? S. Native of Java, in the higher woods, in humid places on Mount Burangrang.

Phlomis-like Achyrospermum. Pl. ½ to 1 foot.?

3 A. fruticósum (Benth. lab. p. 643.) shrubby, with pubescent branches; leaves ovate, obtuse, broadly crenated, rounded at the base, minutely glandular beneath, on cuneated winged petioles; whorls 6-flowered, disposed in loose terminal spikes. ♄. S. Native of Madagascar, Lyall, Bojer. Siphotáxis rósea. Bojer, mss. Ovarium densely beset with pubescent scales at apex. Calyx pubescent, with an oblique 5-toothed mouth. Corolla of *Holmskiöldia*, twice as long as the calyx, of a splendent rose colour.

Shrubby Achyrospermum. Shrub.

Cult. For culture and propagation, see *Holmskiöldia*, p. 856.

CI. COLQUHOUNIA (named in honour of Sir Robert Colquhoun, Bart., resident at Kamaon.) Wall. in Lin. trans. 13. p. 603. tent. fl. nep. 1. p. 13-14. Benth. lab. p. 644.

Lin. syst. *Didynámia, Gymnospérmia.* Calyx tubularly campanulate, 10-nerved, subincurved, almost equally 5-toothed, and having the throat naked inside. Corolla with an exserted incurved tube, which is naked inside, a dilated throat, and a bilabiate limb; upper lip erect, entire, flattish; lower one rather spreading, with 2 short ovate entire lobes. Stamens 4, ascending, didynamous, lower ones the longest; filaments naked at the base; anthers approximate, 2-celled: cells at length divaricate. Style about equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia oblong, dry, smooth, drawn out into a membrane at top.—Twining or scandent, usually tomentose, not pilose shrubs. Whorls loose, axillary, or approximating into a terminal spike. Bracteas minute. Corollas scarlet.

1 C. coccínea (Wall. l. c. tent. fl. nap. 1. p. 13. t. 6.) leaves nearly glabrous, roughish, canescent from fine tomentum while young, as well as the calyxes; calycine teeth ovate, obtuse; upper lip of corolla ovate. ♄. ⌒ G. Native of Nipaul. Hastingia scándens, Roxb.? Holmskiöldia scándens, Sweet.? Leaves ovate, acuminated, 3-4 inches long. Whorls few-flowered, approximating into a spike, which is leafy at the base, and sometimes disposed in short axillary racemules. Calyxes tomentose. Corolla scarlet, twice the length of the calyx.

Var. β, *parviflóra* (Benth. lab. p. 644.) young leaves and calyxes hardly tomentose. ♄. ⌒ S. Native of Gosainsthan.

Scarlet-flowered Colquhounia. Shrub twining.

2 C. vestíta (Wall. tent. fl. nap. 1. p. 14. pl. asiat. rar. 3. p. 43. t. 267.) under surfaces of leaves, stems, and calyxes clothed with white tomentum; calycine teeth ovate, obtuse; upper lip of corolla ovate. ♄. ⌒ G. Native of Kamaon, Wall. Corollas a little smaller than those of *C. coccínea*, but the habit is similar.

Clothed Colquhounia. Shrub twining.

3 C. elégans (Wall. pl. rar. asiat. 1. p. 65, and 3. p. 43. t. 268.) stems, leaves, and calyxes clothed with velvety pubescence; calycine teeth broad-lanceolate, acutish; upper lip of corolla oblong. ♄. ⌒ S. Native of Ava, on Mount Taong Dong. This differs from both the preceding by the calyx being one half smaller, in the corolla being more exserted, with a wider throat, and in the colour being orange, dotted with blood red, not scarlet.

Elegant Colquhounia. Shrub twining.

Cult. These elegant and curious shrubs are well fitted for ornamenting rafters in greenhouses or stoves. A light rich soil will answer them well, or one composed of equal parts of loam, sand, and peat; and young cuttings will strike root readily in the same kind of earth under a hand-glass in a little bottom heat.

Tribe X.

PRASIEÆ (the genera contained in this tribe agree with *Prásium* in the characters given below.) Benth. lab. p. 646. Calyx nearly equal. Corolla bilabiate. Stamens 4, ascending, didynamous; lower ones the longest. Achenia fleshy, rather baccate.

CII. GOMPHOSTE'MMA (from γομφος, *gomphos*, a club; and στεμμα, *stemma*, a crown; in reference to the tube of corolla being inflated above the middle.) Wall. pl. rar. asiat. 2. p. 12. Benth. lab. p. 646.

Lin. syst. *Didynámia, Gymnospérmia.* Calyx ovate-campanulate or tubular, nearly equal, 5-toothed, with the throat naked inside. Corolla with a straight usually exserted tube, which is exannulate inside, and inflated above the middle, bilabiate; lips nearly equal; upper one erect, entire, arched; lower lip spreading trifid. Stamens 4, ascending under the upper lip, lower ones the longest. Anthers approximate by pairs; cells parallel, transverse. Style about equally bifid at top, with subulate lobes; stigmas minute. Achenia fleshy.—Perennial herbs with usually simple erect stems, or with the stems procumbent and rooting at the base. Leaves generally ample, thick, villous or tomentose. Flowers rather large. Whorls sometimes spicate, and sometimes axillary and remote.

1 G. strobilínum (Wall. l. c. Benth. lab. p. 647.) stem erect; leaves elliptic-ovate, wrinkled, hispid above, and tomentose beneath; whorls crowded into a terminal spike or the lower ones are remote and axillary; floral leaves bractea-formed, broad ovate, exceeding the calyxes; calyx campanulate, clothed with soft tomentum, with ovate-lanceolate teeth; corolla about 3 times as long as the calyx. ♃. S. Native of the Burman Empire, at Meong, Prome, and on Mount Taong Dong. Stems tomentose, erect. Cauline leaves 6-10 inches long, and 3-6 broad. Corollas yellow, pubescent outside; tube exceeding the calyx, hardly incurved.

Strobile-spiked Gomphostemma. Pl. 1 to 3 feet.

2 G. villíre (Wall. l. c. Benth. l. c.) stem erect; leaves elliptic-ovate, flaccid, rather hispid above and pubescent beneath; whorls few-flowered, crowded into a short terminal spike; floral leaves bractea-formed, broad-ovate, exceeding the calyxes; calyx campanulate, clothed with soft villi: teeth lanceolate; corollas twice as long as the calyx. ♃. S. Native of the Burman Empire, in the province of Tavoy. Very nearly allied to *G. strobilínum*, but of more humble stature. Leaves pale green. Spike few-flowered. Calyx large.

Green Gomphostemma. Pl. 1 foot.?

3 G. Heynea'num (Wall. l. c. Benth. l. c.) stem erect; leaves elliptic-ovate, wrinkled, clothed with soft tomentum above and dense floccose tomentum beneath; whorls crowded into a terminal spike, or the lower ones are rather remote and axillary: floral leaves bractea-formed, broad-ovate, exceeding the calyxes; calyx campanulate, clothed with soft tomentum, with ovate-lanceolate teeth, which are hardly shorter than the corolla. ♃. S. Native of the Indian Peninsula, on mountains near Courtallum. Habit and stature of *G. strobilinum*, but differs in the tomentum being floccose, in the floral leaves being wrinkled above and tomentose, not glabrous, in the corollas being smaller, inclosed tube, &c.

Heyne's Gomphostemma. Pl. 1 to 3 feet.

4 G. oblóngum (Wall. l. c. Benth. lab. p. 648.) stem erect; leaves oblong-elliptic, wrinkled, rather hispid above, and clothed with dense tomentum beneath: floral leaves similar to the rest; whorls axillary, remote, few-flowered; calyx campanulate, tomentose, with lanceolate-linear elongated acute teeth; corolla 3 times as long as the calyx. ♄. G. Native of the Burman Empire in the province of Tavoy. Leaves smaller and narrower than in *G. strobilinum*. Whorls 2-4-axillary, 6-10-flowered. Corolla pubescent outside.

Oblong-leaved Gomphostemma. Pl. 1 to 2 feet.

5 G. lu'cidum Wall. l. c. Benth. l. c.) stem erect; leaves elliptic-ovate, shining above and pilosely hispid, and densely clothed with rufous tomentum beneath: floral leaves similar to the rest; whorls axillary, remote; calyx tubularly campanulate, tomentose, with short lanceolate teeth; corolla 3 times as long as the calyx. ♃. S. Native of the East Indies at Choppedong, on the Tenasserim coast; and in Pundua. Habit of the preceding, but more robust. Stems clothed with dense rufous tomentum. Leaves toothed or quite entire. Whorls 10-30-flowered. Corollas yellow, tomentose outside.

Shining Gomphostemma. Pl. 2 to 3 feet.

6 G. parviflòrum (Wall. l. c. Benth. l. c.) stem erect; leaves elliptic-ovate, pubescent above and tomentose beneath: floral ones conform to the rest; whorls axillary, remote, loosely many-flowered; bracteas lanceolate or linear, exceeding the calyxes; calyx campanulate, with lanceolate linear teeth, which are subulate at apex; corolla slender, twice as long as the calyx. ♃. S. Native of Nipaul, Silhet, and Penang. Habit of preceding, but the flowers are more numerous in the axils, loosely fasciculate. Corolla yellow, pubescent outside; throat less inflated.

Small-flowered Gomphostemma. Pl. 2 to 3 feet.?

7 G. multiflòrum (Benth. lab. p. 648.) stem erect; leaves elliptic, scarcely pubescent above, and tomentose beneath: floral leaves similar to the rest; whorls axillary, remote, loosely many-flowered; bracteas ovate, foliaceous, exceeding the calyxes; calycine teeth lanceolate-linear; corolla slender, many times longer than the calyx. ♃. S. Native of Silhet. This and *G. parviflòrum* differ from the other specimens in the form of the bracteas, &c.

Many-flowered Gomphostemma. Pl. 2 to 3 feet.?

8 G. crinítum (Wall. l. c. Benth. l. c.) stem erect: leaves elliptic-ovate, pubescent above, and tomentose beneath: floral leaves similar to the rest; whorls axillary, remote, loosely many-flowered; bracteas linear-setaceous, about equalling the calyxes; calyx tubularly campanulate, inflated in the fructiferous state, quite glabrous at the base, with elongated setaceous hispid teeth; corolla slender, twice as long as the calyx. ♃. H. Native of the Burman Empire, in the province of Tavoy. Habit, inflorescence, and corollas of *G. parviflòrum*, but the bracteas and calyxes are very distinct, and the leaves are more ample and less wrinkled.

Long-haired Gomphostemma. Pl. 2 to 3 feet.?

9 G. eriocárpum (Benth. in Wall. pl. rar. asiat. 2. p. 12. lab. p. 649.) stem ascending; leaves elliptic-oblong, coarsely toothed, rather hispid above and tomentose beneath; floral leaves similar to the others; whorls remote, few-flowered; bracteas ovate, denticulated; calyx campanulate, at length inflated, tomentose, with linear setaceous teeth; corolla villous, twice as long as the calyx; achenia tomentose. ♃. S. Native of the Indian Peninsula, near Courtallum. Stems elongated, slenderer than the preceding species. Leaves 3-4 inches long, and 1½ broad. Whorls few, about 10-flowered.

Woolly-fruited Gomphostemma. Pl. ascending.

10 G. ová'tum (Wall. l. c. Benth. l. c.) stem erectish, rooting at the base; leaves broad-ovate, shining and hispid above, but clothed with soft tomentum beneath: floral leaves similar to the rest; whorls axillary, remote, many-flowered; bracteas broad-ovate, outer ones about equalling the calyxes; calyx campanulate, villously tomentose, with lanceolate-linear teeth; corolla 3 times as long as the calyx. ♃. S. Native of Nipaul, Wall. Leaves smaller and broader than in the preceding. Corolla yellow, pubescent, nearly 1½ inch long.

Ovate-leaved Gomphostemma. Pl. 1 foot. ?

11 G. melissæfòlium (Wall. l. c. Benth. l. c.) stem creeping at the base, radicant; branches ascending; leaves ovate, nearly glabrous or rather hispid above, and sparingly tomentose beneath: floral leaves similar to the rest; whorls axillary, remote, loosely many-flowered; bracteas ovate: outer ones equalling the calyxes; calyx hispid, with lanceolate-linear teeth; corolla about 3 times as long as the calyx. ♃. S. Native of Silhet. Prásium melissæfòlium, Roxb. hort. beng. p. 45. fl. ind. 3. p. 26. Very nearly allied to *G. ovátum*, but differs in the creeping stems, in the leaves being scarcely tomentose beneath, and in the flowers being smaller.

Balm-leaved Gomphostemma. Pl. creeping.

12 G. velutí'num (Benth. in Wall. pl. rar. asiat. 1. p. 13. lab. p. 649.) stem creeping at the base, rooting; branches ascending; leaves ovate, thick, densely clothed with velvety pubescence on both surfaces: floral leaves similar to the rest; whorls axillary, remote, few-flowered; bracteas oblong, equalling the calyxes; calyx tomentose, with ovate-lanceolate teeth; corolla about twice as long as the calyx. ♃. S. Native of Silhet, Wall. Allied to *G. melissæfòlium*. Leaves 12-18 lines long, 8-15 lines broad. Corolla yellow, 11-12 lines long, with a slender tube, which is much dilated at top.

Velvety Gomphostemma. Pl. creeping.

13 G. philomoi'des (Benth. lab. p. 649.) leaves oblong, acute at both ends, denticulated, pilose above, and densely clothed with stellate tomentum beneath; flowers fascicled, axillary. ♃. S. Native of Java, in the higher mountain woods. Prásium phlomoides, Reinw. herb. ex Blume, bijdr. p. 840.

Phlomis-like Gomphostemma. Pl. ?

14 G. Java'nicum (Benth. lab. p. 650.) leaves rather large, oblong, acuminated at both ends, denticulated, hairy above, and clothed with stellate tomentum beneath; flowers subfascicled, axillary. ♃. S. Native of Java, in humid mountain woods. Prásium Javánicum, Blum. bijdr. p. 840.

Java Gomphostemma. Pl. ?

Cult. Plants of easy culture. Any light rich soil will suit the species; and they will be readily increased by cuttings and seeds.

CIII. PHYLLOSTE'GIA (from φύλλον, *phyllon*, a leaf; and στέγος, *stegos*, a covering; in allusion to the foliaceous lobes of the calyx.) Benth. in bot. reg. vol. 15. under no. 1292. lab. p. 650. Prásium species, Gaud. in Freyc. voy. pt. bot. p. 452.

Lin. syst. *Didynámia, Gymnospérmia.* Calyx campanulate, ovate or tubular, 10-nerved, nearly equal, sometimes quinquefid, with foliaceous lobes, and sometimes shortly 5-toothed. Corolla

having the tube exceeding the calyx, sometimes much exserted, usually incurved, exannulate inside, with a nearly equal throat and a bilabiate limb; upper lip spreading a little, entire, flattish: lower lip longer, spreading, trifid, with ovate lobes, the middle lobe larger and entire. Stamens 4, ascending under the upper lip; anthers 2-celled: cells diverging, at length divaricate. Style nearly entire, clavate at top or shortly bifid, with clavately divaricate or arched lobes; stigmas terminal, usually thickening into heads. Achenia fleshy.—Erect or ascending, almost simple herbs. Leaves petiolate, ovate, usually toothed. Whorls 6-10-flowered, disposed into a terminal loose raceme, or the lower whorls are axillary. Upper floral leaves small, bractea-formed. Bracteas small, subulate, or wanting.

1 P. dentàta (Benth. in bot. reg. vol. 15. lab. p. 651.) very hairy; leaves rounded at the base; racemes dense; calyx ample, with foliaceous toothed segments; lobes of style clavate. ♃.? G. Native of Owhyhee, on Mount Raah, and Byron's Bay, Macrae. Stem herbaceous, erect, nearly simple, beset with long stiff hairs like the rest of the plant. Leaves on long petioles, 3-4 inches long; upper floral leaves nearly sessile, shorter than the fructiferous calyxes. Whorls about 10-flowered. Corolla small.

Toothed-calyxed Phyllostegia. Pl. 1 foot.

2 P. vestìta (Benth. l. c.) very hairy; leaves roundly truncate at the base: floral leaves similar to the others; whorls axillary, distant; calyx ample, with foliaceous quite entire segments; lobes of style clavate. ♃.? G. Native of Owhyhee, in Byron's Bay. This differs from *P. dentàta*, in the leaves being smaller, and in the other characters given.

Clothed Phyllostegia. Pl. 1 foot.

3 P. grandifiòra (Benth. l. c.) nearly glabrous or clothed with adpressed pubescence; leaves rounded at the base; raceme loose; calycine teeth broad-ovate, foliaceous, quite entire, spreading; corolla incurved, more than thrice as long as the calyx; lobes of style arched. ♃.? G. Native of the Island Oahu. Prásium grandiflòrum, Gaud. in Freyc. voy. pt. bot. p. 453. t. 65. f. 2. Stems hard, procumbent or ascending. Leaves petiolate, 1-2 inches long, or the lower ones are 3 inches long, crenulated; upper ones small, bractea-formed. Whorls 6-flowered.

Great-flowered Phyllostegia. Pl. ascending.

4 P. Chamissònis (Benth. in Linnæa. 6. p. 79.) quite glabrous, rounded at the base; racemes loose; peduncles elongated, trifid; calyx shortly 5-toothed; corolla incurved, 4 times as long as the calyx. ♃.? G. Native of the Islands of Oahu and Mowee. Prásium glàbrum, Gaud. in Freyc. voy. pt. bot. p. 452. t. 64. Stem branched. Leaves almost the form of those of *P. grandiflòra*. Peduncles trifid towards the middle. Corollas size of those of *P. grandiflòra*.

Chamisso's Phyllostegia. Pl. 1 foot.

5 P. gla'bra (Benth. in bot. reg. vol. 15. lab. p. 652.) quite glabrous; leaves roundly cuneated at the base; racemes short, loose, leafy; lower peduncles elongated, trifid; calyx shortly 5-toothed; corolla erectish, scarcely 3 times the length of the calyx; lobes of style clavate. ♃.? G. Native of the Island of Oahu. Allied to the preceding, but differs in the stem being more branched, in the racemes being irregularly branched, and in the flowers being one half smaller.

Glabrous Phyllostegia. Pl. 1 to 2 feet.

6 P. macrophy'lla (Benth. l. c.) nearly glabrous or pubescent at top; leaves oblong, rounded at the base; raceme short, loose; calyx shortly 5-toothed; corolla straight, about 3 times as long as the calyx; lobes of style arched. ♃.? G. Native of several of the Sandwich Islands. Prásium macrophyllum, Gaud. in Freyc. voy. pt. bot. p. 453. t. 65. f. 3. Leaves nearly like those of *P. grandiflòra*, but narrower and longer. Inflorescence of *P. grandiflòra*. Corolla pubescent.

Long-leaved Phyllostegia. Pl. 2 to 3 feet.

7 P. parviflòra (Benth. in Linnæa. 6. p. 79.) pubescently villous; leaves rounded or cordate at the base, clothed with soft villi beneath; pedicels longer than the calyxes; calycine teeth short, acute; tube of corolla about 3 times as long as the calyx; lobes of style clavate, recurvedly divaricate. ♃. G. Native of the Island of Oahu. Prásium parviflòrum, Gaud. in Freyc. voy. pt. bot. p. 453. t. 65. f. 1. Phyllostègia leptóstachys, Benth. in bot. reg. vol. 15. Leaves broad-ovate, crenated, 3-4 inches long, canescent beneath. Corolla half an inch long, glabrous; tube a little incurved.

Small-flowered Phyllostegia. Pl. 1 to 2 feet.

8 P. mòllis (Benth. in Linnæa. 2. p. 79.) clothed with soft velvety pubescence; leaves cordate at the base; pedicels shorter than the calyxes; calycine teeth short, obtuse; tube of corolla exceeding the calyx a little; lobes of style clavate, recurvedly divaricate. ♃.? G. Native of the Sandwich islands. Whorls 6-flowered. Allied to *P. parviflòra* and *P. clavàta*.

Soft Phyllostegia. Pl. 1 to 2 feet.

9 P. clava'ta (Benth. in bot. reg. vol. 15. lab. p. 658.) pubescent; leaves roundly truncate at the base or subcordate; pedicels rather shorter than the calyxes; calycine teeth short, obtuse; tube of corolla exceeding the calyx a little; style clavate at apex, with flattened recurved stigmas. ♃.? G. Native of Owhyhee. Leaves form and size of those of *P. grandiflòra*, but less coriaceous and more villous. Whorls 6-10-flowered. Corollas small, pubescent.

Clavate-styled Phyllostegia. Pl. 1 to 2 feet.

10 P. racemòsa (Benth. l. c.) villous; leaves ovate-lanceolate, cordate at the base; whorls many-flowered; pedicels very short; corolla one half longer than the calyx; lobes of style clavate. ♃.? G. Native of Owhyhee, on Mount Raah, Macrae. Habit of *Stàchys grandidentàta*. Pubescence rather clammy. Leaves 1½ inch long. Whorls about 10-12-flowered. Corollas small, form of those of *P. clavàta*.

Racemose Phyllostegia. Pl. 1 foot.

11 P.? hirsu'ta (Benth. l. c.) very hairy; leaves ample, cordate at the base; racemes branched; calyx glabrous, shortly 5-toothed. ♃.? G. Native of the island of Oahu, Macrae. Stem as in *P. dentàta*. Calyxes as in *P. mòllis*.

Hairy Phyllostegia. Pl. 1 to 2 feet.

12 P. floribu'nda (Benth. lab. p. 653.) pubescent or hairy; leaves elliptic, ample, rounded at the base or narrowed; cymes axillary, loosely much branched, many-flowered, very hairy; calyx hairy, with linear teeth, which are about equal in length to the tube of the corolla; corolla exceeding the calyx a little. ♃.? G. Native of the Sandwich islands, Nelson. Branches hard, woody.? Leaves on long petioles, 2-5 inches long. Corymbs or cymes as in *Bystropógon*. Corollas small, almost like those of *P. racemòsa*, but more slender.

Bundle-flowered Phyllostegia. Pl. 1 to 2 feet.

Cult. For culture and propagation, see *Gomphostémma*, p. 858.

CIV. STENOGYNE (from στενος, *stenos*, narrow; and γυνη, *gyne*, a female; so called in reference to the subulate lobes of the style.) Benth. in bot. reg. vol. 15. lab. p. 654.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate-campanulate, 10-nerved, nearly equal or obliquely bilabiate; sometimes 5-cleft, with ovate foliaceous lobes; and sometimes 5-toothed, having the 3 upper teeth less deeply cleft than the lower ones. Corolla with the tube exceeding the calyx, and incurved, and usually furnished with a pilose ring inside; a dilated throat, and a bilabiate limb; upper lip erect, emarginate; lower lip spreading trifid, with nearly equal entire segments. Stamens 4, ascending under the upper lip; anthers 2-celled: cells at

length divaricate. Style almost equally bifid at top, with subulate lobes; stigmas minute. Achenia fleshy.—Branched, procumbent, ascending or erect herbs, with divaricate subscandent? branches. Leaves usually coriaceous, crenated. Whorls about 6-flowered, axillary, distant, or approximate at the tops of the branches. Floral leaves similar to the cauline ones. Bracteas small, subulate, or almost wanting. This genus differs chiefly from *Phyllostègia* in the form of the style and corolla, and in the axillary inflorescence.

1 S. macra'ntha (Benth. l. c.) very hairy; leaves petiolate, ovate, cordate at the base; whorls axillary, distant; pedicels equalling the calyxes. ♃.? G. Native of Owhyhee, on Mount Raah, Macrae.

Large-flowered Stenogyne. Pl.

2 S. se'ssilis (Benth. lab. p. 654.) glabrous; leaves sessile, roundish, cordate at the base, coriaceous; whorls approximate at the tops of the branches. ♃.? G. Native of the Sandwich islands, Menzies. Stem glabrous or pilose at the nodi. Whorls few, secund. Corolla villous, twice as long as the calyx. Genitals exserted a little.

Sessile-leaved Stenogyne. Pl. ascending.

3 S. cordà'ta (Benth. lab. p. 654.) glabrous; lower leaves on short petioles: upper ones sessile, all ovate and cordate at the base, coriaceous; whorls axillary, distant. ♃.? G. Native of the Sandwich islands, Nelson. Allied to *S. sèssilis*, but differs in the more slender branches, smaller narrower leaves, inflorescence, and smaller flowers.

Cordate-leaved Stenogyne. Pl.

4 S. rugòsa (Benth. in bot. reg. vol. 15. lab. p. 655.) glabrous; leaves on short petioles, oblong, coriaceous, roundly truncate at the base; whorls axillary, distant; pedicels shorter than the calyxes. ♃.? G. Native of Owhyhee, on Mount Raah, Menzies. Stems erect.? Leaves 1½ to 2 inches long, rough. Whorls about 6-flowered; corolla scarcely twice as long as the calyx, nearly glabrous.

Wrinkled-leaved Stenogyne. Pl. erect.

5 S. microphy'lla (Benth. lab. p. 655.) glabrous; leaves small, petiolate, acute, narrowed at the base; whorls few, 2-flowered, secund; calyxes on short pedicels, equalling the leaves in length. ♃.? G. Native of Owhyhee, at Mount Raah, Macrae. Branches subscandent. Leaves scarcely 3-4 lines long, acutely serrated. Pedicels bibracteate under the calyxes. Corolla twice as long as the calyx.

Small-leaved Stenogyne. Pl. scandent.?

6 S. scrophulariοi'des (Benth. in bot. reg. vol. 15. lab. 655.) quite glabrous; leaves petiolate, ovate, flaccid; whorls axillary, distant; fructiferous pedicels longer than the calyxes; corolla pubescent, twice as long as the calyx. ♃.? G. Native of the Sandwich islands, Menzies. Branches subscandent.? Leaves 1 to 1½ inch long, roundly truncate at the base. Whorls 6-flowered. Corollas pubescent.

Figwort-leaved Stenogyne. Pl. scandent.?

7 S. Nelsòni (Benth. lab. p. 655.) glabrous; leaves petiolate, ovate, rather flaccid; whorls axillary, distant; fructiferous pedicels longer than the calyxes; corolla nearly glabrous, 3-4 times longer than the calyx. ♃.? G. Native of the Sandwich islands, Nelson. Allied to *S. scrophularioìdes*, but differs in the larger subcoriaceous leaves, many-flowered whorls, longer calyxes, longer corollas, and much exserted stamens.

Nelson's Stenogyne. Pl.

Cult. For culture and propagation, see *Gomphostémma*, p. 858.

CV. PRA'SIUM (from πρασιον, a name given by Dioscorides to a plant resembling Horehound or Marjoram, and called by Pliny *Pràsium*.) Lin. gen. no. 737. Schreb. gen. no. 992. Gærtn. fruct. 1. p. 321. t. 66. Juss. gen. p. 117. Benth. lab. p. 655.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, 10-nerved, irregularly bilabiate; upper lip shortly trifid; lower lip deeply bifid; all the segments ovate and foliaceous. Corolla with an inclosed tube, furnished with a ring of scale-like hairs inside, and a bilabiate limb; the upper lip ovate, entire, and the lower lip trifid: the middle segment the largest and entire. Stamens 4, ascending under the upper lip; anthers 2-celled: cells at length divaricate. Style about equally bifid at top, with subulate lobes; stigmas minute. Achenia fleshy.

1 P. ma'jus (Lin. spec. 838.) ♄. F. Native of Europe and the North of Africa, in the region of the Mediterranean, and of Madeira. Sibth. et Smith, fl. græc. t. 584. P. minus, Lin. spec. p. 838.—Sabb. hort. rom. 3. t. 37.—Zan. hist. t. 80.—Mor. hist. 3. p. 408. sect. 11. t. 21. f. 3.—Barrel. icon. t. 895. A divaricately branched, usually glabrous evergreen shrub, rarely with some of the young leaves hispid. Leaves ½ to 1 inch long, ovate, acute, roundly truncate at the base or subcordate, irregularly serrate crenated; floral leaves similar, or the upper ones are smaller and more entire, all exceeding the calyxes. Whorls 2-flowered, distant, axillary. Flowers on short pedicels. Corollas white or pale purple, glabrous. Stamens inclosed.

Greater Prasium. Fl. June, Aug. Clt. 1699. Shrub 1 to 2 feet.

Cult. This is a curious evergreen small shrub, which will survive our milder winters in the open air if grown in a dry sandy or gravelly soil, in a sheltered situation; but in moist strong ground it is sure to perish. A reserve plant or two should be grown in pots, that they may be sheltered by placing under a frame in winter. The plant is readily increased by cuttings and seeds.

Tribe XI.

AJUGOI'DEÆ (from *Ajuga*, Bugle; and *idea*, similar; this tribe contains genera agreeing with *Ajuga* in the characters given below.) Benth. lab. p. 657. Upper lip of corolla sometimes very short, sometimes cleft, with cast down, rarely erect, arched segments; lower lip elongated. Stamens 2-4, ascending, usually exserted, opposite the lip. Achenia more or less reticulately wrinkled. In many *Ajugoìdeæ*, especially in some *Teùcria*, *Ajuga*, *Cymària*, &c., the ovarium is less deeply cleft than in other *Labiàtæ*; and in *Cymària* it is very evidently bipartite, with bifid divisions, instead of being equally 4-parted; thus connecting the tribe with the closely allied order of *Verbenàceæ*, ex Benth.

CVI. AMETHY'STEA (so called from the amethystine colour of the flowers.) Lin. gen. no. 34. Schreb. gen. no. 45. Gærtn. fruct. 1. p. 315. t. 66. Juss. gen. 111. Benth. lab. p. 657.

Lin. syst. *Diàndria, Monogynia.* Calyx sub-globose, campanulate, erect, equal, 5-toothed. Corolla having the tube shorter than the calyx, exannulate inside, and a declinate limb; the 4 upper lobes nearly equal, and cast down, and the lower lobe larger. Stamens 2, (inferior,) ascending, exserted between the upper segments of the corolla; the rudiments of the 2 upper ones minute and filiform; anthers 2-celled: cells at length divaricate and sub-confluent. Style almost equal, bifid at apex. Achenia reticulately wrinkled.—This genus only differs from *Teùcrium* in the abortion of the upper stamens. In habit it closely resembles *Teùcrium corymbòsum*.

1 A. caru'lea (Lin. spec. p. 30.) ☉. II. Native of Asiatic Russia; as of Altaia, Dahuria, &c., Pallas; and of

China, Sir G. Staunton. Sims, bot. mag. t. 2448.—Hall. in comm. gœtt. 1751. t. 10. act. ups. 1742. p. 51. f. 1. Herb erect, branched, glabrous, often bluish. Leaves petiolate, 3-5-parted; segments oblong-lanceolate, deeply toothed; floral leaves smaller: upper ones minute. Cymes peduncled, loose, racemosely panicled. Bracteas minute. Calyxes erect, bluish, quite glabrous, with lanceolate acute teeth. Corolla blue, scarcely exceeding the calyx.

Blue-flowered Amethystea. Fl. June, July. Clt. 1759. Pl. 1 to 1½ foot.

Cult. This being a hardy annual, the seeds of it should be sown in the open ground, where the plants are intended to remain.

CVII. TRICHOSTE'MA (from *θριξ τριχος, thrix trichos*, a hair; and *στημων, stemon*, a stamen; in reference to the capillary filaments.) Lin. gen. no. 733. Schreb. gen. no. 988. Juss. gen. no. 116. Benth. lab. p. 658.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx sometimes campanulate, nearly equal, deeply 5-cleft, sometimes depressedly campanulate, very oblique, with the 3 upper teeth (from the twisting of the pedicel inferior) elongated and connate; and the 2 lower ones (superior) very short. Corolla with a slender, usually exserted tube, which is exannulate inside, and a somewhat equally 5-cleft limb; segments oblong, declinate: lower ones scarcely larger. Stamens 4, didynamous: lower ones the longest, and much exserted; filaments sometimes monadelphous; anthers about 2-celled: cells divaricate or diverging. Style bifid at apex; lobes subulate; stigmas minute.—Herbs, with quite entire leaves, and axillary or racemose inflorescence. Very nearly allied in character to *Teùcrium*, but differs in habit. *Isánthus* ought probably to be placed near this genus.

Sect. I. Streptopòdium (from *στρεπτος, streptos*, twisted; and *πους ποδος, pous podos*, a foot; in allusion to the pedicels being twisted.) Benth. lab. p. 658. Calyx very oblique, reversed from the twisted pedicel. Pedicels solitary, opposite, 1-flowered.

1 T. linea're (Nutt. gen. amer. 2. p. 39.) glabrous; leaves linear; flowers reversed. ☉. H. Native of North America, from Philadelphia and New Jersey to Louisiana. T. dichótomum, Roth, nov. pl. spec. p. 280. T. brachiàtum, Lam. ill. 3. t. 515. but not of Lin.—Dill. elth. t. 285. f. 369.? Hardly differing from *T. dichótomum*, unless in being constantly glabrous, taller in stature, larger corollas, &c. Flowers purple or blue.

Linear-leaved Trichostema. Fl. June, Aug. Clt. 1759. Pl. 1 foot.

2 T. dicho'tomum (Lin. spec. p. 834.) glabrous or pubescent; leaves petiolate, oblong; flowers reversed. ☉. H. Native of North America, from Canada to Carolina. T. pilósum, Roth, nov. pl. spec. p. 280. Herb paniculately branched at top. Lower leaves about an inch long: upper floral ones bractea-formed, shorter than the pedicels. Flowers secund. Corollas small, blue or purple.

Dichotomous-branched Trichostema. Fl. June, Aug. Clt. 1759. Pl. ½ to 1 foot.

Sect. II. Orthopo'dium (from *ορθος, orthos*, straight; and *πους ποδος, pous podos*, a foot; in reference to the straight pedicels.) Benth. lab. p. 659. Calyx straight, equal. Cymes many-flowered.

3 T. oblóngum (Benth. lab. p. 659.) pubescent or villous; leaves oblong, narrowed at the base; cymes axillary; calyx about 5-cleft; tube of corolla inclosed. ☉. H. Native of North-west America, in grassy places about Fort Vancouver, Douglas. Leaves green, distant, about an inch long, obtuse. Whorls remote. Corolla small, blue or purple.? Genitals exserted, *free*.

Oblong-leaved Trichostema. Pl. ½ to 1 foot.

4 T. lanceola'tum (Benth. lab. p. 659.) villous; leaves lanceolate; cymes axillary; calyx equally 5-cleft; tube of corolla exserted. ☉.? H. Native of North-west America, near Fort Vancouver, in dry places at the river Multnomah; and of New California. Herb branched, hard at the base, and probably perennial. Leaves sessile, an inch long, stem-clasping at the base. Whorls secund, distant. Corollas pubescent. Genitals exserted. Filaments connate at the base.

Lanceolate-leaved Trichostema. Pl. ½ to ¾ foot.

5 T. lana'tum (Benth. lab. p. 659.) leaves linear, with revolute edges; flowers racemose, woolly; calyx about equally 5-cleft; tube of corolla much exserted. ☉.? H. Native of California, Douglas. Perennial or shrubby.? Branches clothed with hoary tomentum. Leaves numerous, fasciculated, form of those of rosemary, 1-2 inches long, glabrous above, and tomentose beneath. Upper floral leaves bractea-formed. Whorls sub-secund, rather loose, 10-20-flowered. Corolla woolly. Genitals exserted. Filaments free.

Woolly Trichostema. Pl. 1½ foot.

Cult. The seeds of these annual plants should be sown in autumn, in pots filled with light earth; and in winter the pots should be placed under a frame, to shelter them from frosts, but expose them at all times to the open air when the weather is mild. In the spring transplant them on to a bed of light earth, shading them from the sun until they have taken root.

CVIII. TEU'CRIUM (so named from Teucer, son of Scamander, and father-in-law of Dardanus, king of Troy.) Lin. gen. no. 706. Schreb. gen. no. 960. Juss. gen. p. 112. Benth. lab. p. 660.—Chamæ'drys, Scorodònia, Scórdium, and Pòlium, Tourn. inst. t. 93. 97. and 98. and Mœnch. Leucoscéptrum, Smith.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular or campanulate, rarely inflated, 5-toothed; teeth equal, or the superior one is broadest. Corolla with a short tube, which is exannulate inside; the 4 upper segments of the limb nearly equal, or the uppermost one is broader or longer, sometimes oblong and declinate, and sometimes very short, and erectish; lower segment very large, roundish or oblong, usually concave. Stamens 4, exserted between the upper segments, didynamous; the lower ones the longest; cells of anthers confluent. Style about equally bifid at apex; stigmas minute. Achenia more or less wrinkled.—Herbs and shrubs, variable in habit and inflorescence.

Sect. I. Leucoscе'ptrum (from *λευκος, leucos*, white; and *σκηπτρον, sceptrum*, a sceptre; in allusion to the long verticillate spikes of white flowers.) Benth. lab. p. 663.—Leucoscéptrum, Smith, exot. bot. p. 113. Whorls many-flowered, densely spicate. Calyx turbinate, incurved, with nearly equal teeth. Corolla incurved, reflexed; the upper segments very short, broad, truncate, erect.—An Indian shrub, clothed with hoary tomentum.

1 T. macrosta'chyum (Wall. mss. ex Benth. lab. p. 663.) shrubby; branches hoary; leaves oblong, clothed with dense white tomentum beneath; whorls many-flowered, densely spicate; calyx almost equally toothed; upper segments of corolla

very short and erect. ♄. G. Native of Nipaul and Silhet. Leucoscéptrum cánum, Smith, exot. bot. p. 113. t. 116. Clerodéndron Leucoscéptrum, D. Don, prod. fl. nep. p. 103. Leaves crowded at the tops of the branches, 6-8 inches long. Spikes 3-6 inches long. Corollas white, hardly exceeding the calyxes. Genitals much exserted.

Long-spiked Germander. Fl.? Clt. 1826. Shrub 6 feet.?

SECT. II. TEUCRÓPSIS (an alteration of the generic name.) Benth. lab. p. 664. Teucrópsis, Ging. in herb. D. C. mss. Whorls 2-flowered, axillary, or disposed in terminal racemes. Calyx campanulate, declinate; the upper tooth broader, and spreading. Corolla tomentose outside; the upper segments very short, broad, truncate, erect, or hardly declinate.—Hoary shrubs, natives of the Canary Islands.

2 T. HETEROPHY'LLUM (Lher. stirp. 1. p. 84.) shrubby; branches hoary; leaves ovate-elliptic, hoary beneath, or on both surfaces: floral ones similar to the rest; whorls 2-flowered, axillary, remote; calyx straight, with equal teeth; superior segments of corolla very short, erect; ovaria very villous. ♄. G. Native of the Canary Islands. T. Canariénse, Lam. dict. 2. p. 692. Leaves petiolate, 1-2 inches long, obtuse, quite entire, or crenated towards the top. Corolla dark purple, twice as long as the calyx. Genitals much exserted. Whorls 2-4 flowered.

Various-leaved Germander. Fl. June, July. Clt. 1759. Shrub 4 to 6 feet.

3 T. BETÓNICUM (Lher. stirp. 1. p. 83. t. 49.) shrubby; branches clothed with hoary tomentum; leaves ovate-oblong, hoary beneath or on both surfaces; whorls 2-flowered, secund, loosely racemose; floral leaves bractea-formed; calyx declinate, with the upper tooth very large; superior segments of corolla very short: uppermost one broad, erect: lateral ones sub-declinate, tomentose; achenia very villous. ♄. G. Native of Madeira, among rocks. Sims, bot. mag. t. 1114. T. betonicæfòlium, Jacq. coll. 1. p. 145. t. 17. f. 2. T. canéscens, Forst. comm. gœtt. 9. p. 58. ex Willd. T. Maderénse, Lam. dict. 2. p. 692. Scorodònia betonicæfòlia, Link, handb. p. 458. Leaves 1 to 1½ inch long, crenated. Racemes loose, 3-6 inches long. Corolla purple or lilac, pubescent; tube a little exserted. Genitals much exserted.

Betony Germander. Fl. May, Aug. Clt. 1775. Shrub 2 to 3 feet.

SECT. III. TEU'CRIS (see genus for derivation.) Benth. lab. p. 668. Teûcris, Ging. in herb. D. C. mss. Peduncles axillary, opposite, 1-flowered: or loosely cymose, many-flowered. Calyx campanulate, erect, equal, 5-toothed or 5-cleft. Four upper segments of corolla oblong, declinate, but the lower one is oblong and concave. Achenia reticulately wrinkled, glabrous, rarely very villous.—Herbs, under-shrubs, or shrubs, with quite entire or cut, rarely crenated leaves.

4 T. FRUTI'CANS (Lin. spec. 787.) shrubby; leaves ovate, quite entire, flat, clothed with white tomentum beneath; peduncles 1-flowered; calyx tomentose, campanulate, equal, with ovate obtuse teeth. ♄. F. Native of Europe and Africa, in the region of the Mediterranean; as of Barbary, Spain, Italy, Naples, Corsica, Melita. Sibth. et Smith, fl. græc. 6. p. 23. t. 572. Dill. hort. elth. t. 284. f. 368. T. latifòlium, Lin. spec. p. 788. Curt. bot. mag. t. 245. T. tomentòsum, Mœnch, meth. p. 382. Zan. hist. t. 163.—Subb. hort. rom. 3. t. 98. —Barrel. icon. t. 512. Shrub divaricately branched. Leaves on short petioles, glabrous and green above, or loosely cobwebbed. Racemes terminal, or in short, lateral, few-flowered branches. Corolla blue or purple, twice as long as the calyx. In Italian and Melita specimens, the leaves are sometimes rufescent beneath.

Shrubby Germander. Fl. June, Sept. Clt. 1640. Shrub 2 to 3 feet.

5 T. BREVIFO'LIUM (Schreb. unilab. p. 27.) shrubby; leaves oblong, quite entire, with revolute margins, canescent on both surfaces; racemes short; peduncles 1-flowered; calyx tomentose, campanulate, equal, semiquinquefid. ♄. F. Native of Candia, on the sea shore, Melos and Astypalea; among rocks. Sibth. et Smith, fl. græc. 6. p. 24. t. 528. T. Créticum, Lam. dict. 2. p. 692. but not of Lin. Shrub divaricately much branched. Branches short, leafy. Leaves scarcely ½ an inch long, obtuse, sessile: floral leaves similar to the others. Calycine teeth acute. Corolla purplish or red, similar to those of *T. Créticum*. (fig. 88.)

FIG. 88.

Short-leaved Germander. Fl. June, July. Clt. 1824. Shrub 1 to 2 feet.

6 T. CRE'TICUM (Lin. spec. p. 788.) shrubby; leaves oblong-linear, quite entire, with revolute edges, and clothed with white tomentum beneath, but at length almost glabrous above; racemose elongated, strict; flowers nearly sessile, solitary or by threes; calyx clothed with white tomentum, campanulate, with acute teeth. ♄. F. Native of the region of the Mediterranean, and of the Islands of Cyprus, Melos, and Astypalea, among rocks; also of Palestine and Egypt. Sibth. et Smith, fl. græc. 6. p. 25. t. 529. T. hyssopifòlium, Schreb. unil. p. 28. T. rosmarinifòlium, Lam. dict. 2. p. 693. T. Charamoniénse, Cav. descr. 1. p. 82.—Alp. exot. 103. t. 102.—Mor. hist. 3. p. 410. sect. 11. t. 16. f. 3. Leaves approximate at the base of the branches, very like those of rosemary. Whorls 2-6-flowered. Corollas reddish purple. Genitals shorter than the lip.

Cretan Germander. Fl. July, Aug. Clt. 1824. Shrub 1 to 3 feet.

7 T. RACEMO'SUM (R. Br. prod. p. 504.) stem herbaceous, strict, branched; leaves small, oblong: lower ones a little toothed: superior ones quite entire, all glabrous above, and clothed with white tomentum beneath; racemes elongated, strict; peduncles 1-flowered; calyx campanulate, tomentose, equal. ♃.? G. Native of New Holland, on the south coast, R. Br.; in bogs at the river Lachlan, Cunningham. Branches twiggy, canescent. Leaves hardly ½ an inch long, but generally much smaller, furnished with 1-2 teeth on both sides. Corolla downy outside. Genitals shorter than the lip.

Racemose Germander. Pl. erect.

8 T. LANCEOLA'TUM (Benth. lab. p. 666.) herbaceous?; leaves lanceolate, narrowed at the base: lower ones a little toothed: upper ones quite entire, all clothed with canescent pubescence beneath; cymes axillary, pedunculate, corymbose; calyx pubescent, campanulate, with lanceolate acute nearly equal teeth. ♃.? G. Native of New Holland, near Bathurst. Branches ascending, pubescent. Leaves 1 to 1½ inch long. Cymes loose, longer than the leaves. Corolla pubescent, twice as long as the calyx; lobes all nearly equal. Stamens exserted.

Lanceolate-leaved Germander. Pl. ascending.

9 T. CORYMBO'SUM (R. Br. prod. p. 504.) herbaceous?; cloth-ed with fine pubescence; leaves ovate, toothed or cut, green on

both surfaces: cymes axillary, pedunculate, corymbose; calyx nearly glabrous, campanulate, with lanceolate acute teeth. ♃.? G. Native of New Holland, among rocks about Port Jackson; and of Van Diemen's Land. Stem a little branched. Leaves distant: lower ones an inch long: upper floral ones minute, quite entire, clothed with fine pubescence above, and tomentose pubescence beneath. Cymes 5-7-flowered. Genitals exserted.

Corymbose-flowered Germander. Pl. 1 to 2 feet.

10 T. CAPE'NSE (Thunb. prod. p. 95.? Benth. lab. p. 667.) herbaceous, finely pubescent; leaves cuneated at the base, 3-5-cleft, with lanceolate-linear entire or 3-5-cleft segments, green on both surfaces, or canescent beneath; cymes axillary, pedunculate, corymbose; calyx glabrous, campanulate, equal, deeply 5-cleft, with lanceolate acute segments. ♃.? G. Native of the Cape of Good Hope. A'juga Capénsis, Pers. ench. 2. p. 109. Peduncles sub-secund, filiform, 3-5-flowered. Corolla hardly larger than the calyx. Stamens one half longer than the calyx.

Cape Germander. Pl. 1 to 3 feet.

11 T. ORIENTA'LE (Lin. spec. p. 786.) herbaceous, erect, nearly glabrous; leaves bipinnate, with linear, quite entire, or cut segments, green on both surfaces; peduncles loosely racemose; pedicels much longer than the floral leaves; racemes panicled; calyx glabrous, campanulate, with lanceolate equal acute teeth. ♃. H. Native of Asia Minor, and Caucasus, on the gravelly banks of rivulets; as of Armenia, Syria, Iberia. Sims, bot. mag. t. 1279.—Riv. mon. irr. 19.?—Commel. rar. t. 25. Herb branched, sometimes glabrous, and sometimes pubescent or canescent. Lower leaves 1½ to 2 inches long. Corollas glabrous, blue; lower segment large. Genitals longer than the lip.

Eastern Germander. Fl. July, Aug. Clt. 1752. Pl. 1 foot.

12 T. PARVIFLO'RUM (Schreb. unilab. p. 31. icone.) herbaceous, clothed with soft tomentum; leaves deeply twice or thrice ternate; the segments of the lower leaves broad, obtuse; of the superior ones linear; peduncles much longer than the floral leaves, divaricate, 1-flowered; racemes panicled; calyx clothed with soft tomentum, campanulate, equal, semiquinquefid. ♃. H. Native of Armenia and Syria. Stem erect, trichotomously much branched at top, canescent as well as the leaves and calyxes. Floral leaves minute. Corollas small, numerous, hardly longer than the calyxes, blue.

Small-flowered Germander. Pl. 1 to 3 feet.

13 T. OLIVIERIA'NUM (Ging. in herb. D. C. mss. ex Benth. lab. p. 668.) herbaceous, clothed with soft pubescence; leaves cuneiform, deeply toothed at apex, or 3-5-cleft; peduncles much longer than the floral leaves, divaricate, 1-flowered; calyx villous, campanulate, equal, deeply 5-cleft. ♃. F. Native of Syria, between Aleppo and Bagdad, Olivier. Stems leaves, and calyxes canescent. Lower leaves petiolate, 1½ inch long; the upper ones much smaller, and nearly sessile. Flowers disposed in a few-flowered panicle. Lip of corolla 3 times as long as the calyx. Achenia very villous.

Olivier's Germander. Pl. 1 foot.

14 T. CAMPANULA'TUM (Lin. spec. 786.) herbaceous, procumbent, glabrous; leaves sub-bipinnatifid, with linear, cuneated, quite entire, or cut, divaricate segments, glabrous on both surfaces; flowers solitary, almost sessile, shorter than the leaves; calyx campanulate, equal, glabrous. ♃. F. Native of the region of the Mediterranean; as of Spain, Balearic Islands, Sicily, Naples. T. diversifòrum, Mœnch, ex Steud. nom. p. 828.—Riv. mon. irr. t. 24.? Stems prostrate at the base. Branches ascending a little. Corollas blue. Stamens shorter than the lip. Floral leaves less cut, exceeding the flowers.

Campanulate-calyxed Germander. Fl. July, Aug. Clt. 1728. Pl. prostrate.

15 T. CUBE'NSE (Lin. mant. p. 80.) herbaceous, glabrous; lower leaves ovate-cuneated, obtuse, deeply toothed: superior leaves deeply trifid or pinnate, with lanceolate or linear flat segments, green on both surfaces; peduncles axillary, 1-flowered, shorter than the floral leaves; calyx campanulate, equal, glabrous, deeply 5-cleft; stamens scarcely twice as long as the calyx. ♂. S. Native of Mexico, near Papantla, Tampico, Vera Cruz; Texas; Island of Cuba; Bahama Islands; South of Brazil; Buenos Ayres; Mendoza, and Cordova. Jacq. amer. p. 172. t. 188. f. 74. obs. 2. p. 5. t. 30. T. lævigàtum, Vahl, symb. 1. p. 40. T. chamædrifòlium, Mill. dict. no. 15.—Herb erect, branched, densely leafy. Lower leaves broad, cut to the middle. Racemes terminal, subsecund. Corollas blue, glabrous or pubescent; lip hardly twice the length of the calyx.

Cuba Germander. Fl. May. Clt. 1788. Pl. 1 foot.

16 T. BI'COLOR (Smith, in Rees' cycl.) herbaceous, glabrous; leaves ovate-oblong or lanceolate, obtuse, quite entire or cut, green on both surfaces; peduncles axillary, 1-flowered, shorter than the floral leaves; calyx campanulate, equal, glabrous, semiquinquefid; stamens about 3 times as long as the calyx. ♃. F. Native of Chili, on the mountains; and in Pampas de Santa Fe, Gillies. T. heterophýllum, Cav. icon. 6. p. 56. t. 577. T. orchideum, Lindl. bot. reg. t. 1255. Leaves about an inch long, or cut into a few segments, sometimes nearly ovate, trifid; the young ones often linear, quite entire, and trifid. Corollas yellowish, tinged with red; tube inclosed.

Two-coloured Germander. Fl. July, Aug. Clt. 1826. Pl. 1 to 2 feet.

17 T. NUDICAU'LE (Hook. bot. misc. 2. p. 235?) herbaceous? glabrous, or clothed with fine pubescence; branches twiggy, nearly naked; leaves small, remote, trifid, with linear obtuse segments, green on both surfaces; flowers on short peduncles, solitary, spicately racemose; calyx campanulate, equal, semiquinquefid, and is, as well as the corollas, pubescently hairy. ♃.? G. Native of Peru, in the valley of Canta, Cruikshanks. Flowers approximate towards the tops of the branches. Corollas almost of *T. bicolor*, but more villous, and the lower segment smaller.

Naked-stemmed Germander. Pl. 1½ foot.

18 T. AFRICA'NUM (Thunb. prod. p. 95.? Benth. lab. p. 669.) suffruticose; branches erect, tomentosely pubescent; leaves deeply trifid, with linear, quite entire, rarely trifid segments, revolute on the margins, clothed with canescent tomentum beneath; peduncles axillary, solitary, 1-flowered, or the lower ones are subcymose, rather shorter than the floral leaves; calyx campanulate, equal, sub-canescent, deeply 5-cleft. ♄. G. Native of the Cape of Good Hope. T. trifidum, Retz, obs. 1. p. 21.? A'juga Africàna, Pers. ench. 2. p. 109. Stems numerous, rising from a woody base. Leaves fascicled in the axils. Flowers smaller than those of the next species. Racemes many-flowered.

African Germander. Shrub ½ to 1 foot.

19 T. PSEUDOCHAMÆPI'THYS (Lin. spec. p. 787.) suffruticose; branches erect, pilosely hairy; leaves deeply 3-5-cleft, with linear, quite entire, or trifid segments, revolute on the edges, rather hispid above, and finely pubescent beneath; peduncles axillary, solitary, 1-flowered, at length rather longer than the floral leaves; calyx campanulate, equal, pubescent, deeply 5-cleft. ♄. F. Native of Europe and Africa, in the region of the Mediterranean; as of Spain, Barbary, Syria; South of France, about Marseilles.—Sabb. hort. rom. 3. t. 95.—Mor. hist. 3. sect. 11. t. 21. f. 2. Branches numerous, simple, rising

from a woody base, hairy, as well as the peduncles and lower leaves. Racemes terminal, loose, subsecund. Lower segment of corolla 3 times as long as the calyx. Corollas purple or white. ?

False-Ground-Pine Germander. Fl. June, July. Clt. 1820. Pl. ½ to 1 foot.

20 T. LACINIA'TUM (Torrey, in ann. lyc. 2. p. 231.) shrubby, glabrous; leaves pinnately 5-parted: upper ones tripartite: segments linear; flowers axillary, solitary, pedicellate; pedicels much shorter than the leaves; calyx subcampanulate, 5-parted, the lower segment bifid or tridentate. ♄. F. Native of North America, among the Rocky Mountains. Branched. Lower leaves sessile; segments blunt. Corollas large for the size of the plant, violaceous? villous outside; lower segment ovate, acute.

Jagged-leaved Germander. Shrub small.

SECT. IV. PYCNÓBOTRYS (from πυκνος, *pychnos*, dense; and βοτρυς, *botrys*, a bunch of grapes; in reference to the whorls being crowded into simple or branched spikes or racemes.) Benth. lab. p. 671. Whorls from 4 to many-flowered, crowded into simple or branched spikes. Calyx inflated, or tubularly campanulate, declinate, with nearly equal teeth, or the upper teeth are broader. Upper segments of corolla very short, broad, truncate, or declinate: lateral ones small, oblong, declinate: the lower one broad and concave. Achenia wrinkled, glabrous.—Villous or glabrous herbs or shrubs, but never hoary.

21 T. ABUTILOI'DES (Lher, stirp. 1. p. 84.) shrubby; branches pubescent; leaves simple, heart-shaped, green on both surfaces, villous; racemes simple, paniculately branched; whorls 2-6-flowered; calyx declinate, hairy, with ovate obtuse teeth; the upper tooth rather the broadest. ♄. G. Native of Madeira. Jacq. schœnbr. 3. t. 358. T. macrophýllum, Lam. dict. 2. p. 692. Leaves like those of *Sida móllis*, on long petioles, 3-6 inches long, crenated. Corolla 1½ inch long, red. Genitals much exserted.

Mulberry-like Germander. Fl. April, May. Clt. 1777. Shrub 3 to 4 feet.

22 T. WALLICHIA'NUM (Benth. in Wall. pl. rar. asiat. 2. p. 19. lab. p. 671.) herbaceous, ascending; leaves elliptic-ovate, acuminated, narrowed a long way at the base, green on both surfaces; racemes simple; whorls many-flowered; calyx declinate, with hardly unequal teeth. ♃. G. Native of Silhet, in the East Indies. Stems simple, rooting at the base, clothed with rufous villi. Leaves 3-4 inches long, hispid from stiff scattered hairs, quite entire at the base. Whorls about 10-flowered. Calyx hispid.

Wallich's Germander. Pl. 1 foot.

23 T. JAPÓNICUM (Willd. spec. 3. p. 23.) herbaceous, erect, or ascending, nearly glabrous; leaves ovate-oblong or lanceolate, rounded at the base, green on both surfaces; raceme branched; whorls equal, 6-flowered; floral leaves lanceolate; calyx declinate, tubularly campanulate, glabrous, with lanceolate acute nearly equal teeth. ♃. F. Native of Japan, on the mountains. T. Virgínicum, Thunb. fl. jap. p. 244. Stems glabrous or pubescent on the angles. Leaves on short petioles, deeply and sharply serrated, pale beneath: floral ones bractea-formed, ciliated. Genitals about equal in length to the lower lip.

Japan Germander. Pl. 1 to 2 feet.

SECT. V. STACHY'BOTRYS (from σταχυς, *stachys*, a spike; and βοτρυς, *botrys*, a bunch of grapes; so called in reference to the whorls being disposed in terminal, simple, terete spikes.) Benth. lab. p. 672. Whorls from 6 to many-flowered, disposed in simple, terminal, terete spikes. Calyx campanulate, declinate; the upper teeth, and especially the upper tooth, broadest, rarely almost equal. Upper segments of corolla oblong, declinate: lower one oblong, concave. Achenia reticulately wrinkled, glabrous.—Perennial, ascending, or erect, branched herbs.

24 T. INFLA'TUM (Swartz, prod. p. 88. fl. ind. occ. 2. p. 1003.) herbaceous, erect, pubescent or villous; leaves ovate or ovate-lanceolate, roundly truncate at the base, or subcordate, rather canescent beneath; racemes almost simple; whorls equal, 6-flowered; bracteas lanceolate; calyx declinate, inflated, pubescent, or villous, with a contracted mouth: the upper tooth the broadest. ♃. S. Native of Mexico, Jamaica, Spanish Main, Brazil, Island of Tongatabou, Buenos Ayres, &c. T. villósum, Forster, prod. no. 232. T. palústre, H. B. et Kunth, nov. gen. amer. 2. p. 306. T. vesicárium, Mill. ex Steud. nom. p. 830. Habit of *T. Canadénse*; but differs in the leaves being cordate at the base; and particularly in the inflated calyxes, and shorter, usually obtuse teeth. Corolla red or purplish.

Inflated-calyxed Germander. Fl. Aug. Oct. Clt. 1778. Pl. 2 feet.

25 T. CANADE'NSE (Lin. spec. 789.) herbaceous, erect, canescent, or villous; leaves ovate-lanceolate, rounded at the base, rather canescent beneath; racemes simple; whorls equal, 6-flowered; bracteas subulate; calyx declinate, campanulate, hoary, or sub-villous: the upper teeth the broadest. ♃. H. Native from Canada to Carolina; and of Texas. T. Virginicum, Lin. spec. p. 789. T. speciósum, Hill. veg. syst. 14. t. 14. Stems simple, or a little branched. Leaves on short petioles, 2-3 inches long, serrated, hispid and green above, rarely glabrous. Corollas purplish.

Canadian Germander. Fl. Aug. Sept. Clt. 1768. Pl. 1 to 3 feet.

26 T. HIRCA'NICUM (Lin. spec. p. 789.) herbaceous, erect, pubescent; leaves ovate-cordate, sub-canescent beneath; raceme simple; whorls equal, 6-flowered; bracteas subulate, rather shorter than the calyxes; calyx declinate, bilabiate, having the upper tooth very broad. ♃. H. Native of Eastern Caucasus; also of Iberia, in woods and in hedges. Sims, bot. mag. t. 2013. Scorodònia spicàta, Mœnch, meth. p. 385.—Hall, comm. gœtt. 2. p. 343. t. 13.—Ard. spec. 13. t. 4.? Leaves petiolate, 1-3 inches long, coarsely crenated; floral leaves subulate. Spikes dense. Corolla purple, villous outside.

Hircanean Germander. Fl. Aug. Oct. Clt. 1783. Pl. 1 to 3 feet.

27 T. ARDUI'NI (Lin. mant. p. 81.) herbaceous, erect, clothed with soft villi; leaves ovate, rounded at the base, greenish on both surfaces; racemes simple; whorls equal, 6-flowered; bracteas sessile, lanceolate, acuminated, exceeding the calyxes; calyx bilabiate, the upper tooth very broad. ♃. H. Native of the South-east of Europe; as of Dalmatia, Bulgaria, and the Bithynian Olympus, in rocky places. Sibth. et Smith, fl. græc. 6. p. 26. t. 531. T. lamiifólium, D'Urv. pl. arch. in mem. soc. Lin. par. 1. p. 320. Scutellària Crética, Lin. spec. 836. Scorodónia Arduíni, Rchb. fl. germ. exc. p. 315.—Ard. spec. 12. t. 3. Leaves nearly sessile, or the lower ones are on short petioles, 1-2 inches long, serrately crenated. Spikes dense, very villous. Corollas white, villous outside.

Arduini's Germander. Fl. June, Oct. Clt. 1823. Pl. 1½ foot.

28 T. BRACTEA'TUM (Desf. fl. atl. 2. p. 7. t. 120.? Benth. lab. p. 673.) herbaceous, ascending, villous; leaves ovate, cordate at the base, green on both surfaces; racemes simple; whorls equal, 6-flowered; bracteas petiolate, ovate, or lanceo-

late, equalling the calyxes; calyx bilabiate, the upper tooth very broad. ♃. F. Native of the North of Africa, on uncultivated hills near Tangiers, Salzmann; Tariffa, Durand; Mascar and Tlemsen, Desfontaines. Herb a little branched. Leaves ½ to 1 inch, bluntly crenated, petiolate. Racemes loose. Corolla pubescent outside.

Bracteate Germander. Pl. ½ foot.

29 T. conpa'ctum (Lag. nov. gen. et spec. 17.) suffruticose, procumbent, villous; leaves cuneate-ovate, deeply crenated, hairy; floral leaves petiolate, lanceolate, ciliated; flowers spicate. ♄. F. Native of Spain, in Granada, Clemente. Leaves quite entire at the base, narrowed into the short petioles. Calyx inflated, with a narrow throat, semiquinquefid; upper segments ovate, and shorter than the others.

Compact-flowered Germander. Shrub procumbent.

Sect. VI. Scorodo'nia (from σκορδον, *scorodon*, garlic; the *T. scorodònia* has an odour somewhat like garlic.) Benth. lab. p. 674. Whorls 2-flowered, secund, disposed in terminal, usually branched racemes. Calyx campanulate, declinate, the upper teeth, but especially the uppermost one, broader. Upper segments of corolla oblong, declinate. Achenia small, nearly globose, wrinkled or smoothish.—Perennial, ascending, or erect, branched herbs.

30 T. tomento'sum (Heyne, ex Benth. in Wall. pl. rar. asiat. 1. p. 58. lab. p. 674.) herbaceous? erect; branches clothed with tomentose pubescence; leaves ovate, rounded at the base, villous above, and clothed with tomentose pubescence, and canescent beneath, rarely almost glabrous; racemes paniculately much branched; calyx declinate, pilose, bilabiate, the upper tooth the broadest. ♃. H. Native of the Indian peninsula. Herb hard and woody at the base.? Leaves large, 2-4 inches long, and 1½ to 2 inches broad, coarsely and acutely crenated. Panicles dense. Corolla yellowish; tube inclosed.

Var. β, glabriúsculum (Benth. lab. p. 674.) plant nearly glabrous. ♃. G. Native of Ceylon, on Mount Nuera Ellia, Macrae.

Tomentose Germander. Pl. 2 to 4 feet.

31 T. stoloni'ferum (Hamilt. ex Benth. in Wall. pl. asiat. rar. 1 p. 58. and perhaps of Roxb. fl. ind. 3. p. 8. Benth. lab. p. 674.) herbaceous, ascending or erect, glabrous or finely pubescent; leaves ovate, rounded or cuneated at the base, green on both surfaces, not wrinkled; raceme paniculately branched; calyx declinate, ovoid, inflated in the fructiferous state, the upper tooth the broadest; tube of corolla inclosed. ♃. G. Native of Silhet; and the Burman Empire, on Mount Taong-Dong. Root stoloniferous according to Roxb. Leaves on longish petioles, 1-2 inches long, thin, scarcely wrinkled, deeply crenated; the floral leaves in the racemes bracteæ-formed. Flowers pendulous, yellowish.

Stoloniferous Germander. Pl. 1 to 2 feet.

32 T. vi'scidum (Blum. bijdr. p. 827.) leaves ovate, coarsely and unequally serrated, wrinkled; racemes axillary and terminal, secund, and are, as well as the calyxes, clothed with viscid pubescence; bracteas lanceolate, length of calyxes; stem a little branched. ♃.? S. Native of Java, in humid mountain places near Tugu, and at the foot of Mount Burangrang. Allied to *T. Lusitánicum*.

Viscid Germander. Pl.?

33 T. la'xum (D. Don, prod. fl. nep. p. 109.) herbaceous, procumbent? or scandent? finely pubescent; leaves ovate-lanceolate, acuminated, serrated, green on both surfaces; racemes nearly simple, axillary, and terminal; calyxes opposite, declinate, rather pilose, the upper tooth very broad. ♃. H. Native of Nipaul, Hamilt. Differing from *T. stoloníferum* in habit, narrower leaves, and short, loose, few-flowered racemes.

Loose-flowered Germander. Pl. scandent.?

34 T. Royle'anum (Wall. pl. rar. asiat. 1. p. 58. Benth. lab. p. 675.) herbaceous, ascending; branches hispid; leaves on short petioles, lanceolate-ovate, acute, serrated, subcordate at the base, wrinkled, villous, canescent beneath; racemes short, nearly simple; superior floral leaves shorter than the calyxes; calyx declinate, hispid, bilabiate, the upper tooth broader; tube of corolla exserted a little. ♃. F. Native of the North of India, on stony mountains; at Deyra Dhoon, and at Kheeree Pass, Royle; and between Mussooree and Lagrasson, Jacquemont. Allied to *T. quadrifárium*, but the habit and characters are very distinct. Stems procumbent at the base. Racemes few-flowered. Corollas larger than in *T. quadrifárium*, purple or white.

Royle's Germander. Pl. 1 to 1½ foot.

35 T. quadrifa'rium (Hamilt. ex D. Don, prod. fl. nep. p. 108.) herbaceous, erect; branches tomentosely villous or hispid; leaves on short petioles, ovate, serrated, cordate at the base, wrinkled, villous, rather canescent beneath; racemes branched; floral leaves broadly ovate, acuminated, exceeding the calyxes; calyx declinate, hispid, sub-bilabiate, the upper tooth the broadest; tube of corolla inclosed. ♃. H. Native of Silhet, Nipaul, and Himalaya, in stony places and by way sides. Stems usually rufescent. Leaves 1-2 inchys long: upper ones sessile. Racemes dense. Corolla purple, twice as long as the calyx.

Four-ranked Germander. Pl. 1 to 3 feet.

36 T. argu'tum (R. Br. prod. p. 504.) herbaceous, humble, erect; branches villous; leaves lanceolate-ovate or ovate, crenately serrated, truncate at the base, green on both surfaces, and rather hispid; racemes almost simple; floral leaves lanceolate, exceeding the calyxes; calyx declinate, villous, sub-bilabiate: upper tooth the broadest; tube of corolla inclosed. ♃. F. Native of New Holland. Floral leaves ciliated. Flowers subsecund. Nearly allied to *T. quadrifárium*, in the more humble stature, longer petioles, and narrower floral leaves.

Sharp-toothed-leaved Germander. Pl. ½ foot.

37 T. Scorodònia (Lin. spec. 789.) herbaceous, erect, hispid, pubescent, or nearly glabrous; leaves ovate, obtuse, crenated, rounded or cordate at the base, green on both surfaces; racemes a little branched: upper ones panicled; floral leaves minute; calyx declinate, rather villous, broadly campanulate, sub-bilabiate, the upper tooth large; tube of corolla exserted. ♃. H. Native throughout Europe, in woody hilly situations, among bushes and under hedges, where the soil is dry and stony; plentiful in Britain, in like situations. Hook. fl. lond. vol. 2. icone. Smith, engl. bot. t. 1543. Curt. lond. 5. t. 40. Fl. dan. t. 485. Scorodònia heterophýlla, Mœnch, meth. p. 384. T. sylvéstre, Lam. fl. fr. 2. p. 412. Scorodònia sylvéstris, Link, handb. p. 458. Scorodònia, Riv. mon. irr. t. 12. Blackw. t. 9.—Sabb. hort. rom. 3. t. 92. Stems simple, or a little branched. Leaves 1-2 inches long, wrinkled, on short petioles. Racemes slender, loose. Corollas pale yellow, downy outside. Stamens violaceous. The smell and taste of this plant are said to resemble hops. It is called *Ambroise* in Jersey; and in that island when cyder fails, they malt their barley at home, and instead of hops use to a very good purpose the *Ambroise* of the hedges. Rutty says, that when the herb is boiled in wort, the beer sooner becomes clear than when hops are used.

Wood-sage Germander. Fl. July. Britain. Pl. 1 to 2 feet.

38 T. pseudoscorodo'nia (Desf. fl. atl. 2. p. 5. t. 119.) suf-

fruticose, erect, hispid, or pubescent; leaves ovate, obtuse, crenated, rounded or cordate at the base, green on both surfaces, or canescent beneath; racemes nearly simple; floral leaves minute; calyx declinate, rather villous, sub-bilabiate, the upper tooth large; tube of corolla inclosed, or a little exserted. ♄. F. Native of the North of Africa, at Mount Lazar, near Mayane, in Algiers; Tangiers and Gibraltar. Scorodònia salviástrum, Link, handb. p. 458.? Scorodònia Fontanesiàna, Ser. bull. bot. p. 315. This differs from *T. Scorodònia*, in the shrubby stem, erect branches, more simple racemes, rather larger calyxes, and shorter corollas. Flowers yellow.

False-Wood-Sage. Fl. July, Aug. Clt. 1818. Shrub 1 to 2 feet.

39 T. Massilie'nse (Lin. spec. 789.) herbaceous or suffruticose, ascending; branches clothed with hoary pubescence; leaves ovate, crenated, rounded or cordate at the base, wrinkled: lower ones canescent beneath; racemes nearly simple or branched, loose, secund; floral leaves shorter than the calyxes; calyx declinate, rather villous, sub-bilabiate: upper tooth the largest; tube of corolla inclosed. ♃. H. Native of Europe, in the region of the Mediterranean; as about Marseilles, Corsica, Sardinia, Candia, &c. Jacq. hort. vind. 1. t. 94. Scorodònia Massiliénsis, Link, handb. p. 458. Scorodònia cordàta, Mœnch, meth. p. 385. T. odorâtum, Lam. fl. fr. 2. p. 413. T. Créticum, Clus. hist. 1. p. 348.—Ger. fl. gallopr. 277. t. 11. Leaves ½ an inch long, rarely 1 inch, much wrinkled. Racemes and flowers like those of the preceding, to which it is very nearly allied. Corollas purple.

Marseilles Germander. Fl. June, July. Clt. 1731. Pl. 1 foot.

40 T. Lusita'nicum (Lam. dict. 2. p. 692.) herbaceous or suffruticose; branches clothed with hoary pubescence; leaves lanceolate, crenated, wrinkled, rather canescent beneath; racemes a little branched, loose, secund; calyx declinate, upper tooth the broadest; tube of corolla inclosed. ♃. H. Native of the south-west of Europe; as of Spain, Portugal, Balearic Islands, in the fissures of rocks. T. Asiáticum, Lin. mant. p. 80. Jacq. hort. vind. 3. t. 41. T. salviástrum, Hoffm. et Link, fl. port. p. 84. t. 2. Mœnch, meth. p. 384. Habit of *T. Massiliénse*, from which it hardly differs, unless in the form of the leaves. Racemes usually more loose. Corollas purplish.

Portugal Germander. Fl. June, Oct. Clt. 1822. Pl. 1 foot.

† *A species belonging to the present section, but is not sufficiently known.*

41 T. salvia'strum (Schreb. unilab. p. 38.) stems erect, pubescent, clammy; leaves oval, crenulated, wrinkled, tomentose beneath, petiolate; racemes secund. ♃.? H. Native of Portugal. Leaves rounded at both ends, clothed with hoary, silky, short villi above, white beneath; floral leaves lanceolate, acute: upper ones minute, quite entire. Corolla villous outside.

Sage-like Germander. Pl. 1 foot.?

Sect. VII. Scórdium (from σκορδιον, *scordion*, garlic; the *T. scordium* has a smell approaching to that of garlic.) Benth. lab. p. 678. Whorls 2-6-flowered, distant, axillary. Floral leaves similar to the cauline leaves. Calyx tubular, declinate, gibbous at the base beneath; teeth 5, nearly equal, or the upper one is broadest. Upper segments of corolla oblong, declinate. Achenia very or scarcely wrinkled.—Annual or perennial herbs.

42 T. spinòsum (Lin. spec. 793.) herbaceous; branches spinescent at top; whorls axillary, remote, 1-6-flowered; calyx declinate: upper tooth very broad. ☉. H. Native of Europe and Africa, in the region of the Mediterranean; as of Portugal, Spain, Sicily, Naples, Syria, and the Canary Islands. Sibth. et Smith, fl. græc. 6. p. 31. t. 530. T. muconàtum, Lin. spec. 793. Scórdium spinòsum, Cav. icon. rar. 1. p. 19. t. 31. Scorodònia spinòsa, Link, handb. p. 458.—Barrel. icon. p. 319. t. 202.—Mor. hist. 3. p. 423. sect. 11. t. 22. f. 17. Herb procumbent, divaricately branched. Branches stiff, villous, nearly all spinescent. Lower leaves oblong, deeply serrated at apex: upper and rameal ones small, green on both surfaces, but pubescent. Calycine teeth spinescent. Corollas small, white, resupinate from the twisting of the tube.

Spinose Germander. Fl. May, June. Clt. 1640. Pl. procumbent.

43 T. resupina'tum (Desf. fl. atl. 2. p. 4. t. 117.) annual, villous; leaves oblong, narrowed at the base, green on both surfaces; floral leaves similar to the others, but narrower; whorls axillary, 2-flowered; calyx declinate, tubular beneath the gibbosities at the base? with awned teeth: upper tooth the broadest. ☉. H. Native of the North of Africa, on argillaceous hills, near Masear, Tangiers, Algiers. Herb divaricately branched. Whorls secund. Corollas yellowish, resupinate from the twisting of the tube.

Resupinate-flowered Germander. Fl. July, Aug. Clt. 1801. Pl. ½ foot.

44 T. Scórdium (Lin. spec. 790.) herbaceous, perennial, villous, rarely glabrous; leaves oblong, toothed, narrowed at the base or rounded, sessile, green on both surfaces; floral leaves similar to the rest; whorls axillary, 2-6-flowered; calyx declinate, campanulate, with short nearly equal teeth. ♃. H. Native of Europe, and the temperate parts of Asia, in bogs and watery places. Chamæ'drys Scórdium, Mœnch, meth. p. 384. T. palústre, Lam. fl. fr. 2. p. 411. T. arenàrium, Gmel. itin. 1. p. 149. t. 26. f. 2.—Riv. mon. t. 11. Scordium legitimum, Park. theatr. 111. f. 1.—Mor. hist. 3. p. 423. sect. 11. t. 22. f. 14. Stems creeping or rooting at the base; floriferous branches erect or ascending, more or less villous. Leaves about an inch long, hairy, soft: floral ones longer than the flowers. Corollas small, purplish. The fresh leaves are bitter, and rather pungent. Powdered, they destroy worms. A decoction of the plant is a good fomentation in gangrenous cases. It has a strong disagreeable smell, somewhat approaching to that of garlic; whence its specific name from σκορδον, garlic. It was once in high esteem as an antiseptic and an alexpharmic, to which it certainly had no claim. Cullen says it has a bitter, joined with some volatile parts; but that neither of these qualities is considerable enough to retain it in the present practice.

Garlic or Water Germander. Fl. July, Aug. England. Pl. ½ to 1 foot.

45 T. scordioi'des (Schreb. unilab. p. 37.) herbaceous, perennial, woolly, rarely almost glabrous; leaves ovate-oblong, crenated, cordately stem-clasping at the base, green on both surfaces; floral leaves similar to the rest; whorls axillary, 6-flowered; calyx declinate, campanulate, with short nearly equal teeth. ♃. H. Native of the South of Europe, in bogs, especially near the sea; as of Portugal, Spain, South of France, Italy, Sicily, Sardinia, Candia, &c.; in England, but not common; plentiful in the fens of the Isle of Ely; from Cambridge to Histon; at Westbeach, Cottenham; on the banks of the Isis, near Highbridge, and on Fynsham Common, Oxfordshire, &c. T. Scórdium, Brot. fl. lus. 1. p. 164. Woodv. med. bot. t. 57. Oeder, fl. dan. t. 593. Bieb. fl. cauc. 2. p. 36. Smith, engl. bot. t. 828. and of many other authors, but not of Lin. T. lanuginòsum, Bauh. pin. p. 247. Hoffm. et

Link, fl. port. 1. p. 84. t. 9. Habit of *T. Scórdium*, but usually more villous, and differs particularly in the shorter cordately stem-clasping leaves, which are not narrowed at the base. Corollas small, purplish.

Scordium-like Germander. Fl. July, Aug. England. Pl. ⅓ to 1 foot.

46 T. Bótrys (Lin. spec. 786.) annual, villous; leaves deeply pinnate, with oblong, quite entire or cut, divaricate segments, green on both surfaces; floral leaves similar to the cauline ones; whorls axillary, 6-flowered; calyx inflately tubular, gibbous beneath at the base? with equal, lanceolate teeth. ☉. H. Native of the South of Europe and North of Africa, in calcareous arid, dry places; as of France, Spain, Germany, Italy, Sicily, Algiers, &c. Mill. fig. 176. t. 264. f. 1. Sabb. hort. rom. 3. t. 91. Chamæ'drys Bótrys, Mœnch, meth. p. 388. Scorodónia Bótrys, Ser. bull. bot. p. 317.—Riv. mon. irr. t. 14.—Mor. hist. sect. 11. t. 22. f. 18. Herb erect, branched, more or less villous. Leaves petiolate: floral ones exceeding the flowers. Corollas small, purplish. The plant has a pleasant aromatic smell; it may, therefore, be successfully used in fevers, rheumatism, gout, &c.

Botrys or Cut-leaved annual Germander. Fl. July, Sept. Clt. 1633. Pl. ½ foot.

Sect. VIII. Chamæ'drys (from χαμαι, *chamai*, on the ground; and δρυς, *drus*, an oak; the plants are dwarf, with leaves resembling that of the oak.) Benth. lab. p. 680. Whorls 2-6-flowered, distinct, disposed in a loose terminal raceme. Calyx tubularly campanulate, declinate, oblique at the base; teeth 5, nearly equal, or the superior ones rather the broadest. Upper segments of corolla oblong, declinate. Achenia reticulately wrinkled.—Small shrubs, erect or procumbent at the base.

47 T. Lu'cidum (Lin. spec. 790.) herbaceous, perennial, quite glabrous; leaves petiolate, ovate, deeply toothed, crenated at the base: floral ones smaller, scarcely toothed; whorls 2-6-flowered: the upper ones racemose; calyx declinate, tubularly campanulate, with lanceolate nearly equal teeth. ♃. H. Native in the region of the Mediterranean, in the fissures of rocks; as of Provence, Piedmont, Mount Atlas, and the mountains of Cyrenaica. Mud. act. pal. 3. phys. 211. t. 12. f. 7. Chamæ'drys lùcida, Mœnch, meth. p. 389. Magn. hort. 52. icone. This differs from *T. Chamæ'drys*, in the stems being more firm, more erect, and taller; in the cauline leaves being larger and thinner, and in the floral leaves being usually smaller; but especially in the plant being quite glabrous. Calyxes purplish. Corollas reddish purple. Root creeping.

Shining Germander. Fl. June, Sept. Clt. 1730. Pl. 1 to 1½ foot.

48 T. Chamæ'drys (Lin. spec. 790.) perennial or suffruticose, procumbent at the base, pubescent or villous, rarely glabrous; leaves on short petioles, ovate or oblong, deeply crenated, cuneated at the base, green on both surfaces, or canescent beneath; floral leaves smaller, scarcely toothed; whorls 2-6-flowered; the superior ones racemose; calyx declinate, tubularly campanulate, with lanceolate nearly equal teeth. ♃. H. Native throughout Europe and Asia Pontica, on walls, rocks, and by way sides; as of Spain, France, Germany, Italy, Sicily, Turkey, Tauria, and Caucasus; in England, among the ruins of old castles and walls, but by no means plentiful. Smith, engl. bot. t. 680. Woodv. med. bot. suppl. 82. t. 218. Sabb. hort. rom. 2. t. 88. Chamæ'drys officinàlis, Mœnch, meth. p. 389. T. pseudochamæ'drys, Wender. in bot. zeit. 1826. p. 358. T. multiflòrum, Hort. but not of Lin. T. officinàle, Lam. fl. fr. 2. p. 414.—Riv. mon. t. 10. f. 2. Root creeping. Leaves often shining above, glabrous or villous: upper floral ones bracteaformed, quite entire, reddish. Racemes subsecund. Corollas reddish purple, villous outside. This plant has been esteemed chiefly as a mild aperient and corroborant, and was recommended in intermitting fevers, rheumatism, and gout. It has been employed in various forms and combinations, of which the Portland powder is one of the most celebrated instances. Its qualities seem nearly allied to those of horehound, and therefore it may be equally useful in asthmatic affections and coughs.

Germander, Common. Fl. May, Aug. England. Pl. ½ to ¾ foot.

49 T. ca'num (Fisch. et Meyer, ind. sem. hort. petrop. 1835. p. 40.) clothed with hoary tomentum, frutescent at the base, many-stemmed; stems erectish, simple; leaves oblong, toothed, cuneated at the base; floral leaves quite entire; whorls 6-flowered; pedicels length of calyx; calycine teeth equal, acute, mucronulate. ♄.? or ♃.? H. Native of the Transcaucasian province Somchetia. Allied to *T. Chamæ'drys* and *T. quadrátulum*; but differs from the first in being clothed with canescent villi; in the distant loose whorls, and quite entire floral leaves; and from the last in the elongated, almost simple stems, 6-flowered whorls, longer pedicels, villous corollas, &c. Corolla purple.

Hoary Germander. Pl. 1 to 2 feet.?

50 T. multiflòrum (Lin. spec. 788.? Benth. lab. p. 681.) suffruticose, nearly glabrous, or clothed with fine hoary pubescence; leaves on short petioles, ovate, acute, narrowed at the base, acutely toothed at apex, green on both surfaces, or canescent beneath; floral leaves smaller; whorls 2-6-flowered, distant, racemose; calyx declinate, tubularly campanulate, with lanceolate nearly equal teeth. ♄. F. Native of Spain.—Bocc. mus. t. 117.? Intermediate between *T. Chamæ'drys* and *T. Màrum*. Habit of the first, but more branched. Leaves 2-4 inches long. Flowers like those of *T. Chamæ'drys*, but one half smaller.

Many-flowered Germander. Fl. July, Sept. Clt. 1781. Shrub 1 foot.

51 T. Ma'rum (Lin. spec. p. 788.) shrubby, hoary; leaves small, ovate, quite entire, hoary beneath: floral ones smaller; whorls 2-4-flowered, racemose; calyx declinate, hairy, tubularly campanulate, with short nearly equal teeth. ♄. F. Native of the region of the Mediterranean; as of Spain, Corsica, Italy, &c. Woodv. med. bot. 153. t. 56.—Blackw. t. 47.—Riv. mon. irr. t. 23.—Sabb. hort. rom. 3. t. 90. Chamæ'drys Màrum, Mœnch, meth. p. 383. T. maritimum, Lam. fl. fr. 2. p. 414. —A small branched shrub, with the habit of *Thymus vulgàris*. Leaves small, petiolate, rarely obscurely crenated, canescent above, and tomentose beneath. Whorls subsecund, approximate into spikes. Corollas purplish, villous outside. The leaves and younger branches of *Màrum*, when recent, on being rubbed between the fingers, emit a volatile aromatic smell, which readily excites sneezing; but to the taste they are bitterish, accompanied with a sensation of heat and acrimony. Judging from the sensible qualities of this plant, it may be supposed to possess very active powers; and on this consideration it is strongly recommended by Wedelius as an important remedy in many diseases requiring medicines of a stimulant, aromatic, and deobstruent quality: his opinion seems in some measure to have been since verified by actual experience of its efficacy. At present, however, *Màrum* is chiefly used as an errhine, and is an ingredient in pulvis asari compositus. Cats are very fond of this plant, and often destroy it.

Marum Germander, or Cat-Thyme. Fl. July, Sept. Clt. 1640. Shrub 1 to 3 feet.

52 T. microphy'llum (Desf. cor. pl. Tourn. in ann. mus. 10. p. 300. t. 22.) suffruticose, humble, divaricately much branched; leaves small, ovate, crenated, glabrous above and

hoary beneath; whorls few, about 2-flowered; calyx declinate, tubularly campanulate, with lanceolate nearly equal teeth. ½. F. Native of Candia, among rocks. T. quadrátulum, Smith, et Sibth. fl. græc. 6. p. 25. t. 530. but hardly of Schreb. T. divaricàtum, Sieb. pl. exs.? Corollas red. Habit of *T. flàvum*.

Var. β; branches short, canescent; leaves smaller; flowers smaller and fewer.

Small-leaved Germander. Shrub humble.

53 T. flàvum (Lin. spec. 791.) shrubby; branches tomentosely pubescent; leaves broad-ovate, crenated, truncate or cuneated at the base, green on both surfaces, or canescent beneath; superior floral leaves quite entire, acute; whorls 2-6-flowered, racemose; calyx declinate, tubularly campanulate, with lanceolate nearly equal teeth. ½. F. Native of Europe and Africa, in the region of the Mediterranean; as of Spain, Eastern Pyrenees, South of France, Corsica, Sardinia, Italy, Sicily, Dalmatia, Grecian Islands, Algiers, and Mount Atlas. Sibth. et Smith, fl. græc. 6. p. 27. t. 533. Chamæ'drys flàva, Mœnch, meth. p. 383.—Sabb. hort. rom. 3. t. 89.—Jungh. icon. cent. 1. f. 5.—Besl. eyst. 7. p. 11. f. 1.—Mor. hist. 3. p. 421. sect. 11. t. 22. f. 1.? Shrub much branched. Leaves thickish, variable in size, 3-10 lines long. Calyx coloured at top. Corolla yellowish.

Var. β, purpùreum (Benth. lab. p. 682.) flowers reddish purple; leaves usually canescent beneath. ½. F. Native of Spain, Mount Parnassus, Syria, Cyprus, &c. T. règium, Hort. and probably of Schreb. T. lùcidum, Sibth. et Smith, fl. græc. 6. p. 27. t. 532. but not of Lin. T. divaricàtum, Sieb. pl. exs.?

Yellow-flowered Germander. Fl. July, Sept. Clt. 1640. Shrub 1 to 2 feet.

54 T. ramosíssimum (Desf. fl. atl. 2. p. 4. t. 118.) shrubby, much branched, hoary; branchlets filiform; leaves obovate, crenated; flowers solitary, axillary, and terminal; calyx slender, elongated, with nearly equal acute teeth. ½. F. Native of Barbary, in the fissures of rocks near Cafsa. Leaves size of those of *T. Màrum*. Corollas small, violaceous. The whole plant exhales a very sweet scent.

Much-branched Germander. Shrub.

55 T. scórodon (Schreb. unilab. p. 35.) shrubby; stems bifariously bearded; leaves on short petioles, ovate, crenated, glabrous, shining, but bearded on the middle nerve at the base; floral leaves quite entire; whorls dimidiate, racemose. ½. F. Native of Mauritania. Leaves entire at the base, with reflexed cut margins; floral leaves almost lanceolate, more pilose than in *T. flàvum*. Corollas purple. Perhaps a variety of *T. flàvum*.

Shining-leaved Germander. Shrub 1 to 2 feet.?

56 T. resupinum (Schreb. unilab. p. 35.) shrubby, diffuse; branches pubescent; leaves on short petioles, ovate, toothed in front: floral ones quite entire, sessile; whorls racemose. ½. F. Native of Spain and Italy. Leaves deep green, with reflexed edges, shining, beset with short hairs, which are only seen under a lens, hoary beneath: floral ones equalling the calyxes. Whorls contiguous. Corollas purple. Probably a variety of *T. Chamæ'drys*.

Royal Germander. Fl. May, Oct. Clt. 1699. Shrub 1 to 1½ foot.

57 T. myrtifòlium (Poir. dict. suppl. 2. p. 766.) shrubby, erect, pubescent; leaves ovate, a little toothed, villous beneath, and cinereous; flowers spicate; calyx villous, with 5 acute, nearly equal teeth. ½. F. Native of the Levant. Said to be nearly allied to *T. microphýllum*. Leaves petiolate, 3-5 lines long. Middle segment of lower lip of corolla dilated, roundish, crenulated. Perhaps a variety of *T. Màrum*.

Myrtle-leaved Germander. Shrub.

58 T. quadra'tulum (Schreb. unilab. p. 36.) perennial; stems and under sides of leaves clothed with white tomentum; leaves ovate-rhomboid, toothed, shining above; whorls racemose. 4. H. Native of Spain. Stems erect, branched at the base. Leaves similar to those of *T. Màrum*, but a little broader. Racemes short. Calyx pubescent. Corolla purple. This appears to be nearest allied to *T. multifidum* and *T. Chamæ'drys*, ex Benth.

Small-square Germander. Pl. ⅓ foot.

59 T. subspinòsum (Pourr. ex Willd. enum. p. 596.) perennial; leaves quite entire, ovate, acute, petiolate, pubescent, with revolute margins, tomentose beneath; flowers racemose; branches spinescent. ½. F. Native of the Balearic Islands. Very like *T. Màrum*, ex Willd.

Subspinose Germander. Fl. June, Aug. Clt. 1816. Shrub 1 to 1½ foot.

Sect. IX. Pòlium (from πολιος, *polios*, white; the *T. Polium* and some other species are white from tomentum.) Benth. lab. p. 684. Whorls few, condensed into terminal subglobose heads. Calyx tubularly campanulate, subdeclinate, oblique at the base, with 5 nearly equal teeth; the superior teeth hardly broader. Upper segments of corolla oblong, declinate; lateral ones small. Achenia much wrinkled.—Perennial herbs or under-shrubs. Stems generally procumbent at the base, much branched; floriferous branches ascending.

60 T. Pyrena'icum (Lin. spec. p. 791.) creeping, villous; leaves roundish, crenated, green on both surfaces; whorls few, crowded into a terminal head; calyx tubularly campanulate, declinate, with nearly equal teeth. 4. H. Native of the South of Europe; as of Catalonia, Arragon, Pyrenees, and Auvergne, Pòlium Pyrenàicum, Mill. dict. no. 6. T. réptans, Pourr. act. toul. 3. p. 330. T. rotundifòlium, Schreb. unilab. p. 42.?—Boc. mus. 2. t. 61.—Barrel. icon. t. 1086. Stems rooting at the base, creeping under the earth. Sterile branches prostrate; floriferous ones ascending. Leaves on short petioles. Heads solitary, terminal. Corollas pale yellow, the lower segment sometimes purplish.

Pyrenean Germander. Fl. June, Aug. Clt. 1731. Pl. procumbent.

61 T. buxifòlium (Schreb. unilab. p. 42.) suffruticose; leaves obovate-cuneated, with subrevolute crenated margins, green and nearly glabrous above, and canescent beneath; whorls crowded into a terminal head; calyx tubularly campanulate, declinate, with nearly equal teeth. ½. F. Native of Spain, in the fissures of rocks. T. saxátile, Cav. icon. rar. 2. p. 19. t. 121. f. 1. Stems procumbent at the base, ascending, often much branched, pilosely pubescent. Leaves ½ an inch long, numerous, narrowed into short petioles at the base. Heads, calyxes, and flowers of *T. Pyrenàicum*. Corollas whitish, and often reddish.

Box-leaved Germander. Shrub procumbent.

62 T. cuneifòlium (Sibth. et Smith, fl. græc. 6. p. 30. t. 537.) procumbent, clothed with dense tomentose wool; leaves roundish, crenated, cuneated at the base, thick, densely tomentose on both surfaces; whorls few, condensed into a terminal head; calyx tubular, tomentose, with short nearly equal teeth. 4. H. Native of Candia, on the Sphaciotic mountains. This differs from the two preceding species, at first sight, in the whole plant being canescent or yellowish from dense tomentum; but the habit is similar. Leaves scarcely ½ an inch long, thick. Corolla white, yellowish at base.

Wedge-leaved Germander. Pl. procumbent.

63 T. alpe'stre (Sibth. et Smith, fl. græc. 6. p. 31. t. 538.) suffruticose, humble, divaricately much branched, clothed with hoary or yellowish villi; leaves small, obovate-cuneated, round-

ish, crenated, with revolute edges; whorls very few, subcapitate at the tops of the branches; calyx declinate, ovate-tubular, pilose, with nearly equal short obtuse teeth. ♄. H. Native of Candia, on the Sphaciotic Mountains, and near Mirabello. T. saxátile, Sieb. pl. cret. exs. but not of Cav. Habit of *T. thymifólium*, but allied to *T. Pólium* in character. Leaves distant, 2-3 lines long, greenish on both surfaces. Heads terminal, size of peas, composed of 4-6 flowers. Corollas small, white.

Alp Germander. Shrub humble.

64 T. Pólium (Lin. spec. p. 792.) suffruticose, canescent from tomentum, woolly, rarely pilosely hispid; leaves cuneated, oblong or linear, with revolute edges; whorls few, condensed into globose or oblong terminal heads; calyx tubularly campanulate, with nearly equal teeth. ♄. F. Native of Europe and Africa, in the region of the Mediterranean; as well as of Tauria and Caucasus. Stems much branched; branches procumbent or ascending, rarely erect. Leaves sessile, variable in form. Whorls 2-6-flowered. Corollas small, white, yellowish, or purple.

Var. α, flavéscens (Benth. lab. p. 685.) leaves broader; heads very hairy; tops of branches yellowish. ♄. F. In the western region common. T. aúreum, Schreb. unilab. p. 48. Cav. icon. 2. p. 16. t. 117. T. flávicans, Lam. dict. 2. p. 700. T. tomentósum, Vill. fl. dauph. 2. p. 352. Pólium aúreum, Mœnch, meth. p. 385. Pólium lúteum, Mill. dict. no. 2.—Barrel. icon. t. 1082.—Blackw. 456. Flowers of a deep yellow colour. The yellow Poly or Mountain Germander.

Var. β, hirsútum (Benth. lab. 685.) leaves oblong, scarcely canescent, and are, as well as the heads, pilose. ♄. F. Native of Egypt. T. Ægyptiacum, Pers. ench. 2. p. 112.

Var. γ, vulgáre, (Benth. lab. p. 685.) leaves oblong, and are, as well as the heads, clothed with tomentose wool; corolla white. ♄. F. Common throughout the region of all the varieties. T. Pólium, Lin. and other authors. Sibth. et Smith, fl. græc. 6. p. 29. t. 555. T. pseudobyssòpus, Schreb. unilab. p. 45. T. Teúthrion, Schreb. unilab. p. 46. T. Bélion, Schreb. unilab. p. 47. T. Lusitánicum, Schreb. unilab. p. 47.? but not of Lam. T. álbum, Poir. dict. suppl. 2. p. 770. T. trifoliátum, Vahl, symb. 1. p. 40. T. subtriphýllum, Lag. gen. et spec. nov. p. 17. Pólium álbum, Mill. dict. no. 4. Pólium latifólium, Mill. dict. no. 7. Pólium Smyrnéum, Mill. dict. no. 15. Pólium angustifólium, Mill. dict. no. 3. Pólium ramósum, Mill. dict. no. 2. Pólium diffúsum, Mill. dict. no. 13.— Lob. icon. 486.—Barrel, icon. 1074.—Column. ecphr. 1. p. 59. t. 67. White Poly or Mountain Germander.

Var. δ, gnaphalódes (Benth. lab. p. 686.) humble; leaves and heads densely woolly. ♄. F. Native of Spain. T. gnaphalódes. Vahl, symb. 1. p. 41. Lber. stirp. T. lanígerum, Lag. gen. et spec. nov. p. 17.?

Var. ε, purpuráscens (Benth. lab. p. 686.) leaves oblong, and are, as well as the heads, clothed with tomentose wool; corollas reddish purple. ♄. F. On the sea-shore about Marseilles, and on the shores of the Adriatic sea. T. Achænénsis, Schreb. unilab. p. 44. Pólium integérrimum, Mill. dict. no. 14.—Mor. hist. 3. sect. 11. t. 2. f. 12. The purple Poly or Mountain Germander.

Var. ζ, angustifólium (Benth. lab. p. 686.) leaves linear or linear-oblong, and are, as well as the heads, which are small, clothed with hoary, rarely yellowish, tomentum; corollas red. ♄. F. Native throughout the whole region of the species. T. capitátum, Lin. spec. 792. Cav. icon. 2. p. 17. t. 119. Sibth. et Smith, fl. græc. 6. p. 30. t. 536. T. flavéscens, Schreb. unilab. p. 44. T. Valentínum, Schreb. unilab. p. 46. T. pycnophyllum, Schreb. unilab. p. 48.? T. lavandulátum, Pourr. T. corymbíferum, Desf. fl. atl. 2. p. 8.? T. cylíndricum, Lam. ex Steud. nom. p. 829. Pólium capitátum, Mill. dict. no. 5. Pólium serrátum, Mill. dict. no. 12. Pólium spicátum, Mill. dict. no. 18. Pólium fruticósum, Mill. dict. no. 11. Pólium eréctum, Mill. dict. no. 8.—Barrel. icon. t. 1079 and 1078. Pólium Monspessulánum, Bauh. hist. 3. p. 299.

Poly Mountain. Fl. July, Sept. Clt. var. α, 1731.; γ, 1562.; ε, 1816.; ζ, 1731. Shrub ½ to 1 foot.

65 T. amplexicaúle (Benth. lab. p. 687.) suffruticose; branches clothed with white wool; leaves ovate-oblong or oblong, crenated, usually cordately stem clasping at the base, with revolute margins, at first tomentose above, but at length nearly glabrous, and clothed with dense white wool beneath; whorls few, globosely capitate; calyx declinate, tubularly campanulate, with nearly equal broad acute teeth; tube of corolla exserted. ♄. F. Native of Spain. Habit and leaves of some of the varieties of *T. Pólium*, but stiffer. Flowers similar to those of *T. montánum*, and *T. Pyrenáicum*, but much larger than in *T. Pólium*. It differs from *T. thymifólium* in the taller stature, form of leaves, and larger heads.

Stem-clasping-leaved Germander. Shrub.

66 T. thymifólium (Schreb. unilab. p. 50. Benth. lab. p. 687.) suffruticose, humble, much branched; branchlets hoary, ascending; leaves oblong or obovate, hoary on both surfaces or only beneath; whorls about 2-flowered, very few, subcapitate at the tops of the branches; calyx declinate, tubularly campanulate, with nearly equal broad acute teeth; tube of corolla subexserted. ♄. F. Native of Spain. Habit of *T. alpéstre*, tufted. Leaves short, crowded, less wrinkled and less tomentose than in *T. Pólium*, but more so than in *T. montánum*. Flowers 2-6 on each branch, hardly capitate. Calyx one half smaller than in *T. montánum*, and the corollas are reddish.

Thyme-leaved Poly or Germander. Fl. June, Oct. Clt. 1816. Shrub ¼ to ½ foot, tufted.

67 T. monta'num (Lin. spec. 791.) suffruticose, prostrate; branches hoary or pubescent; leaves oblong-linear, quite entire, hoary on both surfaces or only beneath, flat or the margins are revolute; whorls few, condensed into a terminal head; calyx subdeclinate, tubularly campanulate, glabrous or hoary, with nearly equal lanceolate subulately acuminated teeth. ♄. F. Native of the southern parts of Europe, on hills and mountains, in calcareous places; as of Spain, South of France, South of Germany, Italy, Sicily, Grecian Mountains; and of Volhynia and Tauria. Sibth. et Smith, fl. græc. 6. p. 28. t. 534. T. supínum, Lin. spec. 791. Jacq. austr. 5. p. 8. t. 447. Pólium montánum, Mill. dict. no. 1.—Lob. icon. 488. Stem much branched. Leaves smoothish above. Heads larger than in *T. Pólium*, each usually composed of 2-4, 4-6-flowered whorls. Corollas cream-coloured or white.

Mountain Poly or Mountain Germander. Fl. June, Oct. Clt. 1710. Shrub prostrate.

68 T. pu'milum (Lin. spec. p. 792.? Benth. lab. p. 687.) suffruticose, procumbent or erect; branches hoary; leaves narrow-linear, quite entire, hoary beneath, with revolute margins; whorls few, condensed into terminal heads; calyx subdeclinate, tubularly campanulate, with nearly equal lanceolate subulately acuminated teeth. ♄. F. Native of Spain. T. Libanóris, Schreb. unilab. p. 38.? Cav. icon. 2. p. 17. t. 118.—Barrel. icon. t. 1091 and 1093.? This hardly differs from *T. montánum*, except in the more erect stems, narrower leaves, and purplish flowers.

Dwarf Mountain Poly. Fl. July, Aug. Clt. 1816. Shrub procumbent.

69 T. verticilla'tum (Cav. icon. 2. p. 77. t. 198.) stems erect; leaves linear, verticillate, whitish, glaucous, sessile, with revolute margins; heads terminal, leafy at the base; calyx turbi-

nate, tomentose, 5 crenate. ♃. F. Native of Spain, among the mountains. Roots woody. Leaves 4-6 in a whorl. Whorls approximate. Corollas yellowish.

Whorled-leaved Poly or Germander. Pl. ½ to 1 foot.

† *Species belonging to sect.* IX. *Pòlium, but are not sufficiently known.*

70 T. angustí'ssimum (Schreb. unilab. p. 39.) shrubby, erect; leaves linear, quite entire, nearly naked; heads of flowers terminal, pilose; calyx pilose, with a bearded mouth. ♄. F. Native of Spain.—Barrel. icon. t. 1080. Stems filiform, clothed with dense white tomentum. Leaves narrowed, with revolute edges. Heads solitary, usually composed of 3 whorls, small. Corolla white, hardly longer than the calyx. Perhaps a variety of *T. Pòlium*.

Very narrow-leaved Poly or Germander. Fl. June, July. Clt. 1818. Shrub ½ foot.

71 T. cælé'ste (Schreb. unilab. p. 39.) suffruticose, erect; hoary from tomentum; leaves linear, quite entire; heads terminal, tomentose: calyx green, but loosely tomentose, with triangular teeth. ♄. F. Native of Spain, among the mountains in Valentia.—Barrel. icon. t. 1081. Heads solitary or by threes. Corollas white, smaller than those of the preceding. Perhaps a variety of *T. Pòlium*.

Heavenly Poly or Germander. Shrub ½ to 1 foot. ?

72 T. cymòsum (Pers. ench. 2. p. 112.) flowers paniculately cymose; leaves linear, toothed; stem woolly, suffruticose. ♄. F. Native of Spain, near Aranjuez. Perhaps a variety of *T. Pòlium*.

Cymose-flowered Poly or Germander. Shrub.

73 T. marjora'na (Pers. l. c.) spikes ovate; peduncles subcymose; leaves linear, with revolute edges; stem almost filiform. ♄. F. Native of Spain. Perhaps a variety of *T. Pòlium*.

Marjoram Poly or Germander. Shrub.

† † *Doubtful species.*

74 T. sessilifòlium (Clarke's trav. 4. p. 555.) leaves hairy, sessile, obtuse: lower ones lanceolate, quite entire: upper ones and bracteas crenated, elliptic-lanceolate; flowers axillary, solitary; peduncles very short. ♄. F. Native of Turkey, between Constantinople and Rutschuk, Clarke. Stems erect, woolly. Leaves more than an inch long. Flowers an inch long, with a bearded throat.

Sessile-leaved Germander. Pl. ?

75 T. undula'tum (Lour. coch. p. 362.) leaves oblong, undulated, a little crenated; corymbs terminal. ♄. G. Native of Cochinchina, in hedges. Stem shrubby, erect, branched. Leaves obtuse, glabrous, petiolate. Flowers pale, disposed in terminal racemose corymbs. Corolla 5-cleft, with a short tube and obtuse segments, the superior segments divaricate. Stamens very long, ascending. Achenia naked.

Undulated-leaved Germander. Shrub 5 feet.

76 T. the'a (Lour. coch. p. 363.) leaves ovate-lanceolate; stem procumbent; peduncles axillary, 3-flowered. ♄. G. Native of Cochinchina, among bushes. Stem shrubby, 8 feet, procumbent, glabrous, unarmed, terete, branched. Leaves ovate-oblong, acute, quite entire, petiolate, glabrous. Flowers white. Stamens longer than the corolla. Stigma bipartite, acute.

Tea Germander. Shrub procumbent.

77 T. rotundifòlium (Poir. dict. suppl. 2. p. 767.) leaves ovate-rounded, crenated, glabrous, on long petioles; spike terminal, few-flowered; peduncles very long; stem simple, tetragonal. ♃. F. Native of Buenos Ayres, Commerson. T. Commersònii, Spreng, syst. 2. p. 710. Leaves distant, glabrous, petiolate. Peduncle slender, terminal, bearing a short spike of flowers at top. Calyx pubescent, acutely 5-toothed. Lip of corolla blue.

Round-leaved Germander. Pl. 1 foot.

78 T. fasciculá'tum (Poir. dict. suppl. 2. p. 767.) stem shrubby; leaves subfasciculate, narrow-linear, glabrous, with a subtubercular tooth on one or other side; spike short, terminal. ♄. F. Native country unknown. Stem brown, glabrous, terete. Leaves sessile, 6-8 lines long. Corollas yellow.

Fascicled-leaved Germander. Shrub.

Cult. The greater number of the species grow best in a dry soil and shady situation; but *T. Scórdium* and *T. lanuginósum* require a moist boggy soil. All the perennial herbaceous kinds are readily propagated by division and by seeds. Most of the shrubby species being rather tender require the protection of a frame or greenhouse in winter; and they are readily increased by cuttings of young wood. The seeds of annual kinds only require to be sown in the open border in spring, where they are intended to remain.

CIX. A'JUGA (said to be from a priv. and ζυγος, *zugos*, a yoke; in reference to the calyx being equal, not bilabiate; or either from *Abigo*, or from a priv. and Jugo, to yoke: both from a supposed power of procuring abortion, which, however, the plants do not possess.) Benth. lab. p. 690. A'juga and Teûcrium species, Lin. and other authors.—Phleboánthe, Tausch. —Bûgula and Chamæ'pithys, Tourn.

Lin. syst. *Didynàmia, Gymnospérmia*. Calyx ovate or globosely campanulate, nearly equal, 5-cleft or toothed. Corolla with an inclosed or exserted tube, straight or somewhat spirally twisted, usually furnished with a pilose ring inside; limb bilabiate; upper lip short, but generally very short, emarginate: lower lip elongated, spreading, trifid, having the lateral segments oblong, and the middle segment broader, emarginate, or bifid. Stamens 4, ascending, usually exserted from the upper lip, didynamous, lower ones the longest; anthers 2-celled: cells divergent or divaricate, at length confluent. Style about equally bifid at top; stigmas minute. Achenia reticularely wrinkled.—Annual or perennial herbs, usually procumbent or ascending, sometimes stoloniferous. Whorls 2 or many-flowered, dense, sometimes all axillary, when the floral leaves conform to the cauline ones; sometimes the superior whorls are approximate into spikes, then the floral leaves are small, and of a different form from the cauline ones.

Sect. I. Bu'gula (the Latin name of *Comfrey*.) Benth. lab. p. 692. Whorls 6, but generally many-flowered. Corollas usually blue, rose-coloured, white, purplish, but never yellow.

1 A. lobа'ta (D. Don, prod. fl. nep. p. 108.) stolons creeping; leaves on long petioles, roundish, coarsely crenated or lobed, nearly glabrous. ♃. F. Native of Nipaul and Gosainsthan. Herb nearly glabrous or sparingly pilose. Leaves 1-2 inches long, usually deeply cordate at the base, but sometimes truncate and cuneated. Lower whorls 2-flowered, upper ones approximate. Calyx 4-5 cleft.

Lobed-leaved Bugle. Pl. ½ foot. ?

2 A. re'ptans (Lin. spec. 785.) stolons creeping; leaves ovate or obovate, quite entire or sinuated, and are, as well as the stems, nearly glabrous. ♃. H. Native of Europe and Middle Asia, in grassy humid places; plentiful in Britain. Hook. fl. lond. vol. 2. icone. Smith, engl. bot. 7. t. 489. Bûgula réptans, Mill. dict. no. 1. Mœnch, meth. p. 382. Bûgula, Riv. mon. irr. t. 75. f. 1.—Blackw. t. 64. f. 1. Floriferous branches

erect, glabrous, or pubescent. Radical leaves petiolate; cauline ones nearly sessile. Lower whorls remote; upper ones spicate, 6-20-flowered. Corollas varying from blue to rose-colour and white. This was formerly recommended as a vulnerary herb, but it is now altogether neglected.

Creeping or Common Bugle. Fl. May, July. Britain. Pl. ½ foot.

3 A. orienta'lis (Lin. spec. 785.) plant without stolons ascending, pilosely woolly; leaves ovate, coarsely and sinuately toothed, narrowed at the base: floral ones sessile, broad-ovate, deeply lobed or toothed, exceeding the flowers; whorls distant, or the upper ones are approximate; tube of corolla twisted, exserted, naked inside; limb of corolla resupinate. ♃. H. Native of Europe and Asia, in the region of the Mediterranean, on dry hills and pastures; as of Spain, Sicily, Italy, Grecian Islands, Syria, Tauria, and Caucasus, &c. Bùgula obliqua, Moench, meth. p. 382. Bùgula orientàlis, Mill. dict. no. 5.—Dill. elth. t. 53. f. 61. Radical leaves petiolate, large. Calyx deeply 5-cleft, with narrow, very pilose segments. Corollas blue.

Eastern Bugle. Fl. May, June. Clt. 1732. Pl. 1 to 1½ foot.

4 A. pyramida'lis (Lin. spec. p. 785.) plant without stolons, pilosely hispid or glabrous, erect; cauline leaves approximate, scarcely petiolate, obovate: floral leaves broad-ovate, clasping the flowers, tetragonally pyramidate, the upper ones often coloured, all quite entire or obscurely sinuated; upper whorls or all spicate; tube of corolla straight, exserted, annulate inside. ♃. H. Native of Europe, in shady mountain-places; and of Eastern Caucasus; as of Lapland, Sweden, Pyrenees, Cevennes, Provence, Switzerland, Piedmont, Greece, &c. in several parts of the North of Scotland. Smith, engl. bot. t. 1270. Œd. fl. dan. 185. Bùgula pyramidàlis, Mill. dict. no. 3. Teùcrium pyramidàle, Crantz, stirp. austr. Radical leaves 1½ to 2 inches long, gradually becoming smaller as they ascend the stem. Whorls many-flowered. Calyx 5-cleft. Corollas blue or purple.

Pyramidal Bugle. Fl. May, June. Scotland. Pl. ½ foot.

5 A. cilia'ta (Bunge, enum. pl. chin. bor. p. 51.) plant without stolons; stems erect, elongated, glabrous; cauline leaves remote, ovate, coarsely toothed, membranaceous, almost glabrous, with ciliated margins: lower floral leaves similar to the cauline ones: upper ones ovate, acute, quite entire, coloured a little, ciliated; whorls spicate, or the lower ones are remote; tube of corolla much exserted. ♃. H. Native of the North of China, in humid shady places at the rivulet called Ssi-jui-ssy, Bunge. Stems a little branched. Corollas blue. Bracteas purplish. Very nearly allied to *A. Genevénsis*.

Ciliated Bugle. Pl. 1½ foot.

6 A. Geneve'nsis (Lin. spec. p. 785.) plant without stolons; stem erect, pilose; cauline leaves oblong-elliptic or obovate, narrowed at the base: lower ones petiolate: floral ones ovate or cuneated: superior ones scarcely equalling the flowers or shorter, all usually coarsely toothed, membranaceous, green on both surfaces, and beset with scattered hairs; upper whorls spicate: lower ones distant; tube of corolla much exserted. ♃. H. Native of Europe and Asiatic Russia, on grassy mountains; as of Sweden, France, Germany, Italy, Tauria, and Caucasus, North of China, &c.; North of England, among the mountains. A. alpina, Lin. mant. p. 80. Smith, engl. bot. t. 477. A. foliòsa, Tratt. arab. 1. p. 25, with a figure. ? A. rugòsa, Host, fl. austr. 2. p. 120. A. multiflòra, Bunge, enum. pl. chin. bor. p. 51. A. pyramidàlis, Bieb. fl. cauc. 2. p. 82. Lasch. in Linnæa. 5. p. 445, and of many other authors, but not of Lin. A. alpéstris, Dumort, florul. belg. p. 42. ? Teùcrum Genevénsis, Crantz, stirp. austr. Bùgula alpina, All. ped. 1. p. 45. Bùgula decúmbens, Mill. dict. no. 2. Bùgula Genevénsis, Mill. dict. no. 4. Bùgula montàna, Riv. mon. irr. t. 140. f. 2. Plant very variable in stature, form of leaves, and hairiness, as sometimes hardly to be distinguished from *A. pyramidàlis*, and sometimes it is also allied to *A. austràlis* and *A. remòta*. Leaves more or less pilose, with a few teeth or lobes; upper floral ones coloured. Calyx 5-cleft, hairy. Corollas varying from blue to rose-colour and white: tube annulate inside.

FIG. 89.

Geneva Bugle. Fl. May, July. England. Pl. ½ to 1 foot.

7 A. remòta (Benth. in Wall. pl. rar. asiat. 1. p. 59. lab. p. 694.) plant without stolons, branched at the base, procumbent; floriferous branches ascending, villous: leaves oblong-elliptic or ovate, narrowed at the base: floral leaves ovate-cuneated, exceeding the flowers, all thickish and somewhat coriaceous, villous, coarsely few-toothed; whorls remote or the upper ones are approximate; tube of corolla exserted; middle segment of lower lip scarcely emarginate. ♃. H. Native of India, in the provinces of Oude, Hurdwar, and Kamaon, Wall; Himalaya at Nag-kanda, Royle; Deyra Dhoun, Royle and Jacquemont; Beralt and Mirpoor, Jacquemont. This differs from *A. Genevénsis* in the characters given. Whorls many-flowered. Calyx inflately globose after inflorescence. Corollas varying from violaceous or blue to rose colour and white, more slender and smaller than in *A. Genevénsis*.

Remote Bugle. Pl. ascending or procumbent.

8 A. O'Phrydis (Burch. cat. geogr. pl. afr. austr. no. 8700.) plant without stolons, erect, pilosely hispid; leaves obovate, narrowed at the base: floral leaves ovate, equalling the flowers or scarcely exceeding them, all thickish and somewhat coriaceous, glabrous or villous, coarsely few-toothed; lower whorls remote: upper ones spicate; tube of corolla equalling the calyx; middle lobe of lower lip bifid. ♃. G. Native of the Cape of Good Hope, Masson, Burchell. Allied to *A. Genevénsis* and *A. remòta*, but differs from both in the stems being erect and hispid, in the floral leaves being broad, and in the flowers being twice the size, and in the form of the corolla. Corollas blue; tube annulate inside.

Ophrys-like Bugle. Pl. ½ to ¾ foot.

9 A. austra'lis (R. Br. prod. p. 503.) plant without stolons; stems ascending or erect, pubescent, rather villous or glabrous; leaves narrow-oblong, narrowed at the base, quite entire or sinuated, thickish, rather villous: floral leaves similar to the cauline leaves, exceeding the flowers; lower whorls remote: upper ones subspicate; tube of corolla exserted; middle segment of lower lip emarginately bifid. ♃. F. Native of New Holland, in grassy places, at Port Jackson, and in the interior, &c. Very like *A. Genevénsis*, but differs in the leaves being narrower, longer, and more entire, especially the floral leaves. Stem, leaves, and calyxes pubescent, with short adpressed hairs. Teeth of calyx short. Corolla blue; tube annulate inside.

Southern Bugle. Fl. May, July. Clt. 1822. Pl. ½ foot.

10 A. Dieme'nica (Benth. lab. p. 695.) plant humble, without stolons, ascending; leaves narrow-oblong, narrowed at the base, petiolate, or the superior ones are sessile, quite entire or sinuately toothed, thickish: floral leaves similar to the cauline ones, much longer than the flowers; whorls all remote; tube of corolla equalling the calyx: middle segment of lower lip shortly emarginate. ♃. F. Native of Van Diemen's Land, Gunn and Lawrence. Plant more humble, more villous, and less erect than *A. austràlis*. Leaves, especially the floral ones, usually toothed. Corollas blue; ? tube annulate inside.

Van Diemen's Land Bugle. Pl. ¼ foot.

11 A. ACAU'LIS (Brocchi, Osserv. sulli. abruz. p. 22.) plant without stolons; stems very short; leaves oblong or obovate, narrowed a long way at the base, hardly sinuately toothed: floral leaves similar to the cauline leaves, but smaller, all glabrous or pilose; whorls few, condensed; tube of corolla straight, much exserted. ♃. H. Native of the South of Italy, in the higher mountain pastures, in Abruzzo and Calabria; also of Sicily. A. decúmbens, Tenor. fl. nap. but not of Thunb. A. Tenòrii, Presl. fl. sic. p. 34. Stems shorter than the leaves, scarcely 2 inches. Leaves approximate, 1½ to 2 inches long, or longer; floral ones narrower, generally quite entire, about equal in length to the corollas. Whorls few-flowered. Calyx semiquinquefid. Corolla nearly an inch long; tube annulate inside.

Stemless Bugle. Pl. 2 to 3 inches.

12 A. SINUA'TA (R. Br. prod. p. 503.) hairy; stems many, procumbent; radical leaves longer than the petioles, and are, as well as the floral ones, sinuated, attenuated at the base; whorls 6-flowered; calyx very hairy; corolla rather pilose. ♃.? F. Native of New Holland, at the Coal river near Port Jackson. A very distinct species, with the habit of *A. parviflòra*. Flowers small, blue.

Sinuated-leaved Bugle. Pl. procumbent.

13 A. PARVIFLÒRA (Benth. in Wall. pl. rar. asiat. 1. p. 59. lab. p. 696.) plant diffuse, without stolons; branches ascending, villous; leaves broad-ovate, narrowed into the petioles at the base, sinuately subdentate; floral leaves ovate, almost quite entire, exceeding the flowers, all thick, very villous, and subcanescent; flowers minute; tube of corolla shorter than the calyx. ♃. F. Native of the Himalaya, in Kamaon, Wall; at Simlah, Lady Dalhousie; Mussooree, Royle and Jacquemont; at Illahabad, and in the valley of the Jumna, Jacquemont. Stems numerous. Whorls many-flowered. Corollas pale violet, exannulate. Stamens inclosed.

Small-flowered Bugle. Pl. ¼ to ½ foot.

14 A. BRACTEÒSA (Wall. ex Benth. l. c. lab. p. 696.) plant without stolons, diffuse; branches ascending, villous; leaves broad-ovate, narrowed into the petioles at the base: floral leaves similar to the rest, exceeding the flowers, all sinuately toothed or quite entire, thick, very villous, subcanescent; upper whorls spicate; flowers small; tube of corolla exserted. ♃. F. Native of Nipaul, Hamilt. A. integrifòlia, Hamilt. in D. Don, prod. fl. nep. p. 108. Habit and hairiness of *A. parviflòra*, but taller and more branched; cauline and floral leaves larger; whorls more approximate; flowers as large again, but one half smaller than those of *A. Genevénsis*. Corollas blue; tube annulate inside.

Bracteate Bugle. Fl. July, Aug. Clt. 1821. Pl. ½ to ⅔ foot.

15 A. DENSIFLÒRA (Wall, ex Benth. l. c. lab. p. 696.) plant without stolons, humble, ascending, or erect, villous; leaves oblong or ovate, suberenated, narrowed at the base, thick, villous: upper floral leaves or all are shorter than the flowers; whorls spicate or the lower ones hardly remote; tube of corolla equalling the calyx: middle segment of lower lip scarcely emarginate. ♃. F. Native of Nipaul. Allied to *A. parviflòra* and *A. bracteòsa*. Corolla blue; lower lip size of that of *A. Genevénsis*.

Dense-flowered Bugle. Pl. ¼ to ½ foot.

16 A. DECU'MBENS (Thunb. fl. jap. 243.? Benth. lab. p. 697.) plant procumbent, without stolons; leaves subovate, coarsely toothed or cut, narrowed at the base, glabrous or villous: lower floral leaves almost similar to the cauline leaves: superior ones or all are bractea-formed, shorter than the flowers; whorls spicate, or the lower ones are few, axillary, and distant; calycine teeth bluntish; tube of corolla inclosed or a little exserted. ♃. F. Native of Nipaul and Kamaon, Wall; Kheree Pass and Deyra Dhoun, Royle; China, Sir G. Staunton. Intermediate between *A. densiflòra* and *A. macrospérma*. Whorls globose.

Decumbent Bugle. Pl. procumbent.

17 A. MACROSPE'RMA (Wall, ex Benth. l. c. lab. p. 697) plant without stolons, erect or ascending, branched; cauline leaves simple, ovate, coarsely toothed, narrowed a long way at the base, membranaceous, glabrous or sparingly pilose: lower leaves almost similar to the rest: upper floral leaves or all bractea-formed, and shorter than the flowers; whorls spicate, or the lower ones are subremote; calycine teeth obtuse; tube of corolla shortly exserted. ♃. F. Native of the East Indies, on the Pundua Mountains, and on Mount Taong Dong near Ava. Stem paniculately branched. Lower leaves on long petioles, 2-4 inches long. Calyx turbinate. Corolla small, with an elongated tube, which is inflated in the middle, and annulate inside.

Large-seeded Bugle. Pl. 1 to 2 feet.

SECT. II. CHAMÆ'PITHYS (from χαμαι, *chamai*, on the ground, and πιτυς, *pitus*, a pine; the odour of Chamæ'pithys is bitter and resinous like that of the pine.) Benth. lab. p. 697. Whorls 2, rarely 4-flowered. Corollas red or yellow; upper lip very short and truncate.

18 A. LAXMA'NNI (Benth. lab. p. 697.) stems ascending, pilosely woolly; leaves sessile, oblong or elliptic, obtuse, quite entire, pubescent or pilose: floral leaves similar to the cauline ones; whorls 2-flowered; calyx ample, semiquinquefid, with oblong, bluntish, nearly equal segments; tube of corolla inclosed. ♃. H. Native of the South-east of Europe and Middle Asia; as of Hungary, Transylvania, Bessarabia, Tauria, Caucasus, and Iberia. Teùcrium Laxmánni, Lin. syst. p. 489. Waldst. et Kit. pl. rar. hung. 1. t. 69. Phlebonánthe Laxmánni, Tausch. in bot. zeit. 1828. 1. p. 823. Stems branched, clothed with long hairs. Leaves about 2 inches long, stem-clasping; lower ones narrowed at the base; upper ones roundish; floral leaves all exceeding the flowers. Corollas yellow, nearly an inch long. Genitals equal in length to the segments of corolla.

Laxmann's Ground-pine. Fl. June, Aug. Clt. 1800. Pl. 1 to 2 feet.

19 A. OBLONGA'TA (Bieb. fl. cauc. suppl. p. 388.) stem erectish, very pilose; leaves nearly sessile, narrowly oblong, obtuse, quite entire, pilose: floral leaves similar to the cauline leaves; whorls 2-flowered; upper tooth of calyx minute: lower ones equal in length to the tube; tube of corolla shortly exserted. ♃. H. Native of Caucasus, in sandy places; and of Syria, between Bagdad and Aleppo. A. salicifòlia, Stev. mem. soc. nat. cur. mosq. 3. p. 265, but not of Lin. This differs from *A. Laxmánni* in the smaller stature and leaves, more stiff hairs, and form of calyx. Stems usually panicled. Corollas yellow, about the size of those of *A. Laxmánni*, but the lateral segments are rather broader.

Oblong-leaved Ground-pine. Pl. 1 foot.

20 A. SALICIFÒLIA (Schreb. unilab. p. 26.) herbaceous, pubescent; leaves oblong-lanceolate, bluntish, quite entire or a little toothed, narrowed into the short petioles at the base; calyx tomentosely hairy, with oblong obtuse teeth, the upper tooth the shortest; flowers on short pedicels. ♃. H. Native of Syria, between Smyrna and Bursa; and of Tauria and Armenia. Sibth. et Smith, fl. græc. 6. p. 22. t. 526. Teùcrium salicifòlium, Lin. mant. p. 80. Schreb. dec. 1. p. 17. t. 9. This differs from *A. oblongàta* in the short stiff pubescence. Habit and flowers almost the same, but the calyx is larger.

Willow-leaved Ground-pine. Pl. procumbent.?

21 A. CHAMÆCI'STUS (Ging. in herb. D. C. ex Benth. lab. p. 698.) suffruticose; branches white, nearly glabrous; leaves sessile, ovate-elliptic, obtuse, quite entire, green on both surfaces, but finely pubescent or glabrous; flowers pedicellate; calyx attenuated at the base, with oblong obtuse equal teeth. ♄. F. Native of Persia. A very distinct species. Leaves an inch long. Calyx tomentose at the base, whitish, with green teeth. Tube of corolla a little exserted.

Dwarf-cistus Ground-pine. Shrub.

22 A. Iva (Schreb. unilab. p. 25.) annual, diffuse, pilosely hispid; leaves oblong-linear, coarsely toothed or almost quite entire, with subrevolute edges: floral leaves similar to the cauline leaves; whorls 2-6-flowered; tube of corolla exserted. ☉. H. Native of the South of Europe and North of Africa, in the region of the Mediterranean. A. moschàta, Schreb. unilab. p. 26. Teûcrium Iva, Lin. spec. p. 787. Cav. icon. 2. t. 120. Teûcrium moschàtum, Lam. fl. fr. 2. p. 409. Moschària asperifòlia, Forsk. fl. ægypt. 154.—Mor. hist. sect. 11. t. 22. f. 3.—Lob. icon. t. 384. Branches numerous, tufted, leafy. The whole plant beset with stiff hairs. Leaves about an inch long, narrowed at the base. Corolla rose-coloured; tube annulate inside. This species possesses the same qualities as *A. Chamæpithys*. Var. β, flowers yellow. ½. F. A. pseudoiva, D. C. fl. fr. suppl. p. 395. A. Iva, Sibth. et Smith, fl. græc. 6. p. 22. t. 525. This does not differ from the species, unless in the colour of the flower.

Iva Ground-pine. Fl. July, Aug. Clt. 1759. Pl. ¼ to ½ foot.

23 A. tridactylì'tes (Ging. mss. ex Benth. lab. p. 699.) suffruticose, diffuse, pilosely hispid; leaves cuneated-oblong, deeply tridentate at the apex or trifid, with short ovate-oblong teeth: floral leaves similar to the cauline ones: upper ones shorter than the flowers; whorls 2-flowered; tube of corolla exserted. ½. F. Native of Palestine, on the top of Mount St. Catherine, N. Bové; and at the foot of Mount Libanon, Meryon. Habit of *A. Iva*, but differs in the form of the leaves and smaller flowers. Corolla rose-coloured. Filaments pilose, like those of *A. Iva*.

Three-fingered-leaved Ground-pine. Shrub ¼ to ½ foot.

24 A. Cìva (Schreb. unilab. p. 25.) herbaceous, erect, pilosely hispid; leaves deeply trifid, with linear, quite entire or trifid lobes: floral leaves similar to the others, rather shorter than the corollas; whorls 2-flowered, distinct. ☉. H. Native of Europe and Asia, in the region of the Mediterranean, on dry hills; as of Sicily, Italy, Island of Chio, and other Grecian islands; also of Tauria. Sibth. et Smith, fl. græc. 6. p. 21. t. 524. A. Chamæ'pithys, Guss. fl. sic. prod. 2. p. 66. Teûcrium Chium, Poir. suppl. 2. p. 772. Hardly differing from *A. Chamæ'pithys*, unless in the corollas being twice as long, and in the stems and leaves being more hairy.

Var. β, *minor* (Benth. lab. p. 699.) ☉. H. Native of Syria, near Aleppo, Russell. This variety is nearly allied to *A. tridactylites*.

Chio Ground-pine. Pl. ½ to 1 foot.

25 A. Chamæ'pithys (Schreb. unilab. 24.) herbaceous, diffuse; leaves deeply trifid, with linear, quite entire or trifid lobes: floral leaves similar to the others, exceeding the flowers; whorls 2-flowered. ☉. H. Native of Middle and South Europe; also of Asia, in the Pontic region; Tauria and Caucasus. In England it abounds in Kent and Surrey, but otherwise a scarce plant. Smith, engl. bot. t. 77. Teûcrium Chamæ'pithys, Scop. carn. no. 718. Œd. fl. dan. t. 733. Bûgula Chamæ'pithys, Schreb. unilab. p. 453. Chamæ'pithys Chamæ'pithys vulgàris, Link, handb. p. 458.—Riv. Chamæ'pithys trifìda, Dumort, florul. belg. p. 42.—Ludw. ect. t. 130.—Riv. mon. irr. t. 14. f. 1.—Mor. hist. sect. 11. f. 22. f. 1. Stems procumbent at the base, much branched, beset with long hairs like the leaves, which are ciliated with long hairs. Corolla yellow, dotted with red, pubescent outside. Filaments rather pilose. The whole plant has a highly aromatic odour, and was much esteemed in the same disorders as *Teûcrium Bòtrys*, and was an ingredient in the Portland powder.

Ground-Pine, Common. Fl. April, July. England. Pl. diffuse ¼ to ½ foot.

26 A. gla'bra (Presl. fl. sic. p. 56.? Benth. lab. p. 700.) herbaceous, glabrous; leaves dilated at the base, deeply trifid, with linear, quite entire lobes; floral leaves similar to the others; whorls 2-flowered; calycine teeth lanceolate, obtuse, glabrous. ☉.? H. Native of Sicily and Syria. Teûcrium lævigàtum, Russ. nat. hist. alepp. 2. p. 255. This differs from the preceding by its being glabrous, and by the flowers being twice the size; and from *A. Chia* by its being glabrous.

Glabrous Ground-Pine. Pl. ¼ to ½ foot.?

Sect. III. Pseudoanisómeles (so called from the species having the habit of the genus *Anisómeles*, with the anthers of *Ajuga*. False Anisomeles.) Benth. lab. p. 700. Whorls 2-6-flowered. Upper lip of corolla hardly thrice as short as the lower lip. Australian plants. The two species have the calyx, corolla, and nearly the habit of *Anisómeles*, with the anthers of *Ajuga*. The achenia have not been seen.

27 A.? virga'ta (Benth. lab. p. 700.) stems elongated, twiggy, nearly simple; leaves oblong; cauline leaves coarsely serrated, somewhat canescently villous; floral leaves quite entire, exceeding the calyxes; whorls distant, 2-6-flowered, disposed in long racemes; tube of corolla inclosed. ☿.? G. Native of New Holland, in the interior, at the river Lachlan, Cunningham. Stems pubescent. Leaves almost of *Anisómeles*; lower ones petiolate; upper ones sessile, narrow at the base, 1-2 inches long. Flowers nearly sessile.

Twiggy Bugle. Pl. 1 to 1½ foot.

28 A.? tridenta'ta (Benth. lab. p. 701.) stems elongated, twiggy, simple; cauline leaves oblong, petiolate: floral leaves sessile, ovate, trifid at apex, exceeding the flowers; whorls distant, 2-6-flowered, disposed in long racemes; tube of corolla exserted. ☿.? G. Native along with the preceding, Cunningham. Whorls occupying the larger part of the stem, usually 2-flowered. Flowers nearly sessile. Calyx glabrous or pubescent, campanulate, deeply 5-toothed. This differs from the preceding in the smaller calyxes, larger corollas, and tridentate floral leaves.

Tridentate-leaved Bugle. Pl. 1 to 1½ foot.

† *A species not sufficiently known.*

29 A. re'pens (Roxb. fl. ind. 3. p. 3.) biennial, procumbent, villous; leaves oblong-lanceolate, narrowed into the petioles at the base, coarsely and unequally serrated; spikes terminal, cylindrical; bracteas oblong, ventricose, 5-flowered, therefore the whorls are 10-flowered. ♂. G. Native of the East Indies, in the province of Chittagong. A robust diffuse plant, having the lower branches generally radicant.

Creeping Bugle. Pl. robust.

Cult. For culture and propagation see *Teûcrium*, p. 870. Most of the species belonging to section *Búgula* require a moist soil.

CX. CYMA'RIA (from *cyma*, a cyme; in allusion to the flowers being disposed in cymes.) Benth. in bot. reg. vol. 15. lab. p. 705.

Lin. syst. *Didynàmia, Gymnospérmia*. Calyx nearly globose, about 10-nerved, equal, 5-toothed; throat coarctate, naked inside. Corolla with a subexserted straight tube and a bilabiate limb; lips nearly equal; upper lip erect, entire, arched; lower lip spreading, trifid, having the middle segment entire. Stamens 4, ascending under the lower lip, didynamous; lower ones the longest; anthers 2-celled: cells at length divaricate. Upper lobe of style very short; stigmas minute. Achenia dry, wrinkled.—Shrubs. Flowers small, cymose; cymes racemose. This genus resembles *Cremóstome* and *Plectránthus* in habit; yet the rugose achenia, less deeply separated than in most *Labiatæ*,

seem to indicate its station as lying between *Ajugoideæ* and *Verbenàceæ*.

1 C. DICHÓTOMA (Benth. in Wall. pl. rar. 1. p. 64. lab. p. 705.) leaves ovate, nearly glabrous above, scarcely wrinkled; cymes loose, panicled; peduncles slender, 3-4 times longer than the petioles. ♄. S. Native of the Burman Empire, on Mount Taong Dong and at Segaen. Branches tomentose. Leaves on short petioles, crenated, tomentose beneath while young.

Dichotomous Cymaria. Shrub 2 to 3 feet.

2 C. ELONGA'TA (Benth. in Wall. l. c. lab. p. 705.) leaves wrinkled, tomentose on both surfaces; cymes dense, on short pedunoles; racemes terminal, elongated, loose. ♄. S. Native along with the preceding. This differs from the first in the branches being elongated and densely tomentose, in the leaves being on shorter petioles, and usually rounded at the base; cymes of flowers more numerous, disposed into an elongated terminal raceme. Calyx densely tomentose.

Elongated-branched Cymaria. Shrub 3 to 4 feet.

Cult. For culture and propagation, see *Plectránthus*, p. 682.

THE END.
